This communication proposes to analyze the phenomena that are located in the boundary between health (especially mental health) and social networks: it is a question for the analysis, from the daily life of a rural community, of reticular sociability's, which have consequences for practical and care solutions. The central question that I want to explore here can be summarized in this way: everyday practices of sociability imply the construction of resource mobilization, including those oriented toward caring for oneself. Rural communities have a peculiar territoriality, which indicates singular socio-centered structures of interactions with respect to those observed in urban areas. In this way we have the following questions to be addressed: how do people in their territory face the adversities of everyday life, and how are their egocentric networks an important ingredient to be considered? That is, what are the important mechanisms for the study of the sociability trajectories of people in psychic suffering? How can the analysis of social networks be useful for the reconstruction of the search for care?

FONTES, BRENO* (Universidade Federal de Pernambuco, Brazil)

Women, Social Networks and the Take Care of Yourself

Pesquisa recente em uma comunidade de pescadores no Nordeste do Brasil nos mostra um fenômeno importante: a existência de um índice importante de pessoas em sofrimento psíquico, e o uso de psicofármacos enquanto terapia preponderante. Além deste fato acrescenta-se outro de igual importância: que as mulheres eram as principais consumidoras de psicofármacos, representando mais de 80% das pessoas em sofrimento psíquico – em sua maioria transtornos de ansiedade. Questionados sobre este fenômeno, os profissionais de saúde indicaram que os homens, com territórios de sociabilidade específicos, faziam uso do álcool, enquanto auxílio no enfrentamento do stress cotidiano.

A partir deste fato, colocamos como questão central na explicação destas diferentes formas de enfrentar o sofrimento psíquico a partir da hipótese que   as sociabilidades vividas cotidianamente implicam em construção de práticas de mobilização de recursos, inclusive aqueles orientados para o cuidado de si.   Um achado – embora provisório – bastante significativo desta pesquisa foi verificar o fato de que as redes egocentradas das pessoas entrevistadas eram importantes para a iniciação destas pessoas ao uso de psicofármacos. Não somente introduzidos a partir da prescrição médica , mas também a partir de recomendações de amigos, membros da família, vizinhos, enfim pessoas que integram as redes de laço forte destas pessoas. E que estas sociabilidades implicam em diferentes configurações segundo as construções de identidade de gênero, com territórios predominantemente masculinos ou femininos.

New Scenarios for Radical Social Transformation: Emergent Strategy and the Case of Eco Vista, California

The question looming over peoples and movements today is: how do we organize ourselves to envision and enable transformational outcomes?

Students and staff at the University of California Santa Barbara campus are laying the groundwork for a re-imagining of their community of 20,000 people just adjacent to the university, as a model "eco-village." With 80 percent of its population between the ages of 18 and 24, many of the rest being first- or second-generation immigrant families, Isla Vista, California presents unique opportunities for addressing some of the most critical issues facing any community aiming for a just transition based on housing access and affordability, community gardens and food security, a circular economy, no-carbon transportation, local energy under community control, and self-governance and public budgeting.

Our goal is to turn Isla Vista into Eco Vista in the next ten years by unlocking the community's creative capacity to implement diverse and innovative approaches to climate crisis, accelerate radical social transformation, and co-create a workable eco-village and knowledge-sharing base that inspires further innovation and wide-spread collaboration with a network of student communities across the world.

The intellectual currents informing us include Transition Towns, commoning, buen vivir and the rights of Mother Earth, degrowth, pluriversal design, and ecosocialism. One of the approaches that guides our collaboration is that of adrienne

maree brown's "emergent strategy" – working from the bottom up to generate an inclusive, member-driven collective process to articulate desires and achieve most sought-after outcomes.

This presentation will present the fruits of our work so far to turn *Isla Vista* into *Eco Vista*, by critically assessing these efforts to establish an ongoing, multigenerational, student and immigrant community project for an equitable and just transition in Isla Vista, and to put the result, Eco Vista, forward as a model for college communities and beyond.

FORAN, JOHN* (University of California, Santa Barbara, USA)

Transforming the University to Confront the Climate Crisis

Drawing on my own experiences as a college professor of radical social change for 31 years who has been focused on the climate crisis for the past ten, in this paper I explore the crisis of higher education with respect to the climate crisis, the most pressing existential challenge of the twenty-first century, and then propose various approaches, actions, activities, and projects for classroom teachers to find teaching resources, students to engage in projects outside the classroom, and forming networks of educators to share knowledge, best practices, resources, and participatory action research and activism.

These will include the UC-CSU NXTerra Knowledge Action Network digital platform *[http://live-nxterra-ucop-edu-v01.pantheonsite.io/]*, the nearly carbon neutral conference [*https://hiltner.english.ucsb.edu/index.php/ncnc-guide/*], and facilitating students designing and implementing systemic alternatives outside the classroom in their own communities (such as Eco Vista [*www.ecovistacommunity.com*] at UC Santa Barbara, among others.

These initiatives, together with many others by educators across the world, suggest the outlines of a new type of university. The essay will discuss two prototypes of this which the author helped co-found and participates in – Transition U and Eco Vista Open U – which model a process/practice/strategy/pedagogy of co-creating with students, staff, faculty, and community members in Santa Barbara, California, and across the world.

The argument is that we must prefigure the type of more open, cost-free university that we need to confront a climate crisis which our present educational institutions are ill-suited to show leadership on, since they are typically embedded in a neo-liberal, capitalist ideology and business model, the very causes of the crisis itself.

It is hoped that the presentation will constitute an example of what it is about -- namely, an intervention with other academics to find alternatives to the "business-as-usual" model so prevalent around the world, and especially in the United States.

FORNOS KLEIN, STEFAN* (Universidade de Brasília, Brazil)

Intellectuals, Resistance and Immanent Critique

The hereby proposed paper aims to initially take up the Minima Moralia (Adorno, 1951), written in a context that combined scepticism and despair with the necessity of preserving hope and fostering resistance, to shed light on a few of the contemporary problems revolving around conservatism and forms of authoritarianism. Having established its viewpoints, I move towards reflections of the end of the 20th and beginning of the 21st century, more specifically in the Latin American context, and establish a dialogue with the diagnosis brought forward by (Argentinian) Beatriz Sarlo and (Brazilian) Irene Cardoso.

Sarlo's discussion concerning the intellectuals ("Their power was anchored on knowledge. They thought that the diffusion of knowledge was a source of freedom. During a long time they did not take into account that knowledge could be an instrument of social control. But no one besides them denounced that knowledge could be an instrument of social control", Sarlo, 1994) and Cardoso's contribution on the articulation of politics and the university (Cardoso, 2001) act as a second movement of thought to situate the context of how redemocratization in the period following the widely spread military regimes in Latin America formed (bildet) the sociological outlook.

Finally, in the last movement I shall problematize the role of knowledge and intellectuals for our present context, considering the ideological expressions that mark contemporary social conflicts and, as such, pointing out in which ways immanent critique should be seen as even more relevant and poignant to resist under these circumstances. Hereto, aspects of organizational nature that surround the present intellectual stance as well as problems concerning the form and content of critique appear as paramount to such a debate and shall be further deepened in this reflection.

Reducing antibiotics by strengthening intensive and industrial agri-food systems? Transitions in animal farming in the age of Capitalocene

The massive and uncontrolled use of antibiotics, particularly in agriculture, is now considered to be an important factor of the Anthropocene. The farming sector has thus been urged for several years to drastically reduce the use of antibiotics through a series of public and private measures aimed at promoting a transition to a more sustainable agriculture. This paper proposes a critical reading of different forms of transitions and how they tend to articulate (or not) in the field of animal farming. Indeed, although reducing antimicrobial use is presented as a way of strengthening sustainability and of flattering agro-ecological utopia, it more often contributes to processes of re-intensification and re-industrialization which are far from diminishing the human footprint on the planet.

 This paper is based on a series of collective surveys conducted among farms that have succeeded in significantly reducing their use of antibiotics in recent years in France (interviews with farmers, veterinarians and livestock technicians in the cattle, poultry and pig sectors). We show how transitions towards prudent use of antimicrobials is conceived and enacted at different levels, from the technical settings of farming systems to the socioeconomic practices and structures that drive these changes. This analysis makes it possible to reflect on the forms of resilience and attachment of/to the dominant agri-food system that our antimicrobial resistance policies are currently supporting. In the end, transitions in the age of Capitalocene seem to be able to strengthening the intensive and industrial components of the agri-food system, contrariwise to the narrative that the "champions" of antibiotic reduction try to convey.

Access to Digital Justice As a Contemporary Challenge

Access to Digital Justice in Contemporary Law consists of a relevant theme for the future of law and development, as individuals, groups and society becomes more active in the virtual environment, electronic commerce, and technological space of the internet. Nowadays, economic, political, and social conflicts emerge more and more in our online experience than our off-line life in a way that invites reflection on how to provide more access to digital justice. In this context, Online Dispute Resolution (ODR) is already a reality and the exercise of imagination of the future of access to digital justice requires a reflection of the possibilities and challenges of ODR in a setting of multi-door courtrooms, collective actions, small claims courts, electronic arbitration, and various paths of digital justice.

Comparación SOBRE La Inclusión Social Activa ENTRE Modelos Sociales: España E Italia Versus Argentina y Uruguay

COMPARISON ON ACTIVE SOCIAL INCLUSION BETWEEN SOCIAL MODELS: SPAIN, ITALY VERSUS ARGENTINA, URUGUAY
Authors: Antonio Martin Artiles; Vincenzo Fortunato; Eduardo Chaves
Is it possible to import certain patterns of social policies in the face of unemployment? International institutions recommend certain policy prescriptions to deal with unemployment and protection against poverty. The theoretical and conceptual framework of these policies is spread across several countries, often without considering their institutional and structural differences.

An example of this is the Active Inclusion Policy, promoted by the European Union. The objective is to link three pillars: unemployment protection, intermediation in the labor market and active job search. The link between these three pillars is made through the principle of conditionality and vertical and horizontal coordination. In other words, by linking rights and duties. These concepts have been extended through the political literature and today seem to influence the orientation of the employment policies recommended by the International Monetary Fund, the World Bank, Mercosur, among others for Latin America

In this paper we compare trends in two European countries (Spain, Italy) culturally linked to two countries in Latin America (Argentina and Uruguay). The objective is to analyze how the promotion of certain concepts, such as active inclusion, social protection, subsidy, conditionality, vertical coordination, horizontal coordination, intermediation, among others, can have different meanings and produce different results, despite apparently using the same conceptual framework. Institutional and structural differences between these four countries can help explain the differences and the usefulness of these policies.

Studying Vulnerable Populations in Disaster: Issues for Consideration

As disasters increase and intensify, it has become clear that many vulnerable populations globally are hit the hardest and endure the greatest losses. Scientists work to carefully study the experiences of those most vulnerable – such as, but not limited to, those vulnerabilities created by inequalities based on age, social class, and race and ethnicity – in a disaster event, using a multitude of research methods and guidelines. What are the methodological challenges of these studies in a disaster context? What are the ethical considerations? It is important to carefully consider how studies should be designed and carried out. This paper will explore these considerations, discussing methodological approaches, best practices, and impacts on marginalized communities. We will feature in-depth examples in the article, including research on children and youth in Hurricane Katrina, discrimination in disaster relief and recovery processes, and Native American Nations in the aftermath of disasters.   We will also explore issues such as ethical considerations, obtaining consent to participate, as well as obtaining local permission and collaboration. The chapter concludes with recommendations for how best to use various methods with vulnerable populations in the future and to be mindful of the effects of research studies on participants.

Worker Power and Trade Union Strategy: Lessons from the Docklands

From the perspective of many labor movement practitioners and scholars, organizing logistics workers may provide a sort of magic bullet for labor movement revitalization or left political projects today, as disruptions at key chokepoints in the global economy send ripples outward. In this paper, I draw on research conducted in Europe and Latin America on the International Dockworkers Council to examine the possibility of revitalizing labor movements through the global organization of logistics workers and consider the implications for the theorization of worker power more generally. In brief, I find that the structural power of dockworkers is far more complicated than dominant economistic theories suggest. While the dock labor process and dockworkers' key position in the global economic system provide a high degree of potential structural power, this power is only actualized in particular socio-political contexts which differ tremendously across the globe. Unfavorable national contexts impinged on dockworkers' ability to make use of their structural power just as much as they did on the ability of less strategic groups of workers. The result at the national level is weak, ineffective and in some cases, non-existent, dockworker unions. Under such conditions, dockworkers are heavily reliant on external alliances with labor and social movement actors. Yet, surprisingly, even in the successful cases in the project, in which organizing environments were relatively favorable, dockworkers suc-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ceeded through a combination of effective industrial action and external alliance building. As a result of these findings, I propose a novel theoretical framework for conceptualizing worker power, drawing on the work of Nicos Poulantzas to incorporate its simultaneously economic, social and political dimensions. I propose that such a framework is better able to account for both cross-sectoral and cross-national differences in worker power and therefore better able to inform trade union strategy at the national and transnational levels.

Shooting Script and Its Advantages in the Exploratory Stage of Spatial Research

The subject of the presentation would be the shooting script research technique, initially designed by Charles Suchar (1997). It consists of using photography during the observation to put the process in order and record the results. Suchar, when discussing shooting script, focuses primarily on individual researchers perspective and consider the tool usability concerning analytical reasoning (using photography to define and categorise the observed phenomenon). I want to put attention on the advantages of a shooting script connected more with an initial stage of a research process. So when photographing and organising the images help to formulate the research topic, capture how it relates to the material and visual aspect of the space, and the fostering effect of image for research team building, establishing contact with research participants and the social environment. When put together, the indicated advantages of the technique at all stages of the process allow seeing the full potential of this relatively simple but useful research technique. Especially as the shooting script is a useful not only in research practice but also in sociology teaching, due it is easy to understand and use, coherent with the specificity of sociology as a form of understanding (Berger 1963), as well as encourages self-reflection of research as a process that develops over time and amongst human and non-human actors. During the presentation, I will consider not only the possibilities but also the limitations of the technique (including the risk of reduction to the visual dimension of phenomena, delineation of the area to be observed, standardisation of the photographic process, representativeness of results, Western-centricity of visual techniques). The argument will be based on the experience of shooting script utilisation during the project on socio-spatial transformations in the Polish-German borderland I participated.

Germani and Wright Mills: Simultaneity Around "Mass Society" in the South and the North

Gino Germani and Charles Wright Mills, despite coming from -and working in- different countries, not only share a same era that leads them to problematize similar social processes, but also their academic trajectories present a series of coincidences in what refers to journeys, books, intellectual interlocutors and political affinities. Thus, in the first place, both authors produce their ideas from the early 1930's on, standing out, among others, the simultaneity of their conceptualizations about the emerging mass society around the 1950's. Secondly, it is suggestive that both thinkers have worked in one of the most important academic centers of the twentieth century: the city of New York. Thirdly, the Spanish translation of Wright Mills's The Sociological Imagination, but specifically the inclusion of the controversial prologue written by Germani in 1961, stands out as a milestone. Finally, it should also be noted that both sociologists maintained implicit and explicit dialogues in their works with the critical theory perspective of the Frankfurt School. All this raises the question about the location of the knowledge produced by both thinkers. More specifically, we ask in each case: from where and for whom do they write? In this paper, thus, we propose fundamentally two tasks. The first one aims to trace the ways in which the South and the North appear in both Germani's and Wright Mills's lives and works. The second will investigate how each of them have conceptualized the emerging mass society in their works, pointing out both their similarities and differences.

RC05-67.5

FRANCA MONTEIRO, ANA JULIA* (University of Coimbra, Brazil)

Racism in Brazil through the Eyes of the Abyssal Line: A Critical Look into the Legislative Production in the Last Years.

What we call modern common thinking is marked by an abyssal line within the Western world (Santos, 2007). This means there are distinctions drawn that turn individuals into visible and invisible. These conflicts between social regulation and emancipation that are part of the contemporary world, resulting in inequalities and lack of opportunities for certain subjects.

This proposes a critical analysis of the propositions of law regarding race and the Black population presented in the Brazilian parliament (1946 - 2013) (Machado et al, 2015). They were classified into Accommodationist, Integrationist and Assimilationist theoretical approaches for segregated societies. Accommodationist bills of law would have terms that emphasize "difference" in both public and private spheres. An integrationist proposal would have a neutral and common public arena and difference is reserved exclusively to the private sphere. In assimilationist ones, the emphasis is on the creation of something new from the mix of 'founding' cultures, supporting the myth of a racial democracy.

Now, I propose a further look into the propositions by discussing the content of the Integrationist and Assimilationist approaches versus the Accommodationist through the abyssal line lens. The goal is to contribute to the understanding of how subjects with racialized bodies are pushed across the abyssal line, according to the situation, going from visible to invisible, from human to non-human beings. This will enrich the understanding of the dynamics of discourses of race and racism in the political arena throughout the last decades through the legislative power based on the epistemologies of the South (Santos, 2007).

The Political Mobilization of Igreja Universal Do Reino De Deus: An Analyze of the Political Strategies of Folha Universal in the 2018 Brazilian Presidential Election

This paper analyses the discursive strategies adopted by Folha Universal to discuss the Brazilian presidential elections of 2018 and the main political subjects in dispute during the election campaign. A weekly newspaper produced by Igreja Universal do Reino de Deus (IURD), Folha Universal is one of the church's most important media, since it can unite the religious speech with the facts and news of the public sphere, including the political events. When articulating the national political issues with the theological believes of the church, the newspaper becomes an instrument of political socialization. The present investigation seeks to identify the strategies used in this political process. For the analyze, were collected Folha Universal edition from 10/22/2017 to 10/28/2018, corresponding one year of the newspaper publication before the election's day. Facing an extensive database, it was necessary to select by previous analyze the newspaper sections with the most explicit political content. Therefore, were selected the Opinion section and the main story, published on the cover. The content analysis was made using MAXQDA, a software for qualitative and mixed methods. For the codification, was adopted a deductive approach based in the recent research done on the last Brazilian elections, the rise of the new conservative movements in Brazil and the political action of Pentecostals churches and leaders in the country. The analyze points to an approximation between the view of IURD and the political positions of the far-right candidate Jair Bolsonaro, who was elected. In addition, it also points to attempts of the newspaper to value political participation and to emphasize the importance of the religious based vote in the elections.

FRANTZ, WALTER* (UNIJUI, Brazil)

La Organización Cooperativa En El Camino Del Desarrollo Local

En el escenario hegemónico de producción y distribución de las riquezas, las relaciones sociales son predominantemente competitivas, orientadas por la lógica de la acumulación capitalista. Para gran parte de la población es cada vez más difícil la inserción en las relaciones del sistema de producción y distribución de las riquezas y se evidencia la necesidad de nuevas relaciones económicas, nuevas relaciones de trabajo, nuevas relaciones de poder, de nuevos conocimientos. De estos hallazgos pueden nacer perspectivas de actuación, pues un escenario de crisis constituye también posibilidades de alternativas. Para la mayoría de los seres humanos, ciertamente, esta puesto el desafío de construir nuevos referenciales de orientación para sus prácticas, especialmente en relación con las cues-

tiones sociales y ambientales. El escenario apunta a la necesidad de construcción de nuevos mecanismos de defensa para las economías más débiles, sometidas a la lógica del capital. La constitución de instrumentos adecuados y la definición de caminos concretos de desarrollo, especialmente, de desarrollo local continúan siendo cuestiones centrales y retadoras. En la realidad de la economía de mercado no solo existen los aspectos competitivos. Muchos son los aspectos cooperativos, que pueden construir caminos de intervención em procesos sociales de desarrollo. La organización cooperativa y las acciones de cooperación, por su naturaleza social, por su sentido económico y por sus significados culturales y de formación política, se pueden constituir en caminos de un proceso de desarrollo local mas sustentable. Es así como se tiene presupuestado que la organización cooperativa se afirme como una fuerza de promoción de desarrollo, recalcando la cuestión local. De este modo, las practicas cooperativas se pueden traducir en desarrollo local para la construcción de conciencia y fuerza en las relaciones sociales, especialmente, del campo político y económico.

Exploring Emotional Responses to Data Visualizations (graphs, charts and maps)

The recent increase in private, public and political use of data and the increased circulation of data through visual representations indicate that the study of data visualization (graphs, charts and maps) is gaining importance as a research subject. Despite this, there has been little sociological contribution to the understanding of everyday experiences of data visualization (dataviz). Data studies has been characterized by studies of the top-down operations of data power and by a related absence of attention to experiences of data 'from the bottom up'. There is, therefore, a lack of research into emotional reactions of non-experts to dataviz.

To address this gap, my research explores emotional responses to circulating online data visualizations on climate change. Using political campaign organizations, I will investigate whether their dataviz have an emotional impact on people, and whether and how it can prompt political concern and participation in the UK and Poland. The relationship between data visualizations, democratic participation and the political implications of emotions are particularly important at this time of significant political changes both in the UK (Brexit) and in Poland (given the rise of the far-right). Despite different geo-historical conditions, both countries are experiencing the significant role that emotions play in (data-driven) decision making.

Inspired by Actor Network Theory approaches the project uses mixed qualitative methods and include the following: social semiotics analysis of data visualizations which involves interviews with data visualization designers; and individual semi-structured interviews with thirty diverse participants from the UK and Poland. In my presentation, I will discuss the theoretical framework, research design and initial findings of my project.

Resisting the Militarization of Territory Beyond the Environmental and Health Protection: The No Muos Movement in Sicily

The presence of US military bases in Sicily (Italy) has always been a contentious issue. The most recent data report that in the island are hosted about 12 US/NATO military bases. From the 1980s, diverse protest campaigns arose in opposition to the militarization of the territory and the perceived colonization made by US military forces. In the last decade, the No MUOS movement in Sicily has put again these issues in the public agenda. In fact, since 2008 a LULU (Locally Unwanted Land Use) movement has opposed the construction of the M.U.O.S. (Mobile User Objective System), a ground station of satellite communication used by the US Navy, near the city of Niscemi, being part of a global system based also in Virginia, Hawaii and Australia. The No MUOS movement, still existing despite the system has recently been activated, was able to delay its construction and activation, mobilizing thousands of activists and ordinary citizens coming from all Sicily and the rest of Italy. Even if it has risen in a small territory, the No MUOS movement has always had a NOPE (Not On the Planet Heart) perspective rather than being affected by Nimby syndrome. In fact, the frame bridging of different issues characterized the movement: beyond the protection of the environment and of people's health from the electromagnetic pollution, the opposition to the war and the militarization of territory, the antiracism and other issues. Moreover, the movement reached a transnational scale in its peak, involving local committees, national and international networks. With this contribution, we analyse the movement's frames, networks and forms of action, underling not only the connection between antimilitary and environmental issues, but also with others at local and transnational level. We will use the analysis of documents, semi-structured interviews with key informants and participant observation.

FREDDANO, MICHELA* (INVALSI (National Institute for the Evaluation of Educational System of Instruction and Training), Italy)

Action Research for School Evaluation Literacy: Practical Experiences from the Italian Field

In Italy, the culture of evaluation has been developing under the impulse of large-scale assessment surveys (at national and international levels) and the introduction of the Italian School National System of Evaluation with the Presidential Decree n. 80/2013. As a consequence, since 2015 each Italian school has to do self-evaluation and to complete a self-evaluation report, since 2016, has to define improvement actions to achieve and to realize a three-year improvement plan, and since 2019 has to realise a social reporting on results of the improvement plan.

In this framework, local decision-makers supported the schools by promoting events and activities on school evaluation literacy among school administrators and teachers. Particularly this paper reflects on the power of action research for training evaluation literacy among school operators by showing two experiences from the Italian field. The first case regards an experience conducted by the regional school office of Emilia-Romagna region from the 2016/17 school year; the second case focuses on the realization of a school network composed by all the school of the Liguria region. Both the cases have the aim to promote evaluation literacy among schools and to create synergies at territorial level.

The study examines the questions of the balance between practice and research and of the validity of the applied research tools, focuses on its implications at micro-level into driving decision-making, and reflects on its rule to sustain the evaluation culture from a multilevel governance standpoint.

The paper underlines that action research is an important strategy that allow teachers to empower evaluation literacy and to improve organizational and management skills, from the fulfilment of evaluation actions to the development of aware practices, increasing the sensitivity towards the culture of evaluation and the use of its results in the frame of school as learning organization.

FREDDANO, MICHELA* (INVALSI (National Institute for the Evaluation of Educational System of Instruction and Training), Italy)

Understanding Students' Response-Styles in Large-Scale Assessment Studies. an Analysis on Iccs 2016 Data

This research focuses on the challenges and opportunities attached to the process of building citizenship measures. More specifically, the aim of this study is to understand students' response-styles in large-scale assessment studies, with a specific focus on data from the International Civic and Citizenship Education Study (ICCS) 2016.

Different studies show the presence of response-styles, distortions or misrepresentations on answering. It is less difficult to control these aspects when the researcher goes personally on the field to administer questionnaires; it is more difficult to detect when the research consists of secondary data analyses.

Particularly this paper is focused on the analysis of data collected by the European regional questionnaire that is a research instrument administered to students from the European participating countries, with the aim of assessing aspects of civic and citizenship education related to the European context.

With the aim of detecting distortions due to missing data, acquiescence phenomena, response set and for estimating the perceived distance between the different modes of response, an analysis of the correspondences had been done on some of the questions from the European module of the student questionnaire. The questions are measured with ordinal scales, e.g. Likert scale. The sample taken into account for the analyses is that of the 3,766 students attending the third class of the 170 secondary schools of the Italian grade, representative for macro-geographical areas.

The analysis of the correspondences allowed to deepen the influence of the type of question on the behavior of the respondents. Results underline the respondents' comprehension of the questions and if there are semantic differences or similarities among items of the same battery, in the idea that having comparable indicators, if properly constructed and used by researchers with caution, can favor the comparison between the various educational systems and be a useful policy-orienting tool.

FREDES, DANIEL* (Universidad Central, Chile)
MANZANO, LILIANA* (Universidad Central, Chile)

Legitimidad Policial En Contextos De Alta Violencia: Análisis Del Rol Mediador De La Segregación Residencial

En el contexto latinoamericano, Chile exhibe tasas delictuales comparativamente bajas y menores niveles de violencia -medido a través de tasas de homicidio. Este panorama global, sin embargo, esconde la distribución desigual con que se manifiesta el fenómeno criminal en el país, especialmente en las zonas urbanas. El rol de la segregación urbana, la acumulación espacial de desventajas sociales y la distribución del delito en las principales ciudades chilenas ha sido documentado en diversas ocasiones a través de estudios empíricos, en concordancia con las teorías y evidencias levantadas desde la criminología socioespacial.

Adicionalmente, en línea con los estudios internacionales sobre desorganización social y eficacia colectiva, se ha intentado complementar el modelo explicativo de la distribución espacial del delito, con la incorporación de medidas de cohesión y control social a nivel barrial. Sin embargo, los hallazgos empíricos no han respaldado la aplicación de estas teorías al contexto chileno o latinoamericano, emergiendo explicaciones alternativas. Estas explicaciones buscan relevar la legitimidad con que cuenta las instituciones policiales en la ciudadanía, y las posibilidades de construcción de vínculos colaborativos, como factores claves en el desarrollo de comunidades eficaces.

En este contexto emerge la pregunta, ¿En qué medida la segregación residencial modera la asociación entre violencia y percepción de legitimidad policial, en las zonas urbanas (ciudades y comunas) de Chile? Para responder a esta pregunta se han estimado modelos de regresión jerárquicos utilizando las bases de datos procedentes de las Encuestas Comunales de Seguridad Ciudadana (2016) y el Censo de Población (2017), aprovechando la oportunidad única de contar con dos bases de datos robustas dentro de un periodo temporal cercano. Los resultados preliminares de los modelos multinivel confirman el rol mediador de la segregación residencial, realzando la necesidad de integrar las problemáticas urbanas en la generación de políticas públicas de seguridad pública.

Sharing Economy in the 21 Century

This study analyses the construction of sharing economy and its influence on business partnerships and the development of sustainable consumption of products and services. Sharing economy refers to a cross business and people collaboration aiming to solve economic, social and environmental problems by giving consumers access to products and services for free or in lower prices. Sharing economy can contribute to development of sustainable enterprises and to enhancing peoples´ ability out of poverty by allowing the reuse and circulation of resources and generating income to households or saving the environment. The study examines the collaboration between a construction company and car companies in the context of Helsinki, Finland. A qualitative method was used and interviews with respondents from the constructions industry, car companies and public officials. The findings show that there are different motives for collaboration in sharing economy. The public officials aim to increase alternative transportations. The construction company aims to reduce costs and get comparative advantages by selling more apartments. The car companies aim to increase their market share and both companies aim to develop new innovative business by long-term cooperation to benefit their business, the customers and the society. The research contributes with an empirical study to the development of the theory about sharing economy and collaboration of businesses. This research is limited to one case and one context. Comparative research in other sectors and contexts can allow the development of business models for sharing economy.

Sustainable Business Development By Sharing Economy

The aim of this study is to analyse the construction of sharing economy and its influence on business collaboration and the development of sustainable consumption of products and services. Sharing economy refers to a cross business and people collaboration aiming to solve economic, social and environmental problems by offering consumers access to products and services for free or in lower prices. Sharing economy contributes to development of sustainable enterprises and to enhancing peoples´ ability out of poverty by allowing the reuse and circulation of resources and generating income to business and households or saving the environment. This case study examines the collaboration between construct industry and car sharing companies. Interviews have been conducted with three categories of respondents in the construct industry, the car sharing industries and public officials. The findings suggest that there are different factors affecting businesses to collaborate. In general, the collaborating entity shares a common interest to contribute to comparative advantages for businesses by sharing the interest of saving the environment and lower the costs for consumers by providing the use of a service that users do not need to pay for ownership. New innovative business models and consumption patterns for the benefit of the collaborating partners and the society are constructed. The findings contribute to theory development by presenting an empirical study of companies in two different sectors and analysing how respondents motivate cooperation. This research is limited in examining only one collaboration of businesses in one context. Comparative studies about different models of collaboration, what the advantages are for consumers, the environment, the democratizing of the markets and the solidarity to future generations can be interesting future research subjects.

Heritage Assets As Indicators of the Social Origin

The main objective of this article is to propose an indicator of the social origin of families based on social well-being. Unlike the demographic and economic analyzes that assess the social destiny of individuals, focusing on the heads of the families, the focus of the our article is twofold and represents the proposition of two socioeconomic indicators, one based on the social origin and the other based on the destine of individuals. In the absence of a monetary indicator of the social origin, we use this indicator as a proxy for the socioeconomic status of families. This indicator can be useful for the problem of the lack of monetaries informations in different generations, as it happens in some countries, above all, for the analyzes that aim to capture the movement (change or constancy) of societies. It is thus an alternative indicator for researchers interested in assessing the social origin of individuals. The informations are from of the Milênio Institute (2008), used because they contain information about the assets of the heads and their parents.

RC55-672.2

FREITAS, ALAN* (UFRJ, Brazil)

Well-Being and Social Stratification Process in Brazil

The transmission of the socioeconomic advantage in Brazil has a double path, (i) investment in formal education and (ii) direct transfer of socio-economic well-being between relatives. We built a socioeconomic indicator that measures the social origin of individuals to measure access to well-being and we comparated this indicator with the variable - education. Quantitative methodologies (Principal Components Analysis and Path analysis) and data from the Millennium Institute (2008) were used.It was seen that the inequalities associated with the labor market (education) are significant, although historical differences between families are more important for the understanding of contemporary social inequalities.

FREITAS, LEONARDO* (Universidade Federal do Rio de Janeiro, Brazil)

The Strike of 2014 and the Associativist Flourishing of the Rio Street Sweepers: Causes and Consequences

As a part of an ongoing doctoral research, the paper takes as a mark the historical strike of the public cleaning workers of Rio de Janeiro, which took place in 2014 during the carnival, carried out by the so-called "garis", in an independent and oppositional way against their trade union official leadership and also disregarding the court decision that decreed the illegality of the movement. The approach returns to the past, seeking to problematize the antecedents of this mobilization and goes further in an attempt to understand its consequences for

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

the union organization of these workers. Based on related bibliography, on journalistic articles and mainly on the interviews with the street sweepers, it starts from the so-called 2013 June Journeys, which took place just over 6 months earlier the strike, seeking to identify and understand the processes of repertoire and performance transfers from the social movements to the union action of the street sweepers that ended up affecting their strike outbreak. Regarding the consequences of the 2014 mobilization, the work analyzes its symbolic charge over these workers, problematizing how it became a reference in the subsequent strike mobilizations of 2015 and 2019, through attempts, successes and failures to reproduce performances and objectives originally applied in 2014. In addition, it analyzes the dynamics of organization of these workers over this period: how the union leadership has matured its relationship with its base, dealing with embarrassments, sometimes avoided, sometimes deepened; and how the trade union opposition groups moved into political groupings and civil law associations. Finally, it discusses the direction taken by this union segment in the (informal) sense of a company unionism, problematizing particularities of union activism in the state public service sector in Brazil.

Organic (Agri-)Food Systems in Europe and Sub-Saharan Africa: Critical Reflections on Health and Ecological Crises

There is evidence that the COVID-19 pandemic (C19P) could be linked to biodiversity loss and climate change (CC). Therefore, the nexus of FS-C19P-biodiversity-CC is of specific interest for the assessment of the social and ecological adaptive / transformative capacity (ATC) of food systems (FS) to contribute to reduce the risk of current health and environmental driven crises. This paper sheds light on this nexus by describing, comparing and assessing FS in the Global North and South, using the diverse FS in Europe and Sub-Saharan Africa as cases, and critically discusses the ATC of FS under current crises, with a specific focus on organic farming FS.

FS are drivers of, and affected by biodiversity loss, CC and C19P. The Global Corporate Food Regime of the North with its high input agriculture is criticized as one of the drivers of these crises. In the South, smallholder farmers still produce most of the food with low intensity that is distributed via informal market systems. But clearly these comparably low input FS are also one of the main drivers of, e.g., environmental damages. Organic farming is both promising new pathways and, in the meantime, challenged by tendencies of losing their specific socio-ecological, value driven profile.

Methodologically the paper is based on a literature review and theoretical reflections. First, a FS typology is developed interpreting FS as holistic systems from farm to fork, differentiating organic farming small scale-local markets to conventional farming large scale-retail markets. Second, an extended ecosystem services model adapted to the latest crises, assessing FS´ role as drivers of crises, how they are affected by them, and their ATC under crisis. Finally, policy trajectories (e.g., farm to fork strategy) and global commitments (e.g., SDGs; EU Biodiversity Strategy for 2030) potential to support FS transformation processes will be analysed.

Developing Strategies for Educational Inclusion of Young People in Poverty: Teachers' Perspectives, Practices and Projects in Complex Socio-Territorial Contexts

In Argentina, the National Education Law (Ley de Educación Nacional) of 2006 established the mandatory completion of secondary education. This implied a challenge for educational policies, given the high levels of abandonment in the last years of secondary school - particularly in sectors of greatest poverty -. The new legislation installed in the educational system a discourse that emphasized the search for "inclusion" in secondary school, understood not only as access, but as permanence and completion of the educational level. Such discourse guided various policies and programs, some aimed at the entire secondary level - curriculum change, flexibility of the academic regime - and others more focused in a few institutions. The latter proposed an exploration of alternative formats, away from the traditional grammar of modern schooling.

This paper compares two institutions that develop their activity in areas of extreme poverty, in Buenos Aires and Greater Buenos Aires. They are particularly active in the reflection and exploration of strategies aimed at favoring the educational opportunities of young people in poverty. One of them depends on a national university and is presented as a field of exploration for "inclusive" strategies, with the academic and material support of the university. The other, , is a common school in the City of Buenos Aires, and its innovations are the result of the initiatives of their teachers, within the framework of the jurisdictional curricular design. The paper, developed from a research with a participatory action research methodology, analyzes, through teachers' narratives, the different theoretical and ideological perspectives about "educational inclusion" that circulate in these schools, the knowledge and experiences constructed by teachers in relation to "inclusion" and the tensions they experience in their daily work in a complex socio-territorial context.

Jóvenes En Nuevas Universidades Del Gran Buenos Aires: Trayectorias Académicas, Pruebas y Caminos De Inserción Laboral.

Las dos primeras décadas del siglo XXI se han caracterizado por una notable expansión de los sistemas universitarios en diversos países de América Latina. A la creciente demanda por educación superior se suma una agenda de las políticas educativas que pone énfasis en la búsqueda de inclusión y democratización en la universidad. Esto ha dado lugar a estrategias de ampliación de la oferta universitaria (creación de nuevas universidades, tanto públicas como privadas; tanto de formato tradicional como con nuevos formatos, con diferencias entre países) y de generación de programas nacionales e institucionales de apoyo a las trayectorias universitarias. En Argentina, esta tendencia se ha expresado a través de la creación de nuevas universidades públicas en territorios donde antes no existía una oferta universitaria: entre 2007 y 2015 se crearon 16 universidades, 8 de las cuales están localizadas en el Gran Buenos Aires. Estas instituciones nacieron con un mandato inclusivo, implementando dispositivos para mejorar el acceso y la permanencia de jóvenes de sectores populares a la universidad.

La presente ponencia analiza la experiencia universitaria de jóvenes estudiantes (varones y mujeres) que son primera generación de sus familias en acceder a una institución de educación superior, en dos de estas nuevas universidades del Conurbano Bonaerense. Se indaga específicamente las "pruebas" que cada estudiante debe enfrentar en su trayectoria universitaria –tomando un concepto de Martuccelli-, las estrategias que ellos despliegan para trascenderlas y las maneras en que encaran su inserción en el mercado de trabajo de su profesión. En relación a esto último, se exploran tanto sus aspiraciones hacia el futuro como las estrategias que implementan para alcanzar sus metas.

El análisis pone especial atención a las desigualdades y diferencias entre estudiantes de diversos géneros y carreras, explorando así las "pruebas" ligadas a distintos campos profesionales, en intersección con desigualdades socio-económicas y genéricas.

Making Anti-Racism through Arts?

a Collaborative Visual Research with Racialized Youths in Italy

The first part of our paper introduces the collaborative visual research with 30 artists (musicians, film-makers, writers, comic artists, theatre artists, slam poets) who are part of a generation of Italians who usually are not considered part of the "white nation" because of their colour/physical appearance and/or their family migrant background and/or their Islamic belonging. We explored how racism affects their life experiences and how their cultural participation challenges the dominant representation of Italianness and fosters new collective identifications against racisms (i.e. "Afro-Italianness").

The second part of our paper is devoted to discuss methodological issues. We will reflect on how we combined digital ethnography and in-depth interviews with photo-elicitation. Moreover, drawing from critical reflections on the limits of participatory visual research (Luttrell and Chalfen 2010; Guillemin and Drew 2010), the paper will discuss the dilemmas of using participatory video (Milne, Mitchell and De Lange, 2012) with a collective of young artists who are engaged in a self-organised squatting community from Milan. The collective is dedicated to the memory of Abdul (Abba for his friends) Guiebre, a nineteen-year-old Burkinabe-Italian who was murdered in Milan in 2008, by two bartenders shouting 'dirty N-word'.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

He was killed because of a supposed theft of cookies and racism was not recognized as an aggravating factor in the trial. Nevertheless, Abba has become a generational icon and in his name youths continue to fight against racism.

Visualizing Race, Challenging Racial Inequality

an Anti-Racist Action-Research with Primary School Children and Teachers

Visual culture scholars (Rose 2007, 7-12) invite to explore how images make social and cultural differences more or less visible. We are interested in how children drawings about the "others" visualize racial difference in contemporary Italy. We will discuss how images produced by children are looked at and how they are inserted in the social contexts of their daily lives. In Italian schools, there are intercultural programs addressing diversity, but seldom they face issues of power and inequalities. Indeed, as Gabrielli (2015) showed, public schools socialized children to racial knowledge.Children learn race and racism since early childhood (Ausdale and Feagin 2001), but many adults keep on thinking about them as "multicultural angels". Our study is inspired by Paola Tabet research "The Right Skin" (1997) which showed how racist colonial culture is still alive and it affects how children see the "others" in contemporary Italy.

We combined children drawings and narratives with focus groups, involving about 100 10-years old children of primary schools from Padova. Children are active social actors (Corsaro 2018) who do not simply reproduce racial hierarchy but also challenge through their peer cultures. We will illustrate the importance of the process of audiencing (Rose 2007, 22-3) of their images. The site of focus group is crucial to discuss hegemonic representations about "others" and to let emerge (political) subjectivities of children who can reflect on their lived citizenship experiences (Baraldi and Cockburn 2018).

We will offer some thoughts on possible future directions for involving teachers on visuality and antiracism, by working on children images of "others" and their ability to reframe images in a variety of ways.

Foreign Support or Foreign Hostile Force: The Influence of Nationalism on Chinese LGBT Discourse

With China's increasing involvement in the process of globalization, the nationalism also increased, which has brought many challenges to China and the world. This article will respond to challenges to LGBT rights in China because of the conflicts between nationalism and globalism. Nationalism has been a complicated impact factor for LGBT human rights in the globalized world. In China, nationalism cooperating with the Confucian culture is significantly restricting LGBT rights by blocking some LGBT friendly supports from the world civil society. Moreover, the government and the public are trying to construct foreign supports as hostile foreign forces. Based on it, this article tries to reveal the tensions and conflicts between competing identities and discourses (nationalist and LGBT identity) in the globalization environment. And also, this paper will further try to explain why foreign supports for LGBT rights in China are transferred into hostile forces. To this end, this article will analyze the discourses on politics of LGBT rights in the past ten years and deeply explore the *"798 Advocacy Activity"* which is unusual public advocacy for LGBT rights and visibility occurred in Beijing in 2018. This article will deepen the understanding of LGBT human rights predicaments through the perspective of nationalism and deepen comprehension of the limits of transnationals social movements.

Freely Gender Expressions and Mental Health Among Transgender Young Adults in China

Freely gender expressions among transgender young people (young people whose gender identities are different from their sex assigned at birth) can be a complicated process associated with promoting psychological well-being. On the other hand, freely expressing their gender identity may bring social discrimination and stigmatization which are social stressors and may raise risks of adverse mental health outcomes. However, limited research predicts whether or not transgender people can express their gender identity openly and freely in the real-life and related outcomes for their mental health. This paper will aim to examine the complex mental effects of freely gender expression among Chinese transgender individuals. Using data from "2017 Trans/Transgender Community Survey in China" and path analysis, this article will explore whether and through what kind of paths freely gender expression can improve or constrain mental health among transgender individuals in China.

FUENTES, SEBASTIAN* (CONICET/FLACSO-UNTREF, Argentina)

La Feminización En La Psicomotricidad En La Argentina y Su Formación: El Protagonismo De Las Estudiantes y Graduadas En La Expansión Del Campo Profesional

La psicomotricidad en la Argentina inicia su formación universitaria en los años 2000, expandiéndose a partir de la diversificación institucional de las universidades en la década previa, y la creación de nuevos perfiles universitarios que habilitaron la creación de nuevas carreras y/o la academización de formaciones técnicas. Esto permitió el desarrollo del ejercicio profesional en áreas donde no gozaba de legitimidad, más allá de la clínica/tratamiento individual. En el campo de la psicomotricidad, este proceso no modificó la histórica feminización de la disciplina,a antes bien, se expandió su campo de intervención en problemáticas e instituciones vinculadas a la infancia/crianza/educación/cuidado: todas áreas históricamente feminizadas, con menor "prestigio" y menor nivel de remuneración promedio. Sin embargo, ese proceso también permitió a) la creación de nuevos perfiles profesionales en políticas públicas, donde antes estaban ausentes, creando nuevas oportunidades de inserción laboral a las egresadas universitarias; b) el desarrollo de nuevas áreas -como el trabajo en espacios comunitarios, organizaciones barriales, asociaciones civiles, etc.- a partir de iniciativas tanto docentes como de estudiantes. Discutiendo con las representaciones que plantean la hegemonía de la innovación en su versión "tecnologizada", analizo las prácticas, sentidos y proyecciones a futuro que realizan estudiantes y graduadas recientes en psicomotricidad, que se materializa en un cuasi activismo disciplinar y de compromiso social, que permite expandir el campo profesional, generando "demanda" en ámbitos que hasta entonces desconocían la existencia de la disciplina. Este proceso se vincula a su vez con tendencias globales y políticas impulsadas por los organismos internacionales acerca de la profesionalización del cuidado y la atención/cuidados como políticas universales. Basado en una investigación desarrollada con estudiantes y docentes de la Licenciatura en Psicomotricidad de la Universidad Nacional de Tres de Febrero (Argentina), presento las tensiones y las prácticas solidarias y comunitarias, constructoras de este campo profesional en expansión.

RC04-45.1

FUENTES, SEBASTIAN* (CONICET/FLACSO-UNTREF, Argentina)

The Scales of Educational Privatization: The Offer of Private Universities in Different Mercosur Cities

In the Mercosur countries, the growth of Private Universities -in terms of the number of institutions and the concentration of enrollment- could be due to a greater plasticity of this type of institutions to create training offers according to the demands they detect in the "market", helped by differential regulations on the part of the control agencies of the higher education system in each country. In this presentation, I am interested in analyzing the regional and territorial logics in which the offer is built, the institutional-legal typologies of the institutions (e.g. profit, non-profit), the diversification into professional-disciplinary areas, and the political and market regulations that make the "quality" of that offer. As part of a regional study carried out in four Mercosur countries (Argentina, Brazil, Paraguay, Uruguay), I analyze the strategies implemented by the private universities located in: Large urban centers, capital cities and medium-sized cities. In this I seek to understand how mercantile logics are constructed at the regional level, taking into account spatial differentiation, and the focused on specific profile of students. I also observe the weight of "products" that are usually sold by univer-

sities within their courses, such as sports, technological and solidarity experiences, or their apparently greater connection with the labor market and companies. The objective is to advance in the knowledge of privatization processes understanding that they are diverse and unequal according to the territory and scale where this offer is deployed, regional diversity that educational research does not necessarily address. I suggest neoliberalism in education -showcased by privatization and other processes- is not a stable or homogeneous regime, and its effects must be analysed contextually.

FUENTES DÍAZ, ANTONIO* (Benemérita Universidad Autónoma de Puebla, Mexico)

Por Propia Mano. Inseguridad, Linchamiento y Defensa Comunitaria Armada En México

La ponencia discute la aparición de respuestas defensivas de colectivos y comunidades rurales o ciudades pequeñas en México, frente a la violencia y la percepción de inseguridad, caracterizadas por la apropiación de funciones securitarias. La ponencia propone entender estas respuestas como parte de un continuum en la gestión de riesgos, que va desde la justicia vigilante hasta la autodefensa armada; para ello analizará los casos de linchamientos en las tres últimas décadas, así como el movimiento de autodefensas en México que se visibilizó con mayor vigor hacia el año 2013. Discute la tesis que en el actual escenario de inseguridad, colectivos y comunidades reaccionan defensivamente, pasando de reacciones relativamente espontáneas (linchamientos) hacia una mayor organización (auto-defensa armada). Señala que la participación de las comunidades en la apropiación de su seguridad se da en un entorno social donde la legalidad e ilegalidad se confunden, una zona gris funcional al contexto de reconfiguraciones económicas regionales que ha favorecido la violencia. Asimismo se plantea que este tipo de participación colectiva o comunitaria defensiva se entremezcla con el fomento de las políticas estatales de seguridad ciudadana, conformando gramáticas antagónicas de la participación.

Educational Effects of Community Activities at Universities: the Case of Watarai Café Ryoku Project

The purpose of this report is to clarify the knowledge and issues regarding the educational practice that university students take the initiative in, from the cases of "Watarai Cafe Ryoko Project", which the students of Faculty of Contemporary Japanese Society at Kogakkan University have joined.

This project is the collaborative project with Watarai Town and has been carried out continuously since 2016. The purpose is to popularize Ise tea, a specialty of Mie Prefecture, as well as Japanese tea, by product planning, development, sales, and PR, and to activate production areas. Activities include understanding the current situation of Japanese tea and creating new problems through interviews with Japanese tea producers and Watarai Town Office, rediscovering the attractiveness of Japanese tea through tea picking and production experiences, creating PR posters and videos of Ise tea, developing and selling Japanese tea products using Ise tea, and making bread using Ise tea. In addition, at present, Mie Prefecture, especially the Ise-Shima area, has a remarkable problem of an aging society with a low birth rate and is plagued by a lack of local actors. This project is expected to help solve this problem.

Various knowledge was obtained by examining the activity of this project. In the future, we will explore the possibility of commercializing the product developed in the collaboration business, and further promote the efforts for industry-government-academia cooperation including enterprises. Furthermore, the promotion of projects based on the SDGs will be a priority issue.

RC25-306.1

FUJIYOSHI, KEIJI* (Otemon Gakuin University, Japan)

How to Learn to Understand Others without Verbal Communication

Language is an important tool for communication in almost every society. Children are taught how to communicate others as well as how to view the world according to the society's own context. How a society teaches its children how to use its language is, therefore, a helpful window to see the society's view of the world and human relationships.

Some years of research on textbooks of Japanese language for Japanese students shows that Japanese children are taught to express something that they think they are expected to express. They are generally encouraged to understand the situation where they are put and the role they should take in such a situation. There we can understand how Japanese people are taught how to regulate their selves in accordance with the society's convenience.

This presentation shows how children are taught to take a designated part in the Japanese society and suppress their selves for their society's sake. The author would like to make it a starting point to organize comparative researches on how each society teaches its children to use its language to take part in the society respectively in collaboration with the interested scholars in the world.

FUKUDA, TOMOKO* (Chiba University, Japan)

Afghan Migrant Entrepreneurs and Agglomeration of Used Auto Parts Traders in Japan

Japan is famous for its strict standards for refugee recognition and low refugee recognition rates. Even those who wish to apply for refugee status do not apply with little hope of being granted. Another option is the residential status of "Business Manager" for business owners and "Engineer/ Specialist in Humanities/ International Services" for employees. Most of the Afghan migrants who live in the Imba district of Chiba prefecture in Japan are Hazaras. They are ethnic, linguistic, and religious minorities in Afghanistan and seem to be "quasi-refugee." On the other hand, many of them have succeeded in business and are relatively wealthy migrations. Most of them are traders of used auto parts. They agglomerate in the Imba area of Chiba prefecture. In the 2010s, Afghan entrepreneurs also relocated their families to Japan. As the number of Afghan children surged into school, educational administration is under pressure to respond without waiting. Some local Japanese language support volunteer groups barely make up for the lack of service. The kinship network that connects the world is the base of Afghan entrepreneurs' trade. Its most important market is in Sharjah in the United Arab Emirates. This paper argues that international politics, such as the Afghan conflict and sectarianism in the Middle East, influenced Afghan migrants' community formation in Japan.

FUTABA, YASUKO* (University of Tokyo, Japan)

Hidden Racism Under Justified Ablism in Educational Organizations: How Intersectional Systemic Oppression Works in a Meritocratic Institution

This research explores how formal equality under meritocratic institution justifies ablism and ultimately permit other forms of discrimination as racism and social class discrimination in implicit manners. One of the known principles in public education in Japan is strict formal equality in the meritocratic system. Students, receiving precisely the same treatment, are expected to perform as good as others unless impairments are found formally to certify their inability to cope with mainstream education. That does not only justify ablism, which leads students with recognized impairments to exclusion from the mainstream of education but also places students with significant differences but without recognized impairments such as those with different cultural or family backgrounds in critical condition. Ablism seems the only systemic oppression functions in Japanese schools as the criterion for formal exclusion from Japanese schools is whether or not students have any recognized impairments. However, recent studies suggest that discrimination in the forms of racism or social class does operate in Japanese schools under cover of the ablism. The author argues that ignoring invisible systemic oppression may allow additional invisible systemic oppressions such as discrimination based on hetero-sexuality to developed in the institution, or otherwise, such oppressions are already developed but just invisible to researchers.

Children School Time Organization and Life Arrangements in Spain

The Spanish educational system is characterized by having a rigid educational system, with little flexibility in how the teaching hours are distributed among subjects. In the same way, the Spanish educational system is grouped into the set of systems that make a higher and more rigid teaching load as long as it does not fit a progressiveness that accompanies the also progressive evolution of the students' capacity. There is also the most noticeable leap in school load in the transition from primary to secondary school. The Spanish education system is also located among the countries in which repetition and private lessons are most often used, and in which there is a high school dropout. The extensive recourse to homework, tutoring and review classes means that a greater workload is required by the students than the officially established as theoretical teaching time. In this paper we propose a novel look at time-use issue, by studying how time is organized around children's life and with a special focus on how school timing influences the other spheres of children's life. For this, an extensive analysis of the Spanish Time Use Survey is presented. Although the cross-sectional nature of the data does not allow us to prove causality, it provides us with rich information about daily time-use of households (parents and children) and allows us to establish a typology of life arrangements of school-age children across Spain on the one hand, and connect the time-related arrangements with various socio-economic characteristics.

GABALDON-ESTEVAN, DANIEL* (University of Valencia, Spain)

Desynchronized School Time Organization: A Neglected Form of Structural Violence on Children and Youth.

The interlinks between structural violence and inequality have been of interest for social scientist as has been other forms of violence in the school system. In the last years, however, life sciences have been bringing about increasing evidence on the influence of time on the life of individuals. With the recent developments of chronobiology and different streams within chronomedicine (sleep, nutrition, etc.) we are becoming more aware of the consequences of desynchronized life styles on the health, academic performance and the quality of life of individuals. On the other hand, studies on performance underline the relevance of good food and sufficient rest for optimal school performance and the need to adapt classes to the circadian cycles of students. School time that is not properly synchronized to the needs and characteristics (chronotype) of students is, to a large extent, a waste of time and a 'neglected' source of inequality. To explore this novel association for this research we follow Galtung' structural violence to apply it to the study of how desynchronized school time organization can be understood as a form of violence where pupils are harm by preventing them from meeting their basic needs, health, academic performance and the quality of life of pupils.

Enhancement Imaginaries: Exploring Understandings of Pharmaceutical Cognitive Enhancing Drugs Amongst Different Occupations

The growing use of psychoactive substances in everyday life, an increasing experimentation among users and the potential of poly drug use for non-medical or enhancement purposes is an important social issue. The paper aims to build on previous research to gain a more in-depth qualitative understanding of the imaginaries around pharmaceutical cognitive enhancement (PCE). It focuses in particular on how so-called pharmaceutical cognitive enhancing drugs (PCEDs) might be used and the social acceptability of these uses for those in various occupations. Data come from 6 focus groups (20 participants), representing three occupations (academics, ambulance staff and lawyers), recruited in the UK. We discuss four distinct 'enhancement practices' where PCE use was conceptualised as a way to: (1) become the best version of oneself; (2) gain a competitive edge over others; (3) for personal achievement or well-being; and (4) promote personal/public safety. The findings problematise the term 'enhancement' by showing the different ways in which use of pharmaceutical 'enhancement' drugs can be imagined and understood. The implications for the concept of pharmaceuticalisation are also considered.

Emotional Regimes and Commemorative Conflict

This paper proposes a new conceptualization of emotional regimes, developing Laurent Thévenot's sociology of regimes of engagement, and employs it to explain commemorative conflict as well as cases when commemoration is less conflicted than expected.

The study of regimes of engagement is the most theoretically sophisticated variety of French pragmatic sociology. It distinguishes between different grammars of commonality, based on plural orders of worth, individual interest, personal affinities to common-places, or exploration. Each grammar is structured by different intermediary objects, ways of communicating, and modes of settling differences. Most importantly, every grammar is based on a background mode of engagement that structures situated encounters: people are variously assumed to be engaged in justification for the common good, in the pursuit of an individual plan, in familiarity, or in exploration. This paper shows that each grammar also implies a certain emotional regime: moral emotions; individual emotions expressed in a conventional format; authenticity; or excitement. Conversely, every grammar also comes with a view of what constitutes bad affect or emotional deviance: "too personal" emotions not connected to an order of worth; co-dependence / lack of emotional autonomy; inauthentic emotions; and indifference or lack of emotional openness. The paper argues that this approach to emotional regimes enables a more fine-grained and productive account of different types of emotional conflict and emotional communion than do ideas of dominant emotional regimes (William Reddy) or separate emotional communities (Barbara Rosenwein). This is illustrated with examples from a multi-year ethnographic study of commemorative practices surrounding Soviet war memorials and Russian military cemeteries in different countries. The empirical part of the paper discusses both cases where commemorative conflict is unexpectedly absent despite seemingly incompatible interpretations of the object of commemoration, and those where different emotional regimes clash in commemorative practices.

Theorizing Exploration: Science, Protest, Squats, Fieldwork

This paper develops Laurent Thévenot's sociology of regimes of engagements by fleshing out a regime that has received only cursory attention so far: the regime of exploration. Drawing on work by Thévenot and by the late Nicolas Auray, the paper traces the exploratory mode and its attendant grammar of collective exploration or improvisation across a variety of empirical contexts, including scientific discovery, mass gatherings such as protest events, musical performance, computer games, communal living, and sociological fieldwork. In each case it shows how the serendipity that is at the core of exploration is fortuitous but also results from conventional frameworks that either deliberately or inadvertently facilitate it, such as interfaces for databases of scientific data, rules for improvisation in jazz, and the spatial setup of squats or protest gatherings. The grammar of exploration is then shown to reflect phenomena central to theorizing in other traditions in the social sciences and humanities, such as Hartmut Rosa's theory of resonance or Hans Ulrich Gumbrecht's *production of presence*. Particular attention is paid to the ways in which attention to the regime of exploration allows us to bridge the notion of conventions central to French pragmatism with the idea of generative mechanisms at the heart of critical realism: the ways in which, from a pragmatist perspective, the material equipment of conventionally pre-formatted situations can generate serendipity, can be seen as similar to the ways in which mind-independent mechanisms ground discovery in both the natural and the social sciences.

Prácticas Corporales En El Sítio Veiga: Diario Y Identidad

El presente trabajo tiene como objeto de investigación las prácticas corporales realizadas en el Quilombo Sítio Veiga, ubicado en la ciudad de Quixadá-CE-Brasil, un estudio justificado por el reconocimiento de la necesidad de preservar la cultura de este grupo social, e identificó la ausencia de investigaciones relacionadas con este tema. La investigación se esta desarrollando con un enfoque cualitativo y se enbasa en el estudio de caso etnográfico. Los procedimientos para obtener información son: a) observación participante, b) cuestionarios, c) entrevistas, además del contacto informal, en un intento de responder la siguiente pregunta: ¿Cuáles son los significados y significados atribuidos por quilombolas a las prácticas corporales realizadas? en tu vida diaria como expresión de identidad? El objetivo general es comprender los sentidos y significados de las prácticas corporales diarias y su relación de identidad en el Quilombo Sítio Veiga en Quixadá, CE, Brasil. y los objetivos específicos: identificar y registrar las prácticas corporales realizadas por el grupo social, constituyentes de su identidad; Descrebir las técnicas corporales del grupo basadas en la construcción de sus identidades en su vida diaria; Analizar cómo se manifiestan las diferentes prácticas corporales en Quilombo Sítio Veiga; Analizar los aspectos simbólicos que constituyen los elementos de identidad del grupo social, especialmente la Fiesta de la Danza de São Gonçalo El marco teórico utilizado se basará en los conceptos de Simmel (1981) que presenta estudios sobre percepciones sensoriales y emociones; Silva (2005) que trae discusión sobre las prácticas corporales; Le Breton (2009) dedicado a la comprensión de la corporeidad humana como una construcción social y cultural; Mauss (2017) describe que los movimientos más esenciales en la vida son las construcciones sociales y culturales con el concepto de técnicas corporales; Merleau-Ponty (1999) con el objetivo de capturar la esencia de la corporeidad del grupo social en estudio.

GAIGER, LUIZ* (Universidade do Vale do Rio dos Sinos, Brazil)

Reciprocity As a Key Structuring Element of Solidarity-Based Economies and Collective Action

This paper aims at bringing a theoretical contribution centred on the concept of reciprocity, which can be summarized in a few points: first, in order to illustrate the use of the polysemic notion of reciprocity in studies on non-capitalist forms of economy, highlighting some convergences between analytical approaches, as well as some controversies arising from the proximity of the term with neighbouring notions such as compulsory retribution or bilateral exchanges. Secondly, the concept of reciprocity will be resumed in the theoretical perspective of Karl Polanyi, situated in our view in the same line of Marcel Mauss and other authors who have given relevance to the paradigm of the gift. According to this understanding of social life, whose starting point is the primacy of interdependence and of social bonds between individuals and human groupings, reciprocity is especially important as a pillar of social and economic integration. The concept of integration leads to the third purpose of the paper: to verify how reciprocity, by fulfilling an integrative role, articulates other economic principles and gives them another meaning and other functions. The solidarity economy will be examined as a historical case illustrative of this analytical perspective, considering in particular its expressions in Latin America, in which reciprocity structures cooperation and self-management practices. Doing so, reciprocity not only shapes particular forms of economy, but functions as a dynamic principle and foundation for collective interaction and social mobilization. Broadly speaking, this current case, as well as its historical antecedents in the South and in the North, shows how the recognition of our anthropological condition of interdependence gives reciprocity a structuring role of human realities.

WG08-719.4

GAIGER, LUIZ* (Universidade do Vale do Rio dos Sinos, Brazil)

Social Ties and Reciprocity As Happiness Pathways in Solidarity-Based Economy Experiences

According to Marcel Mauss's "The Gift", human life depends primarily on social bonds. Words that evoke seminal works by prestigious intellectuals, like compassion (Karen Armstrong), honour (Kwame Appiah) and reciprocity (Marshall Sahlins, Dominique Temple), would in fact make sense only on the premise of a human nature based on relationships, between givers and plaintiffs of social ties. The essentials in human life pass through them; with happiness is no different. This is the main argument of this paper, resulting from literature reviews and, above all, from several researches on solidarity economy experiences conducted since the 1990s.

Happiness includes a judicious, reflected perception. It is also a process that involves our acting, our thinking, our reason, our emotions and our sensitivity (Eduardo Giannetti). For what reasons would the solidarity economy favour social ties to be built and perpetuated, bringing what matters to happiness? The general answer is that the protagonists of the solidarity economy use their experience in creating social bonds and their willingness to cultivate them. This behaviour is favoured by their life systems, anchored in a logic of reciprocity (Karl Polanyi, Eric Sabourin) that encourages successive retribution between individuals and collectivities, attaches great value to social bonds and does not separate the economy from other spheres of life. In general, the solidarity economy is carried forward by individuals with a pronounced ballast of associative, community-based or class-based experiences who prefer to live a denser, more binding style of sociability. Their experiences in the solidarity economy provide new exercises, enhancements, creations and, thus, an awareness of our anthropological condition of mutual dependence. These social actors refuse to exchange their values and life systems for the benefits of a higher, illusory and unreachable degree of so-called modern civilization, and therefore maintain the critical and insurgent character of their initiatives.

GAILLARD, JC* (The University of Auckland, New Zealand)

Disaster Studies: How Radical Are We?

This presentation discusses how much disaster studies has progressed over the past 40 years. It will particularly focused on the so-called vulnerability paradigm and alleged radical agenda. In the 1970s, we were indeed challenged to not only reconsider what we thought, until then, were the causes of disasters and their impact on societies but also how we researched disasters. We were encouraged to contest Western epistemologies, their concepts and methodologies that were being rolled out across the world under a disguised imperialist agenda. Forty years later, despite much noise about the advancement of the vulnerability paradigm and its impact on how disaster risk reduction policies and practices have been designed, it seems, though, that we have merely scrapped the tip of the iceberg. In many ways, we are still reproducing a number of biases that were criticised in the 1970s, hence often pursuing, often unconsciously, an agenda that primarily serves Western researchers at the detriment of those who are most often affected by disasters in the rest of the world.

GAITÁN, ANA CECILIA* (UNSAM, Argentina)

Violencia y Mujeres Jóvenes. Aportes De La Producción Académica Mexicana Para Pensar El Lugar Del Estado Argentino En El Ejercicio De La Violencia De Género.

A pesar de los acalorados debates mediáticos y académicos, las denuncias públicas y las masivas y heterogéneas movilizaciones sociales bajo las consignas "Ni Una Menos" y "Vivas Nos Queremos", la violencia de género no ha cejado en Argentina. Si bien en los últimos años las reflexiones sobre las violencias como problema teórico ha recobrado fuerza en la región, en dicho país, a diferencia de otros como México, las investigaciones académicas sobre el papel del estado en el ejercicio y la reproducción de la violencia hacia las mujeres y las niñas continúan siendo escasas. Atendiendo a esto y en un diálogo con las producciones mexicanas sobre el tema, el propósito de esta ponencia es presentar aspectos centrales de aquellas conceptualizaciones sobre el lugar que ocupa la violencia hacia las mujeres y sus discursos públicos en la reproducción de las relaciones de género en urbes fronterizas como Ciudad Juárez y Tijuana, las cuales resultan fructíferas para la indagación del papel del estado argentino en la regulación del género. El objetivo de este diálogo, es avanzar en construir nuevas preguntas que permitan indagar en torno a cómo, en el territorio del conurbano bonaerense, la violencia hacia las jóvenes pobres y los constructos discursivos del estado al respecto, inciden en su autonomía en el uso del tiempo y del espacio, a la vez que en sus emociones y deseos. Aunque se encuentran a miles de kilómetros de dichas ciudades, los barrios de sectores populares del conurbano bonaerense albergan a jóvenes mujeres que se encuentran expuestas a una trama de violencias que, si bien adquieren especificidades locales, se configuran, de igual modo, sobre un entramado de desigualdades de género, edad y clase, que aquellas experimentan de manera intersectada.

The RC36 Covid-19 Pandemic Survey: The Political-Economy Context for the Israeli Case Study

This presentation reports on a survey conducted by RC36 in collaboration with the Institution for Population and Human Sciences (IPHS), Bulgarian Academy of Sciences, for the purposes of a comparative study of selected countries. The survey's aim is to investigate how people experience and deal with stresses caused by the Covid-19 pandemic and the consequent changes to their private and working lives. Our particular focus here is on Israel.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

The welfare-oriented Jewish Democratic State of Israel, established in 1948, was based upon pre-state Labour Movement instruments beginning in 1920. It deteriorated after the 1967 conquest and occupation of the Palestinians territories into a capitalist state, and Likud right-wing governments expanded neoliberal nationalistic political-economic policies after 1977. Following the 1995 assassination of Prime Minister Rabin by an extreme right student, Israel became a militaristic, authoritarian, illiberal democracy. The Oligarchic Phase of the state's further degeneration after 2009 resides upon Prime Minister Netanyahu's ideological, brutal, neoliberal austerity policies. Israeli then entered a phase of Disastrous Distraction when the Covid-19 pandemic erupted in early 2020. Israel had been poorly equipped for nearly two decades, with the number of medical staff unchanged since 2003, when Netanyahu, as Treasury Minister, initiated deep cuts in the welfare budget. The country was thus ill-prepared for the new corona virus. Israelis are also now suffering from ongoing poverty, deep unemployment, hunger, and third-world standards of state services. Reliable surveys indicate that more than 65% of citizens feel anger, alienation, and mistrust concerning the conduct of the dysfunctional Netanyahu government. The continuing political-economic crisis serves the Prime Minister's interests by obstructing court proceedings concerning his corruption allegations.

A representative statement from the RC36/IPHS survey findings is "I think that the Israeli government is completely mismanaging the corona virus crisis."

GAL-EZER, MIRI* (Kinneret College on the Sea of Galilee, Israel)

The Struggle of Israeli Liberal Citizens to Cut the Contagious Networks of Fascism

This presentation traces how Israeli Prime Minister Netanyahu has sought to implement Shock Doctrine (Naomi Klein) under cover of the Covid-19 pandemic. His actions set off from the 2003 ordering of deep cuts in personnel and welfare budgets in a reorientation towards neoliberal ideology and practice. Although the Israeli population has since risen from 6.6 million to over 9 million people today, welfare budgets have remained unchanged even as settlers in the occupied Palestinian territories and the military have been generously funded. The further degeneration of the state after 2009 has resided upon the U.S. Republican Party's extreme ideology. Beginning in 2016, Netanyahu has also adopted President Trump's illiberal policies that support the richest 1% and lead to the construction of a fake "reality" and alternative facts that obscure actual reality, break democracy rules, conflate private and state interests, and possibly jeopardize state security.

When Covid-19 erupted in early 2020, Netanyahu promptly took charge of pandemic-control efforts, transforming them into a military-security action. Military secret services operate where public health specialists should be active, "contact tracing" the movements of Israeli citizens through their mobile phones. Mossad was sent across the globe to purchase respiratory machines and protective clothing for health-care staff, and the population has been managed by committees on the basis of emergency orders embedded in Israeli laws that date from the British mandate (1920-1948). The government, parliament, and supreme court have been intentionally weakened by persecutions and parallel secret rulings, while deliberately repeated political-economy crises and general elections serve Netanyahu's interests by obstructing court proceedings concerning his corruption allegations.

Today there are ongoing, very large public demonstrations throughout the country in the face of violent repression by the police and secret anti-terror units as engaged citizens struggle against the deterioration of Israel into an illiberal authoritarian state.

GALAN-GUEVARA, CARLA* (National Autonomous University of Mexico (UNAM), Mexico)

A Sociocybernetics Approach to Understanding Livelihoods Transformations and Sustainability

As has been widely documented, indigenous communities around the world have a very close link with nature and with the sustainability of the environment. In recent decades, many indigenous communities have been increasingly immersed in a monetized and global market economy, leading to modify their livelihoods which, in many cases, puts at risk both sustainability and the diversity of knowledge systems behind the maintenance of vital ecosystems.

How could these aspects be reversed and the continuity of sustainable livelihoods of indigenous communities ensured? To answer this, it is necessary to understand the processes and conditions that can allow the maintenance of sustainable livelihoods; the ways to tackle influences that cause transformations; as well as the conditions and processes through which sustainable livelihoods and traditional knowledge can be recovered.

From a research of the livelihoods of an indigenous community, with an ethnographic and interdicsiplinary perspective, the sociocybernetic approach is adopted in the analysis for the construction of systemic models, by means of

graphic representation. In this way, it is possible to understand the related aspects of sustainability, both in the structure and within the dynamic processes of the system. The processes that worsen or weaken the structure, organization and self-organization of the system (vulnerability) are observed; as well as those that provide a balance (resilience) and the states and processes that reinforce or enable sustainability.

This analysis provides relevant information to locate possible actions regarding sustainability, identifying variables and processes that need to be controled as well as those that need to be strengthened or reinstated to ensure envronmental sustainability and social well-being. The tool of modeling of the structure and dynamics of a system also allows to account for the observer's hypothesis systems, making them available for dispute and discussion in different fora, an aspect inherent to sociocybernetics practice.

GALGOCZI, BELA* (European Trade Union Institute, Belgium)

The Concept of `Just Transition` at the Light of Real-World Practices

Now with having become mainstream, the concept of just transition has become complex and multi-faceted often running the risk of hollowing out or being over-stretched. It should not remain an abstract concept however, but a real practice in real societies and workplaces. This paper will take an attempt to deconstruct the concept by discussing its various interpretations and dimensions and by highlighting the role of trade unions in applying it. Concrete examples from two key sectors of the European economy, energy and automobiles, will follow where massive employment transitions are under way and where social dialogue plays a key role. As social dialogue is seen as a key element – not least as key pillar of the ILO just transition guidelines - of any successful just transition practice, lessons from European practices can also provide inspiration to the rest of the world.

Literature review and reference to several case studies under different institutional settings will be applied. The paper will focus on trade union strategies and related just transition policies in the two sectors analysing the drivers of the transformation, employment and regional effects and the emerging actors` strategies.

After framing the main challenges, section 1 will provide an overview about the concept of just transition as it evolved in the last four decades. Section 2 will discuss the varieties of just transition in a critical way. Section 3 will look at the role of trade unions in just transition at different levels and will argue why in spite of the diversity of their views and attitudes trade unions can play an eminent role in making just transition a success. Section 4 will examine the role of social dialogue at light of case study references from two key sectors, the energy and the automobile sector. Section 5 will conclude.

GALIMBERTI, DEBORAH* (, France)

Regional Economies in Transition: The Politics of Industrial Upgrading on Europe's Peripheries

The communication aims to present the theoretical framework and empirical results of an on-going research on the politics of industrial upgrading in two peripheral economies, in Southern Italy (Apulia) and Lower Silesia (Poland). These two cases are analysed as cases of the capacity of local communities - political élites and organized social actors - to build alternatives to neo-liberal globalization and pursue progressive patterns of local development. We use the concept of "constrained local societies" drawn from Cardoso and Faletto seminal work on dependent economies (1979) to account for the specific social and institutional contexts we are analysing. These latter are indeed characterized by fragmented social institutions and a pervasive and particularistic role of politics. Besides emphasizing the exogenous constraints to development, Cardoso and Faletto analysis factored in endogenous processes of socio-economic change. This research aims to contribute theoretically to this debate by addressing the question of "the limits of actors' capacities to make changes to institutions within particular contexts" (Crouch, 2007) Our research is based on a paired comparison (Tarrow, 2010) of two most-similar and least likely cases as for the emergence of cross-class coalitions and/or social mobilizations advocating for policies delivering inclusive redistribution or forward-looking investments. Our study is bounded to the historical period of neo-liberalism and zoom-in a period of 15 years (2004 - 2018): the rising social and environmental contradictions of capitalism are then considered as an exogenous pressure that might entail the emergence of conflicts even in highly constrained local societies. The analysis will be directed in unravelling and comparing through which causal mechanisms socio-economic change might unfold (Jessop 2005). A methodological discussion will also be engaged around the context or space and time dependent nature of "causal mechanisms" and what does it imply for the generalization beyond our cases.

Las Políticas De Inserción En El Mercado Profesional En México, Análisis De Los Programas: Tú Primer Empleo y Jóvenes Construyendo El Futuro

En México no existe una correspondencia ni remotamente simétrica entre la preparación profesional y el mercado laboral. Cada año egresan de las universidades públicas y privadas miles de jóvenes que no encuentran cabida en un espacio laboral que corresponda a su preparación y cubra sus expectativas de status y de ingreso. El desempleo y el empleo precario son una amenaza constante que acompaña a los recién titulados en la búsqueda de integrarse a un empleo estable y bien remunerado, son el sector que proporcionalmente reporta el mayor índice de no ocupación laboral. Los gobiernos federales han intentado paliar este problema ofreciendo programas que buscan incentivar a las empresas y otras unidades captadoras de recursos humanos calificados a contratar, aunque sólo sea temporalmente, a los solicitantes de empleo. La presente investigación tiene por objetivo evaluar las políticas de empleo implementadas por dos gobiernos de signo político contrario. La primera corresponde a la administración de Felipe Calderón (2006-2012) que se llevó a cabo bajo el programa denominado *Tu primer empleo*. El segundo caso, corresponde al programa que lleva por nombre *Jóvenes construyendo el futuro* implementado por el actual mandatario Andrés Manuel López Obrados (2018-2024) y que tiene vigencia de un año. La hipótesis que proponemos es que ambas tentativas sólo tendrán resultados ínfimos que no resolverán el problema debido a que ninguna de las propuestas gubernamentales aborda el verdadero problema que consiste en establecer una política de Estado que vincule de manera realista la preparación profesional con la activación de sectores económicos que absorban al capital humano recién formado.

Seeking Hope and Joy in Youth Climate Action: Examining Verbatim Theatre in Ethnographic Research Collaborations with Toronto Youth on the Climate Crisis

This paper examines the use of verbatim theatre as a sociological research methodology for studying youth perspectives on the climate crisis. Set in a Toronto high school drama classroom, this research emerges from a five-year, multi-sited ethnography entitled *Global Youth (Digital) Citizen-Artists and their Publics: Performing for Socio-Ecological Justice,* which investigates the role of drama in global youth climate action. We mobilized verbatim theatre as a research methodology and tool for inviting the youth to be co-constructors of knowledge in the research field (see Gallagher, Rodricks and Jacobson, 2020). Our verbatim theatre research revealed our participants to be resistant to the 'popular story' that youth are "the ones the world should turn to in search of hope" in this time of climate crisis (Ojala, 2018, p. 11). Rather, we observed instances of 'eco-anxiety' in the youth's creative processes, marked by distinct moments of distraction, avoidance and escape (Ojala, 2018). However, their verbatim theatre work also revealed a desire for support from older generations on how to develop more 'solutions-oriented' and 'joyful' efforts in confronting the climate emergency (see Ojala 2018, p. 14; Ehrenreich 2007). Our findings call for a reconsideration of how 'climate issues' are framed in discourses of youth climate action. They invite older generations to attend to 'possibility' and 'joy' as productive orientations to meaningful, solutions-oriented climate action in the face of youth climate anxiety.

To Capture Diversity within a Limited Political Categorization: Youth Neither in Employment, Education or Training (NEET)

Confronted with youth difficulties with job placement, various governmental and supra-governmental bodies mobilize the category of people "neither in employment, education or training" (NEET, NEEF, or NINI). The increased usage of the term – particularly in public policy – has expanded the notion to encompass a wider range of both ages and phenomena. Thus, the term NEET now brings together very diverse realities : such youth are not only young people excluded from the labour market and discouraged by job insecurity or training difficulties, but also young people engaged in domestic work, non-commercial or informal activities, workers that are not available to work due to health problems, young travellers, etc. First, the paper aims to describe the limits of the category, both because of its vagueness and because of the synchronicity of its temporality. Second, it explores the feasibility of a statistical approach to identify – among youth that are not in employment, education or training – those who are also to the margins of institutions and have fewer protections. Third, using other analytical frameworks, it aims to identify the NEET youth who are short of a recognized social status (Paugam 2008, Fontaine 2016). This discussion would give an idea of the number of young people most likely to need state support.

El Apoyo a Cuidadores De Personas Mayores: El Caso De Los Servicios Sociales

El apoyo a cuidadores de personas mayores: el caso de los servicios sociales
Los apoyos a los cuidadores familiares de personas mayores son la cara oculta de los sistemas de protección social, de las políticas de apoyo a las personas mayores.
En España en 2006 se aprobó el Sistema de Apoyo a la Autonomía y a las Personas en situación de Dependencia. Se contempla un catálogo de prestaciones de apoyo fundamentalmente dirigidos a personas mayores y con un mayor desarrollo hasta la fecha de prestaciones dirigidas a personas mayores en situación de dependencia. Las personas mayores manifiestan su interés en permanecer en sus casas el mayor tiempo posible en su entorno habitual, en sus casas. Es un hecho que es el segundo país más longevo del mundo después de Japón. Eso tiene sus ventajas, un grandísimo éxito social. Pero también sus inconvenientes, va a suponer una mayor carga de los cuidados/res familiares, teniendo en cuenta que en muchas regiones del país no hay tasas de reemplazo generacional. Se plantea resultados de investigación de los apoyos existentes y los necesarios desde el ámbito de los servicios sociales de primer nivel, los llamados servicios sociales comunitarios desarrollados en el ámbito municipal. Se establece una comparación entre las perspectivas rural y urbana.

GALLAS, ALEXANDER* (University of Kassel, Germany)

Being on the Side of Workers: On the Ethical-Political Commitments of Labour Studies

Labour scholars habitually stress that they are on the side of workers. However, they rarely explain what being on this side actually means. Importantly, a politics of, for and by labour has been attacked from all sides of the political spectrum. This suggests that the political stance of labour studies cannot be assumed to simply reflect the general intuitions of the social science community or the broader public. If labour scholars show sympathy for organised labour, they make themselves susceptible to being charged with bias. In my paper, I seek to defend labour studies against such charges. I analyse implicit normative evaluations made by labour scholars and provide justifications for them with the help of arguments found in normative social theory. First of all, I show that scholarship in the field is informed by what I call political-ethical commitments. In particular, I examine seminal contribution to contemporary labour studies, namely Beverley Silver's *Forces of Labor* (2003), Edward Webster et al's *Grounding Globalisation* (2008) plus the recent attempts to develop a 'power resources approach' (Schmalz et al. 2018). I demonstrate, with the help of a close reading, that there are implicit normative evaluations at work in those texts. In a second step, I argue that these evaluations are compatible with a position in normative social theory called 'qualified ethical naturalism' (Sayer 2005), and explain why this position is plausible. Finally, I demonstrate that 'qualified ethical naturalism', if connected with a systematic reflection of labour relations in capitalism, results in a principled critique of class domination, as was envisaged in Karl Marx's *Capital* (1867/72). I spell out the implications of this insight by developing normative guidelines for research that is on the side of labour and for the strategic choices of labour movements.

GALLON, LUCIANO* (Universidad Pontificia Bolivariana, Colombia)

An Introduction for a Sociocybernetics Approach to Think the Facts of the 21st Century

The four dimensions presented for the IV ISA Forum of Sociology as challenges of the 21st Century are: Democracy, Environment, Inequalities and Intersectionality. However, as sociocyberneticians observing the observers of the data that describes these dimensions, we can ask for the state, trajectories, and dynamics behind the scenes, we can ask for the Facts of the 21st century. This work presents an introduction for a Sociocybernetics approach to think on the facts of this Century, not only based on a first order observation, but also on a second order one. The introduction covers a review of the Cybernetics and Sociocybernetics core concepts and applications, then presents a set of data sources, indicators, and indexes to look at for figuring out how the world problems are behaving and, at the end, propose that with the possibility of open-access data available over the internet, a hands-on workshop session can submerge the participant on a discovery activity about the state of world, steering new thinking on the contradictory results with respect to their personals believes, the media and the public opinions. At the end, some conclusions will enrich the Sociocybernetics approach on facing the problems to understand the envisioned solutions better.

TATAGIBA, LUCIANA (Unicamp, Brazil)

Contradictions of Capitalism and Distributive Conflict. June 2013 in the Light of an "Integrated Protest Approach"

This paper aims to analyze June 2013 demonstrations in Brazil exploring the complex relationship between the upward trajectory of the protests, which is already starting from 2012, and the particular way in which the crisis of capitalism expressed itself in the Brazilian context.

Although it may be tempting to make associations between June 2013 and the global protest cycle against austerity, the Brazilian case has peculiarities, as the protests intensified before the economic and political crises became manifest (Tatagiba and Galvão, 2019). Our hypothesis is that the attempt to deepen the "neo-developmental essay" (Singer, 2015) in response to the crisis of capitalism resulted in intensified distributive conflict during the Dilma Rouseff administration. In turn, this conflict over the appropriation of income and the public budget was expressed in the streets through different agendas that went from defending social policies to fighting corruption.

The article proposes: i) to present the main aspects of our theoretical approach, which we call an "integrated protest approach", seeking to understand how socio-political processes are linked to economic factors in the configuration of collective action; ii) to discuss how the PT governments reacted to the 2008 eco-nomic crisis; iii) to analyze the relationship between protests and distributive conflict between 2011 and 2013; iv) to discuss the "fight against corruption", a claim that grows from 2013 onwards, and its relationship with the distributive conflict.

Cultural Reproduction or Neo-Institutionalism? the Role of High-Stakes Testing Policies on Social Class and Racial Inequalities in Math Placement in U.S. High Schools

Prior research reveals a mismatch between students' academic achievement and their placement in the curricular hierarchy, a mismatch that contributes to racial and social class inequalities in education. Most studies addressing this mismatch have focused on cultural forces such as teachers, and their role as educational gatekeepers, or families' cultural capital. Still, the role of structural forces such as state-policies on how schools distribute educational opportunity remains underexplored. Using panel data from the Educational Longitudinal Study (ELS:2002), a dataset with a nationally representative sample, and hierarchical linear modeling (HLM), I examine the association between high-stakes testing policies and the persisting racial and social class inequalities in high school math placement. High-stakes testing policies, a specific form of accountability policies, rely on the assumption that keeping schools accountable to the state promotes school efficacy, and subject the allocation of schools' resources to the schools' performance on standardized tests. Despite these accountability policies have expanded across the U.S. in the last 30 years, some scholars anticipate a negative impact on equal access to educational opportunities in school for students from different cultural and socioeconomic backgrounds. The findings of this study are analyzed in the light of two central competing sociological theories that have been used to explain educational inequalities: cultural reproduction and neo-institutionalism.

GALVEZ, DIANA* (University of Iowa, USA)

Disparities in Math Placement across Iowa High Schools: The Interplay between Race/Ethnicity and Geographical Location

In U.S. high schools, disadvantaged students, including kids of color and kids from low-income families, are less likely to enroll in advanced placement math courses than other students with similar academic performance. Still, the mechanisms driving these disparities are unclear. Employing public-use data from the Iowa Department of Education from 2015, in this project, I examine: (1) how racial/ethnic inequalities in access to calculus are distributed at the school, district and county levels in the state of Iowa, and (2) how these inequalities vary across rural and urban schools settings. I draw upon dissimilarity indices traditionally employed in the literature on racial segregation and adapt these measures to disentangle inequalities in access to learning opportunities happening at different scales and geographical settings. This methodology allows to address the intersectionality between two central axes of inequalities in access to advanced math courses by high school: race/ethnicity and geographical location. By visualizing the influence of non-merit-based factors on students' learning opportunities in schools, this study disputes the ideologies of individualism and meritocracy as the central driving forces in students' academic success. This study has important implications for policies aimed to promote educational equity.

Inequality and India: The Upward Trajectory

Reducing inequalities is high on the agenda of the Government of India. Several initiatives have been taken up by the government to eliminate poverty, inequality and to empower the marginalized sections of the society by expanding the social security net. India has come a long way in last three decades since the implementation of liberalization and globalization policies. In 2018, as per the World Bank Data, the life expectancy at birth has risen to 69 years of age in contrast to 58 years in 1990. The student enrollment ratio in secondary education has reached 75% in 2018 when compared to 37 % in the early 1990s. The child mortality rate per 1000 live births has declined from 126. in 1990 to 37 in 2018. The Gini coefficient of income inequality for India fell from 36.8% in 2010 to

33.6% in 2015. This is due to the three-pronged Jan-Dhan-Aadhaar-Mobile (JAM) programmes by the government that are aimed at a comprehensive strategy of inclusion, financial empowerment and social security. This paper aims to present the multi-dimensional approach of Indian economy to reduce inequalities of all kinds (including resource inequality, income inequality etc.) due to major policy initiatives by the Government of India that have led to better access to health, banking, education services to different sections of the society. It brings in light the policies and practices of government that are in line with the Sustainable Development Targets aimed at achieving greater equality and promoting the social, economic, and political inclusion of all by 2030. Even though India ranked 147 out of 157 countries in CRI Index by Oxfam, the government is committed to take forward the national focus on inequality through budgetary allocation in multiple schemes and how work on these schemes shall show improvement in country's ranking in future years.

Inter-Religious Dialogue As Antidote to Radicalisation through the Involvement of Religious Communities and Civil Society. a Mediterranean Case

The Council of Europe Counter-Terrorism Strategy (2018-2022) (CM(2018)86-addfinal) highlights the strategic importance of the awareness-raising programs on radicalisation and other preventive measures among frontline practitioners engaging civil society. Radicalization, as a concept, has been considered from different analytical angles: the process leading from extreme values and opinions to using violence to display a political agenda (Goodwin 2018); the everyday interactions through which *microradicalisations* are generated (Holbrook 2013); a socially constructed dynamic through which active subjects co-create the sense of their biographic experience (McDonald 2018). Terrorism - more precisely the threat of violent terrorism - can sharpen social and political divisions, weakening a pluralistic civil society through intimidation and increased polarization. Many concrete questions arise from these issues, one of the most relevant is to explore the "*who*" and "*how*" civil society actors can cooperate to counteract radicalization.

The aim of this work is to discuss the main insights and present the exploratory analysis of qualitative interviews with religious leaders focusing on the relationships between the religious communities and local institutions to counteract religious radicalisation through interreligious dialogue practices. Data discussed are a part of a larger comparative mixed-method action-research conducted in 5 European Countries (Belgium, France, Italy, Poland and Romania). The main insights unveils that the process of creation of a new approach to inter-religious dialogue – considered as a socially constructed practice involving religious communities – must start from mutual recognition of shared principles (ideological level) followed by concrete actions (concrete level) with cooperative activities.

GANDLER, STEFAN* (Universidad autónoma de Querétaro, Mexico)

Self-Alienation and Historical Ethos

Self-alienation is different in each case of a different historical ethos. In difference to Georg Lukács in *History and Class Consciousness*, the former senior faculty of the Universidad Nacional Autónoma de México (UNAM) Bolívar Echeverría (Riobamba, Ecuador 1941 – Mexico City 2010), thinks that there is not one only way of reification, what can be understood as the basis of everyday life self-alienation.

Reification exist in each region and time in *different* forms of behavior, social institutions, ways of speaking/listening, constructing/living, sowing/harvesting, cooking/eating, etc. that make us think and feel that the unlivable is at the end of the day livable. The heart of the question lies in the fact that those forms of everyday life cannot be understood and analyzed simply on the basis of the abstract social form of commodity production (that is, the value relations), but must also be understood through the concrete form of use values produced and consumed in each case, in every region and in different historical moments.

For this reason we have to distinguish at least four forms of *historical ethos* in the actual capitalist modernity: the realistic ethos, the romantic ethos, the classical ethos and the baroque ethos. Each of these four *ethe* includes, and that is the core point of our presentation, different ways of self-alienation.

GANDLER, STEFAN* (Universidad autónoma de Querétaro, Mexico)

Why Does the Angel of History Look Backwards?

Why does Walter Benjamin's angel of history look *backwards*?

We find three reasons for this in Benjamin's *Theses "On the Concept of History"* :

Firstly, epistemologically speaking, looking backwards is both paramount and compulsory. In other words, the angel cannot look forward; he must turn backwards to get his bearings.

Furthermore, because, ontologically speaking, the future does not exist. So-called "progress" does not lead us closer to a brighter future but rather carries us further away from paradise lost, and time is anything *but* automatic, homogenous advancement.

Lastly, because, from a political standpoint, stopping National-Socialism is impossible if it is regarded as an anomaly, a state of exception diametrically opposed to inevitable progress. The angel of history looks behind him to protect tradition from corruption by the powerful, for battles are fought for the dead and defeated of past generations and *not* for promises of the future.

GANTZIAS, GEORGE* (HELLENIC OPEN UNIVERSITY, SCHOOL OF SOCIAL SCIENCES, CULTURAL ORGANISATIONS MANAGEMENT, MSc, Greece)

Info-Communication Culture and Cultural Policy 'Artificial Intelligence Culture', Cultural Management and Collective Will Democracy.

The traditional-based cultural policy training systems requires far more cultural management programs and artificial intelligence technology overall than cultural policy programs we are accustomed to. Moreover, new cultural policy and artificial intelligence programs are found by new technological changes in our social, economic, political and cultural systems. Dramatic changes are underway, not only in the structure of cultural policy system in areas such cultural management as the cultural strategy and cultural communication, but also in the way to policy making them and to develop global public interest principles to sever quality of cultural policy systems in our society. Internet of Thinks (IoT) is likely to have impact on cultural policy programs, and its consequences could be increasingly disruptive. The role of the info-communication culture and Artificial Intelligence (AI) decision making in creating an 'Artificial Intelligence Culture' (AIC) is particularly interesting. Indeed, the operating cultural organization tends to become an organization of artificial intelligences of all kinds in '*Collective Will Democracy' (CWD)*. The depth and rapidity of these changes compel a reassessment of the ability of various cultural organization structures to cope and adapt. AI transformation is likely to create a digital ecosystem that cultural managers focused heavily on what it takes to drive value, reshape the organization, and develop a data-driven culture in info-Communication globalization. This paper considers critical questions: are cultural policy programs adequate to address the AI transformation and digitization of cultural management issues in our society? Can a concept depend on an "Artificial Intelligence Culture" offer a critical perspective suggestive of developing a digital cultural management model in the future? Finally, it also outlines a set of cultural policy issues for developing AI cultural systems in our society.

GANTZIAS, GEORGE* (HELLENIC OPEN UNIVERSITY, SCHOOL OF SOCIAL SCIENCES, CULTURAL ORGANISATIONS MANAGEMENT, MSc, Greece)

Regulating the Regulators in Artificial Intelligence Era: Analytics Regulation, Public Interest and Ethical Issues

Info-communication globalization, artificial intelligence and ethical issues are the next impending revolution will be about given regulators new knowledge opportunities to regulate both locally and globally. Artificial intelligence revolution requires regulatory mechanisms to prepare their regulator, citizens, policy makers, and end users to work and think in new ways. As more AI systems are deployed, a subsequent and equally important issue that all regulators and policy makers in general will need to answer is how to retrain regulators when machines take on regulatory tasks humans once did. We believe regulation academies hold the promise of playing a role in this retraining effort. Our experience suggests that analytics regulation can be an extremely effective avenue for developing an AI-regulator workforce in a concerted manner, providing a network of local and global regulatory mechanisms to protect public interest and ethical issues in info-communication globalization. Regulators with more than 20 years of experience in their respective fields were often unaware, unconvinced, or uncomfortable with recent AI developments. AI technologies are constantly evolving, and

regulation experts need to stay up to date on AI techniques, tools, and supporting technologies. This paper considers critical questions: are regulation mechanisms adequate to address the public interest and ethical issues in our info-communication globalization? Can a concept depend on an Analytics Regulation' (AR) offer a critical perspective suggestive of developing a global regulation model in the future? Finally, it also outlines a set of public interest theories for regulating the ethical issues in info-communication society.

Public Narratives for Public Leadership: An Approach for Building Power and Creating Change Among Civic Communities

Leadership is accepting responsibility to create conditions that enable others to achieve shared purpose in the face of uncertainty. Central for the leadership practice is the capacity to exercise and enable others to exercise agency, acknowledging its relational, values-based, and empowerment-oriented dimensions. The Public Narrative pedagogy emerged as a way of developing public leadership (Ganz, 2008), an approach through which we can harness the power of narratives and thus advance organizational democracy and self-management. We can access the narrative moments in our lives to communicate sources of caring and source of hope, a Story of Self. We can also draw on moments of shared narrative experience to tell a Story of Us. And we can learn to turn the present moment into a narrative moment in which we are confronted by an urgent challenge, a Story of Now, which move us to act. The Public Narrative approach has been developed and used for more than 10 years now, in different contexts and domains -from the Obama Presidential campaign, to community organizing in countries such as Japan, Serbia, or the Pacific Islands, among others. In this paper we discuss the approach and inquiry on those underlying elements that contribute to their potential for adaptation to diverse contexts and settings. Two are the elements that play a role in this regard. First, the universality of stories, that is, that stories matter in all contexts as we learn through stories. Second, using storytelling for social action is an art that can be crafted, what involves that those individuals who learn the Public Narratives, can transfer it to others by means of coaching. In order to illustrate this, we present and discuss some examples of how public narratives are being used worldwide, thus contributing to build power and create change among civic communities.

Why Weights Do Not Matter, but Do Harm

In this presentation I examine the functions and dysfunctions of post-stratification weights in comparative survey research, in particular the International Social Survey Programme and European Social Survey. In particular I maintain that (A) post-stratification hardly matters for point estimates and explain why that is the case, and (B) post-stratification creates considerable harm to statistical efficiency -- an issue that a number of recent treatises on the issue have not paid attention to. I illustrate these points with an analysis of religiosity in the two cross-national surveys.

Educación De Jóvenes En Contextos De Desigualdad Social: Reflexiones Desde El Territorio y En Una Escuela Secundaria

Latinoamérica se encuentra atravesada por procesos económicos y políticos que producen, reproducen y refuerzan desigualdades sociales y procesos de exclusión de las mayorías de las poblaciones, del acceso a derechos fundamentales tales como la salud, la educación, el acceso a la tierra y al trabajo.

En este marco, se vienen dando hace décadas procesos migratorios que confluyen en las grandes ciudades del continente, construyéndose asentamientos que en cada ciudad adquieren características específicas pero que tienen en común algunos elementos estructurales.

En la Ciudad Autónoma de Buenos Aires (Argentina), desde las primeras décadas del siglo XX se han ido edificando asentamientos denominados Villas, cuya población se compone mayoritariamente de migrantes internos de Argentina, así como también externos de países limítrofes. Una de las Villas de mayor extensión y densidad poblacional es la Villa 21-24, ubicada en el Barrio de Barracas.

El presente trabajo se inscribe en una investigación-acción participativa en curso llevada adelante entre la Universidad Nacional de Avellaneda (Argentina), la Universidad Nacional de Quilmes (Argentina) y el CINDE (Colombia). En ese marco, se propondrá indagar en las representaciones de estudiantes de una escuela secundaria pública ubicada en la Villa 21-24 de la Ciudad Autónoma de Buenos Aires acerca de las categorías de *inclusión, paz y ciudadanía*. Se pondrán en juego dichas conceptualizaciones a la luz del proceso de trabajo territorial que viene realizando la escuela, vinculado a estrategias pedagógicas específicas y desde una perspectiva que se propone problematizar, historizar y discutir acerca de los procesos de desigualdad social y su impacto en los y las jóvenes que estudian en la escuela secundaria.

GARAY REYNA, ZENAIDA* (Universidad Nacional Cordoba, Argentina)

El Lugar De Las Decisiones y La Incidencia En Políticas Públicas De OSC: Una Mirada Crítica Desde Al Activismo Ambientalista a La Epistemología Estadocéntrica

Hay importantes dimensiones culturales e históricos en las prácticas y teorías de la espacialidad y la territorialidad. A lo largo de la historia, las organizaciones políticas (estados, imperios, federaciones, etc.) han sido los usuarios más importantes de la territorialidad. Algunos estados, como por ejemplo Argentina, tienen territorialidades más complejas y formalmente jerárquicas que otros, con esquemas de gobierno multinivel. Hoy en día, las empresas transnacionales y globales, e incluso organizaciones no gubernamentales poseen tambien jerarquías territoriales que abarcan las políticas existentes. Por lo tanto, aun cuando algunos usos de territorialidad atenúan o incluso desaparecen, otras emergen. Aunque varían en forma y complejidad, la territorialidad parece estar siempre con nosotros como una estrategia importante para la organización de las actividades humanas, incluso, ya que debe considerarse junto con otros tipos de espacialidad, tales como la interacción a través del espacio y el lugar de decisiones.

Esta propuesta pretende abordar las tensiones existentes en torno a las prácticas de incidencia en políticas públicas de las Organizaciones de la Sociedad Civil, a través de un estudio de caso de la Provincia de Córdoba (Argentina), desde el marco de una redefinición epistemológica estadocéntrica. Nuestra conjetura inicial refiere la importancia de retomar el concepto de lugar y su peso en las decisiones estratégicas por parte de las organizaciones para generar prácticas de incidencia política, que atraviesan los diferentes niveles de gobierno. De este modo, "lugar", se expresa como el sentido de lugar o identificación con con el mismo, como una comunidad única, paisaje, y un orden moral. En esta construcción, cada lugar es particular y, por lo tanto, singular. Un fuerte sentido de "pertenencia" con un lugar, ya sea consciente o como se muestra a través de la conducta cotidiana, pueden ser eje de la participación en los asuntos relacionados con políticas medioambientales.

GARAY REYNA, ZENAIDA* (Universidad Nacional Cordoba, Argentina)

Permeabilidad a Los Procesos De Incidencia De Organizaciones De La Sociedad Civil Desde 2010.

Los diseños institucionales de división de poderes y los mecanismos de rendición de cuentas o accountability se encuentran en debate en América Latina. Refieren a la forma de organización interna de los Estados, los modelos de consolidación democrática que caracterizan a la región y buscan reducir la posibilidad de concentración del poder político (Gargarella, 2010; O'Donnell, 2000). A pesar de los diseños institucionales, los mecanismos de accountability se encuentran limitados por la manera particular de configuración de los Estados, que a la vez inciden en las relaciones que se puedan instituir en el régimen político. Otros autores señalan la importancia de añadir una dimensión social, usualmente informal, que hace de la rendición de cuentas, horizontal y vertical, procesos radicalmente distintos cuando la ciudadanía se involucra y moviliza. Así, la rendición de cuentas se torna en un concepto amplio que incluye el proceso de toma de decisiones, y mecanismos formales para que la sociedad participe en la planeación y evaluación de políticas públicas. En relación a la participación de la sociedad, algunos recurren a la noción "Sociedad Civil", dando cuenta de procesos de apropiación de normas, espacios y dinámicas para exigir cuentas e incidir en políticas públicas. Estos procesos destacan la importancia de la participación de una pluralidad de grupos, organizaciones y ciudadanos en la gestión pública, y cómo las distintas instancias y mecanismos de participación generan procesos y resultados diversos. La incidencia de la Sociedad Civil y sus organizaciones (OSC), como propuesta participativa, refiere una participación instrumental en la medida en que habilita decisiones, políticas, procesos de evaluación y el funcionamiento de los procesos

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

de control. Por tanto, este trabajo busca dar cuenta de los mecanismos y procesos de incidencia de diversas OSC en los espacios públicos locales de Córdoba (2010-2020), Argentina, que permiten generar instancias de accountability social.

Performing Data: Theatre Play 'Amma La'. Reflexive Account of a Mixed Theatre Method in Migration Research in India

Writing the ethnographic data interpretation of my PhD research about the question of Indian citizenship for Tibetan refugees in India as a theatre play titled 'Amma la' (meaning 'mother' in Tibetan) and having it performed together with and for the research participants in India (2019) is a decision made at the end of a process of searching for innovative and collaborative methodologies and motivated by a personal inquiry into what sociological and ethnographic research is, who it is for and what the researcher can do with the research findings. Performing the play 'Amma la' with Tibetan participants in the summer of 2019 is a method of sharing the research findings in a collaborative, creative and novel way that opens up possibilities for shared meanings and transformative re-interpretation of the data, within an embodied, artistic and performative dimension. The performance of the play 'Amma la' in McLeod Ganj in July 2019 sits theoretically at the intersection of verbatim theatre (Paget, 2009), political theatre (Lustgarten, 2015), and participatory drama (Brown et al., 2017), as well as forum theatre (Boal, 2008; Ganguly, 2017; Kaptani, 2019) and physical theatre (Bailey, 2019, Zagaria, 2016). It could also be argued that the play 'Amma la' constitute a form of experimental theatre (Gatt, 2015) that is not complete and foreclosing, but processual and prospective. And finally performing 'Amma la' is a form of process drama (Bowell and Heap, 2013), focusing on improvisation, and the process of creating and acting a scene for the benefit of the participants-actors, and not on the polished and rehearsed performances for a specific audience. For these reasons, I argue that the play 'Amma la' is actually constructed on and theoretically supported by what I will simply call mixed theatre methods, that which I will reflect on during this presentation.

Global Look at Universal Basic Income Programs from the Utopian Post-Work Model

As technological innovations enter workplaces, capital increases with less labor. This sheds concern towards the limiting accessibility to employment. Universal Basic Income (UBI) is a radical utopian option for limited employment. Limited access to employment contributes to social inequality. In this study, we reviewed 20 UBI programs worldwide, including experiments, pilot projects and proposals. The data was collected through databases of academic journals, theoretical books and state reports. The inclusion criteria for selecting UBI programs were: 1) basic income programs implemented in the past 50 years, 2) programs identified as Basic Income and 3) programs whose design harmonizes with the structure of the UBI. We summarized the main benefits, limitations and results of these initiatives. We analyzed the findings in each program through the lens of the post-work utopia. The data collected in this study suggests that there is a tendency of designing and implementing programs for political purposes (e.g. increasing employment and reducing poverty rates). The common vision of the reviewed UBI programs was to provide a social subsidy that functions as supplementary income and not as living-cost support. None of the revised UBI programs reported to liberate participants from their economic dependence with employment. The major benefits reported from the UBI programs were the increase in health, schooling and the decrease in poverty rates and crime. We conclude that, despite the benefits reported, the 20 UBI programs did not create a radical social reform, nor followed principles of the Utopian Post-Work Model which guarantees universal income for all without conditions. Instead, the majority followed a political agenda of alternative social welfare. The welfare agenda could temporally relieve social inequality, when implemented in specific populations for a short period. A social policy of UBI could contribute to reduce poverty and social inequality, if permanently implemented in populations worldwide.

The Environmental Impact Assessments in the Energy Sector. an Opportunity to Develop Environmental Expertise.

An overview is presented on the evolution, within the energy sector in Mexico, of the environmental impact assessments that evolved from characterizations of contaminated sites to environmental baselines. The starting point is the change-ment in the state regulations on the production of energy in recent years. This process has been called Energy Reform and has introduced significant changes in two markets (oil and electricity) that were exclusive monopoly of the Mexican State for more than 70 years.

The normative effects of such reforms have already manifested in the the the need for environmental impact studies that meet international standards. In this context, this paper present the experience of a team of researchers and professionals from the academic sector (Department of Sociology, Universidad Autónoma Metropolitana, Mexico) who have been linked to the oil industry by developing social and environmental impact assessments on the territories affected by oil extraction.

Buycott y Boycott Alimentario. Nuevas Formas De Participación Política En España

Este trabajo analiza el consumo político alimentario como forma de participación en la que la ciudadanía a través del mercado transmite sus preocupaciones asociadas a la producción y consumo de alimentos, y su compromiso con una sociedad más justa y sostenible. Las acciones del consumidor político de alimentos se materializan a través del buycott, o la compra de determinados productos basada en valores éticos, medioambientales o políticos; y del boicott o el rechazo a adquirir determinados alimentos, manifestando de este modo su crítica a los valores que representan. Este artículo persigue varios objetivos: analizar qué factores predicen el comportamiento (buycott y boycott) de los consumidores políticos alimentarios. También queremos conocer la percepción que tienen de que sus acciones pueden contribuir a un cambio social o político (eficacia política interna) y de que el sistema político responderá a sus intereses y a las necesidades de la población (eficacia externa). Además, descubrir si el comportamiento de buen ciudadano para el consumidor político alimentario se acerca más a las normas de compromiso social o de obediencia. Este trabajo presenta un análisis empírico del consumismo político alimentario en España. Para llevar a cabo este análisis, se diseñó una encuesta ad hoc a la población española de 18 años y más. Los principales resultados reflejan a un consumidor político alimentario interesado en la política que desconfía del gobierno y las grandes empresas, seguro de su capacidad de influencia para cambiar prácticas alejadas de sus valores y con un alto grado de compromiso social.

GARCÍA MONTES, NÉSTOR* (Universidad Complutense de Madrid,)

Metodologías Participativas Para La Implicación Ciudadana En La Sostenibilidad Local

La participación ciudadana en los asuntos públicos y comunes es un tema que está adquiriendo cada vez más presencia en la sociedad. En la sustentabilidad socioecológica se considera fundamental la implicación social desde la base, ya que de este actor social depende en buena medida la identificación de problemas, la construcción de propuestas y la asunción de hábitos sustentables. Pero para desarrollar procesos participativos es necesario contar con metodologías adecuadas, y desde algunos sectores de las ciencias sociales se está trabajando en esta línea. En esta presentación se hace una reflexión sobre este tipo de metodologías y procesos participativos.

La reflexión que se plantea en las siguientes páginas se basa en la experiencia acumulada en casi 20 años de aplicación de metodologías participativas para la implicación ciudadana en los asuntos comunes, especialmente en los relacionados con la sustentabilidad de los hábitats y de los territorios (fundamentalmente urbanos). Desde un equipo de investigación vinculado a la Universidad Complutense de Madrid y la red CIMAS hemos ido aplicando las metodologías participativas en numerosos proyectos y experiencias en Europa, Asia, América Latina y África. Se trata de un método de investigación y aprendizaje colectivo de la realidad, basado en un análisis crítico con la participación activa de los grupos implicados, que se orienta a estimular la práctica transformadora y el cambio social desde una visión ética de profundización en la democracia directa, en línea con la

　　　　　　　　　　** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

IAP y la sociopraxis. Esta forma de proceder desarrolla un paradigma innovador de construcción y aplicación colectiva del conocimiento, alternativo al tradicional dominante en la sociología, que resulta especialmente pertinente y útil en lo que a la sustentabilidad socioecológica se refiere, pues éste se constituye en un objeto de conocimiento y acción eminentemente participativo y práctico.

GARCIA-MINGO, ELISA* (Universidad Complutense de Madrid, Spain)

Feminist Cyberactivism Against Against Sexual Violence and Rape Culture. the Spanish Case.

In this presentation I reflect about how digital culture has reconfigured the ways activists fight against rape culture. To do so, I analyse the case of La Manada, a notorious case of gang-rape that took place in Spain in July 2016 that has shaken the public opinion and has created a huge debate about social attitudes towards sexual violence. The public reaction to this case has sparked a cultural movement against rape as hundreds of thousands of Spanish women have taken to the streets in protest during the three years of the case and have flooded the social media with hashtags such as #IdoBelieveYouSiter, #WeAreYourWolfpack, #NoIsNo). Through a mixed-methods approach (social media metrics analysis and qualitative interviews with activists) I analyse how feminist associations have created new activist strategies that combine on-line and offline actions. I propose that new activist repertoires for action are challenging rape culture and gender stereotypes in the Spanish legal system.

Inequality, Social Exclusion, and Procedural Justice: The Undermining Effect of Social Exclusion on the Perception of Procedural Justice of the City Hall, Police, and the Judiciary in São Paulo

The perception of procedural justice of social institutions is based on how institutions make decisions (e.g., fair, neutral) and how they treat people (e.g., with respect, dignity) (Blader & Tyler, 2003). These two components are usually evaluated by means of the direct contact that citizens have with institutions through their representatives (e.g., civil servants). However, people also have indirect contact with such institutions through the characteristics of the contexts. The aim of this paper is to present preliminary results regarding the relationship between the perceptions of vulnerability derived from inequality and social exclusion contexts (e.g., perception of social disorder, lack of public services, and victimization), on the overall evaluation of the procedural justice attributed to three different social institutions (city hall, police, and judiciary system). We tested this idea in a two stage process (exploratory and confirmatory, *NStudy1*=539; *NStudy2*=1806), by using survey data from two data sets collected by the Núcleo de Estudos da Violencia under the project "Building Democracy in the Daily Life". We found that people attributed lower scores of procedural justice to the three institutions, when 1) they perceived higher levels of social disorder in their most immediate context, and 2) when people reported higher victimization. We also found that policing in the neighbourhood was associated with better perceptions of procedural justice for the City Hall and the Judiciary system, but not for the Police. Additionally, we found that the better the access to public spaces (e.g., parks, libraries), the better perceptions of procedural justice of the City Hall, and Police, yet this values were just significant under a *p*<.10. We discuss these findings from the social psychological literature on inequality, relative deprivation, and social exclusion. We argue that feelings of vulnerability linked to segregated spaces, undermine the perception of procedural justice and the legitimacy of institutions.

Old-Age Provision, Social Protection and Subjective Health

As social inequality rises and the pension systems across Europe are challenged by demographic development, different sources of income and wealth become more important to ensure health and well-being in old age. Crucial material resources of old-age provision are public and private pensions as well as home ownership and financial assets. The question remains to what extent the negative health-related consequences of the unequal distribution of privately accumulated economic resources in old age can be absorbed by public pensions and social assistance.

Using data from wave 6 of the Survey of Health, Ageing and Retirement in Europe (SHARE), we examine the relationship between different sources of old-age provision and subjective health outcomes within different European countries. We relate public pensions to other sources of old-age provision and analyze the moderating role of social protection combining survey data and country-specific indicators of pension and social protection in old age.

First results show that apart from individual wealth and income, the composition of the old-age provision matters for health outcomes. Our analyses suggest that country-specific characteristics of social security and pension expenditures account for between-country differences concerning inequalities in subjective health outcomes. Our new data linkage thus allows us to assess the interaction between macro and micro level factors, and their influences on health inequalities in a comparative setting.

The Making of Women Trade Union Leaders in the Informal Economy of Mumbai and Jakarta

The participation of women-workers in Asia's informal economy is large. Conversely, women's participation and leadership within trade unions is low. Existing literature presents multiple factors that deter women's membership and leadership in trade unions such as lack of awareness and unwillingness among women-workers to join unions, barriers from family, pressure from employers, socio-cultural factors, and gendered role expectations of women to balance responsibilities of the household and the workplace. Despite the merit of these arguments, their implicit assumption— and the dominant narrative in the labour movement— renders women passive, meek, powerless and consequently, responsible for their lack of participation in workers collectives such as trade unions.

This paper highlights the agency of women-workers in the urban informal economy of two Asian megacities, Mumbai and Jakarta. It charts the journeys of women trade union leaders in participating, leading and successfully building sustainable women-workers' collectives. It attempts to understand the motivation of urban poor women to join unions, the in-process benefits experienced by them and the effectiveness of unions in living up to their original expectations. It also uncovers the dynamism in trade unions of informal workers, providing a platform for women to learn from each other, develop their critical faculties and capacities, share their struggles, expose and address intersectionality, collectively strategise to realise their goals, and advocate for gender equality and decent work. It shows how leaders of trade unions representing women workers in informal economy address practical gender needs and strategic gender interests. While the large mainstream trade unions— organising mainly workers in the formal sector— have historically excluded informal workers, this paper shows that in their quest for dignity, respect and recognition, trade unions of women workers in the urban informal economy promote inclusion and emphasise convergence with other rights-based movements, thereby positively influencing the global labour movement.

Inclusion or Exclusion? an Intersectionality Approach on the Integration of Migrant Descendants in Portugal

Portugal has become a society in which 'super-diversity' has become extremely pronounced in certain geographical landscapes. Sintra (Lisbon Metropolitan Area), one of the largest municipalities in which migrant communities live, illustrates well how conviviality exists among distinct ethnic groups. This paper aims to analyze the non-adaptation of migrant descendants living in Sintra by using an intersectionality approach in order to understand how some categories like gender, social class, ethnicity and migration status influence this process.

Data is drawn from 45 in-depth interviews conducted to migrants' descendants of some of the most representative migrant communities in this municipality (Africans, Brazilians, Romanians and Chinese). Results obtained exhibit differences on the non-adaptation pattern of each national group, particularly when considering their (non)inclusion in areas like school, work, or political participation. However, in specific domains like culture or art expression, these migrant descendants present more satisfactory patterns of social inclusion in society. These results indicate that (non)adaptation processes in migration involve a complex scenario, in which some areas are a source of privileged inclusion, while in others migrant descendants continuously suffer processes of social exclusion.

GASSEAU, GEMMA* (Scuola Normale Superiore, Italy)

Re-Municipalisation of Urban Water Services between Resistance and Re-Appropriation: Some Reflections on Naples, Italy

Re-municipalisation of urban water services has in the past years gained increasing academic and policy attention, as an alternative to the ongoing privatisation of the last thirty years. The literature thus far has focused on counting the cases of re-municipalisation worldwide and evaluating whether it is a trend or not, however little attention has been posed to in-depth investigation of particular cases. I aim at filling this gap by examining the re-municipalisation of water services in Naples, Italy. Social movement studies list Naples' re-municipalisation among the successful outcomes of the Italian mobilisation for public water, while economic and legal studies evaluate its technical consequences. In looking at the such consequences, I instead take a sociological approach, centered around the concepts of environmental justice and social reproduction, examining the transition in the mode of governance and to what extent the claims of the water movement translated into the institution. In doing so, I will touch upon temporalities of collective action and institutionalisation processes of social movements. The methods used are qualitative, focusing on interviews with local policy makers and activists, accompanied by content analysis on the documents produced by such actors.

Technology Assessment As a Practice of Consensus Building in Scientific and Technological Development

Technology has often been opposed to man and nature, acting as a medium between them. However, both technology and nature are the habitat, constructed as realization of collective human fantasies of power and control. Technology, in its turn, influences and designs human activity, embedding a person into complex assemblages of various human and non-human actors. Thus, the human agency in modern complex and often opaque socio-technical systems becomes both theoretical and practical problem, surrounded by the emotionally charged visions, ranging from alarmism to the optimistic beliefs in "inevitable progress" and "human upgrade".

Basing on the concrete examples of projects from still short, but already rich history of TA, we are trying to grasp the process of emerging, constructing, cultivating or appointing of the agency in technological development.

The notion of consensus, which has been largely discussed and criticized in sociological theory, thus can be reconceptualized through reflection of TA practices: from parliamentary to participatory, different models of TA can be regarded as consensus in-the-making, or as concensualizing process. This requires, however, transcending the expectocratic mindset in social science as well as in engineering.

Masculinity and Gender Order in the Narratives of Russian Working-Class Youth

The study aimed to research the means and patterns of masculinity constructing in the working-class culture of modern Russia. Both the practices of producing its multiple forms in daily interaction and the stable structures of social inequality, which consolidate gender order at the institutional level, have been considered. An empirical study of young representatives of the new working class helped determine the common structures of gender order: standard male social roles, stereotypical everyday fulfilment of male gender roles, gender restrictions and privileges. The empirical base of the research is represented by the mass survey of 1534 respondents and the biographical interviews of 31 informants living in the Ural Federal District of Russia, aged 16-30 and occupied in the field of industry, technical maintenance, and customer service. It was found that conservatism and patriarchal family values, which are attributed to the working class in mass culture, while remaining the dominant reference model, nevertheless do not find unequivocal support from the absolute majority of the young people surveyed and have little to do with the real situation in workers families. In view of the extremely low income, the classical patriarchal model of the family is rather an idealistic construction, in Russian realities accessible only to the middle class representatives. Wages in the service sector, where the majority of employees are women, are still much lower than in industry, mining and construction. Consequently, the remaining structural disproportion between sectors of the economy in the level of remuneration and the gender composition of workers determines translation and reproduction of the male breadwinner pattern that has power in the family on the basis of control over economic resources. This report is supported by the Russian Science Foundation grant № "17-78-20062 Life strategies of young people of the new working class in modern Russia".

GAVRILYUK, TATIANA* (Tyumen State Oil and Gas University, Russia)

New Working Class Youth in Russia: Media Representation and the Constructs of Identity

The subject domain of the study is the analysis of the new working-class youth representation in contemporary Russian media space, the creation and translation of class normative patterns and stereotypes, their consistency with the shaping of individual identity and how these are being constructed and legitimized. The notion of the "new working class" and the criteria for its definition have been proposed and substantiated. The research explores the interrelationship between the official representation of working-class youth and the discursive practices of self-positioning and self-perception of working-class young people. The empirical basis of the research is the textual transcripts of the key communicative events marking the working class as a political subject; the array of the most cited newspapers for a wide audience; in-depth biographical interviews with 31 informants; the content of the thematic groups in social media. Two main analytical methods have been applied to the data: a reflexive phenomenological analysis of the biographical narratives and social media data as well as critical discourse analysis of the official media data. It has been established that the forgotten concept of a "working class" was re-assembled as one of the means of ruling class positioning in the 2011-2012 electoral cycle. Official newspapers give a distorted picture of labour relations and living realities of the group under study fulfilling a governmental task to make working-class occupations more attractive for youth due to the lack of blue-collar workers in Russia. The analysis has shown the controversial professional and class identity of working-class young people. Being ready for the challenges of the new era of employment, they demonstrate a lack of desire to consolidate actions in defending their interests. This report is supported by the Russian Science Foundation grant № "17-78-20062 Life strategies of young people of the new working class in modern Russia".

GAWRON, GRZEGORZ* (University of Silesia in Katowice, Poland)

The Seniors Co-Production. Selected Cases of Local Initiatives in Low and Middle Income Countries.

The speech will present the assumptions of the co-production concept. Although it was developed in the 1970s, it is now beginning recover. This concept is generally understood as the conscious and intentional participation of citizens (clients, recipients, beneficiaries) or civil society organizations in the organization and delivery of public services. In this speech, co-production will be presented in the context of global aging as a process that determines significant changes in the demographics of many modern societies. The basis for the empirical investigation will be research carried out by one of the World Health Organization (WHO) agencies - the WHO Center for Health Development in Kobe. They included the analysis of case studies of social support of seniors in local environments of low- and middle-income countries (Poland, India, South Africa, Thailand, Vietnam, Uganda, China, Russia, Ukraine, Chile, Sri Lanka, Serbia, Lebanon, Iran). The key criterion for the selection of the analyzed projects was the direct involvement of institutional and non-institutional representatives of local communities in the implementation of projects whose main goal was to support and activate the elderly. The author (was involved in research in Poland and Ukraine) will attempt to demonstrate the potential of senior co-production of individual initiatives that were implemented in various parts of the world.

An Evidence-Based Code? Measuring the Impact of Empirical Socio-Legal Research on the Legislative Process of the 2015 Brazilian Code of Civil Procedure

The draft explanatory memorandum of the 2015 Brazilian Code of Civil Procedure (CPC) stated that norms of substantive law turn into "pure illusion", without the guarantee of its realization, in the "empirical world", through norms of procedural law. This study seeks to answer whether, to achieve that implied purpose of an improved connection between procedural norms and reality, the respective legislators considered empirical socio-legal research — beyond legal dogmatics exclusively — when drafting the CPC/2015. The evidence comes from analysis of legislative documents and perceptions of social actors with relevant roles in the mentioned legislative process. The theoretical framework combines Thomas Kuhn's theory of paradigms and Pierre Bourdieu's theory of social fields. This study is positioned within a research project called "The Impacts of Sociology of Law in Brazil: Between the Academic Field and the Juridical Field". It also aims to contribute to a developing subfield (or subfields) of Sociology of Law named in various ways, such as Sociology of Administration of Justice, Sociology of Dispute Resolution and Sociology of Procedural Law.

Fragmentación Cultural y Política De Las Clases Medias Altas y Elites En Chile: El Papel De Las Instituciones Educativas

Recientemente ha habido una crítica a la forma algo dicotómica de concebir las orientaciones políticas de los grupos más privilegiados, entre polos conservadores y liberales/progresistas apuntando hacia su fragmentación interna. Esto se ha explorado empíricamente en estudios seminales (Lamont, 1992; Savage et al, 1992) y más recientemente por investigaciones sobre percepciones de la pobreza y desigualdad (Reis and Moore, 2005), diferenciación ideológica (Atria et al, 2017; Hay and Muller, 2012), valoración de la democracia, tolerancia a la diversidad, visiones sobre el rol del Estado y las políticas públicas (Real-Dato, Lengyel and Göncz, 2012), orientación hacia la diversidad socioeconómica y étnica/racial (Moya, Pelfini y Novoa, 2018); demandas de democratización y mesocratización (Pelfini, 2014); percepciones sobre divisiones y roles de género (Madrid, 2017; Hjellbrekke and Korsnes, 2016); diversidad en creencias religiosas (Thumala, 2011; 2007).

Esta ponencia se propone exponer las dinámicas de fragmentación de este grupo, explorando cómo los procesos de reproducción de la posición de clase y la diferenciación política y cultural se entrelazan en la vida cotidiana y dan lugar a fracciones diferenciadas que cohabitan, pero también se encuentran en tensión al interior de este segmento social. En esta ponencia nos proponemos contribuir a la caracterización de la fragmentación política y valórica de la clase media alta y alta respecto de procesos relativos al posicionamiento estratégico de las instituciones escolares y universitarias en la producción de las fracciones más elevadas de la clase media alta santiaguina, lo que se hace en gran medida a partir del estudio sistemático de sus repertorios político-culturales. Para ello, combinamos patrones de encuesta, donde se ubican con claridad las instituciones educativas en un espacio producto de un análisis de correspondencias múltiples, junto a información proveniente de entrevistas realizadas a unas 50 mujeres de la clase media alta y elite en Santiago.

Agency and Structure in Water-Type Consumption: A Comprehensive Study of Bottled Water and Tap Water Consumption in Flanders, Belgium

Considering the negative environmental impact of the production and consumption of bottled water, this study provides a comprehensive analysis of the major factors associated with its consumption. Understanding the behavioural aspects associated with water consumption is critical for the management of water demands and supplies. Using survey data (N=2309), we first compare bottled water drinkers to tap water drinkers through bivariate correlation analysis. Subsequently, we construct a path model in order to further investigate the factors associated with water-type consumption. Whereas previous product-oriented approaches have led to 'agency explanations' (including health and safety concerns about water sources, taste preferences, environmental and price considerations), we aim to provide a more contextualised approach by including socio-contextual explanations. On the one hand, we consider the socio-demographic characteristics associated with water-type consumption. On the other hand, we consider the broader societal structure: the technical structure (i.e. access to drinkable water) and the social structure (i.e. social norms). Results show that the consumption of bottled water is most common among older people, men and the lower educated. In addition, bottled water consumers perceive tap water as less healthy and safe. They also consider the taste of bottled water superior. In contrast, environmental and price considerations are most common among tap water consumers. Lastly, our results indicate the importance of structural factors. Access to drinkable tap water is an important prerequisite for its consumption. Furthermore, we found that social norms promote the consumption of bottled water, particularly on special occasions. We conclude that research on water-type consumption benefits from a comprehensive approach, taking into account the product, actor and broader structure. Moreover, we suggest approaching water-type consumption as a social practice embedded in both individual lifestyle choices and the structure wherein choices are made. The paper ends with specific recommendations for future research and policy.

GENYS, DAINIUS* (Vytautas Magnus University, Lithuania)

Rethinking Po-Soviet Democracy: Technocratic Influx in Civic Domain

The paper aims to discuss the specific impact of Soviet and post-Soviet modernization on the individual and society - by deconstructing the consequences of psychological modernization for the individual and society. The attention is drawn to the asymmetry of power between technological rationality and its practical manifestation in the context of a pandemic: instead of increasing human means (attentiveness, understanding, empathy, etc.) to solve the problem, we rely almost entirely on technocratically streamlined regulation of public life, which calls into question not only democratic values   (freedom, participation, equality) but also democracy itself. The first part of the paper discusses the dialectical nature of modernization and the psychological consequences for society; the second focuses on the aspects of Soviet modernization that have strengthened the belief in progress and technological thinking, as well as possible forms of public behavior. An overview of the dialectical development of modernization shows its multiple consequences for human psychology and values. The outright acceptance or rejection of the essential imperatives of modernity, its critical reflection and adaptation to personal experience, eventually manifests itself in different personality types, which could be named as modernist, underground and postmodernist. We are witnessing the practice of extremely rapid growth of the technological axis

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

and declining confidence in people's social skills. This trend is even more painful in the post-Soviet space, where not only low level of social capital and empathy prevail, but the power of government is growing in relation to civil society.

GEORGI, RICHARD* (University of Gothenburg, Sweden)

Peace That Antagonizes: Reading Peace As Hegemonic Crisis in Post-Accord Colombia

On the 24th of November 2016 the Colombian government and the insurgent group FARC-EP signed what has been arguably the most comprehensive peace accord in human history. While the demobilization of the FARC-EP represents a major step towards peace, the implementation process so far has failed to meet the promises of substantial social transformation. In fact, post-accord Colombia also experiences an increase in levels of targeted political violence against human rights defenders, putting the life of those fighting for the accords at high risk.

I argue in this paper that this surge of political violence must be understood in the context of the politicization of the peace envisioned in the accords. That is to say, the peace accords represent a dislocation of Colombia's socio-political conflict order that gave rise to a hegemonic crisis in the post-accord phase, which as an interregnum stage represents a political battlefield on Colombia's social order in-between conflict and peace. I mainly build my argument on forty in-depth interviews with Colombian human rights defenders during six month of field work in 2018 and 2019, foregrounding the perspective of activists from very different organizational backgrounds, sectors, and regional focuses. Adopting a post-foundational, discursive pair of analytical lenses, I identify in particular three interrelated aspects in their narratives: The construction of the identity as 'human rights defender' as political, popular identity; the peace process as a 'political moment' that ruptures socio-political structures of violence; political violence in the post-accord stage as the result of political antagonization of Colombian peace in the implementation process. Here, human rights defenders as a constructed identity in defense of peace with social justice face fierce opposition from what they perceive as the political elites that benefited from violence over defining peace and the roads towards achieving it.

TG03-733.1

GEORGI, RICHARD* (University of Gothenburg, Sweden)

Peace through the Prism of Human Rights Activism: A Discourse Network Analysis of Human Rights Interventions on the Colombian Peace Process.

On the 24th of November 2016 the Colombian government and the insurgent group FARC-EP signed what has been arguably the most comprehensive peace accord in human history. The peace process, however, that started in 2012, led up to the agreement, and finds itself now in a precarious implementation stage has been enormously politicized around the issue of 'what kind of peace' shall guide Colombia's future. In this regard, human rights activist groups around the country have mobilized in pushing forward their demands of a peace with social justice to shape a transformative vision of post-conflict Colombia.

In this paper, I conduct a discursive network analysis to map out different understandings of peace and concomitant social demands brought forward by different Colombian human rights activist groups. Applying discourse network analysis I build on descriptive methods of Social Network Analysis to illustrate how peace is articulated in a database of app. 1,000 documents issued by very diverse human rights activist organizations between 2012 and the election of Ivan Duque in 2018. By this, I seek to illustrate the diversities and commonalities in the human rights activist scene with regards to their vision of peace. Moreover, I seek to point out the role of constructing common antagonisms in what could be described as a common counter-hegemonic discursive block on peace through the prism of human rights activism. This helps us not only to shed light on ongoing discursive coalitions and rifts in Colombian activist discourse on peace, but also to better understand the different forms peace and human rights can be articulated with each other.

GEORGIEVA-STANKOVA, NADEZHDA* (, Bulgaria)

The Forgotten Holocaust -

the Struggle for Recognition of the Porrajmos and Its Contemporary Re-Contextualisation

The Holocaust, one of the most tragic events revealing the other face of the modern civilisation (Bauman 1992: 7), continues to provoke various debates and new interpretations. In recent years, we have witnessed a new phenomenon related to a reconsideration of World War II experience - the pluralisation of the concept. Today, the Holocaust discourse of the Jewish people (called the Shoah)

is joined by the tragic fate of other victims of the Nazi regime, such as the Roma (suffering during the Porrajmos), in the context of growing anti-Roma sentiments, racism and xenophobia. The article presents the existing debates on the "uniqueness" of the Holocaust and its contemporary re-contextualisation in the struggle for recognition led by the international Romani Movement, interpreted as part of a politics of belonging (Anthias 2016; Yuval Davis, 2011). Discourse historical analysis is applied to analyse various attempts at inclusion and exclusion of the Roma as victims of the Holocaust in political and academic discourse. The role of the Porrajmos in building an aspired identity (Erikson 1968) is studied in the process of politicising Romani ethnogenesis and constructing a historical narrative, understood as identity politics, seeking a new kind of recognition, as well as redistribution of resources (Fraser 2003), bearing important symbolic and political significance in the struggle against growing exclusivist rhetoric and violence against the Roma on the European continent.

RC32-402.1

GERASYMENKO, GANNA* (Institute for Demography and Social Studies, NAS of Ukraine, Ukraine)

Gender-Specific Forms of Corruption

Corruption continues to be the main obstacle to development, which in turn reduces the efficiency of resource use, slows down economic growth and sets the stage for human rights violations. Although corruption has a negative impact on the population as a whole, empirical evidence suggests that men and women perceive its manifestations and outcomes differently. Similarly, they encounter different forms of corruption and demonstrate different attitudes towards combating corruption. At the global level, the importance of the simultaneous promotion of gender equality, empowerment of women, and implementation of anti-corruption programs as mutually reinforcing development strategies is recognized.

Corruption can have different impacts on the lives of women and men, thereby reinforcing gender inequalities in access to power, resources and opportunities. Multiple evidence demonstrate that women tend to be more vulnerable to the negative effects of corruption; there are also specific gender-based forms of corruption. Sexual favors demanded from women or girls in exchange for services or some preferences when providing services may become an informal "currency" of bribery. Most often, such cases go unreported, since victims feel scared, ashamed or expect victim-blaming attitudes. As a result of community-based attitudes and stigmatization of victims of violence, women also do not seek help, expecting public condemnation or accusations of their own provocative behavior. Due to women's reluctance in seeking help, the collection and monitoring of data on such abuses remains a challenge and the evidence base constitutes of case reports.

The proposed paper addresses the issues of gender-based forms of corruption, including sextortion and sexual harassment, gender-based violence and survival sex in the conflict setting, trafficking in human beings and sexual exploitation. The empirical database of the paper will be provided by targeted surveys, situational analysis and case studies conducted in Ukraine in 2016-2019.

RC18-217.1

GERBAUDO, PAOLO* (King's College London, United Kingdom)

Digital Parties As Movement Parties: The New Organisational Template of the 5 Star Movement and Podemos

In recent years a new generation of political parties has emerged, ranging from the 5 Star Movement in Italy to Podemos in Spain and France Insoumise in France. Despite their ideological differences these formations have been described as representatives of an emerging party type: the digital party (Gerbaudo, 2019). This conceptualisation highlights the way in which these parties have adopted digital platforms of communication in a way that resembles the operations of social media sites and their extraction of value out of users interactions. In this paper, my attention focuses on the comparison between digital parties and cartel parties. The cartel party is a party-type discussed by Katz and Mair in the 1990s (1994) and which has been used to capture the transformation of many political parties in recent years. My argument is that, at first sight, the digital party appears as an extreme version of the cartel party as seen in the way in which it adopts plebiscitarian tendencies that are a clear symptom of "cartelisation". This is aided, in the case of digital parties, by the way in which they use digital technology as a means of disintermediation involving members in a number of consultations and decisions. This change however is not just a matter of degree, namely purely an intensification of the plebiscitarian tendencies of cartel parties, rather it is also a difference in kind. It will be argued that digital parties introduce forms of organisation and leadership that are quite different from the ones that are usually associated with cartel parties. In particular we see a return of forms of charismatic leadership, which I characterise as "hyperleadership", that go hand in hand with the promise of a participatory democracy involving members in a number of key decisions about party strategy.

RC48-JS-23.3

GERBAUDO, PAOLO* (King's College London, United Kingdom)

The Crowd and the Logic of Action of Contemporary Movements

One of the most surprising interesting trends in commentary on present protest movements is the debate about the return of crowds . This notion has been associated with many protest movements such as the French Yellow Vests, the Spanish Indignados, and the Hong Kong pro-democracy protests, that are usually taken as incarnarting a different protest logic from the one he anti-globalisation cycle. Besides their adoption of a rhetoric of "the people", what marks them out from previous social movements is a shift in organisational logic. These movements project a "crowd logic" in the way in which they seem to involve a moment of amassing and indistinction. They typically adopt tactics in which people gather in large numbers in routine occasions, either in the same space, or in the occasion of repeated events, as the Acts of the Gilets Jaunes. I will argue that these tactics are not merely picked for the purpose of organisational efficiency. They also communicate the values and meanings of these movements. They bespeak the way in which these movements are expression of highly atomised societies in which traditional forms of class organisation, such as trade unions, pressure groups and traditional parties, are uncapable of mediating between the individual and the state. In this context, the crowd acts as a moment of public representation of grievances that are piling up yet they cannot be structured and focused in a strategic way. The prominence of the crowd is in this sense the manifestation of a demand for new forms of collectivity and community, that remain at a gelatinous level, failing to crystallise into more longstanding structures. This situation, it will be argued, condenses well the political dilemmas, of our society at a time at which polarisations are returning but are yet to find a stable form.

GERSON, JUDITH* (Rutgers University, USA)

German Jewish Refugee Remember and Forget: Fractured Stories of Flight from

the Nazi Regime

This paper is based on 62 unpublished, archived memoirs written by German Jewish refugees who fled their homes between January 30, 1933, when Hitler rose to power and October 23, 1941, when Jewish emigration from the Reich became illegal. Although many of these memoirists migrated more than once, this paper focuses on refugees who eventually resettled in the United States before the end of the war in Europe in May 1945. Thus this group is distinct from those typically known as displaced persons. They differ among themselves and occasionally are uncertain as to whether they are actual survivors or not. Indeed some would prefer we think of them as immigrants rather than refugees, a vexed question that opens this paper. Who writes these memoirs, when do they write, and who is their intended audience? I read these refugee accounts using two methods. First, I compare the memoirs to each other and seek to discern dominant patterns. How do memoirists describe their decisions to leave, what were their preparations, and what were the opportunities and constraints they faced? Here modal patterns matter but so do significant variations. Second, I compare these memoirs to the recorded historiography of the period, which enables me to begin to document absences in the memoirs. While these omissions or silences may or may not be deliberate or conscious, they point to patterns of forgetting. Using the evidence presented as a case study of biographical writing about a catastrophic past, the paper concludes with attention to ongoing questions of forced migration and human agency in the aftermath of a crisis.

On Media Representation of Sociology:

A Case Study of the Bulgarian Digital Media

The question "What is sociology?" has been asked around since the time Auguste Comte introduced the term in the 19th century. Since then, many sociological paradigms aim to answer the question using different perspectives. However, the term definition within the academic field does not necessarily correspond to what is recognized as sociology out of the academic halls and research centers. We are looking for an answer to what is popularly considered as sociology, and in particular, how sociology is represented in the media. The mass-media influence on the public opinion is well known and researched, so the way sociology is presented in the media is a key to understanding the popular comprehension of sociology, and respectively whether the academic definition of sociology matches the popular one. The research is focused on publications on the most popular Bulgarian media sites for the period of 5 years. These sites also include web pages of TV and broadcasting media so practically most mass-media channels will be covered in the analysis. We will discover what the most popular associations (themes, persons, events) are in relation to sociology and its word family, and thus, we will try to identify what usually represents sociology in the media.

Another purpose of the paper is to prove that the methodology, along with its technical execution, can be applied in another thematic fields by automating as many parts of the process as possible, using free data mining tools and algorithms, e.g. for topic extraction, association rules, data structuring and processing and others.

Analysis of Heterogeneity between Cognitive Environmental Social Capital and Environment Protection Practice in Iran

Experiences indicate that human interventional modern entrance to the nature, despite its positive outcomes, has also been accompanied by many costs and damages. Today, preserving the nature and also promoting sustainable living environment has become a fundamental issue on the agenda of all scientific and policy making areas in developed as well as developing societies. Achieving a comprehensive apprehension of the relationship between nature and human, we have defined environmental social capital in addition to other forms of human capital (e.g. cultural capital, economic capital, physical capital, etc.) which is simultaneously an indicator of the existence of sustainable social development and, like other capitals, can serve as a source for social development. Environmental social capital has 2 dimensions; subjective and practical. The cognitive aspect of this form of capital appears in citizens' mentality and perceptions about environment while the practical aspect is relating to the way of their actions toward the nature. These dimensions are linked together. It seems that possessing the more cognitive environmental social capital, the more environment protection will be practiced but as a matter of fact, according to the results of our secondary analysis of related national surveys in Iran, There is a deep gap between aforementioned two dimensions of environmental social capital among Iranian individuals. Therefore, when citizens profoundly concern about the environmental issues –indicating their high rate of cognitive dimension- they don't act in a way to protect the environment and heal the crisis. Through a systematic review of theoretical debates, this article aims to explain the structural reasons of this phenomenon including the priority of economic growth over environmental protection, societal system of asymmetric norms, domination of particularism over universalism, lack of ethical responsibility, social trap, short-term rationality, socio-economic inequalities and eventually Free-rider problem.

Cultivating Technology: Dreams and Practice of Agrarian Futures in the United Arab Emirates

In recent years, the United Arab Emirates (UAE) has embarked on a very ambitious quest to become the most food-secure country in the world by 2051 (based on the Global Food Security Index), while at the same time becoming a hub for agricultural innovation. In this relatively small yet oil-rich Middle Eastern nation with a challenging environment, the government and the Ministry of State for Food and Water Security are devoting considerable efforts to enhance local food production using technological innovations. In parallel, private sector-funded controlled-environment agriculture (CEA) projects using hydroponics, aquaponics, or aeroponics techniques are developing at a very rapid pace. Tellingly, the Minister of State for Food and Water Security declared in an interview in 2018: "We are trying to create the equivalent of Silicon Valley – but with food" ("UAE Minister Talks Plans to Build a 'Silicon Valley' of Food Technology", 2018). This represents the ambitions of the UAE's government to transform the desert into a green tech oasis. While visions of agrarian futures (and their technological ramifications) have dominated the agri-food sector in the UAE for decades, little is known so far about the imaginaries and practices of agriculture technologies there. In this paper, I explore the development of agriculture technologies from an abstract vision, a dream of agrarian possibility at the governmental level, to actual practices at the farm level. Combining a socio-technical imaginary approach with qualitative empirical research in the UAE, I seek to unpack the extent to which digital and "smart" technologies are actively restructuring the agri-food sector in the UAE, and the way they accentuate the role of capital, resources, and a nuanced reading of food security.

GHIDONI, ELENA* (Universidad de Deusto,)

Not a Harmless Categorization. Stereotyping As Means of Subordination in Judicial Reasoning through the Lens of Intersectionality

Stereotypes have been recognized as forms of discrimination in international human rights law and have gained attention quite recently in European legal doctrine. Legal scholars described how stereotypes lurk into the legal domain, not only through normative production but also judicial interpretation and law enforcement in ways that make them difficult to detect and therefore to question, especially since they are products of dominant social and cultural views. Further research has also theorized stereotypes as particular forms of generalization and categorization. However, since general rules and categories are embedded into legal systems as such, more accurate analyses are needed to distinguish between generalizations that serve legitimate ends and stereotypes that entrench inequalities.

Acknowledging that categories and generalizations cannot be eliminated as such, this paper narrows down the attention on stereotypes as both products and means of perpetuation of systems of oppression. In order to do so, it adopts structural intersectionality as an analytical tool that center the attention on power hierarchies and social groups. Intersectionality also allows an understanding of stereotyping as a complex mechanism that can adapt and modify according to the intersections.

Through some examples from the ECtHR case law at the intersection of racism and patriarchy, the paper will first expose how stereotypical constructions influence judicial reasoning, in particular the fact-finding process and the evaluation of evidence in ways that hinder the ability of the individual applicant to access legal remedy. Subsequently, in light of this analysis, the paper will attempt to unravel the distinction between stereotyping and other forms of generalizations, providing elements for a more precise definition of the former.

Religion-Based 'Personal' Law, Legal Pluralism and Secularity: A Field-View of Adjudication of Muslim Personal Law in India

In India, the phenomenon of 'legal pluralism' is conditioned and facilitated by the commitment of the democratic state to religious freedom and socio-cultural diversity. Articles 25 to 29 of the Indian Constitution confer and safeguard this freedom to its citizens. Although community-based adjudicating institutions such as the Dar-ul Qazas function within this constitutional framework, every citizen also has the right to approach a civil court as and when they deem necessary. As a result, the disputes that fall within the ambit of personal law can be dealt with both religious and secular courts. So far, the discourse on Islam, personal law, and the secular state have revolved around the question of a Uniform Civil Code (UCC) and gender justice, leaving out the sociological investigations on how disputes involving the issues of kinship and inheritance are resolved among different religious communities. Using a sociological lens, the present study shifts the focus of the personal law debate from codification and reform to the social matrix of the law and praxis of conflict resolution. Drawing on a long-standing history of legislation and reform of the Muslim personal law and an ethnography of cases from the religious forum of dispute resolution, the study offers a 'field-view' of dispute resolution and legal pluralism. The findings from the Dar-ul-Qazas were corroborated by observations and cases from civil/family courts to understand the collocation between the multiple forums. Thereby, the research comments on the complex negotiations between the religious and the secular in the context of post-colonial nation states.

Expressing Research Equity Using Pictures: Peronas, Social Groups and Environments in Schools with Diverse Abilities

AvenuePM is a web-progress monitoring tool that teachers use to collect assessment data, along with other evidence in the classroom and other learning environments to inform their decisions. To evaluate the effectiveness of the AvePM program, the research team is collaborating with schools in diverse settings where students of all abilities participate.

Originally, the community was centered around the needs and goals of the Deaf or Hard of Hearing (DHH) community. A central question remains: how is a student perceived in a school or a learning environment and if they have any control of how they affect their own learning outcomes?

To ensure that the research team keeps the interests of students at the center of all decisions and priorities, we do field research and involve them in various research and design activities. However, many decisions and research happen far away from schools and students. It is imperative that feedback from students and school community members are considered at different times. Research teams need to be cognizant of the impact of their decisions and to ensure that they actively include the larger community.

One of the techniques we use is visual storytelling by including photographs of different community members. This allow researchers to consider their feedback and viewpoints and allows them a different lens for asking questions and incorporating feedback. We find, similar to role-playing, it offers research teams to be more considerate of members who may not always be present. This also encourages the researchers to include emotional and sociotechnical considerations that may not be always part of remote analytical methods in research and design.

This paper will present the emotional and cultural aspects of including photographs in the research and design process. Examples will shared on participating people, social groups and environments in schools with diverse abilities.

Universal Design for Learning Consideration: Design of Progress Monitoring Software for Students Who Are Deaf or Hard of Hearing

AvenuePM is a web-based progress monitoring tool that allows teachers to track progress in reading and writing. The software was primarily designed for students who communicate using the American Sign Language (ASL) or spoken English. It is currently being used in multiple schools that have students who may be Deaf or Hard of Hearing (DHH). These schools are often diverse in the abilities of students and the software can be used by students of all abilities.

The software uses principles of Curriculum Based Measurement (CBM) to create assessments that are easy to administer, take only a few minutes, valid, and reliable (Deno, 2003). Teachers and students can track progress against learning goals on a weekly or monthly basis, including for tracking Individualized Education Plans (IEPs).

American Sign Language and students of different abilities in different schools results in considerations and priorities that are often not part of technology considerations. Basic usability considerations and keeping it simple for everyone are important considerations for selecting and implementing technology in schools. To address the considerations of teachers and students with diverse abilities, principles of Universal Design for Learning (UDL) are being used so that everyone can access and use it regardless of language status or ability. In UDL, barriers and disabilities are considered as a characteristic of the learning environment and not of the learner; learning environments are designed by considering the widest possible needs and preferences of learners by designing student-centered learning environments, tools and curriculum materials.

We find that following such an approach results in better technology that is simpler for all. This paper shares design considerations and principles that focuses on students who are DHH but shows how it benefits everyone by creating better tools.

The School Community: An Opportunity for School Improvement

The local level of a school, the school community (Gsp, 2017), represents a key element, since the school shares with the community the social value of the education action, encouraging the development of a community that it's supportive and involved in school improvement *(Dewey, 2004)*. The development of an advanced education system, equitable, sustainable and inclusive, should engage all the resources of the specific school community, families, public institutions, associations, municipalities, non-profit institution etc. (UN, 2018). The school capacity in collaborating and activating synergies with subjects of its own context

represents an important indicator of the school autonomy (Mujis et. al., 2011). It is also an indicator of its capacity to improve: structural weaknesses of complex organizations such as schools could be transform in a collective force and a truly significant institutional presence (Muijs et. al., 2010; Catts & Ozga, 2005)

The contribution aims to illustrate the self-evaluation and external evaluation results of a sample of 375 schools on different aspects of the school networking. Since 2015 all Italian schools carry on a self-evaluation process and every year a sample of them receive an external evaluation visit, according to the same data driven quality framework (INVALSI, 2014; 2017b). The presentation will pursue the following objectives: to highlight the school networking; to verify if the results of the self-evaluation are valid in relation to an independent criterion, represented by the judgments attributed by the external evaluators; to verify if the collaborations with the various subjects of the territory represent a lever for the school improvement shared also by the external evaluators. First results of our study show a composite and differentiated Italian reality by geographical area and school level. The schools also do not consider the collaboration with families and other subjects as levers for school improvement.

The Redistribution of Power between Patients and Healthcare Professionals in Patient Engagement Practices

The consequences of patient engagement practices in terms of power redistribution between patients/their families/caregivers on one side, and healthcare professionals on the other side, represent a critical point. Research shows that the process of patient engagement is positively correlated to higher compliance, costs cut, and increased patient satisfaction towards the care process, so it worth it to invest in the promotion of these practices, even more so in the case of chronic illnesses such as cancer. Through in-depth interviews with healthcare professionals (doctors, nurses, etc.) and members of voluntary organizations dedicated to the support of cancer patients, the aim of this research is to provide a focus on the level of dissemination of engagement practices in the Italian healthcare system, and in particular in the assistance provided to cancer patients. Engagement practices involve a process of power redistribution between healthcare professionals and patients; a change that has already started with the advent of technology, the increased health literacy of patients, and the primacy of patient's autonomy promoted by social movements. The study wants to understand how these practices are perceived by healthcare professionals and what impact they have on the organization of the healthcare system. What are the steps that healthcare professionals need to take to guarantee that patients, their families and their caregivers have the knowledge they need to make informed decisions? What are the challenges that healthcare professionals encounter if they try to engage patients in the care path? What is the new role of healthcare professionals in this context?

Adopting an Adaptation-Mitigation-Resilience Framework to Ageing

Population ageing is presented as one of the 'grand challenges' of the twenty-first century. Yet, policies designed to offset these challenges seem to be a jumbled, disjointed mix with no clear, overarching narrative. One of the successes of climate change science is the development of a clear, distinguishable framework to plan action: adaptation, mitigation, and resilience. This framework can be applied to designing better policy for ageing: *adapting* to support people in need today; *mitigating* future challenges by ensuring that people and institutions 'age better'; and developing economic and social *resilience* through both inter-generational solidarity and policy learning.

GIFALLI, SAMANTHA* (Federal University of Rio de Janeiro, Brazil)

Between the Backlands and the City: An Analysis of the Political Relations Around the House.

This paper aims to understand how the relationship between the state and informal organizations occurs. For this, I want to observe how what we treat as informal or state boundaries are produced in relation to it.

This study is the result of field research in Colônia Juliano Moreira, a neighborhood located in Rio de Janeiro. This neighborhood was formed from the opening of a former Psychiatric Colony Hospital. Today it is a region dominated by the informal land, housing, and security market. This group is responsible for the informal allotment of the region, as well as having a close relationship with the government in the execution of public policies.

From the analysis of public policies that led to the process of opening the hospital, I could see that disputes over the property (be it land or home) are the main conflict that leads to the reconfiguration of powers in the region. In order to understand this situation, I intend to analyze the public policies of housing concession or regularization in the region. I delimited three processes: the regularization of houses of former hospital residents, the process of removing residents at risk or in areas of public interest, and the granting of housing through the "Minha Casa, Minha Vida" program.

My hypothesis is that in each situation of conflict generated, a cycle of hope, wait, and uncertainty opens that consolidates the political structure from a new arrangement. In this way, I intend to analyze how the ideal of "own house" consolidates a system of lasting relations between professional politicians and local leaders based on housing negotiations in the context of the transformation of the hospital into a neighborhood. Negotiations related to the desire for homeownership would thus be the central object that highlights the relationship between local politics and the state.

GIL, MAGDALENA* (P. Universidad Católica de Chile, Chile)

Narratives of Risk and Responsibility: The Case of the 2010 Chilean Earthquake

Under the modern framework of risk disasters are no longer seen as problems where people are the unintended victims of destructive forces beyond ordinary human control. Today, the problem is reshaped into one in which into one in social, economic and political conditions are responsible for society´s vulnerability to hazards, and where human actions and political decisions are crucial to mitigate impact. This has enormous political consequences for governments, since discussions of responsibility almost always follow catastrophic events. In this paper, I explore the case of the 2010 earthquake in central-south Chile that killed at least 525, affected 69% of Chile´s territory and more than 75% of its population, causing a total damage of $30 billion USD, equivalent to 18% of the country´s GDP. The event became a turning point for the Chilean state, not only because of the destruction but also because critical problems in terms of urban planning, technological failure, inadequate protocols and misinformed human decisions became evident. This led to a public discussion aim on attributing responsibility for the disaster, and eventually to a legal battle between the families of those who died in the tsunami and the state. Finally, the question about who is responsible for the catastrophe has not found one common answer in Chilean society. Overall, I argue that discussions about risk inextricable from discussions on responsibility.

GIL, NATALIA* (Universidade Federal do Rio Grande do Sul, Brazil)

School Failure Index in the Measurement of Quality Education

The objective of this paper is to present the analysis of the relations established in Brazil between the indices of school failure and the measurement of the quality education. Thus, initially, I intend to present the criteria used in the production of school statistics from 1932 to 2018 in the country. Next, my intention is to focus on the discussions on the possibility of quantifying the quality of teaching. For this purpose, I have reviewed official documents and articles published in scientific journals since the 1930s. At this point, an important result of the research is the evidence that, in the first half of the 20th century, there was a naturalization of the students' poor school performance based on racial theories. Such theories had a wide circulation in Brazil until the 1940s. Nevertheless, in the 1950s and 1960s, such interpretations competed with the understanding that school failure would be a mechanism of selectivity and exclusion serving for the discrimination of specific social groups. In the most recent period, it is possible to observe the coexistence of both perspectives in the current Brazilian educational context. To illustrate this aspect, my analysis focuses on the Basic Education Development Index (IDEB) that, since 2007, quantifies the quality of the schools in Brazil. The IDEB calculation associates two educational indicators: the results of the Prova Brasil, which evaluates students' proficiency in Portuguese and mathematics, and the approval rate in each school. However, while in public policies a high approval rate is considered important, in schools the prevailing understanding is that failing many students would be indicative of the high quality of education.

Work Intensification in an Extreme Context: Cabin Crew and Work-Life Issues

Work is more and more intense in many professional groups. We have studied the case of cabin crew in Canada, France and other European countries and observed how work in such a particularly intensive and extreme context, with very particular schedules and a lot of travel can have an impact on personal and family life, and pose huge challenges. Our presentation is based on the analysis of the 90 qualitative interviews as well as some results of an online questionnaire, some direct observations and analysis of legal documents. These working conditions have intensified, and the work is often done in difficult and even extreme contexts. We will present the work of the Cabin Crew and their safety / security activities. We put forward the idea that the Cabin Crew develops a specific "social and professional system of management of safety/security" / a social and professional system of "risk management", which is particularly active and indispensable in flight – but not only during a flight, also between flights. Several types of "resources" and professional logics (different factors) contribute to this system.

The organization of work requires the collective functioning of all the staff and allows the implementation of the necessary regulations and coordination to carry out the tasks, within the team of flight attendants and in connection with the cockpit, and with the ground crew. The cabin crew develops a set of individual and collective professional practices: relational attitudes with passengers and personal qualities, very strong observation skills, coordination, cooperation and solidarity between crew members and cabin crew management (cabin chiefs).

We look at how the intensification of this Cabin Crew work in such a difficult context has an impact on work-life interactions and challenges.

GIMENEZ BELIVEAU, VERONICA* (CONICET, Argentina)

Health and Healing Trajectories in Migrants: A Study of Catholic Exorcists and Their Therapeutic Groups in France

Health and religion are frequently interrelated, both in the approaches to the intervention of spirituality in healing processes and in the perspectives that study the motivations related to health in the adherence and frequentation of certain cults.

In the contemporary Western Christian field it has been possible to observe, for some decades, the growth of therapeutic-spiritual approaches often organized by exorcist priests to face certain non-specific discomforts at the intersection between the social, the psychological and the spiritual. The groups that deal with these sufferings put into practice a series of procedures that are situated at the intersection between biomedical therapeutic practices, psychoanalytic listening and spiritual care. In the Catholic field, we have seen these groups grow in various contexts: here we present the preliminary results of a study based on qualitative methodologies and conducted in the French context (in the cities of Paris, Vernon and Lyon) which prompted us to ask ourselves, from the analysis of spiritual care groups, about the relationships between health, healing and religion in migrant groups.

The diversity of problems raised by migrants did indeed attract our attention: in a research that did not initially take them as an object of study, migrants presented health/spiritual problems with unique characteristics, which showed their being between two worlds. Migration opens a space-time that is constructed between at least two loci. "Here" and "there", "native" and "current" places are at the same time urban, social and meaning spaces in which processes that dialogue among themselves and that often enter into conflict are experienced. In this presentation we will approach the processes of discomfort, health and healing, focusing on non-specific malaises that trigger consultations with support groups in the Catholic field, asking about the production of moralities that regulate the definition of disease and the processes of healing.

Social Movements, Activist Knowledge(s), Academic Knowledge(s). Circulations and Memories in Liberationist Catholicism in Argentina

The wide space of liberationist Catholicism resurfaces in post-dictatorship Argentina (1983), taking up the memories and knowledge(s) of both local and Latin American traditions of Liberation Theology. After the breakdown of the organizations perpetrated by the dictatorship, the groups and actors intended to rebuild a space in which they could both express a kind of Catholicism committed to the world of the poor and propose actions of resistance to neoliberalism and to the rise of the right wing forces. Catholic liberationist groups were assembled into organizations with different forms, articulated as a network: the memory of the victims gradually occupied a central place.

In this presentation we are keen to investigate the transmission of knowledge(s) and the circulation of people in the spaces of liberationist Catholicism starting from post-dictatorship.

How were activist knowledge(s) transmitted? What elements appeared during the period of activist effervescence of progressive governments in Latin America (2003-2015)? Who were the agents who transmitted this knowledge(s) and memories? What role did intellectuals play in this process? What changes does Francisco's pontificate introduce in this weave of actors and knowledge(s)? From an ethnographic work undertaken with diverse spaces of liberationist Catholicism (1999-2003 and 2014-2019), we intend to analyze the intersections between religious and political groups, the networks of exchange of knowledge(s) with scientific and intellectual environments, the international circulations of groups and agents.

GINNERSKOV, JOSEF* (Uppsala University, Sweden)

Outlining the Content of Assessed Sociological Knowledge – the Case of Swedish Sociology Dissertations, 1949-2019

What distinguishes sociological knowledge? When glancing through some of the articles branded as sociology during the last years, one quickly becomes overwhelmed by the content variation. Throughout the last century, sociologists have made numerous attempts to demarcate "what sociology is". The main issue with the lion's share of these accounts is, unfortunately, that the answer is given without any empirical investigations. In this presentation, I will demonstrate how a particular content of sociological knowledge has evolved throughout history, namely academic texts that have survived a sociology assessment. My chosen case is all dissertations put forward at Swedish sociology departments – making up a little over one thousand units – since it is one of the few instances where sociologists de facto grant a book the academic stamp of sociology. In the attempt to give a deep relational account of how this sociological content fluctuates over time-space, I try to not rely on ingrained explanations such as authors' intentions or trajectories, organizational structures of departments, or preferences of scientific communities. The dissertations are not treated as assumed successors – either of a department or a sub-field of sociology – but are conceptualized as individual moments where a multiplicity of heterogeneous elements becomes actualized. To depict the common forms and expressions embedded within the corpus, I work with both qualitative and quantitative methods at different levels. Examples are automated text analysis tools that provide common meanings from a corpus of full texts; interpreting the content of auto-presented descriptions found in abstracts and keywords; describing how quantifiable properties of the dissertations – e.g. language use and author gender – are arranged. The result is a dynamic set of illustrations that together show how a particular content of sociological knowledge is patterned.

GINSBURG, RUTHIE* (Beit Berl College, Israel)

What Love Got to Do with It: Netta Barzilai, Picture of Victory, Unfamiliar Body, and Spaces of Emotions in Israeli/Palestinian

In this presentation, through careful attention to the affordances of the picture of victory, I advance the discussion on images of bodies that present the interconnections linking emotions, body performativity and space. I draw on my research on the celebration of Netta Barzilai's Eurovision Song Contest victory held in the center of Tel Aviv, Israel, and on the lethal confrontations between Palestinian protestors and the Israeli army at the Gaza fence during May 2018. Using visual cultural analysis and emotion theory, I explore the picture of victory and the socio-political spatial performance of the unfamiliar bodies of Netta and of the Palestinians. Following Sara Ahmed's observations on emotion of love (Ahmed 2004), I show how the widespread embrace of Netta's unusual body by Israelis is linked to apathy toward the Palestinians' afflictions. Adding to this conviction, the article offers an inspection on the 'unfamiliarity' of Netta's body, which is centered on her fatness, and forming Palestinians and their bodies as alienated. As demonstrated on May 2018 Netta's body was awarded by the public as unusual, while Palestinians received estranging attitude, expressed by indifference to lethal violence they endured.

Notas Sobre La Subjetivación Política De Los Jóvenes Que Participarón En El Movimiento De Ocupación De Escuelas

Se pretende presentar los resultados preliminares de la investigación doctoral en curso sobre experiencias de participación politica y itinerarios juveniles. La investigación cualitativa ha empezado en 2018 y tiene como objetivo comprender las repercusiones de la experiencia de participación en los caminos de los jóvenes que participaron en las ocupaciones de las escuelas públicas que ocurrierón en 2015 y 2016, en São Paulo y el municipio de Sorocaba, en el interior de São Paulo. Situada en el campo de los estudios de la juventud en la interfaz con la acción colectiva, la investigación está vinculada a un amplio proyecto colectivo que tiene como foco principal la comprensión del proceso de formación política de los jóvenes que participaron en ocupaciones en varios estados brasileños, en escuelas y en las instituciones de educación superior. Desde la experiencia de ocupación de escuelas, surgió un proceso de subjetivación política. Así tenemos la intención de presentar y discutir los datos - obtenidos por entrevistas individuales - relacionadas con este proceso de subjetivación politica vivido por jóvenes de São Paulo y, por lo tanto, contribuir a la construcción de nuevos conocimientos académicos sobre la relación de los jóvenes brasileños con la vida colectiva, especialmente frente a un contexto político señalado por numerosas pérdidas de derechos, pero también por la resistencia.

GIRAUT, CAMILLE* (Graduate Institute of International and Development Studies, Switzerland)

When Transnational Policies Meet Local Cultural Repertoires: How French Students Mobilize the Language of Diversity to Make Sense of Affirmative Action Policies

The transnationalization of affirmative action policies, occurring since the mid-1960s, involves the importation and the resignification of categories such as diversity to justify the local implementation of those policies.

In early 2000 in France, the school of Sciences Po Paris implemented a parallel entrance program for high school students of "priority education zone", promoting the dispositive through the label "The excellence in diversity". The institutionalization of diversity creates tension since it is closely associated with a multicultural model of identity based on the recognition of individual and group differences, while the French model is traditionally associated with universalism and "colorblindness".

On the one hand, this paper explores in what way beneficiaries of the dispositive at Sciences Po relate to the notion of diversity when they make sense of the policy, and how they mobilize the language of racial or ethno-cultural differences when they speak about diversity in a context where race is officially absent.

My preliminary results show that students mention diversity as an important dimension of the dispositive, but they perceive it as a polysemic category. Indeed, they either retranslate it in social terms or they understand it in culturalist and/or racial terms and use it to point out the consideration or valorization of one's (non-European) origins by Sciences Po.

On the other hand, the paper also explores in what way the institutionalization of diversity impacts the way students project, or experience, their integration at Sciences Po.

Regarding this dimension, my preliminary results show that, while beneficiaries of the dispositive see diversity as an important value, most of them are also critical of the different effects it can produce. For instance, some report being potentially the object of tokenism by student associations, while others feel that they should sometimes 'perform (their) difference' to meet the expectations of others.

GIRGIN, YASEMIN* (Bogazici University, Turkey)

Actors' Career Trajectories

Turkey is the second biggest TV serial exporter of the world. Television is the most fundamental source of earnings and recognition for the actors living in Turkey. Thereby, TV series form the most significant part of actors' career planning. Acting, by definition, refers to the art of playing different characters. The actors who manage to enrich the diversity of the characters they play are the ones who can achieve greater success in terms of entitlement and status. However, do actors get the chance to/or prefer to play great diversity of parts to reflect their acting capacity, talent and creativeness; or do they keep playing similar roles over and over again? And why do they do what they do? To answer these questions, I am interested in analyzing actors' patterns of permeability in terms of 'stickiness of the role'.

I conceptualize the colloquially discussed and yet not exclusively studied social phenomenon 'stickiness of the role' as a force positioning the actor to a certain point in the TV sector based on some character that was once acted, the state of

being 'stuck' to a certain portrayal that previously pleased the audiences and the producers. The project consists of two stages of research: a quantitative stage to measure the role stickiness via data gathered from TV series; and a qualitative stage, consisting of in-depth interviews with actors, producers, casting directors, agents and directors to inquire the structure that (re)produces the role stickiness.

First findings indicate that the roles played by women in Turkish television stick more than the ones played by men. The genre 'comedy' is stickier than the genre 'drama'. The female actors, while selecting roles, self-censor themselves more than male actors. The research, overall, aims to reveal the patterns of the TV acting field that maintain the existing problematic norms.

Struggles over Discursive Legitimacy during the Covid-19 Pandemic through the Language of Risk and Threat in Swedish Mass Media

Compared to many other countries, Sweden has managed the COVID-19 pandemic with less regulation and more voluntary action expected of citizens and organizations based on recommendations. In studies of increased securitisation it has been shown that the interaction between social debate and historical experiences can enable certain types of threat images that relatively quickly can create acceptance of policy and decisions which had previously been impossible and unacceptable. Departing from an understanding of securitization, risk governance as performative (Giritli Nygren et al 2020), we analyze this exceptional situation in the public debate. The aim of the paper is to analyse the development of crisis narratives and struggles over ideological legitimacy in Swedish mass media during the first phase of the COVID -19 pandemic in Sweden. Crisis narratives are seen here as performative and governing to the extent that at the same time as a narrative is expressed, for example that Swedish preparedness is poor, this crisis is also created. Employing a linguistic and critical discourse analysis, we investigate media coverage of Covid-19 by three Swedish newspapers; Aftonbladet, a national tabloid, Dagens Nyheter, a national morning newspaper, and Dalademokraten, a regional morning newspaper, during 2020. We combine descriptive analyses of the development of the crisis narratives with analyses of how these narratives become performative, targeting the effects of the narratives and the forms of governance they promote. The study indicates that three crisis narratives dominate the coverage: Health, economy and democracy and that there are a number of struggles over legitimacy in the handling of COVID -19 focusing on centralisation versus decentralisation, herd immunity and Swedish exceptionalism, struggles anchored in different ideologies.

The Construction of Self-Legitimacy: Analyzing the Interactions and Expectations between Police Officers and Citizens

This paper analyzes the daily construction of police self-legitimacy from an empirical research with police officers from the city of São Paulo (Brazil). Departing from the proposal developed by Anthony Bottoms and Justice Tankebe of understanding legitimacy as a permanent dialogue between power-holder claims and audience responses, the investigation explores how officers perceive the image the population have of the police. The proposal is developed in dialogue with the recent criminological literature that have developed the hypothesis that the routine exercise of authority during the contacts between state agents and citizens is a fundamental predictor of legitimacy. The centrality attributed to the daily contacts the population stablish with state institutions make it necessary to consider the expectations built from past experiences, individual or collective, which necessarily organize the interaction. The self-legitimacy of police officers is also affected by the contact they experience with the population and with the expectations the population express toward them and their work. The paper analyzes data from twenty-eight interviews with police officers from the military police force who work in different areas of the city of São Paulo. Results shows the officers perceive the population as having a mostly negative image of the police and that this image is associated with the excessive use of force. Part of the interviewees mentioned the past individual and collective experiences the population had with the police to explain this negative image. For this explanation, they frequently mentioned the troubled relationship between the police and poor neighborhoods, where the bad expectations and the attitude of being against the police would be particu-

larly strong. Therefore, the results allow us to discuss the role played by unequal treatment as a historical trait of the police work in shaping the permanent dialogue which continually construct legitimacy from daily contacts.

GIUGLIANO, ROGERIO* (Federal University for Latin American Integration, Brazil)

Cash Transfers, Poverty and Inequality after the Authoritarian/Populist Neoliberal Turn in Latin America.

Conditional cash transfers started to diffuse throughout the global south, in tandem with the neoliberal advance of the 1990s, as a strategy for poverty reduction alternative to universal social protection schemes. At that time, CCTs were part and parcel of the attempts to reduce fiscal deficits by implementing less expensive social-structures based on focused public policies. In most countries of Latin America, the neoliberal turn resulted in profound social-economic crises that fueled demand for political change and led to power many left-leaning governments across the region. Once in power, these political forces continued to develop and sometimes even expand national CCT programs. These policies, combined with minimal wage increases, intensification of South-South relationships, and public investments in infrastructure, contributed to reducing poverty and inequality.

Within the Latin-American progressive turn, two broad political paths can be perceived. In countries like Brazil and Argentina, CCT policies were part of the social conciliation between the political left, social movements and local elites. In contrast, countries such as Venezuela and Bolivia adopted a State-centred and confrontational model aiming more profound social/economic transformations. Nevertheless, even in these cases, CCTs policies continued to figure as part of the poverty reduction efforts. After a decade marked by social advances, inclusion and equalization a renewed neoliberal agenda emerged supported by national elites, prompted by political and economic crises that struck the region. In Brazil, this change was brought forward by divisive, right-wing populist/authoritarian forces.

How does these recent political/economic reversal affect Latin-American anti-poverty struggles? This paper intends to explore policy shifts and impacts on poverty and inequality indicators since the rise of the populist/authoritarian right in Brazil. It also considers the ascent of neoliberal forces in Argentina and the return of traditional elites to power in Paraguay to establish parallels between directions adopted in Latin America.

Democratic Values and Climate Change Views: A Cross-National Multilevel Analysis

Research attempting to explain variation in climate change concern finds a key trend in the United States is the increasing political polarization of issues related to climate change. Internationally, there is evidence this trend exists in some countries but not in others. Unlike the literature on environmental concern, where politics matter but demographic factors tend to remain significant predictors, systematic reviews and meta-analysis of the literature on the determinants and outcomes of belief in climate change show that traditional demographic factors have far less predictive power than political affiliations, ideologies, or values. In this paper, we examine determinants of concern about and views regarding climate change using a multilevel modeling approach to analyze data from a survey of global attitudes for individual respondents in 37 countries. Controlling for other relevant factors such as gender, age, education, income, and religiosity, we find a key predictor is an individual's score on a measure of commitment to democratic values. We also examine how the effect of this individual level variable on a respondent's climate change views depends on various country level contexts. This research further extends the research on the role of politics in the variation in global views and perceptions of climate change.

Beyond Autonomy? in Search of Community and Agency in Professions of the Built Environment

Scholarship on professions has long examined the growing challenges to professionals' autonomy at work. The rise of large organizations and administrative professions has been an important factor in the transformation of the meaning and salience of autonomy for professionals. However, scholars have not exam-

ined the different forms these challenges take and how they are translated into professionals' action. This paper links theories of professions as epistemic communities to those of professions as communities of practice, presenting a novel approach to studying professional groups within Abbott's linked ecologies perspective. The authors demonstrate this approach using qualitative data on the advocacy, activism or social justice work of two professions of the built environment—civil engineers and architects. Analyzing in-depth interviews as well as participant observation data from professional events centered on the engagement of professionals beyond their field of practice, we show how different professional groups experience and frame challenges to their autonomy. Our findings indicate that challenges to civil engineers' autonomy translate in a search for community within one's profession, whereas to architects autonomy challenges lead to a search for agency through reaching outside one's profession. These findings have implications for our understanding of professions as linked ecologies and in service of the public interest.

Hate Speech on the Internet: New Methodological Challenges

Hate Speech on the Internet: New methodological challenges

Today, the Internet represents the most important platform for political debate. The characteristics of online communication (such as anonymity, echo chambers and filter bubbles as well as the difficult attribution of speaker and identities) lead to an increase, diversification and a potentially permanent accessibility of hate speech.

May the main challenge for the research on hate speech in analogue contexts be to explore the various – especially latent – types of hate speech and the intersections between different hate ideologies (such as antisemitism, racism(s), sexism and/or anti-genderism), methodological problems with respect to the Web 2.0 even increase: When it comes to the web, a detailed and representative analysis of hate speech is hindered not only by the countless types of explicit and implicit hate speech and imagery, but also by the immense amount of text as well as the status of the web as a three-dimensional very complex medium. The examination of intersectional racist, antisemitic, sexist and/or anti-genderist hate speech online requires a profound reflection upon adequate methodological approaches that can lead to clarifying and representative findings.

In our paper, we will present a mixed methods approach applied to various British mainstream websites in the context of Brexit. Brexit is widely perceived as a catalyst for negative concepts and emotions. Thus, it leads to an increase in instances of hate speech and a normalization of exclusionary views within British mainstream society.

Our examination is based on discourse analysis with interpretative methods. Here, the different representations of and intersections between hate ideologies are taken into account. This step is followed by a quantitative examination in order to analyze normalising trends in British society. The ignorance of such trends online might have vast implications for the persistence of democratic and pluralistic societies.

The „Participation Chance Act" - a New Form of Governmentality?

The „Participation Chance Act" - a new form of governmentality?

With the so called Hartz-reforms introduced in 2003, German social labor market policy was geard towards the welfare-to-work principle and the commodification of social security. In this context, there was also a radical reduction of publicly supported employment. Unemployed should instead take training measures to improve their employability in order to find a new regular job as soon as possible. This approach has been the subject of a critical debate for years, especially because it was believed that anyone who is officially considered 'fit to work' can actually find a job in first labour market. Although officially categorized as 'fit to work', there are people that have no chance in the first labor market due to multiple mental and physical limitations. With regard to this group it is not only criticized that it depends on transfer payments on a permanent basis, but that it also suffers the most from social exclusion. Not least forced by an increasing socio-economic and political polarization and driven by international discourses on social exclusion/inclusion and cohesion, in 2018 the German parliament has passed a law to improve the social participation opportunities of these long-term unemployed ("Participation Chance Act"): More than 4 billion euros will be spend for publicly funded employment programs. Scientists from the Institute for Employment Research were commissioned to evaluate the implementation of these programs. In our contribution we want to present first results of this implemen-

　　　　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

tation study. On the basis of document analysis and interviews with actors who were responsible for drafting the law, we will discuss the question, if it can be seen as a 'laboratory of a new form of governmentality' transcending the commodification trend of the last 20 years.

RC15-177.1

GOBELEZ DUMAS, SELEN* (EHESS, France)

The Impacts of the Upsurge of Caesarean Births on Women's Childbirth Experiences in Turkey

Over the past decades childbirth practices in Turkey have become progressively influenced by normalization of medical technology and ideology. Some of the components of medicalization of childbirth include routine intravenous infusions and oxytocin, continuous electronic foetal monitoring, routine vaginal examinations and forced dorsal position as well as unnecessary use of instruments such as forceps and vacuum. Another dimension of over-medicalization is the categorization and treatment of pregnant and birthing women as "sick patients", inhibiting them to participate in decisions about their healthcare.

My PhD research in-progress on "Childbirth Narratives of Women in the Face of Medicalization of Childbirth in Turkey", deals with the debates around the controversial "caesarean law", enacted in 2012 and the inefficiency of this law is examined vis-à-vis the multiple dimensions of the dynamics of high C-section rates in Turkey. In Turkey, with the highest C-section rates in overall OECD countries, the birth by C-section, which was 13.9 per cent in 1998 has increased to 53,1% in 2015 and 2016, according to Turkey's Ministry of Health.

The main questions that shall be elaborated are how are the inequalities inflicted by medicalization and commercialization of childbirth are experienced by women and how are the subjectivities of birthing women formed vis-à-vis the authority positions and decision mechanisms in the over-medicalized maternal healthcare system in Turkey,

In order to retrieve the voices of women, detailed interviews are conducted with a sample of forty women who gave birth within the last 25 years. To provide a plurality of experiences, the field consists of mothers from various geographical settings, who gave birth at private institutions, public hospitals or at home, vaginally as well as via C-section. These women whose age at first birth varied between 14 and 40, belong to differing social classes, with educational levels varying from illiterate to PhD graduate.

GODAZGAR, HOSSEIN* (University of Warwick, United Kingdom)

'Suicide' in 'Islam': A Social Constructionist Approach Towards Understanding of 'Sunni' and 'Shi'Ite' Ethics

Given the continued influence of Enlightenment, it is very tempting to follow a 'liberal' approach in tackling different ethical ideas and practices, including the right to life in various contexts. Indeed, this approach has dominated modern western philosophical ethics and those of 'religious' ethical traditions that seek to explore a common, single methodology to identify and understand the myriad different ethical values and conceptions of 'right' and 'wrong' across the globe. However, it leaves little space for history, religion and culture. Against this background, Alasdair MacIntyre proposes a communitarian culture-bond rational approach that presupposes a world of different civilizations, each of which has developed certain ethical conceptions via distinct cultural experiences over history. Thus, the very existence of a form of 'religious' or 'non-religious' ethics is indicative of a distinctive discourse that a particular tradition or culture has gone through over its history. This approach goes beyond the biological nature of individual and group identity: '... man without culture is a myth'. This approach is also consistent with so-called 'post-modernist' and 'social constructionist' methodologies, as elaborated by Talal Asad and James A. Beckford, respectively, on the basis of which the meanings of 'religion', 'ethics' and their relevant terms are socially constructed and change (or continue) across time and space. Informed by the philosophical notions of instrumental, intrinsic and personal value as well as the 'first order' social constructionist approach to 'Islam' and the 'religious ethics' of 'suicide' with reference to twenty-two arguably major Sunni and Shi'ite exegetists in the last eleven hundred years, this paper argues that, like any other culture, these exegetists' collective and individual commonalities and differences towards 'suicide' are rooted in their social contexts and the ways in which they have conceptualized the meanings of 'suicide' and 'the value of life' as ethical notions over history.

Gender Stereotypes and "Glass Ceiling" in a Strategic Career of the Brazilian Public Service

The text discusses the results of a research carried out with female workers of a strategic career of the Brazilian public administration, the Specialists in Public Policy and Government Management. They are subjects and subjects housed in senior management and advisory positions, that is, in the middle and high echelons of various organizations of the Public Administration of a Brazilian state. The research was conducted between 2016-2018; in addition to collecting quantitative data about the career of these servants, which allowed us to quantitatively highlight the differences between men and women (salaries, career advancement, workload, among others), interviews were conducted with women servants about the work environment, professional trajectory, among others.

The objective of this paper is to present the qualitative results of this investigation, especially from the interviews conducted about his work and the organizational environment. They showed how the skills, competences and attitudes of women are naturalized in the context of work in the sector. Also, how treatment by bosses and colleagues contributes to nurturing a diverse appreciation of male and female work by reinforcing the awarding of jobs or subordinate tasks to women. In addition, they indicate how women and men working in the public service deal differently with domestic responsibilities; and how it impacts work and career advancement.

When Stakeholder Theory Meets Justification Theory: An Intersection Proposal

The present theoretical essay proposes an intersection of two theories, Stakeholder theory, a managerialist approach, and Justification theory, a French pragmatic sociological theory, to analyze organizational decisional and action phenomena related to corporate and social responsibility. Stakeholder theory is still used in companies and management studies, even after more than 30 years of its inception (Freeman et al., 2010). Even though Stakeholder theory provides an explanation about the importance and how to identify stakeholders, it does not address the analysis of how such stakeholders employ narratives in order to achieve their goals. Furthermore, from another point of view, a sociological perspective, Justification theory, created by Boltanksi and Thévenot, examines interactions between individuals starting from the premise that such interactions require the use of justifications. Consequently, it aims to study the different situations that demand different decisions and action regimes and their justifications. Since organizations are constituted by individuals, it is used to analyze organizations. Hence, this study consists on analyzing how stakeholders negotiate, prioritize and build on conflicting points of view and interests, by elaborating or modifying their narratives in order to justify their actions, anchoring them on the narratives of different orders of worth, (market, industrial, civic, domestic, inspired, opinion and green) and mainly on the ground of the "common good". This essay demonstrates a possibility within organizational studies that answers to the question: in what way do the theories of justification and stakeholder converge in order to analyze some organizational decisional and action phenomena? In order to do so, articles that use this approach were analyzed and related situations, mapped. In short, this study aims to contribute to the paradigmatic elaboration of the Stakeholder theory, to enlarge its explanatory range insomuch as there is little research on this topic.

New Conflicts, Social Movements and Forms of Collective Action in Brazil Post 2013 and New Theoretical Approaches

This paper part of the question of the panel: do postmodern, post-colonial or post-western analyses can explain the social and cultural meanings of social movements like Arab Springs, Occupy Wall Street or Umbrella Movement, and adds another question: These theories explain social movements from young autonomists and young conservatives of the right in Brazil, post June 2013? What theories can explain them? It is known that most of them are organized as 'collectives'. Can they be called social movements or are a new form of collective

action? How do they articulate with society, and with current public policies? What news do they bring? It is known that they are diffuse, fragmented, represent a broad range of political-ideological tendencies-from conservators to libertarian autonomists. Many refuse partisan politics but not participation in the state public sphere. The paper presents a retrospective of these groups and collectives in Brazil from 2013 to 2020 and draws possible theoretical approaches to analyze them.

Participation of Young People in Politics Today: From Civil Society to the Parliamentary Sphere

The paper investigates in the scenario of civil associativism groups of young people who participate in movements, collectives and civil organizations, highlighting in these groups new leaders who entered the world of institutional politics, via electoral process in 2018. In this context, it is questioned how these young people passed from the world of civil collective actions to partisan institutional political life, participating in the electoral dispute. What is the trajectory of young people who started participatory life in movements and collectives and then joined these groups? How they became leaders and launched candidates for public elective positions, with or without the support of these external groups. Which are the agents and mediation agencies. How do the courses of political training or ' Party renewal ' work that many of these new parliamentarians have attended? How do new civil organizations who develop or support these courses work? As it is explained that in a period of discredit in democratic institutions and erosion of the foundations of democratic life, or ' democratic recession ' (Larry Diamond), or even of desmocratization (Charles Tilly), young people of different layers social, and different political-ideological spectra, have made the choice to act in the public sphere. Which their work agendas and how they have operated in the period of 2019-2020, within the parliament. The research focuses on young people who entered the policy representing the state of São Paulo, acting on both the state and federal level

GOMES, CARLA CASTRO* (, Brazil)

Body and Emotion in Contemporary Brazilian Feminism and Conservative Movements

This paper explores how body and emotion have been transformed into political resources by Brazilian feminists. By researching the "Marcha das Vadias" [SlutWalk], a global anti-rape protest that gained high visibility in Brazil from 2011 on, I argue that body and emotion are fundamental in the constitution of two central processes of social movements: the construction of new repertoires of protest and the production of political subjects. In the first case, body and emotion are converted into repertoires: nudity and humor are the main elements in constructing a frame that emphasizes gender transgression rather than the experience of victimization, as it used to happen in anti-rape protest so far. In the second case, body and emotion are fertile ground for the elaboration of identity politics: they are mobilized in the relations of differentiation and identification between "sluts" and their "others".

The research brings interesting contributions to social movements studies, whose main approaches take bodies for granted, making invisible the fact that they are important political artifacts for activists. From critical dialogues with the concepts of embodied performativity, choreography of protest and emotional work, I propose the notion of "flag body" to designate the production of the body as an individual and collective locus of resistance, expression and political differentiation. The notion of flag body allows to "embody" key concepts of social movements studies, such as frame and repertoire, expanding their reach. It also helps to reflect on how bodies and emotions are mobilized in the construction of differences of race, class, sexuality and age, thus constituting raw materials for the production of political subjects. I conclude this paper by pointing out that this approach can be useful not only for the analysis of feminism and other social movements, but also for "conservative" movements that have been gaining worldwide visibility.

Environmental Education and Climate Justice:

Cartographic Scenarios of Visual Impairment

This research is part of the project International Network for Environmental Education and Climate Justice (REAJA), as well as the Research Group on Environmental Education, Communication and Art (GPEA), whose studies revealed the invisibility of the processes that trigger the current climate collapse. Focusing on environmental education and motivations in the study of climate justice, we include visually impaired people as a social group in a vulnerability situation to disaster risk, seeking to understand the dimensions of vulnerability among these people associated with the context of the climate crisis. The methodological procedures were based on bibliographic, documentary and qualitative field research, involving the georeferencing of 44 residential addresses of visually impaired people, in addition to the Blind Association of Mato Grosso, the Blind Institute of Mato Grosso, 42 schools and 136 municipalities public schools in the metropolitan region of Cuiabá-MT. The results point to the importance of the cartographic instrument, as well as the social participation of blind and low visual community, in the construction of public policies aimed at reducing vulnerability to disaster risk, as well as inclusive practices based on environmental education.

Who Is Leadership? from Gangs to the Federal Penitentiary System

Recent episodes of violence in prisons in different Brazilian states, especially those which are located at the North and Northeast regions of the country, have exposed disputes and dramatic scenes of violence involving different prison-based gangs that have rivaled spaces, relationships and reconfigured the dynamics of the criminal scene in Brazil. (DIAS, 2017). Since 2000, the creation, strengthening and capillarization of criminal organizations across the country has been observed (MANSO and DIAS, 2018). Over the same period, the Federal Government has made an effort to create the Federal Penitentiary System (FPS) as an answer to the demand of state governments as a way to confront such groups, mainly through the isolation of the prisoners appointed as their "leadership". The FPS constitutes a specific model of imprisonment, modeled according to the US supermax (broad vigilance, daytime cell segregation, strict control and discipline). Therefore, the current five units of the Federal Penitentiary System hold in their custody individuals who are in mostly of the cases, classified as the most dangerous prisoners and who are a risk to the country's prison order and public safety. In this sense, from the analysis of institutional documents such as those produced by the National Penitentiary Department (DEPEN), decisions produced by the full Supreme Court (STF), media news and documents produced by criminal organizations, this proposal intends to critically understand how prisoner transfers processes and mechanisms to the FPS involve producing and / or enhancing the image and position of certain individuals as "leaders" of criminal organizations. Thus, it's a matter of understanding the FPS as a device that, in addition to violating basic rights, constitutes a mechanism for the strengthening of criminal organizations and, in this sense, to the reproduction and diffusion of criminal networks which today constitute illicit markets in Brazil.

Intimate Labours: Women Return Migrants As Caregivers for the Elderly in Trinidad and Tobago

Caribbean women have historically done productive and reproductive work that has been under-valued economically and socially for the state, family and community in what is conceptualised as triple-duty. Migrant women continue to fulfil these responsibilities transnationally. Emigration from the Caribbean to economically wealthier states across the Global North and South, which require

labour (also under-valued) remains an important route to improvement for persons and families. With ageing populations in many middle-income developing countries, such as Trinidad and Tobago (World Bank 2010; UNDESA 2017), the issue of caring for ageing parents becomes important not only to the state and how it allocates resources for this population, but also for children and families. This small-scale, empirical study will centre the ongoing lived experiences of women return migrants to Trinidad and Tobago in the English-speaking Caribbean from countries of the Global North and South. What are the everyday, structural and affective experiences of returnees to Trinidad and Tobago? From unstructured and semi-structured interviews with eight women returnees in Trinidad and Tobago, the paper will detail their motivation for re-migration to care for ageing parents. In the pre-retirement phase of life, aged early forties to mid-sixties, these 'adult children' move with the economic, social and cultural capital to successfully reintegrate into the country of origin. They can be categorised as "skilled" re-migrants. By concentrating on their stories within the political economy of gender, this discussion will highlight the cross-sectional structural vulnerabilities and everyday experiences of "skilled" return migrants in performing intimate labours of care. By examining the gendered and intergenerational power dynamics within the home, the reproduction of systemic inequalities as well as affective effects will emerge in these participants' stories. Implications for social change through policy reform will be explored.

Conservative Activism in the Shaping of Markets: The Case of the Cosmetics Industry in Brazil

This paper explores the challenges to inclusive corporate initiatives posed by conservative activism. We discuss the case of the Brazilian cosmetics companies Boticário Group and Natura & Co., which since 2014 have introduced LGBTQ depiction on advertisement material and intensifing LGBTQ inclusion in personnel, embedded on broader diversity concerns. Evangelical Christians reacted against these actions, spearheading a conservative backlash. These actions are consonant with the recent conservative wave in Brazil which culminated with the election of president Jair Bolsonaro (PSL) and relates to the increased visibility of violent and symbolic attacks against minorities and women. This research object - the dispute between conservative groups and companies - relates to different theoretical issues. It is not marginal to the economy, as the Brazilian domestic market for cosmetics is responsible for 6% of world sales, forth only to the USA, Japan and China, and as cosmetics constitutes a relevant and expanding middle technology industrial sector. Boticário Group and Natura & Co. are also leading actors in corporate social and environmental responsibility in Brazil. We mobilize evidence from interviews with stakeholders and investors in companies and LGBTQ activists, complaints filed at the Brazilian Advertising Standards Council and companies documents on finance and social responsibility. Our preliminary results point to how companies are responding to the conservative activism. Overall, they persist on the emphasis on diversity issues and inclusion to the larger public in marketing and corporate identity, indicating limits to the conservative wave in the economy. However, firms also employ elusive strategies, such as targeted communication and retail design embodying compromises with conservative stakeholders and public.

GOMES LEME, CAROLINE* (UNICAMP (University of Campinas), Brazil)

"Walking Backwards into the Future":

Raymond Williams' Contributions to Critical Social Theory Today

This presentation considers Raymond Williams' theory as a social theory and not just a theory of culture. It is argued (despite the different theoretical trajectories and working style) that Williams presents several points of contact with the tradition of Critical Theory, such as "Dialectical Imagination", interdisciplinarity, immanent critique methodology, critique of ideology and the conjunction of normative-utopian and analytical-explanatory elements of diagnoses. In his own way, Williams also thinks about the role of subjectivity and culture in the process of domination and criticizes both the instrumental rationality and the reification of social relations. Critical of the Structuralist Marxism, he rescues the dialectic between agency and structure, heterodoxly interprets the relationships between base and superstructure, and reformulates the concepts of determination and totality. Always aware of the importance of language, Williams – after claiming culture as productive – advocates a change in the very notion of mode of production to mode of livelihoods. The intention is to underline that human beings' relationships with nature, with each other and with themselves must be different from that of appropriation as a "raw material". By opposing the capitalist rationality of competitive individualism to socialism in its original sense, linked to the idea of   sharing (decisions and livelihoods), he criticizes the logic of particular

strategic advantages that have even contaminated the practices of leftist parties and movements. His proposals are similar to the ones of Olin Wright about social empowerment socialism and his ideas bring original contributions to the present debate of the critical social theory (in a broad sense), especially those regarding the critique of neoliberal rationality in its various theoretical formulations, as well as possible alternatives related to conceptions of "common". His concept of "mobile privatization" is another relevant theoretical finding, in a context in which elections are being decided over the internet.

Dealing with Uncertainty: The Role of Extended Family and Community in Transnational Migration from Senegal to Spain

The *Ley de Extranjería*(4/2000) [Immigration Law] in Spain has created a complex world in which extra communitarian migrants pass from a legal to a illegal status depending on their situation in the labour market. The experience indicates, moreover, that the law has created hard and soft frontiers, and hence a hierarchy among migrants on the basis of their origin and race. This work deals with how migrants from Senegal and their families deal with these situations of precarity and uncertainty. Based on in-depth interviews to migrants in Spain and their families in Senegal it explores how migrants sustain large periods of uncertainty in Spain and how they manage the expectation families and the community of origin places on them. In turn, how families in Senegal deal with uncertainty and long periods of absence of the migrant, and the role that extended family and community links play to sustain the care of minors and aged persons during that time. Last, the work analyses the different gender roles in these migratory processes.

GOMEZ LOZANO, YULY* (Universidade Federal do Rio Grande do Sul, Brazil)

From the "Ajiaco Santafereño"to the "Crepe Sanqqa": Traditional Food with a "Free Mining" Meaning

There's been demonstrated that the formulation of many alternative food networks is linked to social movements and consumers that promote a series of social and/or environmental values. In this way, related with the idea of returning personality to food and responding to the need for farmers to access markets that shorten physical, social, cultural and economic distances, by providing consumers with the information needed to reconnect food with producers, these markets are connected with the place of origin and the context where the producers live. With context, I refer to the political, social and environmental dimension where the food is produced. In this way, these networks are also mobilizing a group of meanings and values related to the consumers' logic where the economic value started to be less important and the sustainability and other causes start to be the protagonist. This article aims to present the case of the arracacha in Cajamarca, essential food of typical Colombian dishes, such as the ajiaco santafereño, in a context of mining and revindication of the territory. Wherefrom the popular consultation of March 2017 that drove the mining Company Anglo Gold Ashanti from the territory, the arracacha becomes a symbol of resistance against mining and the main ingredient of the "Sanqqa crepe" of one of the most popular restaurants of Bogota. In this case, the restaurant stopped being a simple intermediary and became a mediator between the producer and the consumer, seeking to put on the plate a food that has a set of meanings but is also placed differently way.

Analytical Explorations on the Transformations of the Work of the Security Forces' Professional Group - the Portuguese Case.

In the last thirty years, important social changes have reconfigured the "world of work" in European countries. The organizational and technical innovation in the productive fabric, new forms of work organization, the predominance of the service sector, the high level of academic and professional qualification and feminization of employment, the persistent discrimination and devaluation of women in the labor market, wage inequalities, contractual instability and job insecurity are some of these reconfigurations that reflect the socioeconomic model of advanced capitalism. Our communication focuses on the problematization of the nature

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

and working conditions of the security forces' professional group in Portugal, which reflects, in particular, the changes pointed out, but also the changes in the functions and organization of the State within the framework of the "new public management" model. Based on the empirical information of the project (focus group) - Medicines and dietary supplements in performance consumptions: practices, contexts and literacy, we will discuss: the work practices and routines and their redefinition, with widening of the intervention areas of the security forces, which implies an occupational profile in which the multi-purpose and multi-skills prevail leading to the increase of work (aggravated by the personal deficit); the extension and irregularity of working hours; high incidences of occupational accidents, occupational diseases and physical and emotional fatigue with an increasing manifestation of professional pressure. New forms of relations between the group and society subsist (permanent evaluation of its actions, particularly through the media and denunciations on social networks) and with political and judicial power (disciplinary proceedings and civil and criminal actions). We will analyze how the changes relate to the use of performance consumptions (dietary supplements and medicines) by the security forces for their professional performance, in physical, intellectual and social terms.

GONÇALVES, MARIA DO CARMO* (Pontifical Catholic University of Rio Grande do Sul (PUCRS), Brazil)

Hatice's Tears: Migrants from Turkey in Brazil

Turkish refugees in Brazil experienced the escape of an authoritarian regime that persecuted and punished their political opponents or anyone who identified in any way with the Hizmet religious group, whose leader was accused by the Turkish government of waging a coup in July 2016. Hizmet became a target of the Turkish government, was systematically repressed by the state in Turkey and in countries where the movement was established. In the case of these refugees, telling their own story, even living in Brazil, where freedoms of political opinion and religious belonging are guaranteed, recently gained special relevance. In 2019, the Turkish government requested the extradition of a Hizmet member that resided in Brazil under the accusation of collaborating with the coup attempt and belonging to what the Turkish government termed as a "terrorist" group.

In this context, the narratives of Turkish refugees belonging to Hizmet do not portray a condition of suffering that stopped after they settled in Brazil. The events after the 2016 coup attempt are not a traumatic fact linked to a past left behind. The persecution on Brazilian soil took the form of legal rhetoric from the Turkish state against which Hizmet members in Brazil opposed themselves by narrating their life stories. For the researcher, the framework in which the stories of these individuals develop presents some questions: How authoritarian systems can reach the diplomatic field and individuals seeking protection in countries with democratic regimes? How to analyze the impact of the "founded fear of death" in the stories of subjects in which fear manifests itself in their daily life in Brazil? How to understand the limits of freedom of expression presented by the interview subjects in this context?

Criminal and Juvenile Justice in Belo Horizonte: Different Models in the Search for Democratization and Citizenship

The principle of equality was laid down in the Declaration of the Rights of Man and of the Citizen of 1789. However, ensuring legal equality has been a challenge in countries such as Brazil, where there is a gulf between legal statements and concrete situations of discrimination. This article demonstrates, through a comparison between juvenile justice and adult justice, how the Criminal Justice System (CJS) has been conducted after redemocratization, revealing that old inquisitorial practices of ordinary justice still permeate institutional innovation initiatives and reiterate the social-historical inequalities. Through interviews and participant observation that took place between 2016 and 2018 in the city of Belo Horizonte, we investigated institutional practices in the prosecution of intentional homicides, which follow the traditional rite of the jury court, as well as two innovative practices of justice. First, a Child and Youth Court, ruled by the Estatuto da Criança e do Adolescente (Child and Adolescent Statue) seeking to ensure adequate treatment for psychosocial development of young people accused of committing criminal acts. Second, the custody hearings, instituted in 2015, in order to ensure that any person arrested in the act is presented to the judicial authority, avoiding pre-trial detention in unnecessary situations. The study aims to show how authoritarian and punitive practices of ordinary justice, verified in the processing of intentional homicides, overlap with the most guaranteeing legal and institutional arrangements of rights in juvenile justice and the recent institute of custody hearings.

The results of the analysis show that while inquisitorial logic undermines the existence of universal criteria for the promotion of justice and conflict management, modern institutional arrangements for juvenile justice and custody hearings are a democratic trigger for legal equality to be effectively achieved.

Beyond "One Size Fits All"—Organizing Effective Coalitions for Collaborative Shareholder Engagement on Sustainability Issues

A growing number of institutional investors are undertaking collaborative engagements to influence the sustainability behaviors of firms in which they invest. Existing studies have highlighted the efficacy of investor activism for influencing firms' behaviors—both on a unitary basis and collectively. Yet less is known about how these collaborative coalitions can be best organized to encourage corporate sustainability, including in relation to the ongoing climate crisis.

Using traditional analytical approaches, prior studies highlight the impacts of many important constructs on a standalone basis, such as power, issue salience, and organizational capabilities. However, we argue that organizing collaborative engagement involves effectively combining three types of characteristics: (1) mobilizing the right types of investors, (2) selecting appropriate target firms, and (3) designing appropriate engagement content. By ignoring the interactions between these combinations of characteristics, prior research has provided few insights into the design of collaborative engagements that are conducive to improving subsequent corporate sustainability.

What combinations of characteristics of investor coalitions, target firms, and engagement content enable (or hinder) successful engagement on sustainability issues? To answer this question, we apply fuzzy-set Qualitative Comparative Analysis to identify patterns of attributes that are present when (un)successful collaborative engagement occurs. We use this method to analyze 1,035 corporate-investor interactions in the context of 30 coalitions of collaborative sustainability-related engagement led by the UN-supported Principles for Responsible Investment initiative. In doing so, we identify three distinct families of pathways to successful engagement, in addition to two pathways which are associated with unsuccessful outcomes.

By bringing together these attributes in a single analytical framework, our study highlights how various structures and practices relating to corporate engagement and oversight affect their behaviors on sustainability issues. This emphasizes the role that can be played by institutional investors—as managers of capital—in addressing sustainability issues, including those relating to the climate crisis.

Emergencias De Mundo Común EN La Experiencia De Mujeres Colombianas. UNA Mirada Desde Hannah Arendt Y La Diferencia Sexual.

En este trabajo nos proponemos analizar, desde la perspectiva de Hannah Arendt y del pensamiento de la diferencia sexual, LAS EMERGENCIAS DE MUNDO COMÚN EN LA EXPERIENCIA DE MUJERES COLOMBIANAS. UNA MIRADA DESDE DE HANNAH ARENDT Y LA DIFERENCIA SEXUAL

Nuestro presupuesto es que la obra de Hannah Arendt y muchas de sus distinciones, se pueden intersectar con los debates del feminismo de la diferencia sexual para situar un análisis de las mujeres y su obra en común desde el contexto de la realidad Colombiana.

Nos concentramos entonces en dos problemáticas fundamentales, el mundo común desde la perspectiva de Arendt y el feminismo de la diferencia sexual, que actúa como bisagra para el análisis en grupos de mujeres que despliegan acciones con y entre mujeres en torno al emprendimiento, propósitos comunitarios y sociales.

En la actualidad, en Colombia se abre a partir de los acuerdos de la Habana, de los pactos con las mingas indígenas y afrocolombianas, de la masiva migración venezolana, entre otros acontecimientos, es examinar las formas de sobrevivencia de la política y la posibilidad de pensar y someter a revisión la manera como se comprende la existencia con y entre los otros.

Se nos imponen entonces exponer inicialmente que el mundo común, la política, configura condiciones para la relación con y entre mujeres, en la posibilidad de un espacio de aparición que potencie no solo lo común sino las condiciones

para la política. Grupos de mujeres, que en contextos algunas veces de violencia extrema   ejecutan pactos, acuerdos y   promesas, en la fragilidad y temporalidad de los hechos y los discursos que les acontecen.

Old Authoritarianism in New Clothes? Socialization and Antidemocratic Values in Brazilian Political Culture

Three decades have passed after the transition and for most of local political scientists Brazil was a consolidated and functional democracy characterized by the "coalition presidentialism". So, the election of an anti-system and authoritarian apologist candidate was a surprise. This work proposes an opposite view, that conservative and authoritarian values have been an important part of Brazilian political culture unchanged during democratic years. Based in data form World Values Survey we discuss the socialization process in democracy, showing that even new generations that were born and educated and lived under democratic rule share anti-democratic values that undermine the cultural foundations of the regime. So, the stability in the last two decades could be explained more by satisfaction with material outputs than by abstract support of formal rules and liberties.

Coworking: del Emprendimiento a la Innovación Social. Estudio Cualitativo de las Motivaciones para la Creación de Espacios de Cotrabajo.

El cotrabajo o coworking constituye una forma de innovación social emergente dentro del contexto de la economía colaborativa. Se trata de una respuesta de las clases creativas a la situación de precariedad laboral y aislamiento consecuencia de las transformaciones en las formas de trabajo, así como de emprendedores de ciertos sectores. Su expansión y desarrollo se circunscribe fundamentalmente a la última década, tratándose de una innovación aún en situación de flexibilidad interpretativa. A través de una investigación cualitativa aplicada a los espacios de coworking en la ciudad de Alicante (Comunidad Valenciana, España), se profundiza y desarrollan estas cuestiones mediante datos empíricos, detectándose dos dinámicas en su desarrollo en función del perfil profesional de quienes los promueven. Así se configuran espacios de cotrabajo diferentes a partir de las motivaciones que llevan a su creación.

GONZALEZ DURAN, SANDRA* (University of the Basque Country,)

Activism As a Therapeutic Landscape in Uncertain Times: Giving and Receiving Care in the First-Person Digital Narratives of Psychiatric Survivors and Users during the Lockdown in the UK

In response to the uncertainty related to the Covid-19 pandemic self-care practices were promoted intensively among the population in the UK by governmental institutions, the media, as well as mental health users led groups.

Based on a governmental approach, this communication focuses on the role of care in the first-person narratives of the #NSUNCovidLife of the National Survivor User Network (NSUN) of the UK, which was an online initiative aimed at publishing members' experiences under lockdown.

 'Self-care' recommendations and practices can either be read in foucauldian terms as a disciplinary form of 'self-management' that re-inscribes the ideal psy- and biopsychiatric subject, or alternatively, as 'the care of the self' practices that problematize the hegemonic subjectification process. Therefore, the objective is to understand the way in which the care towards oneself is conceptualized as a way of managing an uncertain time in the narrations collected by this initiative in the form of blog entries and short video series.

The digital ethnography of the #NSUNCovidLife initiative and the discourse analysis carried out reveal that, first, care is a notion that is crossed by reciprocity and enacted by a relational self; second that practicing care requires to contextu-alize psychic suffering in precise personal, socio-economical and historical coordinates; third, that the emotional self acquires legitimacy and, forth, that experiential knowledge is crucial for caring of oneself.

To conclude, as in this first-person narratives the care of the self mobilizes non-normative ways of knowing and acting on the self during the pandemic especially by activists and in the social networks mobilized by activism, the social response of activism arises as a therapeutic landscape from which to manage the challenges that emerged with the onset of the pandemic.

GONZÁLEZ FLORES, MARÍA* (Universidade da Coruña, Spain)

Self-Management Strategies and Female Leadership Dynamics in Palestine: Dealing with Internal Displacement

In recent years, the practices through which migrants, internally displaced persons and refugees act and react within and against the migration and asylum regime have been receiving greater attention. On a theoretical level, that research overlaps with the problematization of securitization narratives and population control techniques from different perspectives, especially from the Critical Security Studies. Political agency of refugees in peripheral and exceptional, provisional spaces, such as refugee camps, displaced communities or detention centers, has to be acknowledged. The role of humanitarianism and public policies needs some rethinking, shifting the focus to how and why those people who are relegated to the margins recover and rebuild social and political communities, generally in form of response to those systems already established and imposed. The refuge regime and its spatial manifestations (especially refugee camps), become spaces of grief and reappropriation, but also of resistance and mobilization, where geopolitical and social logics are renegotiated. In Palestine, these supposedly provisional spaces ended up being permanent, and forms of internal organization naturally arise within the communities. The present communication will explore models of self-management strategies in refugee communities in the OPT, as well as the dynamics of female leadership that originate in these contexts where double victimization (as women and refugees) intersects with the symbolic reproductive and ideological role of women as representatives of the collective identities of their communities.

GONZÁLEZ LAURINO, CAROLINA* (Universidad de la República, Uruguay)

LEOPOLD COSTÁBILE, SANDRA (Universidad de la República, Uruguay)

La Seguridad Pública En El Centro Del Debate Político En Uruguay. Una Agenda Parlamentaria Marcada Por La Alarma Pública

Pese a la percepción exterior «como país seguro», Uruguay no se presenta con ajenidad frente a las demandas populares del incremento del populismo punitivo de la región. En el recorrido por la legislación uruguaya de los últimos años es posible visualizar la implementación progresiva de un modelo conservador y regresivo en materia penal juvenil en el que participan todos los partidos políticos que será objeto de esta ponencia.

Resulta imposible analizar el sistema penal juvenil uruguayo sin una lectura del contexto sociohistórico de sanción legislativas que modificó algunas de las garantías del Código de la Niñez y la Adolescencia, Ley N.° 17.823, aprobado el 7 de setiembre de 2004.

Entre 2011 y 2014 el debate público giraba en torno a la propuesta de Reforma Constitucional de bajar la edad de imputabilidad penal de 18 a 16 años, presentada por el sector Vamos Uruguay del Partido Colorado mediante un proceso de recolección de firmas que, con el apoyo del sector del Herrerismo del Partido Nacional, habilitó su plebiscito el 26 de octubre de 2014. La reforma constitucional propuesta fue rechazada, aunque alcanzó el 46.81% de los votantes habilitados.

En este sentido, es posible rastrear un sistema restrictivo de garantías y derechos producto de la legislación nacional que actuará en función de la alarma pública creada por infracciones protagonizadas por adolescentes que adquieren carácter mediático. Si se indaga en los orígenes, parecería que las tres leyes - 18.777, 18.778 y 19.055 - que entre el 2011 y el 2013, aumentaron la punitividad del sistema penal juvenil aprobadas en el parlamento nacional, tienen como correlato un caso puntual con amplia difusión en los medios de comunicación masiva, ante el que la opinión pública reclama incremento de las penas como si estas medidas resolvieran, mágicamente, una situación específica difundida por la prensa.

Women Political Party Leaders: Analysis of Three Political Leaderships in Mexico

Analysis of the leadership of three women who held the national presidency of three political parties in Mexico. The position of leadership is studied from the competences component. The aim was to identify which are the characteristics of women's leadership who have held management positions in Mexican politics and how their competences are articulated with political life, in addition, if this can be related to the results of his political career. The objective of this research is to identify and analyze scientifically and objectively the leadership characteristics of women who have been leaders of political parties in Mexico to determine the style and skills that have allowed it to stand out and occupy the leadership positions of the party. The selected cases are: Amalia Dolores García Medina, former leader of the Party of the Democratic Revolution (PRD), María Guadalupe Cecilia Romero Castillo of the National Action Party (PAN), and Beatriz Mojica Morga of the Party of the Democratic Revolution (PRD). In the first place, the theoretical framework will be discussed on what are the antecedents regarding the political advancement of women and the leadership of women in politics. Secondly, the method to carry out this research is proposed, consisting of a qualitative approach (interviews) according to dimensions of analysis derived from the model of leadership. Subsequently, the analysis of the data collected and the results obtained, finally, the inferred conclusions and future lines of research.

GORDILLO, CLAUDIA* (Universidade Federal de Paraná, Brazil)

Fotografías Desde El Yo: Álbumes Familiares y Autorepresentaciones Subalternas

Esta ponencia tiene el objetivo de presentar una reflexión académica y pedagógica del lugar que ocupan las fotografías documentales de la comunidad de Triana en Buenaventura (Colombia) en la construcción de la memoria visual del conflicto armado colombiano. Imágenes que tienen dos procedencias: los álbumes familiares de las comunidades y las fotos producidas por la comunidad en los talleres de memoria. Partimos de reconocer que las fotografías contienen una fuerza reveladora de las relaciones familiares, comunitarias y sociales, que posibilitan el entendimiento de lo cotidiano y la emocionalidad. En este sentido, trabajar en un acervo de archivos familiares de la comunidad de Triana víctima del conflicto armado colombiano significa privilegiar las narrativas, por medio de la indagación de imágenes que documentan sujetos, objetos, historias y contextos en primera persona, es decir, que dan lugar a los subalternos (Spivak, 2003), para que sean ellas/os a partir de la experiencia incrustada en su cuerpo, quien enuncie los acontecimientos. Desde ese lugar de enunciación, el propósito es construir una memoria colectiva (Halbwachs, 2004) que narre desde la comunidad sus historias en primera persona y que permita dar cuenta de saberes locales. El enfoque metodológico de la investigación es la Investigación Acción Participativa (IAP) en el cual los sujetos son reconocidos desde un diálogo transversal y anima a la experiencia participativa, abriendo la posibilidad de construir colectivamente la realidad social. Para esto, se usará la etnografía visual como parte de la apuesta metodológica que busca conocer a las comunidades y sus contextos a partir del trabajo con imágenes fotográficas. Lo que interesa en esta ponencia es presentar la construcción de otro orden de la historia y de la cultura visual del conflicto armado colombiano, pensado desde las fotografías familiares y las autorepresentaciones como pseudo presencias o signos de ausencia Sontag, 2004).

RC19-239.2

GOSWAMI, DIPANJALI* (Central University of Jharkhand, India)

Voice from the Margin: A Socio-Educational Appraisal of the Parhaiya Tribe of India

This paper concerns itself with the Parhaiya tribe of Jharkhand (India), which is identified as one of the most marginalized groups among the tribes of the state. On the basis of their poor socio-economic situation, dwindling population, this group is categorized as one of the Primitive Tribe Groups (PTGs), which later came to be known as Particularly Vulnerable Tribal Group (PVTGs). The increasing inequality, vulnerability of concerned people seems to question the different government initiatives in terms of poverty reduction, educational upliftment, etc. Whether such initiatives actually help the marginalized or it is just to show or follow some growth oriented slogans? The child is covertly denied right to clean and healthy living, right to nutritious food, right to qualitative education etc. How do we ensure justice for rural areas in education in the matter of allocation of resources, educational facilities and providing quality education? What is to be done to remove the disparities in education and increase their participation? Here, in this paper, I try to connect and probe into the sorry state of affairs of elementary education and state run agencies and propagated policies. The methodology used for this research is field survey and consultation of data by secondary sources. The question that has been tried to tackle here is to unravel the notion of 'one size fit all' vis-à-vis education and policies which are supposedly initiated by the state to cater to the needs of these groups for bringing them to the centre from the margin.

GOSZCZYNSKI, WOJCIECH* (Nicolaus Copernicus University, Poland)

In Search for Vocabulary: Sustainability in Central and Eastern European Alternative Food Networks

Studies on alternative food networks went long, intellectual way since the first conceptualisation. Researchers moved their focus from analysis on re-localisation of food production to a broad range of studies about progressive policies, social and cultural exclusions, global challenges, civic activities. Still, there are two asymmetries in afn studies which we want to address in this paper. First one is about separation on producers and consumers studies. Second crucial for us is an asymmetry between core countries and semi and full peripheries. Vocabulary and intellectual frameworks for sustainable food provision studies came almost entirely from western Europe and USA. This 'western bias' challenge researchers working in different cultural context and leaves them with option copy-paste strategy, which leaves them blind for some context-specific process and sustainable food practices or with a task to rework core concepts and both: theoretical and empirical vocabularies used for sustainable food systems researches. This is the case for alternative food networks in Central and Eastern European Countries. Going through social and economic transformations, using folk turns to look for lost or disrupted identities, with a strong emphasis on family and informal sharing networks, those countries set up a broad range of specific and unique sustainable and unsustainable food practices inside of alternative food networks. In this paper, our goal is to reconstruct the core elements of quality turn amongst actors involved in the CEE afn's and to look for intellectual frames which can be used to fill the western gap in understanding sustainable food systems at the semi-peripheries.

Paradoxical Positionings of Unaccompanied Minor Refugees in the Host Family Setting. Using Relational Hermeneutics for the Integration of Multiple Methodical Perspectives

The presentation focuses on host families for unaccompanied minor refugees as new emerging and negotiated social spaces. In comparison to other forms of accommodation, host families are supposed to address the "specific" needs of young refugees and individually support their integration into society out of a familiar, intimate setting.

Host families arguably have to deal with conflicting requirements. On the one hand, a meeting on even terms is created in which host parents and unaccompanied persons adapt to each other and the guardians advocate for the rights, equal access and status of the minors into the receiving society. On the other hand, host families are not only because of the supportive role embedded in societal discourses and their mechanisms of inequality, which they refer to. Thus, unaccompanied minors are also positioned as rescued, traumatized, vulnerable subjects, which must be educated, parented and fought for. So that young refugees are - despite all integrative efforts - in some situations denied the capability to act. The aforementioned orientations are continuously negotiated and go hand in hand with ambiguous, situationally different (external) and (self-)positioning in which social inequalities and a power (im-)balance are depending on the context (re-)produced or transformed.

By using different empirical data material, which gives insight into the everyday context of the family as well as into narratives of unaccompanied minors and host family members, it can be shown how actors negotiate orientations and positionings in different situations. On a methodological level, empirical fragments will be used to show how Relational Hermeneutics can be applied to systematically include comparative horizons from various data material to reconstruct these paradoxes.

GOVENDER, JAYANATHAN* (University of KwaZulu-Natal, South Africa)

ODHAV, KIRAN (North West University, South Africa)

South African Sociology: Betwixt NEO-Liberal Democracy and Politics of Decolonization

The history of South African sociology has been a history of divided and contested ideologizations. Sociology was aligned to social work, intended as policy to address the so-called poor white problem as part of broader social administration, rather than a distinct academic discipline. Crucially, where a sociologist appeared in the social structure and one's race determined the sociology to be believed, taught, researched and practiced. Claiming a sociological imagination in South Africa is therefore precarious.

Sociology was apartheid sociology when it was introduced in South Africa in the 1930s. The shifting emphasis on theory, methods and politics reorganized sociology not on a spectrum, but on claimed twists, i.e. what and whose purpose was served. Mercifully, academics within the social organization in South Africa had multiple nodes, some progressive, some extremely radical that bruised both the apartheid regime and a racialized sociology.

The current context sees sociology if not in decline, then as inert and constricted to a narrow base. Much of the reason has to do with disinterest, hostility and slacking of academic outputs resulting from attrition of the most experienced researchers under the ongoing higher education transformation programme. Given the current neo-liberal politics, coupled with the decline of governance; the recent disjointed decolonization efforts of citizens and university students; and the slide of the South African sociological professional body on the tracks of higher education transformation programme, South African sociology is thereby slowing and constricting in terms of critique and its publics.

The paper will explore the perspectives of Burawoy, Webster and Sitas, as well as other secondary data in the analysis of the movements of South African sociology. Given that South African politics does not mirror the politics of the other BRIC countries, this paper will provide the initial work for comparative sociology in BRICS.

Dalit Women, Western Classrooms and Travelling Theories

This paper explores what insights an intersectional lens yields when employed to critically examine two mobilisations for social justice, one in a Global South context and another in a Global North context, namely, Dalit women's activism and assertion in India and Decolonising the Academy in the context of British higher education. The paper is based on two research studies of mine: ethnographic research conducted back in 2004-2009 on NGO-led women's activism with a focus on Dalit women in rural Uttar Pradesh, North India, and auto-ethnographic research conducted in 2017-2019 on decolonising feminist classrooms at the British University where I am presently employed. The paper discusses what an intersectional lens enables us to understand about the character and scope of marginality and privilege, and about mobilisations for social justice, beyond mere class differences, and through this discussion attempts also to contribute to the ongoing wider theoretical debates on the purchase intersectionality itself has outside the context of its origin, the interpretative mutations it undergoes as it travels South-ward, and how it is received in its places of arrival.

GOW, JAMELLA* (Gonzaga University, USA)

De-Linking Blackness, Re-Inscribing Resistance: Tracing Global Blackness in the Caribbean through Migration and Diaspora

While some scholars of race analyze the global phenomena of racism, others argue for its specificity to local contexts; however, what both may miss is how global-historical factors of race, in fact, become particularized in local contexts. I suggest that the lived experiences of Caribbean migrants are important for understanding the global and local linkages between race and global exploitation both past and present. The Caribbean is where Afro-descent people and the land they inhabited first became resources for capitalism on a local and global scale. Slavery, by linking Afro-descent people with a labor status using color as a marker, transformed a diverse group of people from different ethnic backgrounds into what would become an emphatically global, racial labor force across colonies.

Today, exploitation remains as the Caribbean and its people serve as sites for agricultural production, tourism, and migrant labor. Rather than rely solely on shrinking social support from home, Afro-Caribbean migrants must seek livelihoods for themselves, their families, and communities by migrating for work throughout the world. Through the racialization of their labor and legal status,

they are again "made Black" since these political economic processes keep them global, flexible, and disposable. As migrants, Afro-Caribbean people become a Black global labor force still de-linked from the nation-state as many survive by migrating for work. Global Blackness comes to encapsulate their persistent diasporic status as a mobile, disposable, labor force through the compounding of their racialized Blackness and immigrant precarity. Through a comparative analysis of Jamaican, Haitian, and Afro-Cuban migration to the U.S., I analyze how Afro-Caribbeans are variously read as globally Black, and how, by de-linking racism from Blackness, they uncover possibilities for transforming Black identity and ensuring their community's survival.

GOYAL, MANJU* (SHAMBHU DAYAL POST GRADUATE COLLEGE GHAZIABAD, India)

Globalization and New Communication Technology in a North Indian Urban Setting

The process of globalization in India brought many changes not only in the sphere of Indian economy but also enabled the mass media to expend its network at global level. The advent of satellite television in the early nineties and new communication technology in the later part of nineties shaped the globalization of mass media in Indian subcontinent in a significant manner. Computerization of different private and government organization has not only improved the performance of these organizations but also helped in the growth of service sector in India. The number of internet users and mobile phones increased tremendously in the recent past. It has enabled fast and uninterrupted communication between the masses located even in remote rural and tribal areas. These new communication technologies are giving rise to new patterns of communication and culture and have great impact on the style of life of users. The advent of smart phone and its expansion even in rural areas across the caste and class structure revolutionized the communication system. The use of social media has increased among the people. The present paper is aimed to understand the social background of the users of new communication technologies and the patterns of mass media exposure as well as patterns of using new communication technology-internet and mobile phone in Ghaziabad town of Uttar Pradesh on a purposive sampling administering a highly structured interview schedule. It was found that there was a sharp difference in the patterns of using internet and mobile phone. The mobile phone use was relatively wider than the accessibility of the internet. The connectivity of mobile phone spread cutting across caste, class and gender categories but internet connectivity which was initially confined to some selected sections of the mobile users is now widespread with the expansion of less costly smart phones.

BAUR, NINA* (Technische Universität Berlin, Germany)

Measuring the Same Phenomenon By Means of Different Sources: Updating the Classical Toolbox for Analyzing Survey, Digital and Administrative Mass Data, Exemplified By the Generation of Corruption-Data

There has been a long discussion on how administrative mass can be made amenable for social research. We trace this discussion back to the suggestions by Bick and Müller (1984) (also Baur 2009) who suggested a framework for analyzing administrative data and show that the difficulties in using this kind of data are rather similar to modern digital data. It follows that suggestions for overcoming shortcomings of administrative data can be applied in similar way to digital data.

While we are particularly interested in questions on how a social phenomenon can be *measured* by means of data from different sources which are obviously (or at least indirectly) related to the phenomenon of interest – problems and solutions can only be shown for specific phenomena. For reasons of illustration and application we refer to the social phenomenon of corruption. Issues pertaining different measurement sources have become relevant in recent years because, in the wake of the digital turn, new data sources have become available. These new sources, such as media and regional (or spatial) data, augment the array of classical sources, such as statements (e.g. intentions of actions) by persons regarding corrupt practices (survey data) or the number of cases registered by prosecuting authorities (administrative data).

Although there are several good examples of administrative or digital data working as a complement or a substitute for data generated by scientific processes, such as surveys, there are still challenges to overcome in measurement and scientific application.

Desigualdades e Inequidades En Estudiantes De La Universidad Autónoma De Chiapas-México

Desigualdades e inequidades aparecen como características comunes en todas las sociedades contemporáneas, empero, es necesario analizar las manifestaciones de estas, no solo para dar cuenta de ellas, sino para buscar estrategias que permitan atenderlas. El contexto escolar universitario no está exento de ello, como parte del sistema educativo formal, por un lado aparece como una opción de desarrollo y/o cambio de estatus y por otro de acuerdo con el planteamiento de Bourdieu, reproduce las desigualdades provenientes del origen de clase de los estudiantes.

Si bien, el capital cultural permite la permanencia en la escuela y el ascenso a sus diferentes niveles, la vida escolar trascurre en un entramado complejo de problemas que no cualquier estudiante puede enfrentar y resolver, la escuela por sí misma no es el vehículo para el logro del éxito en la vida.

Por ello el objetivo de la presente ponencia es analizar la relación existente entre quienes estudian una carrera determinada y su diferente origen de clase y proveniencia regional (que determina su capital cultural), se considera que cada grupo de estudiantes que estudia una carrera determinada, constituye una región sede según el planteamiento de Giddens. En este caso se estudiaron tres sedes, elegidas en función del nivel de exigencia académica impuesto por la universidad a sus aspirantes, licenciaturas en: Medicina Humana, Contaduría y Administración y Sociología, cuya característica es que su población proviene de diferentes regiones socioeconómicas del estado de Chiapas, cada una de ellas con diferente nivel de desarrollo económico y social.

La investigación se realizó utilizando una metodología cualitativa-estructuralista, basada fundamentalmente en la técnica de grupos de discusión, a través de la cual se pretende conocer el tipo y nivel de capital cultural con el que los estudiantes de las carreras antes mencionadas, enfrentan los retos que la educación superior impone.

Gendered Professions and Social Standing: An Empirical Analysis

Despite social developments and the opening of all professions to both men and women, society continues to obey to stereotypes and many professions are considered as feminine/masculine. Another important notion is the prestige which implies a ranking of professions resulting from a strong social consensus (Chambaz, C. et al. 1996): prestigious professions are those combining higher wages, higher stability and autonomy (Ganzeboom & Treiman, 1996).

Starting from this point, the aim of this paper is to study the social representation of the professions according to two dimensions: the degree of feminisation and the degree of prestige given to an occupation.

We lead a survey asking individuals to rank a list of sixty professions according to these two criteria.

Results obtained show a gendered ranking of the professions highly affected by societal stereotypes: more than 65% of the individuals ranked midwives at the top of the feminine occupation. We also observe a ranking according to the social status where the gender of the individual seems not to be discriminating: two occupations are ranked in first and second positions by all individuals regardless of gender - Surgeon and Astronaut- and among the top 10 occupations, seven are common to girls and boys.

Finally, as first proposed by Gottfredson (1981), crossing the two dimensions, we establish a cognitive cartography of the professions.

Epistemology of Social Science from a Southern Perspective

My aim is to develop an epistemology of social science from a southern perspective but with universalistic vocation. I want to show how, in the social sciences, what I call "research contracts" play a similar role to Kuhnian paradigms in the natural sciences. Using an analytical frame adapted from works of Dascal, Rescher, Walton and Wroblewski, I examine the debate on the Brazilian populism, in the 1960-70s, as an example of a recurrent controversy pattern.

Research contracts regulate the controversies in social sciences. They define the rights and duties of the scientific audience and the individual social scientist toward each other. The audience must fulfill the burden of questioning: it must appreciate any contribution presented by individual researchers, in their official forums. The individual researcher must meet the burden of proof: furnish arguments and empirical evidence to justify his theories, according to the scientific community standards.

Any research contract has the following clauses. First: a theory must be expressed in a controlled metaphysical language ML. Second: there must be a commitment to a rule of method RM. According to this rule, facts described in ordinary language as f will be considered true if an index i is present. Third: it is possible to translate the fact f, in ordinary language, to the fact F, in ML. Fourth: the theory is valid in restricted spatiotemporal coordinates ST.

Most times the burden of proof is set ad hoc. So, a debate begins with the question: "does f corresponds to F in ST?", before moving to an even more fundamental one: "What is at stake in the question about f being F in ST?" The contract clauses are now the subject of discussion. Despite being empirically inconclusive, such debates are valued as a systematic statement of the research problem.

Research Contracts and Controversies in Social Science

I want to show how, in the social sciences, what I call "research contracts", without paradigms in the strict sense presented in the Kuhnian scheme commonly applied to the natural sciences, play a similar role to puzzle-solving in normal science. Using an analytical frame adapted from works of Dascal, Rescher, Walton and Wroblewski and Dascal, I examine the debate on the Brazilian populism, in the 1960-70s, as an example of a recurrent controversy pattern.

Research contracts regulate the controversies in social sciences. They define the rights and duties of the scientific audience and the individual social scientist toward each other. The audience must fulfill the burden of questioning: it must appreciate any contribution presented by individual researchers, in their official forums. The individual researcher must meet the burden of proof: furnish arguments and empirical evidence to justify his theories, according to the scientific community standards.

Any research contract has the following clauses. First: a theory must be expressed in a controlled metaphysical language ML. Second: there must be a commitment to a rule of method RM. According to this rule, facts described in ordinary language as f will be considered true if an index i is present. Third: it is possible to translate the fact f, in ordinary language, to the fact F, in ML. Fourth: the theory is valid in restricted spatiotemporal coordinates ST.

Most times the burden of proof is set ad hoc. So, a debate begins with the question: "does f corresponds to F in ST?", before moving to an even more fundamental one: "What is at stake in the question about f being F in ST?" Identity, Violence, and Resistance: Contending with the Biopolitics of Disability

The social model of disability made it possible to think of disability as structural oppression. It engendered two radical and related shifts: it allowed for political efforts to target social institutions and relations for increased integration of disabled people and it provided a language for claiming positive individual and collective identities. The social model of disability provided a rallying cry for people with disabilities to work collaboratively towards eliminating oppression.

Proponents of the social model of disability, given their unique focus on social recognition, have framed people with disabilities as impaired bodies that have already arrived. As a result, modellists have not contended with the violence that makes certain groups more prone to becoming impaired and/or less likely to be recognized as disabled (Puar 2017). To capture the materialization of capitalist and colonial violence on specific bodies, Puar (2017) conceptualizes debility as a

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

necessary disruption of the dichotomy between disabled and non-disabled bodies through which racialized bodies are not legible. It is therefore essential to reflect on the tensions between claiming disability pride and the violence underlying capitalist and colonial processes of disablement.

In light of these debates, I contend that claiming a positive identity and remaining accountable for debilitation are mutually reinforcing and can be better theorized in their interconnection. I recognize that the very survival of many people with disabilities, especially multiply marginalized individuals, depend on hiding their differences. Yet, I also believe that the work of unearthing the root of ongoing violence against marginalized people will benefit from the experiences and knowledge of people with disabilities and their allies globally. In this paper, I will support my position by rethinking the disability identity through crip theory and taking a Critical Disability lens to understanding capitalism and colonization provides valuable insights into biopower processes maiming particular individuals.

GRASSI, MADDALENA* (University of Bari Aldo Moro, Italy)

Questioning the Relationship between Poverty and Social Work Ethnographically: The Meaning of Reciprocity in the Homeless People-Social Street Workers' Interaction Systems. a Case of Southern Italy.

Exploring the relationship between homeless people and social street workers in daily life and work context is the main objective of the ongoing PhD research project which the contribute refers to. This structural relationship - a persistent model between social positions – is theoretically analysed through the categories of the Gift Theory, emphasising the money mediated disengagement relationship typical of the (post-)modern individualisation process. The relative-relational approach to the study of poverty considers its symbolic-relational element as the determining dimension: the definition of 'the poor' depends on the social and cultural context and, consequently, it changes according to the policies and the social workers' view. Based on a constructivist approach, the analysis has two main objectives:

- Describing the social services' network and the urban context, in order to understand the local policy vision of the extreme poverty phenomenon and of the social work network system and the functioning of this network in the daily interaction with the marginalised urban environment;

- Analysing the symbolic representations of the social workers and the poor users as concerns their experience with the homelessness phenomenon and the social street services' organisation, focusing on the material conditions, the identity dimension and their interaction's dynamics.

The research adopts a mixed-methods approach aimed to integrate three kinds of tools: the ethnographic observation of the urban context and of the social street services' nets, a set of in-deep interviews and oral stories, focus groups with homeless people, professional and volunteer social street workers.

The contribute wants to show the research process of the meaning of home from the points of view of the actors of the relationship, which takes place in the space of an interaction structured in a power relation based-system.

GRAZIANO, EUGENIO* (Università degli studi di Torino,)

How Many Deservingness? - Subjectivation Processes between Actors and Minimum Income Policies in Italy

In the neoliberal transformations of social policies, access to social protection is increasingly becoming a transaction between a benefit provided by the community and an individual behavior of the recipient that have to conform to society expectations. According to this, the notion of merit as individual responsibility becomes crucial. Merit turns into an internal device for social policies, on one hand as a legitimizing resource for politcs and on the other one as an instrument of recipient's control and discipline. This device is defined through social representations, stabilized norms of behavior, and also by practices and interactions between social workers and recipients.

But how many perceptions of deservingness might coexist in a social policy? What effects do they induce in terms of subjectivation of the benefit recipient? The paper analyzes these questions starting from the case study of an Italian metropolitan context and from the recent implementation of the "Reddito di Cittadinanza", the new minimum income measure in Italy. The focus is on concepts and practices of deservingness within public-private partnerships and governance that manage job and social inclusion projects: in these policy areas operate several public actors, catholic associations, banking foundations and left whing associations with different conceptions of social citizenship and inclusion. Claimants must confront with these contrasting ideas and practices of merit and then they develop strategies of action, staying inside the policy or out of it, structuring the representations of their experience as recipients and also representations of their peers.

GRECO, FRANCESCA* (Prisma srl, Italy)

Storytelling of Pandemic in Lockdown: The Role of Social Media

The spread of the virus was an unexpected and frightening event that took the world by surprise. During the first lockdown, people has largely used the social media to communicate and exchange their experiences. the media played a relevant role in allowing the communication and the construction of storytelling aiming to reorganize their traumatic experience of pandemic. The aim of the study is to identify the main topic of the communication during the first lockdown in Italy.

In order to understand the storytelling of pandemic we scraped over two million messages in Italian language containing the word "coronavirus" from Twitter repository in three different moments of the first lockdown and we performed Emotional Text mining (ETM), which is an unsupervised procedure allowing for the analysis of large amount of data.

Two main dimensions characterize the governance of the Covid-19 pandemic, the defense and the protection from the contagion and their consequences. Not surprisingly the sentiment is negative overall unless on April in which 24% of messages are positive looking for the lockdown conclusion. The main topics characterizing the beginning of the lockdown are the forced confinement, the lockdown, the contagion and the foreign threat, the national threat and the red zone. At the end of March, the reaction to the press conference announcing the extension of the lockdown brings out new topics: the governance of the pandemic and the civil society's reaction seeking for information. On the second extension of the lockdown new topics arise: the lockdown conclusion, the breaking of Easter traditions, and the doubt of resolving the pandemic. Two topics remain unchanged along the lockdown: the contagion bulletin and the need of information. Apparently, social media played a relevant role both in allowing the communication and the experience sharing, building new storytelling to support people's coping.

GREIBE, ANDREA* (Universidad de Chile, Chile)

La Educación Como Factor De Posicionamiento Social En Profesionales Primera Generación

Durante las últimas tres décadas Chile ha experimentado un fuerte aumento del número de jóvenes que ingresan a la educación superior, masificación impulsada por políticas de corte neoliberal, que han impulsado la creación de instituciones privadas, la disminución del financiamiento directo a las instituciones públicas y la generación de sistemas de pago de matrículas subvencionando a la demanda.

En este escenario se ha promovido el ingreso a la educación superior de nuevos sectores sociales, aumentando el número de estudiantes que son los primeros de su familia en cursar estudios superiores.

Sin embargo, este proceso no ha significado una mayor democratización del sistema. La matrícula de estudiantes de menor nivel socioeconómico ha crecido más lento que la de estudiantes de sectores de mayor ingreso. En tanto, la diferenciación de universidades de acuerdo a su calidad, ha llevado a la segregación de la matrícula según rendimiento académico, factor fuertemente asociado al origen socioeconómico de los estudiantes.

Más allá de las restricciones a la movilidad social, la educación constituye un eje central en el que los sujetos depositan su confianza para asegurar mejores condiciones de vida (OCDE y BIRD, 2009); sin embargo, las particularidades del sistema educacional chileno generan tensiones y experiencias que es interesante conocer.

Desde una perspectiva comprensiva, se busca establecer cuáles son los sentidos asociados a la educación con relación al posicionamiento social por parte de profesionales primera generación, que han estudiado en universidades selectivas, tradicionales y de alto prestigio; y, en universidades no selectivas, privadas y de menor prestigio.

Los resultados reportan el análisis de entrevistas en profundidad realizadas a egresados de estos dos tipos de universidades indagando en su trayectoria educativa y en la valoración que tienen de ésta respecto a su posición social actual.

Environmental Meaning of the Financial Turn: A Cross-National Study of the Finance-Economy-Environment Nexus

Over the last several decades there have been substantial shifts in the organization of the global economy which have resulted in financial processes accounting for an increasingly large share of total economic activity. Although the process of financialization has changed the way that economic growth is carried out, little research has been done to explore the ways in which the increasing finan-

cialization of national economies has changed the well-established association between economic activity and environmental impacts, such as CO2 emissions. To explore the ramifications that the process of financialization has for the environment-economy relationship, we construct a series of fixed effects regression analyses with robust standard errors for 172 nations between 1960 and 2014. We then estimate how the growing dominance of financial processes in the economic sphere moderates the association between GDP per capita and CO2 emissions per capita, as well as whether or not such changes alleviate the pressures that manufacturing activities place on the environment. We find that financialization decouples total GDP per capita from CO2 emissions per capita, but that it fails to do so for economic activity that is attributable to manufacture. Noting the absolute rise in manufacturing activity during this period, we argue that such findings suggest that the economic reorganization financialization represents may obfuscate the ongoing pressure the economic growth places on the environment.

Perceived Discrimination in Cross-Generational Context: Mental Health and Life Stressors Among Children of Immigrants

Immigrants and their children have driven nearly all of the overall population growth in the United States since 2000 (Nunn, O'Donnell, and Shambaugh, 2018) and are expected to continue to do so through at least 2065 (Lopez, Passel, and Rohal, 2015). Classic theories of assimilation suggest that differences between immigrant and native groups largely disappear within a few generations as immigrant groups become less marginalized (Alba and Nee, 1997). Contemporary models of assimilation suggest a more segmented process whereby some immigrant groups may remain marginalized across generations, even as other immigrant groups achieve a pathway toward economic and social assimilation (Haller, Portes, and Lynch, 2011; Portes and Zhou, 1993; Zhou, 1997). While research has examined how socio-structural factors may shape experiences of assimilation, limited research has examined the cumulative effects of discrimination across immigrant generations (National Research Council, 2004). We use data from the Children of Immigrants Longitudinal Study (Portes and Rumbaut, 2018) to examine the effects of cumulative discrimination on mental health and stressful life events among the children of immigrants. To consider the dynamic process of cumulative discrimination we measure adult parent (first-generation) and adolescent child (second-generation) perceived discrimination, and assess patterns of cross-generational perceptions of discrimination. In addition, we examine the cumulative effects of discrimination over time on mental health in adolescence and stressful life events in early adulthood.

GRIBOVSKIY, MIKHAIL* (Tomsk State University, Russia)

The Dark Side: The Ideas of Modern European University Lecturers about the Negative Aspects of Their Profession

This study is based on in-depth interviews with lecturers from the United Kingdom (2016: universities of Birmingham, Manchester, Leeds, Sheffield), Germany (2017: universities of Cologne and Passau), France (2018: Paris, Nice, Toulouse, Rouen) and Russia (2019: Tyumen University and Tomsk University). A total of more than 80 interviews.

The interviews aimed to find out the features of the professional identity of modern European university lecturers. During the interview, respondents were asked a wide range of questions about their attitude to their profession.

The collected field material allows us to cover various aspects of university life. One of them is the problem of negative aspects of university lecturers profession.

Reasoning of respondents on these topics paint a picture of problematic circumstances of modern European University life in the context of four national models of higher education.

The report will contain references to specific statements on the condition of anonymity of the respondents.

In a generalized form, the conclusions reached by the author on the basis of an analysis of the interview can be reduced to the following:

In the answers of respondents from different countries there are identical negative characteristics of the teaching profession, such as: higher education bureaucracy, unfinished nature of the performed work, irregular work schedule, and not the highest salary in the market.

However, the frequency of mentioning these problems (and, therefore, their severity) in different countries is different. Thus, respondents in the UK most often mentioned bureaucratization, but rarely in Germany.

At the same time, the interviews revealed problems that were more specific only for a particular country (or countries): the difficulty of gaining a perma-

nent position (Germany and Russia); intense competition between teachers for resources (France and Russia); decline in the prestige of the profession due to an increase in the number of lecturers (UK).

From the Body to the Self: Holistic Practices, Rehabilitation Trajectories and the Remaking of the Self

In the last decades, holistic practices, such as yoga and meditation, have been gaining popularity as therapeutic interventions in western countries. In this paper, I take the spread of yoga programs within public institutions (prisons and hospitals) as a point of departure for an analysis on the role of holistic practices in the remaking of the self within neoliberal therapeutic landscapes. Through two empirical case studies of yoga practitioners -one with long term prisoners' and the other one with cancer patients- I explore the following three questions: a) the role of what Marcel Mauss terms 'techniques of the body' in processes of biographical reconstruction; b) the existence of an elective affinity between holistic practices and therapeutic narratives on the self-responsibilization and the need to proactively work on oneself in processes of healing and recovery, and finally c) an analysis of the "carriers" of these holistic practices within the domain of health and penitentiary institutions and the negotiations and tensions that their institutionalization entails.

GRIESER, CHRISTOPHER* (Technical University of Berlin, Germany)

Innovation As Keeping up: How the Necessity to Maintain Compatibility for Interdependent Technologies Fuels the Innovation Imperative

In my contribution, I will explore a key aspect of the innovation imperative: The necessity to maintain compatibility between interdependent technologies which subsequently creates an ecosystem-wide imperative to innovate. While recent research extended its focus from technological innovation to include social or cultural innovations, I want to refocus on technological causes of innovation, namely the interdependence of technologies. ‚Interdependent technologies' means that the functioning of one technology is dependent on the functioning of the other, and vice versa. This interdependence implies a compatibility requirement that creates pressure to innovate, as one technology cannot be innovated when the other does not at least adapt to the corresponding changes. While existing research on path dependence and on large technological systems does take the interdependence issue into consideration, current work barely investigates how compatibility requirements are dealt with in practice.

Based on my ongoing PhD-project on the governance of innovations in technological platforms, I will present empirical evidence on how compatibility requirements fuel an innovation imperative throughout the sphere of a software ecosystem. I investigated the platforms iOS and Android by analyzing field documents, and by interviewing app developers as well as CTOs of app-developing-companies. My findings show that app developers are swayed by the platform operators to implement certain innovations. This creates an „life-nospan" after which apps become obsolete without an update, showing how the innovation imperative creates a constant pressure to keep up. Furthermore, my study shows how platform operators enforce the imperative to innovate apps through various means, ranging from technologically mediated coercion to incentives in the marketplaces they organize (i.e., app stores). I will conclude with some insights on how the ecosystem-wide innovation imperative differs in regard to technological properties of the app and size of the developing company, thus amplifying the stratification of the ecosystem.

Denying Domestic Violence — through the Use of Sexuality?

Despite actively embracing new media, a significant proportion of Russian citizens rely on the traditional source of television for both news and entertainment. Out of the wide variety of choices, scripted television shows, both sitcoms, and melodramas, remain popular year after year, with locally produced material often attracting large audiences. While the topic of domestic violence against women remains a taboo, a few Russian primetime shows of the last decade, such as *Boiling Point* (2010) and *The Perfect Victim* (2015), addressed it.

My study argues that post-Soviet Russia, despite the publicly declared progress in the sphere of sexuality and human rights, in the last ten years has been

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

reverting to a traditional societal model, with the patriarchal distribution of gender roles, dominant masculinity, and misogyny. These anti-gender tendencies are tacitly supported by the government, and primarily promoted by mass media.

My research is focused on critically assessing the choices their creators made while approaching this topic and how the audiences interpret these depictions. Russia-1, the TV channel that produced the shows considered in the presentation, could make an impact should it choose to portray domestic abuse; instead, it sexualizes violence.

My presentation is based on numbers from research lately conducted in the context of my PhD.

Health and Society: Classic and Emerging Topics in the Brazilian Sociology of Health

Sociology of Health in Brazil is recognized, already for a long time, as a consolidated field of research. However, the broad scope and complexity of the topics investigated and the wide range of applications represent a challenge to establish a specific identity for this field.

With the purpose to analyze the amplitude of this field of research, this presentation examines the ideas and debates of the papers presented in the five consecutive sections on Sociology of Health during the Congress of the Brazilian Sociological Association.

We focus on three issues:
- The dilemmas of interdisciplinary work (in teaching and research);
- the challenges of integrating specific policies (e.g. inclusive policies related to gender, indigenous, etc.) within general health policies;
- the ambivalent way of studying health and disease: on the one hand as a medical/technical/organizational process vs the social/emotional/behavioral aspects.

The Construction of Health Causal Relations in the Belo Monte DAM Context

Literature has plenty of examples showing the socio-environmental impacts from dams' construction in the most different contexts (CERNEA, 1988, 2003; SCUDDER, 1997, 2005; FEARNSIDE, 2001, 2006, among others). However, there are few studies that succeeded in establishing consistent causal relations, especially regarding health impacts and the causal relations of the outcome impacts. This is most due to the small number of research and assessment projects that monitored the process longitudinally before, during and after the installation of a hydroelectric dam. In the specific case of health impacts, it is also due to the lack of studies assessing health conditions that go beyond sheer medical aspects; to failures in the official health records on the population impacted by the project and the scarce number of researches on the human and animal health conditions prior to the impacts. This paper focus on problems related to the construction of causal relations in the emergence of diseases or injuries, having as examples the relationship between migration and workers' diseases (brought or acquired), cases of syphilis in pregnant women, violence-related deaths (homicides) and traffic accidents in the context of construction of the Belo Monte dam.

The flow of migrant workers was particularly intense between 2011 and 2017. More than 40,000 new inhabitants came to settle in the middle town of Altamira (85,000 people in 2010), in the heart of the Brazilian Amazon. These rural and urban migrants from across the country have upset the local social, environmental and health order.

Going beyond the deterministic view of the causes of diseases, we will discuss the challenges of building a complex network of causal relations that incorporate the bio-physiological causes with others deriving from human actions or political decisions (or omissions), and rank the degree of influence of these causal factors in this specific context.

What Do Bolsonaro's Voters Think about Democracy? a Comparison with the Brazilian Population

In the 2018 presidential elections in Brazil, there was a strong ideological charge that polarized both voters and presidential candidates. One of the milestones of this electoral process was the presence of an anti-system and anti-democratic speech, especially on Jair Bolsonaro's campaign. Considering this scenario, the research objective was to identify the perception of democracy by the voter who declared their vote on Jair Bolsonaro. In this sense, investigating if their electoral choice has any or none correlation with the perception the voters have about the political system. To do so, we analyzed data from the 7th wave of World Values Survey for Brazil, divided into two sample groups for comparison: 1) a representative sample of the Brazilian population and 2) a sample of the voters who declared vote for Jair Bolsonaro in the last presidential elections. Results indicate that the perception of democracy itself does not differ significantly between the two groups. However, Bolsonaro's voters tend to prefer technocratic and military political systems. These results contribute both to characterize these voters and to further studies on electoral behavior in Brazil.

GRONDONA, ANA LUCIA* (Universidad de Buenos Aires, Argentina)

The Limits of the Notion of "Reception" and Latin-American (neo) Baroque As a Key to Understand the South-North Production of Social Problems.

This paper is part of a wider project, aimed at building "contaminated genealogies", as a perspective for a sociology of problematizations from the South. This entails, not so much to illuminate the specificities of the emergence or reception of social problems in the peripheries, but to insist on the ways in which the later are also interwoven in the history of the emergence of devices, problematization, concepts and diagnoses that are usually presented as "self-produced" from the North.

As part of this broader inquiry, the present text investigates the ways in which discussions about Latin American (neo)baroque (especially, the works of Severo Sarduy and Néstor Perlongher) alluded to the problems of translation, the logic of simulacrum and *retombée*, since, we understand that they offer elements that allow us to transcend the "reception" or "circulation" metaphor. Even in its classical formulations (for example, in Alejo Carpentier), the critique of Latin American baroque and neo-baroque has demonstrated that these were more than creative appropriations of European styles and confront us with a destabilization and thematization of the original-copy relationship in a similar vein as the interests of our inquiry.

After a section in which we address theoretical aspects of the approach, the paper presents an illustrative case (the debate on development styles between 1965 and 1981) that, sets in motion the concepts of the first part. One of the issues that will interest us in particular is to discuss, from these results, the ways of thinking about the temporal-spatial dimension of the production of social problems also beyond the limits of the metaphor of " coevalness".

GROS, ALEXIS EMANUEL* (1986, Germany)

The Power of Imposing Social Typifications upon Others: A Schutzian Account

It is often claimed that Schutzian phenomenology is unable to account for "sordid" aspects of sociality such as asymmetrical relations of power. Indeed, according to many of his critics, Schutz conceives of the everyday lifeworld as a "harmless" place, *i.e.*, as domain that is safe from the dangers of power. As against this view, I intend to show that the Viennese phenomenologist provides original insights on a specific form of social power that tends to be neglected by contemporary sociological theory, namely, the power of imposing typifications upon Others. More specifically, Schutz deals with this issue in his paper "Equality and the Meaning Structure of the Social World", where he also analyzes the *alienating* effects on subjectivity of unwanted social categorizations, i.e. of socially imposed typifications that are at odds with the subject's own self-interpretation. Especially

drawing upon that 1955 paper, but also resorting to other texts by Schutz, my presentation will attempt to systematically reconstruct his account of this particular form of power and to discuss its current social-theoretical relevance.

GROS, ALEXIS EMANUEL* (1986, Germany)

"Relationships to the World" or "Forms of Life"? a Counterpoint between Hartmut Rosa's and Rahel Jaeggi's Approaches to Critical Theory

Rosa and Jaeggi are two of the main figures of the new generation of the Frankfurt School. In his 2016 book, *Resonanz: Eine Soziologie der Weltbeziehungen*, Rosa presents a *phenomenologically* inspired Critical Theory centered on the critical analysis of the "relationships to the world" [*Weltbeziehungen*] of everyday subjects. In turn, in *Kritik der Lebensformen*, from 2013, Jaeggi develops a *praxeological* approach that focuses on the criticism of quotidian "forms of life" [*Lebensformen*]. In spite of their undeniable differences, both Jaeggi's and Rosa's accounts can be understood as efforts towards developing a *non-paternalistic* version of Critical Theory. That is, one that takes everyday experiences, practices, and interpretations seriously and attempts to criticize them from an *immanent* perspective, instead of systematically discrediting them for being mere products of an ideological "false consciousness". In this connection, the notions of "relationships to the world" and "forms of life" play a key role: they are conceptual categories specially tailored for reconstructing and critically assessing the meaningful, experiential, and practical structures governing the quotidian life of a specific socio-cultural formation. The aim of my presentation is to establish a productive and mutually corrective dialogue between Rosa's and Jaeggi's approaches. It is my contention that this dialogue can contribute to developing an integral approach for criticizing contemporary societies in a non-patronizing manner.

GROSSE, INGRID* (Dalarna University, Sweden)

Social Trust and Migration

The prevalence of migration across the world poses the question inasmuch migrants will assimilate, uphold their social, economic and cultural way of life or both? Related to this broader question, this paper examines inasmuch migrants keep or change the level of social trust prevalent in their origin country to the one in the destination country. Social trust in other people is regarded by many researchers as a central contributing factor for democratic, wealthy and stable societies. It is seen as an indicator for open-mindedness and socio-trophic orientations of individuals. Therefore, social trust is an interesting value-orientation to study sociologically.

Concerning value-orientations in general, researchers disagree about inasmuch migrants keep or change them. Studies of American immigrants show mixed results: some ethnic groups preserve to a great extend their own culture, while other immigrants assimilate quickly into the American way of life. Concerning social trust, however, immigrants display a long- term divergence from the American mainstream. By contrast, European studies on immigrants come to mixed results, but show predominantly that second generations are to a great extend assimilated to the culture of their destination country. This is especially the case concerning the level of social trust.

I examine levels of social trust using World Values Survey data for the available ethnic groups from many countries around the world. World Values Survey data were used by only a few studies of social trust and migration. In order to capture national, economic and historical legacies, I will apply multilevel analysis.

The Social Construction of Climate Change: Are We Stuck between Risk and Danger?

The grand challenge of climate change has been known for decades, and so have the reasons for it and the means to stop it. However, from a sociological perspective, climate change can be understood as a social construction. To become social reality, the "thing" known as "climate change" must be observed by society in some way and thereby constructed as the phenomenon that we nowadays call "climate change". Against this backdrop, I assert that society's striking inability to effectively tackle climate change can be better understood by looking at the way of how climate change is constructed as a societal problem. To do so I will draw on Niklas Luhmann's (1993) theory of risk, which proposes to draw a conceptual distinction between *risk* and *danger*. In this view, risks are those for which certain decisions can be identified as causes so that responsibility for these decisions can be attributed to specific decision-makers, i.e. individuals and organizations. In contrast, dangers can be characterized as something exogenous so that the cause for corresponding damages and harm is attributed to the environ-

ment. Based on this theoretical groundwork, I argue that the current way of how climate change is socially constructed is stuck between risk and danger. On the one hand, climate change is broadly seen as caused by human-made decisions and therefore as a risk. On the other hand, responsibility for climate change is typically attributed to humanity as such or to the sum of all individuals. As a consequence, no certain decisions by certain actors can be identified as causes for certain climate effects – which portrays climate change rather as danger. These insights have wide-ranging theoretical implications, which I will outline in the final presentation. I will moreover unfold the theoretical argument in more detail and derive policy implications accordingly.

Inequality and the Self-Activated Subject: Gendered Everyday Strategies and Embodied Experiences between Resistance and Compensation.

Recent societal transformations like the neoliberal turn from welfare- to workfare-state in european countries, promote a new type of (self-)activated subject. This "new" entrepreneurial subject is called up to organize the personal life according to managerial and economic compatibilities. We show, that new articulations of subjectification challenge the self-regulation in the workplace but also self-management in everyday life. Further, this form of self-activated subjectification builds upon existing gender inequalities and aggregates them, but also puts forward new forms of gender inequalities. This especially can be seen in the daily forms of dealing, experiencing and "using" the body.

Drawing on episodic and problem-centred interviews with employees working in sectors with both high and low levels of formalization (academia, social work, administration, education), we investigate different subjective perceptions and action strategies employed to deal with workplace requirements like efficiency, adaptability/flexibility and self-regulation as well as different living and care arrangements. By looking at how people organize and manage their performance both within the workspace and between work and life, we are able to identify different (embodied) aspects of resistance and compensation. With a special focus on the facet of self-care, we show that the demands of work and life in a neoliberal capitalist society are gendered and that the body plays a central role that sometimes can align with the (neoliberal) requirements for the "new" self-activated subject. Everyday strategies used by employees, range from incorporating neoliberal workplace demands (in the sense of technologies of the self) to sophisticated strategies of resistance. We will show that some of them succeed in protecting employees from self-exploitation, while others do not. Although the entrepeneurial/neoliberal subject is often argued to be gender-neutral, in reality the everyday experiences and practices of women and men differ strongly and show new forms of structural and individual inequalities.

GRZYMALA-KAZLOWSKA, ALEKSANDRA* (University of Warsaw, Poland)

Advancing the Theory and Methodology for Researching Marginality and Diversity

The paper proposes a new theoretical and methodological framework for researching diversity and marginality where marginality. Unlike the dominant discourse on marginality, focusing on structural inequalities, with those on the margins depicted as powerless and lacking resources, this paper will highlight the potential of marginality to challenge inequalities. This will draw on Hook (1990:341) presenting marginality as a site of resistance that 'offers the possibility of radical perspectives from which to see and create, to imagine alternatives, new worlds'. In a similar vein, Giroux (1997) also emphasises the importance of counter-hegemonic discourses which articulate the multiplicity of perspectives and experiences that may bring opportunity for innovation and transformation, while Wilson (2018) proposes the term of 'transcendent marginality' to highlight the emancipatory potential of marginality with voices from peripheries that do not reflect and reinforce the status quo social structure. The paper will also argue for co-production and participatory community based research as means for advancing the theory and methodology of diversity and marginality. As Freire (1982) highlights different types of participatory action research (PAR) offers potential as means to overcome relations of domination and subordination between oppressors and the oppressed. PAR can be seen as a vehicle to not only address the needs of communities but also empower them, promote social justice, democracy, civic and political engagement (Fals-Borda 1995). This refers to the concept of 'cognitive injustice' which recognizes the multiplicity of forms of knowledge and a need for active recognition of diversity to offer an alternative vision of society not colonized by the market with a collaboration of memories, legacies, heritages, and new forms of power sharing and problem-solving that go beyond the limits of voice and resistance (Bhambra and de Sousa Santos 2017).

Cultures of (Un-)Availability: An Analytical Framework for Investigating Life Sciences Worldwide

Science in general and life sciences in particular involve the transgression of boundaries. Initially, in all science, it is a quest to discover something new, to overcome the limits of the known. In life science, however, it is difficult to distinguish between "observing" and "changing". The aim of better understanding biological processes is always connected with improving them, thereby curing diseases or preventing them. Furthermore, the overcoming of the limits of what is known in this field is in most cases also related to the overcoming of ethical limits. Animal trials, human germline engineering, or the production of human-animal-chimera: these are only three out of many controversial topics in this sense.

The paper presents a research perspective that focuses on the construction of boundaries. Theoretically, it is oriented towards the phenomenological work of Alfred Schütz and Thomas Luckmann (1973) who developed the term of small, intermediate, and great transcendence. In turning this phenomenological idea into a concept of agency, the paper analyses constructions of boundaries between availability and unavailability in the field of life sciences. Empirically, the paper is based on two laboratory studies in stem cell research, one conducted in Germany and one in US. The results imply that even in this highly dynamic field, there are boundaries of making things available. For content-related technical or for moral-ethical reasons, specific cosmological concepts remain outside of human availability in both laboratories.

Beyond the particular case studies, the concept of unavailability provides a framework for comparative studies in STS, aiming at identifying fundamental belief systems in contemporary societies.

Literature:

Gülker, Silke (2019): Transzendenz in der Wissenschaft. Studien in der Stammzellforschung in Deutschland und in den USA. Baden-Baden: Ergon.

Schütz, Alfred/ Luckmann, Thomas (1973): The Structures of the Life-World. IL: Northwestern University Press.

RC22-257.3

GUELKER, SILKE* (Leipzig University, Germany)

The Social Construction of (Un-)Availability in the Time of COVID-19

How do contemporary societies deal with the limits of what can be experienced? The paper argues that this question can open up the action-relevant and thus socio-political aspects of the sociology of religion without getting entangled in debates on the definition of religion.

Schütz and Luckmann describe as transcendence what is indicated in a current experience but cannot be experienced. They distinguish between small (in regard to space and time), medium (in regard to a counterpart) and large (in regard to "other realities") transcendence. The article takes this phenomenological perspective as its starting point and develops a concept of unavailability as an action-theoretical mirror term to that of transcendence: Transcendence turns into unavailability in the moment in which the limits of experienceability are addressed in action and thus their potential changeability comes into view.

The social construction of boundaries between availability and unavailability of space and time, of the counterpart, or of an order of the world opens or limits the scope for changes in the world. It can, but does not have to be institutionalized in religious social forms - however, their analysis can help us understand the ideational foundations of action in contemporary societies.

The article concretizes this perspective theoretically and illustrates it using current debates on the COVID-19 pandemic as an example.

It thus offers a contribution to the discussion on "Entanglements among science, religion and spirituality in COVID times" as well as to the session "Wtf? ('What the Faith?') - Peering Anew into the Conceptual Domains of 'Religion', 'God', 'Spirituality', 'Faith' and Related Constructs".

GUERRA, JOÃO* (University of Lisbon, Portugal)

Communities and Solastalgia in the Antropocene

Global environmental problems are crosscutting. From this point of view, they are potentially democratic in their effects, because they can affect the whole of humanity, but at the same time, they are hierarchically felt and perceived, and primarily affecting the weakest groups and least prepared communities to face adversity (Beck, 2009). Hence environmental justice issues interact with pre-existing socioeconomic inequalities, gaining particular acuity at the local level (Agyeman, Bulard & Evans, 2003), at a time of global transformation that some authors have already called a new era: the Anthropocene (Crutzen & Stoermer, 2000). Indeed, in local communities, ecological disasters and calamities, as well as their consequences in daily life, give rise to existential anguish that intensifies among the populations of the affected areas, in a process in which familiar places often became unrecognisable, or even hostile (Albrecht, 2005). We are, thus, facing concepts that somehow intersect: i) the "Anthropocene", which describes and evaluate the consequences, the magnitude and the scope of human-induced changes on the planet, such as terrestrial surface transformation, or the alteration of the atmosphere composition, and ii) the "Solastalgia" that emerges from a psychic or existential suffering caused by environmental damage, which disrupt the human (communities) conditions of existence. In this line, ecological degradation can be seen as a primary factor of social anxiety, enhancing feelings of abandonment and helplessness, especially among the most fragile social groups. In light of these concepts, and based on some specific cases located in Brazil and Portugal, we will reflect on the present condition of local and fragile communities, without forgetting the most traditional theoretical framework of environmental sociology and sustainability.

ROLDÁN, SANDRA (Universidad Nacional de la Patagonia Austral- Unidad Académica Caleta Olivia, Argentina)

Cuando El Cuerpo Irrumpe En La Investigación: Haciendo Lugar a Las Emociones En Un Encuentro Intergeneracional

El presente resumen tiene como punto de partida la indagación realizada en el marco de un proyecto de investigación radicado en el Programa de Políticas Públicas de la Universidad Nacional de la Patagonia Austral (República Argentina), cuyo objetivo consistió en producir conocimiento sobre el estado de situación del embarazo adolescente y las políticas públicas implementadas en Caleta Olivia, provincia de Santa Cruz, Patagonia sur-sur. Se trató de un estudio de carácter exploratorio cuanti-cuali, en cuyo marco se hicieron visibles articulaciones del fenómeno objeto de estudio con otras situaciones relativas a las juventudes en la región, habida cuenta de que es la franja etaria más afectada por la desigualdad social. Tal caracterización derivó en la realización de la Jornada "Juventudes, desigualdad social y políticas públicas", iniciando el encuentro con el conversatorio denominado "Tejiendo diálogos entre jóvenes y adultos".

Interesa entonces presentar algunas reflexiones a partir de una experiencia donde comprobamos que disponiendo lugares y tiempos que habiliten la expresión y el tratamiento colectivo del malestar social, los/as jóvenes (y los/as no tan jóvenes) se permiten poner en juego el cuerpo y las emociones. Esa puesta en juego de las experiencias de las/os jóvenes desde sus cuerpos, esto es decir, lágrimas, temblores y voces quebradas obliga a revisar teórica y metodológicamente la escisión entre cuerpo-lenguaje, para poner en cuestión el lugar privilegiado y dominante del orden del discurso, desencarnado de la vida misma. Sostener el silencio que habilita la escucha, permitió que el llorar no resulte un acto individual (algo a lo que el capitalismo nos tiene acostumbrados como si los problemas - y sus "causas" - fueran de orden individual) sino que el llanto mismo cuando es escuchado y sostenido solidariamente, habilita a que las palabras y emociones compartidas aporten a la construcción de un nosotros/as, esperanzados aún en tiempos sombríos.

Análisis Del Rol En La Organización De Directores De Escuelas Públicas Chilenas: Una Apuesta Para Salir Del Management.

La educación chilena pasa de ser municipal a ser estatal. Así, cambian los roles de los distintos actores y en especial de los líderes de escuela. Se espera cambiar la lógica de la gestión managerial que destruyó la relacion profesor-director- estudiante y transformó en clientes a las familias. En esta nueva estructura estatal el rol es acompañar a los profesores y profesoras en sus aulas, construyendo nuevas formas de hacer comunidad, ciudadanía y participación, pero sin cambiar las leyes manageriales. Para colaborar en este cambio, se nos financió un estudio de tres años con cuatro escuelas bajo las clínicas del trabajo. En esta comunicación mostraremos la metodología y resultados de la primera etapa. Presentaremos metodología de análisis del rol desde la perspectiva del socioanálisis, que contempla el uso de dibujos individuales, fotoelicitación, entrevistas individuales y sesiones de trabajo colectivas por escuelas e interescuelas. Los resultados señalan que las prescripciones de cambio de ley están en el discurso de los directivos,

sin embargo, si no se cambian las leyes laborales manageriales de competencia y exitismo, no se puede tener un rol centrado en la colaboración con los otros actores. es incompatible competir con otros, buscar la excelencia en pruebas estandarizadas y acompañar a los profesores en aula. Los directivos valoran los encuentros con metodologías de la clínica del trabajo y la necesidad de reflexionar, aprender y elaborar estos cambios paradigmáticos. Como conclusiones señalamos que la política pública educativa chilena hace mandatos contradictorios a sus trabajadores y no entiende que está pidiendo cosas epistemológicamente distintas, dejando a los sujetos presos en paradojas que inmovilizan a los sujetos. Al acompañar a las comunidades, podemos mostrar la paradoja y abogar por nuevos cambios en las leyes escolares. Pasar del análisis de su propio trabajo y malestar a una transformación política.

Desde El Sentido Del Trabajo, a La Agencia y La Capacidad De Actuar.

El objetivo de la comunicación es mostrar metodologías de intervención con trabajadores de servicio público para reencontrarlos con el sentido de su trabajo y para activar los procesos de agencia y transformación de la labor que realizan. La presentación parte del supuesto que la sociedad del management ha puesto el énfasis en los juicios de utilidad, de los logros y no en el trabajo entre pares que hace avanzar el oficio. Los trabajadores buscan resultados y olvidan que tienen personas a su lado. Esto les quita el sentido del trabajo y pasión por lo que hacen.

Mostraremos tres actividades que realizamos habitualmente con trabajadores de los distintos sectores públicos en que nos volvemos a contactar con los beneficiarios, con sus pares y con el sentido del trabajo. Las metodologías de trabajo duran una hora, permitiendo rápidamente pensar el propio trabajo y poder analizar con los pares la propia acción. Estos dispositivos sensibilizan a las personas para aprender nuevas herramientas y las utilizamos al inicio de los cursos que hacemos. Las actividades son: línea de tiempo profesional, el teatro imagen y el análisis de la fotografía del puesto de trabajo.

De esta manera esperamos revitalizar la agencia, la capacidad de actuar de los trabajadores que se encuentran bajo la tiranía de los indicadores y el reencuentro con aquellos que les da placer en el trabajo en un continente con mucho compromiso social.

Addressing Gendered Experiences of Rohingya Refugee Adolescents Living in Cox's Bazar, Bangladesh

Although humanitarian aid structures have secured survival needs of Rohingya refugees, understanding the point of intersection between gender, age, culture, and disability in the context of migration will prove critical in addressing the mid to long-term trajectories of Rohingya adolescents. Two years in, the crisis remains amongst the fastest growing emergencies in the world where the challenge of delivering to support disparate needs persists. As part of the Gender and Adolescence Global Evidence programme (GAGE), our mixed-methods longitudinal research captures and tracks the voices Rohingya adolescents between 10-19 years old on their everyday lives and the structures in place to support them. We have surveyed 1,000 Rohingya adolescents across 35 camps, and engaged with a subsample of 75 adolescents, their families and communities through a variety of individual and group in-depth qualitative approaches.

GAGE preliminary research findings indicate that girls' experiences and their ability to access services are shaped by entrenched intrahousehold gender dynamics and disruptions to community structures. Older adolescent girls have severely limited mobility in the camps partially due to parental safety concerns and gender-based social norms, and are further compounded by the disruption of formal education. While their civic involvement pre-displacement was limited, delivering on mechanisms and structures to leverage gender-transformative change where girls feel valued in their communities will prove critical as the crisis protracts. Boys' lived realities are now shaped by boredom and a lack of livelihood opportunities, which has pushed many towards the use of narcotics and illicit activities in the camps. As the crisis extends, we recommend that policy makers and aid agencies take into account the specific needs of Rohingya adolescents beyond basic survival by acknowledging their voices and experiences, and in this way better support their wellbeing now and as they transition into adulthood.

Convergences and Divergences on Care Work. a Latin American Perspective.

Care services have become a significant area of paid work, resulting in an expanding professional labor market. Besides, the development of public policies for long-term elderly care, as well as for childcare and the disabled impacts individual careers and the professional regulation of the labor conditions and relations. This phenomenon has also elicited a rising interest in Latin America where a growing range of research projects has been conducted in many countries. Actually, Latin America is a social space where professional care has expanded dramatically over the past twenty years. However, unlike Japan, and European countries, such expansion took place in a context of heterogeneous, highly unequal and poorly structured markets. The paper intends to present, in a comparative perspective, solid results gathered by this new generation of research projects. They have been carried on by a network of social scientists from five relevant Latin American countries – Argentina, Brazil, Chili, Colombia, and Uruguay. These countries are also strategic cases for documenting the profiles and challenges of different public policy experiments on care work regulation. The paper will situate this new set of empirical results vis-à-vis the international debates in the field. Thus, will elaborate on how the Latin American experience transforms existing understandings on the social organization of care, especially on its relations with gender and race/ethnicity inequalities.

Intermediaries and Job Intermediation in Brazil: Actors, Devices and Regulations in a Historical Perspective

The presentation will analyze the job intermediation system in Brazil, comparing three moments in the constitution of the intermediation market, namely: the 1960-70s, the 1990-2000 years and the current moment. Thus, we will start from the moment of its initial regulation (in the first ten years of the military dictatorship), and we will follow the movement of internationalization of intermediaries, until we reach the current forms of massification in the market for job candidates through the platforms. We aim at understanding how job intermediation chain has been changing, and how these changes have modified its actors, devices and regulations.

Public Policies of Adult Education, Local Labor Market and Social Contexts of Young People: Adult Education Courses at the Crossroads of Ambivalent Aims

This paper is an outcome of the research project YOUNG_ADULLLT, and aims at analysing VET courses delivering both, an academic diploma and a professional certification.The analysis developed is affiliated from the theoretical point of view on the political cultural economy (Jessop, 2004, 2010). The adoption of this theoretical ramework allows us to critically discuss the discursive rhetoric that underpins the creation and implementation, the way target groups are constructed and the effects (expected and unexpected) on young adults' life courses. The data analysis is supported by an empirical corpus built on the collection of legislation and semi-structured interviews with 4 local managers of these provisions in a region of Portugal (Alentejo Litoral) and 4 education and training professionals involved in them. The empirical corpus was later subject to thematic content analysis (Bardin, 2009). The analysis of the collected data reveals, from the legislative point of view, a discursive rhetoric strongly anchored in a technical-instrumental perspective of education and training, oriented towards human resources management and employability. Providing individuals with a high school diploma and a vocational qualification according to the needs of the local labour market are the main purposes of these courses. Increasing individual employability, combating unemployment, reducing early school leaving and promoting inclusion are the official objectives in some cases, and unofficial in others, to which the interviewees unreservedly adhere. Adherence to vocationalism is one of the dominant emphases of their discourses, although mitigated by references to the role these provisions play in democratizing access and success in fulfilling compulsory education.

The results confirm the hegemony of a technical-instrumental and vocationalist perspective in the design of VET policies and question the 'magical thinking' that education and training are the solution to unemployment and social exclusion.

Brazil: New Approaches to Relationships between Research Groups and Firms

The paper focuses on the university-business relationship in Brazil. We examine key features of these relationships, taking into consideration that a) there has been a significant growth of the number of collaborations between academic and business sectors, in the country, over the last two decades and b) since the end of the 1990s, governments have implemented a number of policies and incentives to stimulate the process of technological "catch up", especially the knowledge transfer from academic researchers to the productive sector. Our discussion is divided up into two sections. The first provides a brief description of laws and incentives that provide support for technological catch up as well as the process of catching up itself. In the second part, we examine the data collected in the research we conducted with researchers from eight universities of South and Southeast regions of the country. Among our findings, we highlight a) changes in researchers' perceptions on university-business relationships, now evaluated as positive, contrary to the predominant views of the past; b) the firms we researched expressed satisfaction and interest in continuing to collaborate with universities researchers. Nonetheless, most of the companies sought out partnership in order to solve immediate problems, which does little to raise technological levels of production. Our main conclusion is that although the institutional context is not an unfavorable one, there are still obstacles that get in the way of more fruitful partnerships, such as the low technological levels of most Brazilian firms, excessive bureaucratization of procedures in public universities and lack of academic incentives to researchers involved in knowledge transfer with the productive sector.

RC31-JS-30.1

GUIRADO NETO, JOSÉ* (University of Sao Paulo, Brazil)

The Social Movements of the Precariat

Historically, migrant labour has gone *pari passu* with changes in the global economy. Political-economic changes such as unequal and combined integration and interdependence of national economies, the facilitation of capital reallocation made possible by advances in information technology, the restructuring of production chains, have been accompanied by growing deregulation and informal labor markets and a weakening of the unions. Immigrant workers and racial minorities from different branches of the economy felt the most perverse effects of these processes. Undoubtedly, one of the most paradigmatic examples is that of garment workers.

In this sense, much has been discussed about the advancement of sweatshops in the US, UK, Eastern Europe, South America and Asia, but still too little about the existence of collectively organization of these immigrant workers in extremely adverse contexts. Based on the results obtained during our doctoral research completed in September 2019 by the University of Sao Paulo, we will discuss and compare in our presentation two experiences of political participation by Bolivian immigrants from the garment industry who took the form of "social movements from below" in the Metropolitan Region of São Paulo (Brazil) and Greater Buenos Aires (Argentina) between 2005 and 2019. Thus, we will explore what their main demands, which organizations compose their networks, what their ideological underpinnings and which strategies each one of them have been using in order to carve out a space to accommodate their interests within Brazilian and Argentine States and its civil societies. To this end, theoretically, I draw on Antonio Gramsci's conception of subordination and take the persistent and purposeful organized collective actions of subordinate groups as social movements from below.

GUIVANT, JULIA* (Federal University of Santa Catarina, Brazil)

The Cosmopolitan Turn and Low Carbon Innovations: The Case of Soy Certification

The Round Table of Responsible Soy (RTRS) includes standards aimed at controlling environmental (as well as social) problems that have been widely questioned by social movements and consumer resistance. This feature is part of the global dynamic in which the environment becomes institutionalized in a new way in the economic area. The changes in environmental governance in conditions of globalization have been widely studied. A recent view that may illuminate the analyses of RTRS comes from the theory of cosmopolitanization formulated by Ulrich Beck. Following this theory, cosmopolitan communities around low carbon technologies can be identified and may involve: 1) new transnational constellations of social actors; 2) common experiences of mediated climate threats; 3) pragmat-

ic reasoning about causal responsibilities in climate risk; and 4) possibilities for collective action, decision making and generation of international standards. In this presentation I discuss whether it will be possible to consider RTRS a cosmopolitan (following Beck's terminology) network of climate risk. In a first moment I characterize the certifications and standards mainly from the perspective of the SSS. After this, through a study of RTRS documents and field interviews, I analyse the RTRS profile, the critiques that it receives and how they are incorporated into the discourses and practices of the Round Table. Finally, I argue that the certification and standards translate many of the claims of social movements against GM soy since the 1990s, within a strategy that attempts to represent "universal" interests, such as reducing carbon emissions. As well, several of the elements of cosmopolitan communities can be identified in the RTRS proposals, constitution and operationalization. RTRS case can be seen as emblematic to understand potentialities and limitations for the emergence of cosmopolitan green innovation regimes, with possible implications for new patterns of relationship between consumption, distribution and food production.

Social and Economic Empowerment of Women through Information and Communication

Technologies (ICT): A Study of State of Haryana

The concept of female gender empowerment is common phenomena in the world. This issue got new dimension with the advancement of technology. The socio-economic empowerment of female and improvement in living standard through education and health has positive correlation. The women empowerment is the critical parameter for achieving the sustainable development goal (SDG) of gender equality.

The citizens of any country in the world mainly depend on the government services from cradle to grave. The level of services has direct impact on citizens empowerment and hence of quality of life. In India, the trust of citizens on service delivery Government institutions was at nadir, when the mode of service delivery was manual, untimely and opaque. The Centre and States Governments in the country took the challenge to improve the quality of services with the help of technology. Government of India started Mission mode projects(MMP) in Year 2006, one of the MMP was Common Service Centre (CSC).

Today in era of technology, the citizen expects services in their locality to save time and money. CSC is seen as realization of the direct and manifested will of citizens. The political leadership channelized the demand of people into effective delivery of citizen centric services in the locality of citizens.

There are Appox 10000 CSCs in Haryana and Appox 10% CSCs entrepreneurs are females. This paper aims to study the impact of common service centre on the socio and economic empowerment of women in Haryana State of India. The paper is based on primary and secondary data. Primary data was collected using technology. It highlights how technology interventions can improve the quality of life.

'respect to National Will': Populist Mobilizations in Turkey

Protests have long been the tool of the 'voiceless', those groups who does not have direct impact on the policy making processes or the policy outcomes in a local, national and/or transnational level. Recently, some developments in various settings with populist governments such as in Turkey and Hungary, showed us that not only the voiceless mobilize, but also 'the people', who has a significant role in populism. Based on the political style approach to populism (Moffit and Tormey), this paper is aimed at observing the "political theater – the manner in which populists design their visual representations (banners, posters, leaflets, etc.) and stage their public performances (marches, rallies, demonstrations)" (Kotwas and Kubik, 2018:10). To be more precise, it analyzes the public performance of populism in the form of counter-mobilization: government-led counter-mobilizations called 'Respect to National Will' organized against the popular mass Gezi Park protests in 2013 in Turkey. In order to do so, the paper employs protest event analysis method using the archives of state-owned Anadolu Agency. The finding will help us to further understand the way populism works on the streets and how it is thickened as an ideology.

GUPTA, DEVARUPA* (INTERNATIONAL INSTITUTE FOR POPULATION SCIENCES, India)

Feminization of Ageing in India

The process of ageing universally shows a greater number of older women than men in the later years of life. The percentage of 60+ population increased in the last three decades in India. The population of the elderly changed from 6.76% in 1991 to 8.58% in 2011 in the country. Females have higher life expectancy than males biologically but in India, the sex ratio is in favour of males for age groups below 60 years.

This paper assesses the phenomena of 'feminization' of ageing in India. A pictorial representation of the spatial distribution by mapping has been done. Hotspot analysis shows the clustering of the pattern of increasing aged sex ratio in the states and predicts the future patterns.

The number of states undergoing the process has increased from six in 1991, to sixteen in 2001 and seventeen in 2011. Of the total female population of the country, almost 9 percent belong to the aged population whereas the proportion that for male population of the country is about 8 percent. The sex ratio in the age group of 60 years and above shows an increasing trend over the years from 960 females per 1000 males in 1981 to 1033 females per 1000 males in 2011 with a sudden decrease in 1991 to 930 females per 1000 males. The southern and western states of the country have reached this process ahead of the others. Urban-rural disparity in sex ratio is prominent with rural parts having higher sex-ratio above sixty years. In India, sex ratio of 80+ population is 1137 females per thousand males. In 1995-99, 10.33 percent of remaining years of life among the total population had to be redistributed to have male-female equality; which increased in 2007-2011 to 12.38 percent suggesting that the gap between sexes have increased over time.

The Changing Urban Ecology of Kolkata: An Appraisal of 50 Years (1971-2011)

In India, the caste wise social stratification has always played an important role in allocation of residential space for a community. Interestingly, megacities in the country have enclaves according to economic division of population which often created fortified upper and middle-income residential and commercial enclaves excluding the poor and marginalized.

Research Question: "How has residential pattern influenced the urban ecology in Kolkata?"

The paper tries to understand the stratification of urban space and associated characteristics of the population and their access to resources by using socio-economic, demographic and housing data for Kolkata Municipal Corporation area from 1971 to 2011, as provided by the Census of India at the ward level. Factorial Ecology approach has been used to study the urban ecology of Kolkata. The data was analysed in Stata 13. Choropleth maps for the factor scores were plotted in Arc GIS.

Kolkata observed a huge influx of migrants in 1971. Settlements were extended in the southern and eastern parts of the city as 'refugee' colonies. From 1971 to 1991, more Scheduled Caste and Scheduled Tribe population were associated with primary activities with a higher social groupism and workforce composition gradient. The peripheral wards of the city had a higher score for this factor. The northern and central parts of the city relatively had higher literacy and workforce gradient. However in the last two decades there is a significant change in the workforce composition and literacy in the southern and eastern parts. Better housing conditions and better assets owned in the southern and eastern Kolkata. People engaged in primary activities shifted to other activities.

Residential segregation in Kolkata is more prolific on the social classification of caste (SC and ST) than on slum dwellings, with concentration of SC and ST population in the southern, western and eastern parts.

Ensuring Social Inclusion of Aged with Changing Reciprocal Roles in Families in India: Issues and Challenges

The shift from the agricultural society of the past to an industrialized and mechanized economy undermined the factors making for the solidarity and cohesiveness of the extended family. We have moved from multi-generational living arrangements towards a separate residence for nuclear family. The old system of family relations have disrupted and no new system of relationships have evolved. Yet the expectations and sentiments of the earlier period tended to persist although the situation in which they arose has changed. At present, there is confusion and conflict because the relation of the older and younger generation has

not been re-defined in terms of the present situation. The present paper analyses research on changing inter-generational relationships between aging parents and their children in the city of Chandigarh in India. It provides an overview of the situation and seeks answers to some of the questions such as: Should children offer an ageing parent or parents a home; what should be a moral and legal responsibility of children for the financial support of indigent parents and what, if any, should be the reciprocal roles of ageing parents and their adult married sons and daughters?

Right to Adequate Housing for Urban Poor in India: A Study of Public Housing Schemes in Chandigarh

Homelessness is usually the result of the cumulative impact of a number of factors, rather than a single cause. The dual problems of urban poverty and inadequate human settlements conditions in developing countries constitute two of the most fundamental challenges for policy-makers throughout the world. The Global Strategy for Shelter (2000) adopted by the General Assembly of the United Nations in December 1988 called for the introduction of enabling shelter strategies for facilitating the actions and potential of all participants in the shelter delivery process. SDGs in its 11th goal focused on ensuring access to adequate, safe and affordable housing and basic services and upgrade slums by 2030. In India, homelessness and inadequate housing is one of the biggest problems. Despite the global recognition of the right to adequate housing, about 13.75 million urban households i.e. 65 to 70 million people live in informal settlements as per 2011 Census of India. The Government of India had initiated various housing policies to provide adequate and affordable housing for the poor and homeless people. One of the biggest problems of planned urban development is that it is preceded by unplanned settlements of construction labour and other service providers needed for undertaking the planned development. Despite being a totally planned new city the emergence of non-plan settlements and services was an inevitable outcome of the non-integration of socio-economic planning in implementation of the Chandigarh Plan and the virtual absence of holistic housing and employment policies. The present study analyzes the implementation of various housing policies and schemes with respect to the accessibility of services and facilities for urban residents in the newly constructed public housing in Chandigarh.

Transforming RURAL Governance through Women Empowerment – a Case Study of Village Janacholi of Hathin Block, District Palwal, Haryana

Aspiring to achieve Gender equality is not only a goal, but the key factor for sustainable economic and social development. Men and women must be provided same opportunities including decision making in diverse fields to achieve a sustainable path of development. It is also important to ensure that the interests of both men and women are taken into account while allocating the resources. Innovative opportunities are needed to strengthening the capacities and to facilitate representation in policy formulation at the village level.

The development can be achieved only by strengthening the Local Self Government Institutions in both rural and urban Areas. The local self governance in India was strengthened with the initiative of 73rd and 74th Amendment Act way back in the year 1994. The enactment of these Acts empowered women socially and politically by providing reservation of 33 percent in local governance institutions. The empowered women can play a visionary role in the development of any area.

The present study is based on the primary and secondary data. It focuses on the interventions used by the lady Sarpanch at village Janacholi in Hathin block of Haryana to promote education and economic partnership of women in a backward area of the state. Further, the study highlights how an empowered woman can help in bringing about changes in the lives of the people, by using strategies to bring forward initiatives related to women's dreams, aspirations and over all development of the area.

Peasant Movements and the Latin American Left in the 2000s: Beyond the Autonomy-Cooptation Dichotomy

What has been the role of peasant movements in the resurgence of the Latin American left in the 2000s? Which factors have contributed to the rising prominence of peasant movements against neoliberalism? How have peasant movements shaped the formation of the Latin American left, and vice versa? What lessons can be drawn from the mobilization of these movements in working toward

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

a more livable world? Based on process tracing, this paper argues that the role of peasant movements in Latin America's struggle against neoliberalism has been particularly pivotal. The pivotal role of these movements was enabled in the first place by the neoliberal restructuring of the economy and the global food regime, with its effects being felt in the form of de-industrialization, the informalization of labor and the rise of global agribusiness. In reaction to these transformations, peasants expanded the target of their struggle from the landed oligarchy to a more diversified agenda around agribusiness activities, deregulation, land commodification, consumerism, autonomy, democratic participation, and health and environmental degradation. The peasant movements that have come to the forefront as a result of these transformations include the Confederation of Indigenous Nationalities of Ecuador, Brazil's Landless Workers' Movement, and the Sole Syndical Confederation of Rural Workers of Bolivia, or CSUTCB. The Zapatista Army of National Liberation (EZLN) could also be included in this category, even though its mobilization does not really coincide with the rise of the Latin American left. The EZLN will be discussed in this paper in terms of its relationships with Mexico's MORENA government. Important questions that beg for answers are: (a) whether these movements have been co-opted and eventually demobilized through so-called postneoliberal welfare policies offered by left-wing governments, and (b) whether autonomist strategies refusing to engage with the state have achieved tangible results against neoliberalism.

El Conflicto Por La Tierra: Bloque En El Poder, Violencia Paramilitar y Criminalización De La Resistencia En Colombia

Esta ponencia busca retratar las relaciones entre la consolidación del paramilitarismo en Colombia y su relación con las dinámicas de acumulación por desposesión en los departamentos del Cauca y del Cesar. A partir de tres trabajos de campo: la emergencia de movimientos armados en la década de 1970, la violencia paramilitar en el Cesar y la consolidación de mecanismos de despojo de los territorios indígenas en la implementación del acuerdo de paz en el Norte del Cauca; proponemos un análisis de la violencia paramilitar de las últimas décadas desde un enfoque de más larga duración. Buscamos demostrar cómo el surgimiento y la cohesión del bloque de poder contrainsurgente ha constituido un factor decisivo en la configuración del conflicto armado interno, que en el marco de la llamada "guerra por los recursos" ha dinamizado los procesos de concentración de la propiedad de la tierra.

Profundizaremos en el análisis de coyunturas históricas en los que se han gestado alianzas entre élites políticas y económicas, que les han permitido establecer mecanismos de control territorial, políticos y sociales, claves en el afianzamiento actual tanto de la explotación económica del territorio como del despliegue de la violencia estatal y paraestatal desde, por lo menos, mediados del siglo XX. Así, buscamos proponer una analítica de la violencia y del conflicto armado basada en una perspectiva multinivel, que nos permitirá dilucidar las relaciones entre las élites locales y nacionales, y la reproducción de la doctrina anti-comunista norteamericana, como fundamento del bloque de poder contrainsurgente, elemento *sine qua non* tiene lugar la pretendida legitimación de la persecución sistemática de grupos políticos y movimientos sociales, considerados como una amenaza para el mantenimiento del status-quo. Asimismo analizaremos los diferentes procesos de resistencia organizada y de lucha por la recuperación de las tierras por parte del movimiento indígena y campesino.

Mestizaje and White Skin. an Intersectional Approach with Mexico City´s Youth

One of the central themes of Mexico's national identity is mestizaje. The mestizaje refers to the fact that the nation is the result of the Spanish and Indigenous fusion that began in 1521. It has been taken up as a policy of integration in the nation-building stage and through its educational policies since the middle of the twentieth century. The mestizaje has also been the policy to integrate and assimilate the native indigenous populations. Mestizaje seen as a cultural and racial fusion has resulted in Mexicans identifying themselves as mestizos. In this paper I will present some results derived from a survey with an intersectional approach to 1200 young people, as well as 40 in-depth interviews. The survey targets women and men of three age groups, including ethnic and racial markers, in the metropolitan area of Mexico City. The importance attributed to skin color will be discussed. Using a catalog of faces with different skin colors, the results show that the vast majority claim to have lighter skin. The paper discusses that the

self-perception of having lighter skin is a strategy to resist racism and discrimination, avoiding being identified only as indigenous originals. Being only indigenous in Mexico is a profound disadvantage. Therefore, the mestizo self-perception as a fusion seeks to show the validity of the European cultural and/or racial influence linked to the white phenotype.

GUTIERREZ CHONG, NATIVIDAD* (Universidad Nacional Autonoma de Mexico, Mexico)

Races and Ethnicities in the Urban Youth of the Metropolitan Area of the Valley of Mexico. New Results of an Intersectional Analysis

Mestizaje, race mixing, is a policy of cultural and racial integration. Policy and philosophy that has been the support of nation-building. The preponderance of mestizaje in the national life has caused that the studies on the importance of race have been minimized in spite of the open exclusion and discrimination by racial criteria as they are the color of the skin or the phenotypes. In recent years, research has been carried out with the purpose of measuring the influence of race and skin color among the population, and censuses have included ethnic markers such as language or self-ascription. These results have led to new avenues to learn more about Mexico's ethnic and racial diversity. However, the use of racial criteria is problematic in a society with diverse ethnic groups of indigenous origin. My discussion proposal derives from the results of an in-depth survey and interviews applied to young people with diverse racial and ethnic identities in Mexico City. The racial criterion cannot be studied in isolation, so that ethnicity, age and descent indicators are used in a complementary manner generating a proposal for intersectional analysis. It will be discussed that the intersectionality of youth is correlated with skin color and socioeconomic income, likewise, it will be emphasized that the ethnic origin of young people with light skin color is a new variant in studies on race, ethnicity and racism.

GUTIERREZ CROCCO, FRANCISCA* (Universidad Alberto Hurtado, Chile)

Neopaternalism: The Threat to New Forms of Labour Participation in Latin America.

In response to workers' mobilizations in the 1970s, capitalism was forced to refine its control mechanisms at the workplace. In order to boost productivity and ensure talents, a new type of human resource management (HRM) emerged, which emphasized the commitment and participation of workers in decision-making processes. Whether these forms of participation have improved democracy in the workplace and workers' well-being, remains a key topic in the academic debate.

Developed mainly in Western Europe and the United States, the HRM approach to workers' participation has recently been applied in some companies in Latin America. Yet, there is a dearth of scholarly attention on the particularities of the implementation of this HRM style in the region.

This paper presents the results of a case study that included interviews to managers and union officers, analysis of corporate and administrative documents in 10 large Chilean companies. It shows that companies in recent years have introduced new individual and collective spaces for workers. However, this change has not overcome the paternalism that traditionally has characterized employer-employee relations in Latin America. Companies continue to infantilize workers and control their decisions, albeit through much more subtle mechanisms than in the past. The paper analyzes this "neopaternalism", its expressions and implications for workers and democracy at the workplace.

Forced Migration of Kashmiri Pandits, Abrogation of Article 370 and 35(A)and Its Impact on the Life of Dogra Population

Migration has been at the centre of all the civilizations, since the time immemorial. Many migrated out of their place of birth and got attracted to new destinations because of Globalization, Urbanization and changes in the Socio-economic conditions, while for many others it was forced upon them either by the natural calamity or by the local masses looking forward to bring about a change in the demography of the region by getting involved in the act of Ethnic cleansing. Jammu region has been defined by an English traveler named Foster as, "hospitable, productive and peaceful". The foundation of this society was heterogeneous but as far as spirit and culture is concerned its nature was homogeneous. This paper will attempt to focus on the forced displacement of Kashmiri Pandits from their

land of Origin, the circumstances that led to their fleeing overnight from the Valley, removal of special status(article 370) and its overall impact on the life of local inhabitants of Jammu region i.e. Dogra population.

Further, it will try to discuss the effect on this insurgency on economic opportunities of local people, its influence on the local culture and most importantly it bearing on the individuality with the focus on identity crisis. Two distinct types of methodologies will be employed in collecting information for this study. Firstly, collection of secondary data will be done with respect to the issue of internal displacement of Kashmiri Pandits with in the state, the reports of repercussions or local discontent, if any reported, from the articles. This data will be further enhanced by adding set of data collected from 50 people by developing a structured schedule.

Inclusiveness Among Health Professionals in the Era of Globalization: A Case Study of Nurses in Surat, India

Increasing diversification amongst the societies of developing world is a result of the forces of globalization. This diversity has taken over the institutions of these societies, particularly the health care system and its professional groups. The profession of nurse was confined to the women of Christian background and failed to attract the women of other communities in India due to rigidness of its social structure and an entirely new occupational category developed in the context of western societies. In this paper, focus will also be laid on understating the historical significance of the stigma attached to this profession in Indian context, in order to develop better understanding of the low status that has so far been associated with this profession. However, in post-independence era with the growth of modern education and with high demand of the health care personnel in the Middle-East countries in the era of globalization the phenomenon of stratum mobility took place and as a result, women from other religious groups also joined the profession of nursing within and outside the country thereby making it more inclusive. The present paper makes an attempt to understand the process of inclusiveness among health professionals specifically focusing on nursing industry in an industrial as well as well-known Migrant city of Western India, Surat by administering an interview schedule on a purposive sample (N=50) in private as well as public hospitals of Surat, in terms of the motivating factors to join the profession, their demographic as well as socio economic background.

Multigenerational Social Mobility of Migrants' Descendants in Western European and of Non-Migrants in Turkey

Intergenerational social mobility is widely regarded as an indicator of equal opportunity within societies and hence has generated a huge volume of research. Recent studies have extended the analysis of transmission between parents and children to take account of grandparents' social class. However, applying the theory and application of social mobility analysis to the occupational pathways of migrants and their descendants poses both theoretical and methodological challenges. Social mobility experienced among the children of migrants can be understood as consequent on the impact of migration and of the destination context, which may either enhance or reduce occupational success. But social mobility may also reflect pre-migration resources and attainment, including family (grandparental) resources. The ability to take account of pre-migration position could therefore illuminate the mechanisms of migrants' mobility outcomes. While studies of intergenerational mobility among migrants and their offspring within destination countries are increasing, we rarely know how such patterns relate to migrants' pre-migration social position and compare with non-migrants; and research incorporating grandparental characteristics is scarce.

This paper extends research on migration and social mobility by asking: Do migrants and their descendants achieve greater upward social mobility than their non-migrant counterparts? How far are patterns of mobility shaped by grandparental as well as parental education and occupation? It demonstrates the potential for enhancing our understanding of European patterns of migrant (im)mobility with reference to the origin country. It does so through exploiting the multi-generational multi-site 2000 Families data, which includes information about 20,000 Turkish-origin adults in Western Europe and Turkey. Preliminary findings show that migrants were already more likely to be socially mobile before they migrated, compared to those who never left Turkey. Conversely, we find that social reproduction is stronger among non-migrants. We reflect on the implications of our findings.

Women Entrepreneurs: New Ideas, Old Practice

This study explores the genderial reasoning and motivation of middle and upper middle class women who chose to become entrepreneurs. One line of current research perceives women entrepreneurship as reflecting the equal and entrepreneur practices of women within the new labor market, while another line examines gender difference, and demonstrate that women entrepreneurship is less related to choice and entrepreneurship but serves as occupational alternative that allows women to fill their traditional occupations. By employing mixed methods of both quantitative and qualitative approaches we study the relationship between the number of children and their age and the entrepreneurial patterns and timing of middle and upper middle class women, and thus analyze the genderial motivation and reasoning of 70 entrepreneur women from Israel. Our findings suggest that although highly professional, well- educated middle and upper middle class women become entrepreneur, they also limit their businesses to female-type occupation. Moreover, becoming an entrepreneur is significantly related to their parental stage (number of children and their age).

By limiting their business operation, middle and upper-middle class women reproduce traditional gender roles, and reinforce the traditional perception that the main role of the Israeli woman is to be a mother. This study points out then, the ways whereby women entrepreneurship serves as a social practice that reinforces gender hierarchy and social order.

Social Protests and the Inclusive Turn in Latin American Social Policy

How and when do protests influence social policy? Latin America remains the most unequal region in the world despite a long history of welfare state development. The first social protection schemes were circumscribed to a small number of politically influential groups, but a progressive turn towards more inclusive social policies in the 2000s has extended coverage to low-income households, informal and rural workers. Comparative analyses of social policy expansion in Latin America highlight the importance of political factors such as democratic legacies and left party involvement, but several case studies have also observed an effect of social mobilizations routinely used by citizens to express their discontent and influence governments. This paper applies a two-step qualitative comparative analysis (QCA) to analyze the determinants of universalistic social policies in 18 Latin American countries (2000-2015) taking into account protests, electoral politics and socio-economic institutions. It focuses on two policies – conditional cash transfers and social pensions –which typically target outsiders, i.e. individuals out of formal employment and not covered by contributory social insurance. Our findings show that both protests and left-wing parties in government have in different contexts fostered the expansion of policies for outsiders in the region.

HAAS, Oded* (Faculty of Environmental Studies, York University, Canada)

Beyond the Housing Crisis: Transformations in Israel's Housing Regime and in Palestinian 'sumud'.

Major transformations in Israel's centralised planning system have been attempting to address an unprecedented public demand for 'affordable' housing and for 'equitable' treatment of the state's centre and periphery: since 2014, a new planning mechanism has been enabling the government to bypass checks and balances for the purpose of increasing privatised supply in the housing market. As the country's landscape is rapidly changing, these new planning laws are being criticised for their undemocratic framework as well as for facilitating ineffective urban planning and housing design. This paper suggests that privatisation and 'bad' planning are not merely results of a local response to the global 'housing crisis'. Rather, like in past articulations of the Zionist housing regime, the new planning mechanism is designed, inter alia, for colonial control over Palestinian citizens of Israel.

Specifically, current manifestations of housing planning, design and even struggle – as strikingly evident in the project of the 'new Arab city' Tantour – are instrumentalised to counter the Palestinian praxis of Sumud, which refers to remaining on the land and being resilient in face of displacement and dispossession. Thus, looking at the relationship between the Jewish state and its Palestinian citizens through the perspective of housing regime, current neoliberal solutions to a 'crisis' can be understood as both colonial tools as well as opportunities for anti-colonial resistance.

Global Dynamics and Local Interactions? Shaping Alternative Visions in Land Conflicts in Argentina

In the wake of global crises and structural transformations, growing land acquisitions by (foreign) investors, land grabbing, can be observed – also in Argentina. These are aimed at implementing large-scale raw materials and infrastructure projects, or the mining or cultivation of mineral, fossil and agricultural resources. Consequently, land conflicts involving parts of the indigenous Mapuche population and movement have intensified, causing the actors involved to adapt and renegotiate their positions and strategies. How do Mapuche communities construct alternative visions of the future? During my research stay in Argentina in 2019, I investigate this question empirically through methods of qualitative social research. Results show that the Mapuche struggle for a way of life that is constantly re-establishing the harmony with the environment, therefore, proclaiming the Buen Vivir (Good Living) as a guiding concept. The Good Living understood as an alternative concept to the capitalist and (neo)extractivist model deepened by the state in the name of progress and development, focusing on alternative pathways to sustainable post-development. Also, as an alternative to individualism, emphasizing a community-based living. Therefore, this vision of the future is closely related to identity construction, as the Mapuche cosmovision is practiced collectively, requiring community life tied to their ancestral territory. In consequence, the (re)occupation of ancestral land is crucial for the political, economic and spiritual process of rebuilding the Mapuche nation. They emphasize their identity as a nation and claim the transformation towards a pluri-national state. The analysis indicates that it is decisive for their utopia to be built, to dissolve the idea of progress that goes beyond development, or as an alternative to development by constructing a post-capitalist society. As this contradicts the state's development strategy and global dynamics, land conflicts are characterized by escalating conflict contexts.

HADJ-MOUSSA, RATIBA* (York University, Canada)

Thinking the Relationships between Political Expression and the Everyday (Algeria)

For decades Maghreb societies were apprehended by social sciences as societies that were dominated by political institutions with a blatant absence of their populations. With the advent of the Tunisian Revolution, these interpretations shifted to the analysis of more mondain Maghrebi peoples' actions. While a solid theorization has still to be developed, this paper reflects on the Algerian situation of the last twenty years. On one hand, it questions past political conceptualizations on the region, and on the other hand, it documents the ways in which the everyday becomes one of the most significant angle to comprehend the news citizenship affirmations. In doing so, the paper will reflect on the political claims and alternative types of 'organizing' based on small acts, 'ordinary indifference

and defiance', as well as new communication networking. In addition, the notion of street will be assessed as a fluid terrain in which and around which the everyday evolves and transforms and enrich the views on the common goods. Finally, with this paper we wish to contribute to the debates about the significance of the everyday and the ordinary in the making of citizenship and the political in non-democratic contexts.

HAGEN, MALFRID IRENE* (Independent researcher, Norway)

Political Art Activists in the Past and Present Time

The well recognised Norwegian artist Per Kleiva (1933-2017) was one of the front figures of the Norwegian art activist group Gras in the late 1960s and early 1970s. These artists, who mainly worked within graphic art, were engaged in a variety of political problems both in Norway and global. For example the Vietnam War, the military coup in Chile in 1973, the cold war and threats of a potential nuclear war, pollution and environmental damage. They expressed their protests through their art, many of them by using printing techniques inspired by Pop art such as serigraphy. The most iconic serigraphic print of Per Kleiva is American Butterfliesfrom 1971, showing American war helicopters over Vietnam, applied with butterfly wings. In this paper, I discuss these Norwegian art activists in the perspective of a broader tradition of artists as political activists, as well as the political conditions and movements of the current period. An interesting aspect of the political movements and art activists of the 60s and 70s is that they were also predicting several consequences of future pollution and environmental damage at a time when few politicians were sincerely concerned about these problems, which are on top of the political agenda in many countries today. Finally I also look at how art activism appears in contemporary art while we are approaching 2020, seeking to explore; what are the main issues of the art activists today?

HAGEN, MALFRID IRENE* (Independent researcher, Norway)

The Significance of Art, Design & Architecture; Aesthetic Experience and Perception

The art critic, artist and pedagogue John Ruskin (1819-1900) believed that art was an important way of learning, as well as an aesthetical school environment was important to stimulate the ability of children to learn. A similar belief appear in my examination of 12 corporate art collections, and the architecture of 12 headquarters in four countries (Hagen, 2011), as the most pronounced objectives for collecting art and emphasize the headquarters architecture, was to increase the wellbeing and creativity of the employees. In this paper I discuss how disciplines within art, design and architecture may have significant influence on peoples lives in two ways. First through practical experiences with these and related subjects at school, and secondly through the perception of art, design and architecture in their everyday life, whether this is at home, at school or at work. In accordance with Bourdieu, learning art subjects at school is crucial for children from families with low art interest and cultural capital. In general, there may be no doubt that practical art subjects at school may influence children in a positive way, and create creative, aesthetical and emotional encounters. Professional artists may have similar experiences. At work, many corporate collectors tell that they emphasize the knowledge value of art, and offer art courses for employees, believing that art knowledge increase wellbeing and encourage creativity. Many employees confirm their own experiences of these expected positive effects, although some also mention negative effects, as some artworks become a burden. While Rosanna Martorella claims that we do not know much about the actual ability of art to encourage creativity, Dag Østerberg claims that architecture may appear as a relief or a burden, depending on our cultural knowledge. Thorstein Veblen (1857-1929) also emphasize the meaning of cultural knowledge.

The Public Prosecutor's Service of South America in a Comparative Analysis with Brazil

The Public Prosecution Service is an important institution in the organization of modern republics for proposing criminal action. However, their functions may exceed this premise according to their structure in each country. The object of study of this research is the Public Prosecution Service of South America, especially in the following countries: Argentina, Brazil, Chile, Uruguay, Paraguay, Peru, Colombia and Ecuador. In the methodology, we used the comparative method and the documentary analysis of the South American Constitutions and Public Prosecution laws. The objective of the paper is to observe among the South American Public Prosecutor's Office which would be the most independent of other powers (Judiciary, Executive and Legislative), and compare their attributions and mode of operation. The countries chosen for the research have in common the geographical location (South America) and both have new Constitutions (after 1988) as Brazil. In this context, we seek to map a comparative of the organization and independence of the Public Prosecution Service of these countries (Argentina, Brazil, Chile, Uruguay, Paraguay, Peru, Colombia and Ecuador) and Brazil, highlighting the particularities of performance and organizational hierarchy in each one. As a result, we can point out that among all the countries studied, the Brazilian Public Prosecution Service is the most independent, both institutionally and from the perspective of its prosecutors. This analysis helps to rethink the role of the Brazilian Public Prosecution Service and its degree of Independence in our democracy.

Worldviews of Australia's Generation Z (AGZ): Negotiating Religion, Sexuality and Diversity

This paper reports on a recently completed ARC-funded project, conducted jointly by researchers from the Australian National University, Deakin University and Monash University. The **Worldviews of Australia's Generation Z** (AGZ) study explores young Australian's attitudes to religion, sexuality and diversity across all three sectors of public, Catholic and independent schools. The research team conducted 11 focus groups with teens across Australia, a nationally representative survey of 1200, 13 to 18-year-olds, and 30 in-depth interviews with survey participants. We argue that understanding young people's worldviews, and their perceptions of diverse worldviews, can enhance and inform debate about how education assists or impedes interreligious understanding. We will present an overview of the AGZ study findings, and consider the implications they have for teaching about diverse worldviews and religious literacy in Australia.

Making Religious Identity through the Media Use: The Case of Christian Minorities in Poland

The paper draws on sociological research on constructing and negotiating the minority Christian identity in the context of mediatization. It focuses on the use of media by two minorities of various denominational backgrounds, various ethnic composition and various histories of presence on the Polish territory: the Seventh-Day Adventist Church and the Polish Autocephalous Orthodox Church.

The paper draws on in-depth interviews with media specialists from the two Churches (press, radio and TV editors, webmasters, etc.) and it approaches the issue of public presence of religion in Poland from two angles. On the one hand, the public presence refers to religious minorities: the paper discusses efforts by the two Churches to make their voice be heard by the broader Polish audience. These efforts involve adjusting the media message to the expectations of the audience and strongly rely on specific (personal, material) resources available to the minorities. On the other hand, the public presence is about the dominant Church: the paper discusses the minority Churches' efforts to challenge the hegemony of the Roman Catholic Church (RCC) in Poland, that is, not only the RCC's dominance in the public space, but also the RCC's privileged position in the domain of state law and policies and the widely shared societal belief about the strong link between the Roman Catholic and the Polish identity.

The contextual factors suggested above, such as power relations involving religion or (im)possibilities to draw on various forms of capital, translate into constant negotiation and transformation of the studied minorities' identity in the discursive field. The paper highlights the processual nature of the minority religious identity construction in the times of mediatization.

Healthcare Professionals' Reasoning Around Racism in Swedish Healthcare

This research explores the reasoning of 57 healthcare professionals, from various professions and ethnicities, around racism in Swedish healthcare. The research is situated within a context of racial denial that dominates the public discourse in Sweden. While racism is generally considered inadmissible in Sweden, experiences of racism remain largely unacknowledged and are mostly considered as deviant individual acts driven by prejudice rather than systematic racism. This denial of racism and of Sweden's racial history is part of the general (self) image of Sweden as a progressive welfare state and of Swedes as egalitarians. Research suggests that denial of the existence of racism acts as a barrier that discourages individuals from making claims of racism. The denial of racism is exacerbated in healthcare settings as healthcare is ideally based on values of non-maleficence and solidarity. Hence, racism can be denied behind a curtain of healthcare neutrality indicated by scientific rationality and discussed as lack of cultural competency. Studying how healthcare professionals reason around racism is a way to examine how racism continues to be reproduced within a context of racial denial. Our interviews show that racism is discussed along two levels of denial; proximal and distal denial. Proximal denial implies a direct defense mechanism where racism is readily denied, and or normalized and trivialized. This proximal denial was based on a fear of being labelled as victims or perpetuators of racism. Distal denial implies that healthcare professionals while acknowledging the existence of racism in healthcare, positioned themselves as observers of racism and through doing so positioned themselves as antiracists. When racism was acknowledged, healthcare professionals attempted to separate themselves from the politics of racism and showed little reflection on their own role in racialization processes. This implies that the responsibility of racism belongs to another domain and is left unexamined.

Ignorance Production As the Epistemic Project of the New Global Right: The Discourse on 'Gender Ideology'

Global right populism has engaged into a 'cultural war' against ideas such as 'cultural marxism', 'globalism' and 'gender ideology'. This cultural war rests on a apparent paradox: on the one hand, it represents an alternative epistemic project of knowledge and truth production to justify the dismantling of social policies related to inclusion and inequality reduction; on the other, it rests on a form of agnotology, or the cultural production and distribution of ignorance. The paradox is dissolved once one takes into account that ignorance is not merely the absence of knowledge, but can also refer to the active production of doubt or uncertainty central to knowledge itself. By focusing on the discourse of 'gender ideology', I illustrate how right wing populism has engaged into agnotology practices by capturing and distorting an academic concept whose meaning is deeply antithetical to their populist counterpart.

La Percepción De Movilidad Social De Los Estudiantes En La Licenciatura: ¿Se Estrecha o Ensancha?

En este trabajo, tomando como referencia las encuesta realizadas a estudiantes, al inicio y en el último año de tres carreras universitarias diferentes y de seis distintas instituciones, se intenta una primera exploración sobre su percepción de movilidad subjetiva, para saber sí se estrecha o se ensancha la oportunidad de aspirar a una mejor posición social. La movilidad social se entiende como el cambio de posición en la distribución social y económica de una sociedad dada (Vélez et al., 2012). Partimos de que el rol de estudiante universitario se acompaña de la emergencia de un nuevo sistema de aspiraciones, que la educación superior es una de las llaves que abre el acceso a la movilidad social, que concluir la licenciatura representa un logro académico y que la capacidad de aspiración de futuro -que es la distancia entre lo que se tiene y se quiere- cambia en distintos momentos. La percepción cambia con la experiencia, de acuerdo a la teoría sobre la Eficiencia para Mantener la Inequidad (EMI) de Lucas (2001), cuando se satura la posibilidad de lograr moverse a una posición mejor, se introducen nuevos criterios diferenciadores que operan para discriminar y se mantenga la desigualdad. Es decir, uno se queda en ese mismo rango social a pesar de los esfuerzos para lograr ascender, pues se añaden requisitos cualitativos que obstaculizan

el ascenso como la experiencia de trabajo, la internacionalización o demostrar liderazgo. La exploración busca contrastar la percepción de movilidad social de los estudiantes al inicio y al final de su carrera de acuerdo al tipo de universidad (de alto o medio desarrollo académico) en lo concerniente a sí advierten criterios diferenciadores que estrechen o ensanchen sus oportunidades de aspirar a una mejor posición social en lo personal, lo laboral y en lo económico.

(Re)Producing the Meaning of Domestic Work in the 'Middle Space': The Case of Transnational Migration Brokerage in Sri Lanka

Brokerage is a universal phenomenon in the contemporary political economy of domestic care. Positioned in the *middle space*, between migrant domestic workers and their home/host states, migration brokerage largely (re)shapes and (re)conditions the making and trading of domestic work in the global care market. Migration brokerage therefore offers critical lens through which to reconsider the shifting meaning of domestic work in the global care market. This paper is an attempt to explore and understand this: Based on my field research in Sri Lanka, a key home country for domestic work to the Middle East, first, this paper will analyze the migration brokerage process and practices associated with domestic work, which will give an overall picture of the workings of migration brokerage in the Sri Lankan context. In the second part, this paper will try to understand the ways in which the migration brokerage process and practices aid and/or inhibit migrant domestic work and thus how critical (or not) it is for migrant domestic workers to navigate and explore the complex and austere Middle Eastern migration regime. The third part of the paper will delineate how domestic work is (re)defined and (re)constructed by the mediating practices at the juncture of its engagements of facilitation and limitation. In conclusion, this paper will argue that the meaning of domestic work tended to oscillate between 'work' (*real* work) and 'non-work' (*not so real* work), which was embedded in the precarization and a concurrent valuing and de-valuing of domestic work by the migration brokers. Domestic work was attached a stronger affective (emotional) valence rather than an economic importance, which (re)affirmed the conventional conception of domestic work in the private.

The Dialectic of Freedom of Religious Practice of Youth People in Morocco : Between Political Coercion and Cultural and Religious Pluralism.

Some Moroccan Christian activists created a YouTube channel and posted videos making their presence known, claiming to be a religious minority standing up for their full rights as citizens.

This is being widely seen as a huge behavioral shift inside a religious community outside of Sunni Malikite Islam. This video is the first instance of Christian discontent with social and societal considerations ever witnessed in Morocco. There have been a few notable exceptions in other parts of the region, such as so-called "Brother Rachid," host of an evangelical Christian television program in Europe, who has been very vocal in the media about his conversion from Islam to Christianity.

Just how many Christians in Morocco share the feelings expressed in the video is hard to determine in a country where 99% of the population is Sunni Muslim.

As a result, the annual report from the U.S. State Department on human rights in Morocco remains one of the few reliable statistical perspectives available to track this issue. The 2014 report estimated the Jewish population, primarily seniors, at 3000 -4000 nationals, 2500 of them based in Casablanca alone, with the remainder living across the country. The same report placed the number of Moroccan Christians at 4000, most of them ethnic Amazigh, who practice their religion in churches. Some estimates count the number of Moroccan Christian churchgoers at 8000. According to the report, there are also 400 Baha'is, 8000 Shiite Muslims .

The question that frames this paper is why many youth Moroccans changed islam to Christian religion?how they defends their rights as a citizen in a contry refuse that?

The paper invokes qualitative method (based on interview and observatory's participation).parallel with this,this paper relies on the method of "case study",region of rabat(capital of Morocco) and casa blanca (economic capital of Morocco)

Legitimate Educational Inequalities. Conceptions and Expectation of Middle Classes in Germany and Chile about Educational Justice.

Following neoliberal developments, we notice an enormous increase in inportance of education. Assuming the premise of equal opportunities and with its claim of meritocracy, education system promises social mobility depending on individual achievement. Thus, education may be the main principle to legitimate social inequalities.

The neoliberal order of economy, state and privacy with its central principles of competition, freedom as well as individual responsibility already obtained the education system in many countries. Chile with its persistent neoliberal education system since military dictatorship may be classified as the 'prototype' of it and has caused mass protests for almost 15 years. In Germany, neoliberal developments are noticed since 1990. But unlike Chile, the German educational policy with its patchy reforms, seems to rushing-headlong which often cause conflicts, too and manifest in petitions or in turning away from public school system.

Issues in educational policy attract attention primarily to heterogeneous middle classes, because under neoliberalism, education is essential for their social reproduction more than ever. Also techniques of social distinction is gaining more significance due to the constant educational expansion.

Concepts of justice as a human construction and in this case, as main value to evaluate the education system may help to understand the different conflicts and political debates about a fair procedure in education system and therefore distributive justice of education.

The theoretical conception of education as a field of struggle between different private stakeholders with competing interests and their influence on educational policy is analyzed according to Bourdieu, by means of guided expert interviews with different political actors, like Think Thanks, NGOs, teacher associations etc. Additionally, group discussions with parents from different middle classes were conducted to understand the issues of separation and integration, equality and excellence in education system and the question: "Is education a public job or individual responsibility?".

Recovery to Replacement Level Is Possible? Fertility Development of Japan Since 2005

Around 2005, the upturn of TFR has been observed in many developed countries and the "End of 'Lowest-Low' Fertility?" was speculated. Within ten years, Japan's TFR recovered from 1.26 at bottom (2005) to 1.45(2015). This study focused on the fertility development of Japan since 2005, to clarify if this trend shows recovery to replacement level of fertility or not. A Lexis diagram indicates the shift of relatively high fertility from young to upper ages. It occurred since 1975 and at the same time the fertility distribution trends to be leveled and its peak is lowered. The TFR under 29 is decreasing and TFR over 30 is increasing. This trend continues unchanged until today. The upturn happened, when the TFR over 30 caught up and over the TFR under 29 around 2005.This timing shift was related by increasing mean age at first marriage since 1974. The extending average years at school after age 15 causes a timing shift with delayed start for match making process with a partner. The four-years delay has changed the distribution of age specific first marriage rates, from an early pattern with high peak, left skew and narrow range, to late pattern with low peak, right skew and wide range. As a result, the cumulative first marriage rate grows too slowly and cannot reach high level at the end of reproductive period. It increases the unmarried rate at 50 years old and shift the mean age of first birth to later age. This increases again the childlessness rate. The same effect was confirmed in the second and higher births order. The probability of multiparity is diminishing. The model estimation indicated 1.78 as the maximum level of TFR in 2016, which is less than the replacement level of fertility 2.08.

HARRING, DANA* (Rosenheim Technical University, Germany)
SCHUTTER, SABINA (Rosenheim University of Applied Sciences, Germany)

Children's (Non-)Participation in Research: Ethical Implications

In sociologial childhood studies children are regarded as „active (co-)constructors" (James & Prout, 1990) of their social world. Throughout the last years, they are more and more included in research concerning questions about their lives and living environments. (Bollig & Kelle, 2014) This can be considered as a positive development towards fulfilling children's rights and the recognition of children's agency (James & Prout, 1990; Convention on the Rights of the Child, 1990).

However, research with children is considered to bear specific ethical implications (Andresen & Seddig, 2014; Gerarts, 2015; Graham, Powell, Taylor, Anderson, & Fitzgerald, 2013). A main focus of the ethical discourse is children's ability of giv-

ing informed consent about the research and the consequences of participating in it (Dockett & Perry, 2011). Legally, parents have to agree for their child, but can also refrain from participation. Apart from legal constraints, leaving parents the (sole) decision of participation, is a reproducing a generational power imbalance (Eßer & Sitter, 2018; Graham et al., 2013). The academic discussion about children's ability to give informed consent on their participation in research is again an expression of generational order, as research with vulnerable groups of adults requires the same considerations.

Additionally, other gatekeepers have to be kept in mind: e.g. teachers, ECEC staff. Those different steps a researcher has to take to inform the children about the research display a bottleneck influencing on the constitution of childhood in social science (Flewitt, 2005). The antinomy of children being interested in participating, with their parents refusing their consent and vice versa is illustrated with insights from an ethnographic research project on children's well-being in flexible day care. In this paper ethical considerations concerning research with children (as an example of vulnerable groups) and the impact on the study design and data collection will be discussed.

Challenged or Resilient? Exploring Medical Authority between Doctors and Patients

Medical authority can be understood as patients' willingness to follow professional advice without questioning its rationality, status or legitimacy. It is related to both professional status and social closure, but as suggested by Starr, it essentially rests upon the perceived 'legitimate complexity' of medical problems and expertise. Many speculate that medical authority is currently being challenged due to the democratization of knowledge through social media and the internet as well as linked to critical debates about the efficiency of medical treatment such as vaccines. However, we know relatively little about how medical authority is negotiated or contested between physicians and patients, and how the public critiques of medical authority may influence professional work at the frontline. We also do not know whether medical authority is challenged by or resilient towards increased marketization and governance reforms with emphasis on patient rights. Finally, critical debates about the moral habitus of the medical profession and industry may lead patients to see doctors as self-interested and with increased scepticism.

In light of these challenges, this paper asks: What is the status of medical authority in meetings between doctors and patients? Are doctors increasingly being contested about the evidence and legitimacy behind their diagnoses and treatment of patients? Or is medical authority resilient to the challenges and simply express itself differently faced withcurrent challenges? We explore these questions using both a quantitative survey with 1.700 Danish citizens as well as qualitative interviews with 20 general practitioners and 20 patients. By combining survey data with interviews from both sides of the physician's desk, we hope to develop a richer understanding of how medical authority is negotiated in contemporary professional practice. What makes patients willing to accept or contest medical advice, and what strategies do general practitioners use to approach or persuade patients driven by medical skepticism?

HARTMANN, ANNA* (, Brazil)

The Social Construction of the Efficacy of Drug Addiction Treatment in Alcoholics Anonymous (AA) and Narcotics Anonymous (NA) in São Paulo and Its Relation to Medical and Psychological Representations

Given that Alcoholics Anonymous (AA) and Narcotics Anonymous (NA) are self-help and mutual help institutions to drug addicts whose stated goal is to promote the recovery of their members, but that their treatment success is, while advocated by the institutions, an open question in scientific literature, my research investigates how efficacy of treatment in AA and NA is socially constructed. The empirical reference of the research will be both articles from medical and psychological fields that deal with the efficacy of this treatment and two units of these institutions located in downtown São Paulo, AA Santa Cecília and NA Campos Elíseos. The research aims to answer the following specific questions: 1) What are AA and NA members' representations of the efficacy of this treatment? 2) What are the scientific representations of this treatment's efficacy? 3) What are the representations presented by the members about the scientific representations? To this end, I will first analyze representations in scientific articles that deal with the issue of efficacy published in the last 10 years in English and Portuguese, then conduct semi-structured interviews with members. The interviews will initially focus on members' representations of treatment efficacy, then on what are the representations members believe medical literature and psychology have about the treatment, and lastly, I will succinctly inform members about the results of the analysis of the scientific representations and ask how they respond to them.

The bet here is to understand from a sociological approach influenced by phenomenological authors, especially Peter Berger, Thomas Luckmann and José de Souza Martins, how a specific reality — members' belief in the efficacy of their treatment — is socially constructed; in other words, not to attest its veracity but to understand how it relates to scientific literature as another social construction.

Brics Towards a Common Future: China and Brazil Youth Environmental Values

In the context of Risk Society (Beck, 1986) and in the face of current environmental challenges, it is crucial to consider the Youth as the center of the discussion of the future development of society, especially as the BRICS concentrate more than 40% of the World Youth. The Youth is considered an important actor with high susceptibility of changing their behavior guided by environmental consciousness and they can also become multipliers of new practices (Collings & Hitchings, 2012).

This research focuses on the environmental values of the Youth in China and Brazil investigating the profile of young university students and their perception and willingness to adopt a "green behavior". The analyzed data is part of the first Sino-Brazilian survey in Social Sciences entitled Jovens Universitários em um Mundo em Transformação: uma pesquisa sino-brasileira (2016) that researched the perceptions and values of young university students in China and Brazil. This research will contribute not only to shedding light on important issues experienced by the Youth and their environmental values (Dwyer, 2016; Nakano, Sposito, Chen, 2016), but also point to possibilities of dialogue between the two societies that could lead to the construction of a common future.

In view of the challenges Climate Change and Global Warming bring about for all of humanity, we believe that research in developing countries is of great importance. Especially research on BRICS' Youth, that will have a key role in solving current and future adaptation strategies is thus believed to be of extreme importance. Understanding local perceptions of global issues such as the ones presented here are another key point for discussion, as common challenges demand joint responses and a collaborative approach (Ferreira, 2017). In a globalized world, only bringing different perspectives and experiences together can assure an inclusive and sustainable development.

Intergenerational Dependency & the Role of Family: Brazil, China and India Discussion and Comparative Perspectives

Cultural aspects make comparisons between BRICS countries challenging as all five countries are in very different phases of the Demographic Transition. Building on the experience of Western European countries, the Demographic Transition theory must be criticized and understood according to the historical context of each country for comprehending its association with processes like economic development, industrialization and urbanization. Changes in mortality and fertility incur changes in the age structure of the population. Such changes lead to new dependency relationships between the three major age groups: children, adults and the elderly. As life expectancy increases, the relative weight of older age groups will progressively expand and demand special care. Aging is a demographic phenomenon with major social implications, which should be considered from the perspective of social rights and the organization of family structure. The theorists of the Reflexive Modernity believed that an important issue regarding the transition to modernity is the trust in institutions, where the centrality of the Family - a traditional institution of First Modernity - was expected to lose importance through the process. Contrary to Beck's belief however, it continued to be an important and highly reliable institution in Brazil, China and India, according to the World Value Survey. Even though these three countries present characteristics of modernization as the Demographic Transition, it was developed within the particularities of the concept of the family, different from the traditional European concept that has been guiding contemporary sociological and demographic research. Sociology, to become a more inclusive discipline that correspond to reality has to consider and compare narratives and experiences from the Global South (Connell, 2007). Understanding the development of intergenerational dependency in BRICS contexts is only possible as we comprehend the concept of family from the perspectives of these countries.

Anti-Coal Movements in Japan: Issues, Actors, and Collaborations

Following the Fukushima nuclear accident, the use of coal-fired power plants has become a contested issue in Japan. This paper examines the pros and cons of coal-fired power plants on international, national, and local levels based on the analysis of news reports and participatory observation. In 2012, there were 50 new coal-fired power plants planned for construction. Among them, 13 projects were cancelled or converted to wood-based biofuel plants, and 13 plants were built and were operational. What caused Japan to rapidly invest in coal energy? Power companies and the Japanese government are forcing a decision between "nuclear or coal." The Ministry of Economy, Trade and Industry (METI) and power companies have been reluctant to promote renewable energy as they seek to uphold the monopolized position of current energy producers. The anti-nuclear sides prefer renewable energy resources, whereas the pro-nuclear factions prefer nuclear or coal energy. For many years, Japanese nongovernmental organizations (NGOs) have protested nuclear energy but ignored coal energy. The current Abe Cabinet, METI, and power companies want to export nuclear and coal energy to developing countries such as Indonesia, India, and Turkey. Three case studies of plans for coal-fired plants are examined in this paper. Each plan has been sued by local citizens; hence, the reasons behind these local protests, problems with the operations, and reactions of the companies, local government, and Ministry of the Environment are also studied. This paper also investigates the major supporters of local citizens and the collaboration between various actors, such as international and national NGOs, scholars, and lawyers. Lastly, this paper evaluates the social impact of these protests on the energy transition process in Japan.

Informal Multigenerational Care within Mixed Legal Status Families: The Case of Senior Iranian Women in Canada

This paper analyzes the work of informal multigenerational care within mixed-legal status families by looking at the experiences of senior Iranian women, who immigrated to Canada through the "Parent and Grandparent Sponsorship Program." This study brings into conversation scholarship on non-citizenship with the literature on gender and migration by considering how non-citizenship, a dynamic, relational process (Blomeraad 2018; Landolt and Goldring 2015), interacts with gender and generational power relations to shape the work of care in immigrant families. Through the case of senior Iranian women, the paper specifically asks, what are the negotiations that precarious non-citizen women in mixed status families engage in, with other family members, over the division of informal care work at home? My analysis draws from semi-structured, in-depth interviews with 20 senior Iranian women, who have been sponsored by their children and have lived in Toronto for at least 5 years. I conceptualize the mixed status family as a site consisting of tensions and solidarities through which migrants can negotiate rights yet also experience constraints (Luibhéid, et al., 2018; Rodriguez, 2016; Schueths 2012). The study shows how members of mixed status families engage in negotiations and develop strategies, sometimes as individuals in conflict with one another and sometimes as a unit, to access citizenship rights including the right to care (Creese et al., 2008; Espiritu, 2003; Goldring and Landolt, 2013; Menjivar, 2003). This study shows how migration policies that tie an immigrant's entry and presence in the country to a sponsoring family member interact with gendered household strategies to shape these immigrant women's experiences. The study contributes to broader discussions around non-citizenship that show how the erosion of citizenship is increasingly extended not only to noncitizens but also to citizens and permanent resident and can have long term effects for broader social inequalities in Canada.

HASLBERGER, MATTHIAS* (University of Oxford, United Kingdom)

Back to Square One: The Upgrading Nature of Technological Change

Many labor economists argue that recent technological change is routine-biased, leading to the loss of middle-wage jobs and a polarization of the employment distribution. However, the finding of pervasive polarization has rarely been replicated outside the US and the UK and has been met with scepticism by economic sociologists. This paper adopts a comparative approach and shows that routine-intensive occupations tend to be concentrated at the bottom, not in the middle, of the occupational hierarchy, and that it is occupational complexity, rather than routine intensity, that best predicts occupational employment changes in EU and OECD countries. As a consequence, there is no pattern of widespread polarization. Simple descriptive statistics, as well as shift-share and regression analyses, all support the older hypothesis that technological change is predominantly upgrading over the recent polarization argument.

My paper also makes several methodological contributions to the literature: firstly, I provide the hitherto largest dataset of ISCO-88 2-digit occupational employment shares based on the Luxembourg Income Study database, covering the period since 1980. Secondly, I introduce novel occupational task measures which, as I show, better capture the theoretical concepts of occupational complexity and routine intensity. This illustrates the benefits of a more sociologically informed understanding of processes of technological and occupational change.

Overall, my findings directly contradict the argument made by labor economists that routine-intensive occupations around the middle of the wage distribution are suffering technological displacement. Instead, we're back at square one: technological change turns out to be predominantly skill-biased and therefore upgrading.

Meditating for a Better Self? Buddhism and Therapy in Japan

"There is no right and wrong way of practicing mindfulness." – This is an often-repeated phrase within the global post-modern mindfulness movement. It is commonly accepted from within the community that the way you choose to practice mindfulness may not be the way others would choose for their own practice. The practice itself is described as highly individually.

However, whereas mindfulness teachers tend to emphasize this nonexistence of right and wrong in practicing mindfulness, some tend to distinguish between right and wrong in *understanding* mindfulness. This notion of differentiation is then often linked to Buddhist ethics and aims to criticize the incorporation of "mindfulness" in spheres of the military or the corporate world.

This paper will address the complex relationships between Buddhism, therapy, and the corporate world in Japan – especially with regard to collective debates. Among others, the following questions will be addressed: Who are the actors of mindfulness in Japan? Which strategies are used by mindfulness teachers to gain legitimacy? Which (moral) values are ascribed to practitioners of mindfulness in the post-secular age?

Políticas De Seguridad En La Argentina Post-Crisis: Entre La Institucionalización Política, La Militarizacion y Los Derechos Humanos

En esta presentación presento un análisis de los desarrollos en las políticas de seguridad nacional desde 2001 a la actualidad, tomando a la política de seguridad como un espacio de disputas por prioridades, definiciones y componentes legítimos . Analizo en particular como la re-conformación del espacio política con posterioridad a la crisis de 2001 y sus mutaciones centrales impactó en los cambiantes contenidos de la política de seguridad. Destaco en particular las cambiantes orientaciones hacia la institucionalidad estatal en el gobierno nacional, como así también los componentes de información, policiales, militares y de protección de derechos que fueron propuestos, disputados y diferencialmente institucionalizados en el período. El análisis es parte de un trabajo comparativo de largo plazo, donde se analiza la evolucion de las políticas de seguridad desde el inicio de la democracia en Argentina y Chile. El análisis se basa en analisis de documentos y entrevistas con actores expertos, políticos y burocráticos.

Social Policy Interdependencies

Social policy research has a long tradition of comparative studies. But despite this transnational focus social policy interdependencies have so far not been systematically analyzed. Whereas a large body of research looks into trade relationships or military alliances, the network of social policy relations between nation states and between nation states and international organizations has received much less scholarly attention.

The goal of this paper is to present a first global analysis of the multiplex network of social policy relations between the countries of the world. We analyzes the structure of relationships that is created through bi-lateral social policy agreements, social policy related financial transfers (esp. remittances and development assistance for health) and compares this to interdependencies in other areas. The aim is to analyze whether strong connections in the field of social policy correspond to strong connections in economic and political relations or whether social policy relations are governed by other, field-specific logics.

The paper bases its analysis on data collected within the CRC 1342 "Global Dynamics of Social Policy" at the University of Bremen.

Asians in Brazilian Racial Relations: From Model Minority to Antiracist Solidarity

The ideology of "racial democracy" continues to play a role in the contemporary clashes of Brazilian racial relations. The racialized and minoritarian place of Asian Brazilians is often instrumentally used as an empirical evidence of this racial ideology. In 2017, journalist Rachel Scheherazade posted a photo on her social media supposedly explaining "why Asians do not require quotas to enter Brazilian universities." Between the lines, one can read that a poor racial minority had risen socially through the effort, without government aid. *

But a critical trend towards the ideology of "racial democracy", mobilized by black movements since at least the 1970s, has gained strong repercussions in recent decades. One of its consequences is the racial quotas system for entry into universities and public service careers. This new trend already affects the Asian-Brazilian population as well: part of this population critically reflects on their specific role as a non-white and non-black category in Brazilian racial oppression. This debate is developed by different organizations (Oriente-se, Yoo Ban Boo, Lotus, Perigo Amarelo, Asiáticos pela Diversidade), with different approaches, but with the experience of being Asian Brazilians as a common feature. A peculiarity of these organizations is the alliance of people from different Asian ethnic origins (Japanese, Okinawan, Chinese, Taiwanese, etc.) into the same "Yellow" or "Asian-Brazilian" racial category. It is an unprecedented formation in Brazilian racial relations. In this presentation, I would like to analyze these two facets of the Asian presence in contemporary Brazilian racial relations: on the one hand, as a "model minority" underpinning the ideology of "racial democracy"; on the other hand, as an effort to build an antiracist solidarity.

Schooling and Social Mobility of Japanese Brazilians: High Selectivity and Positional Advantage

In this presentation, I analyze the role of schooling in the social mobility of the Japanese-Brazilian population in Brazil. Following Beltrão et al. (2008), I identify this population in the statistics by selecting foreigners of Japanese nationality and Brazilians declaring "yellow" as their race/color – excluding households with non-Japanese foreigners. In a first step, I compare the schooling of Japanese immigrants before coming to Brazil (based on statistics from the Japanese government and from the 1958 Japanese-Brazilian community census) with the schooling of the rest of Brazilian population. I want to demonstrate the presence of high selectivity, as described by Lee and Zhou (2015), that is, the average schooling level of the migrant group is higher than that of the host country. Even if this schooling as a human capital does not necessarily imply better jobs immediately after immigration, this higher average of schooling tends to be reproduced (status attainment model) or even expanded in the subsequent generations – enhancing the positional advantage.

In a second step, I analyze then the more concrete impact of schooling on the upward social mobility (as reflected in income and occupational status) of the second generation group (children of Japanese immigrants). Attending Brazilian public schools since the beginning of the mass migration in 1908 (long before the school expansion in Brazil), my intention is to record with more precision the great positional advantage of this group in terms of schooling and hence income and occupational status. The most detailed analysis of this phenomenon will be carried out based on the census of 1960, 1980, 1991 and 2000 (no information on race/color for 1970).

Regulating Race, Banning Intimacy: Polygyny, French Identity and Postcolonial Troubles

This paper examines how regulating polygyny as forbidden in France depends on an imagined French family that is white, heterosexual, and ostensibly monogamous. While defining and regulating family has been central to French national identity, it is France's colonial past and postcolonial present that shapes its relationship to forbidden intimacies and therefore to normative sexual and family life. Republican universalism, the belief in an abstract concept of citizenship that transcends cultural and historical difference, shapes how French law has dealt with polygyny, at times in a frenetic manner. I uncover how an insistence on the uniformity of legislation—that polygyny no longer exists in France after being

banned in 1993—leads to fundamental contradictions in France's alleged refusal to recognize group-specific cultural rights, whether customary or religious. While nationally, France upholds an image of having eradicated polygyny, at the administrative level, it struggles to deal with an issue whose existence continues. France's indecisive relationship to postcolonial migration, and the fact that its Republican universalism cannot recognize the racialized status of migrants from western and northern Africa, shapes the construction of the boundaries between forbidden and normative intimacies. In other words, the refusal to recognize race and/or racial discrimination propels the delicate dance around the inconsistencies of France's colonial past and how it defines forbidden intimacy. The paper analyzes current legislation in France that regulates sexuality and family in terms of race.

The Temporal Consequences of Wealth. the Case of a Comparison of 'Rich' and 'Poor' in the UK

Research in sociology, social psychology and economics has drawn connections between individuals' economic resources and their ability to project themselves into the future, delay gratification and engage in time discounting behavior, respectively. This paper addresses the consequences of wealth for people's ability to project themselves into the future. Drawing on the literatures of economic inequality and new economic sociology we theorize a temporal contrast between experiencing money in the form of wealth (and income) or income alone. Based on a comparison of qualitative interviews with 'rich' and 'poor' participants living in London, we argue that the 'rich's' experience of money as enduring wealth (stock) facilitates long-term orientations, while the 'poor's' experience of money as predominantly fleeting income (flow) constrains orientation to the future. Our findings corroborate existing research establishing that the 'poor' are restricted to short-term perspectives of making ends meet, while the 'rich' can engage in long-term wealth accumulation strategies. They can affect future generations and build dynasties. Our findings of the ways in which wealth relates to individuals' orientations to the future contributes to our understanding of how economic inequality is sustained over time.

Adaptive Dynamics in the Nexus of Practices and General Understandings: Examples from the Evolution of Sustainable Consumption

Since the beginning of the 2000s the practice turn has evolved as a new approach in social theory and methodology. Within this paradigm, practices are the fundamental unit of analysis and effort has been made to understand the dynamics of practices as 'dependent variables'. More recently, we have seen increasing focus on how practices change and can be changed to be more sustainable. However, despite recent advances in practice theory, there are still important questions related to how practices relate to social change across scale and time. The interlinkages between change in culture and everyday life are of increasing importance in the common goal to cope with the grand global challenges. In this paper we use sustainable consumption as a case through which we contribute to the discussion on the practice-theoretical concept of *general understandings* (GU) and the ways in which this concept can be usefully applied in studying the transition to more sustainable practices. In this endeavour, we introduce the concept of *adaptation work* and ask, how is, and should, sustainable transition be accounted for in practice theory? In probing this question we use substantive examples from studies on consumption and consumer culture to develop a threefold typology of adaptive practices based on their adaptive potential between general understandings and practices. We suggest that 1) translations of meaning, 2) social reorganisations and 3) material transformations are of particular importance in the dynamics between GU and sustainable consumption practices. Our conclusion is that understanding sustainable transition requires an analysis of the dynamics of how adaptive practices constitute a necessary mechanism between GU and practices that may enable and contribute to changes across scale and time. Future studies on change in sustainable consumption should therefore focus on identifying and develop the understanding and the potential in such adaptive practices.

Digital Vs. Analogue Ways of Gaining Record Linkage Consent

The combination of data from different sources offers many benefits. For the German study "Life courses and pension provisions" (Lebensverläufe und Altersvorsorge; LeA), extensive survey data on life courses and pension provisions in different pension schemes are linked with administrative data from the respondents' individual state pension accounts. Because of the strict data protection rules in Germany, every respondent is required to explicitly consent to the data linkage; otherwise, the administrative data may not be extracted and linked to the survey data. In practice, this means the respondents need to sign a consent form during the interview, which is a lot to ask from respondents who have already consented to take part in a lengthy survey. For the first time, LeA alternatively provided the respondents with an electronic consent form implemented in the CAPI questionnaire, thereby considerably reducing the burden on the respondents of filling in, signing and sending off the form. Actually, more than 90% of the consenters made use of the digital form.

The proposed paper will report the record linkage consent rates for specific sub-groups of the population and their use of the digital consent form (compared to the analogue paper form), e.g. older and younger people, women and men, Germans and migrants, employees and civil servants. To further examine socio-demographic characteristics of digital consenters, we estimate a multivariate logit model. Due to high rates of digital consent in LeA, we do not expect bigger differences. Nevertheless, the results will show for which socio-demographic groups digital forms are more or less the method of choice and for which groups analogue methods of gaining record linkage consent are still important to avoid selectivity in the record linkage process.

Producing Havana's Digital Revolution

This presentation considers the ramifications of the so-called Digital Revolution in Havana, Cuba. Based on fieldwork and online observations, we study urban transformation as experienced by a group of social media influencers and street artists in Havana. The onset of Cuba's Digital Revolution, which has developed in three stages—the launching of cyber parks in 2015, Internet access on phones in 2018, and private Wifi and router imports in 2019—opened a new space for citizens to present online narratives of urban transformation on a daily basis. At the same time, a group of street artists began displaying visual statements expressing their personal viewpoints on local and global affairs.

The state-led expansion of Internet access has for the first time provided Cuban citizenry mass access to the Internet, allowing for negotiating the impact that such access has on people's understanding of societal change and personal mobility on national and transnational levels. By juxtaposing online experiences with visual statements in public space, we demonstrate the ways in which various groups of people appropriate the Digital Revolution for their own purposes. The social media influencers produce their own narratives and images of the city, while the street artists move beyond place-based art and claim a stake in glocal street art communities.

The availability of Internet connectivity prompts important questions regarding individual and collective agency, distribution of and access to information, and sites to be un/seen. By mapping quotidian experiences, this presentation offers a discussion of the theoretical and practical implications of the Digital Revolution, exposing it as a contradictory site with multiple linkages between the online and on-site transformations underway in Havana. The where and how of the Digital Revolution reveals multiple un/intended consequences related to urban transformation, spatial mobilities, and everyday politics, with implicit and explicit quests for visual agency.

Democratic Community Engagement in Eco System Management – the Experience from Sri Lanka in North Central Province

Geographically, Sri Lanka comprise of a dry zone which covers 70% off the land area in the island. Historically, there were man-made tanks which were built to hold the water during dry seasons, these man-made tank cascade systems covered a large area, enabling farmers to continue rain fed agriculture during any season. Without small scale irrigation, farmers in the dry zone in Sri Lanka we will not be able to cope with the increasing intensity and frequency of droughts and attain food security. Approximately 18000 man-made ponds and tanks in the dry zone are classified as 'abandoned' or need repairs.

Traditionally, there was a well-organized self-governing mechanism on managing village irrigation system which was led by the village community leaders with full support of beneficiary communities. That system functioned well up to 1818 until British captured Sri Lanka. Later, due to negligence of colonial period, vast number of cascades in the dry zone were abandoned and disremembered over time and gradually the system was paralyzed. The indigenous irrigation management system entailing with transparency, participation, collective decision making and implementation on a voluntary basis. However, effectiveness of the historical tanks and cascade management system were recognized by different parties.

Therefore, number of initiatives taken by government, donor agencies, civil society organization, farmer communities is to work to reactivate the traditional participatory governing system on irrigation management. This paper shared is based on action research conducted in the dry zone district in Sri Lanka to reestablish local participatory eco system management with active stakeholder engagement.

Conceptual and Methodological Reflections from Science Novels on the Autonomy and Social Responsibility of Science

My Ph.D. dissertation seeks to contribute to the debates on the relationship between science and modern society by examining the cultural differences in the conceptions of the autonomy and social responsibility of science as they are manifested in a corpus of science novels from the U.S., Germany, and India. These novels can constitute an apt epistemic offer for sociological thinking, because they depict narratives which are directly or indirectly concerned with aspects of the autonomy and the social responsibility of science and, ideally, allude to actual cultural and institutional configurations in each science system. In order to work out the relevant topics of the novels from a sociological standpoint, my methodological approach combines a close reading with qualitative data analysis.

The purpose of my contribution to this roundtable is to discuss the conceptual and methodological framework of my thesis. In line with this, it starts with a short theoretical outline of the autonomy and social responsibility of science. The second step is to propose how science novels due to their narrative character can be different and nevertheless fruitful starting points to look upon science as a social system than more usual approaches to the social studies of science. The third step is to sketch an analytical approach to science novels from a sociological perspective that is informed by theories of functional differentiation and social action. The fourth and final part of the presentation demonstrates in brief how the results of this analysis might be utilized as a sociological lens for further reflection on corresponding facets in the respective science systems of each society.

Understandings of Scientific Autonomy and the Societal Responsibility of Science in Science Novels from Three National Variants of the Culture of Modernity

This presentation is based on a project that examines the cultural differences in the conceptions of the autonomy and responsibility of science as they are manifested in science novels from the U.S., Germany and India. The idea of an autonomous science has become an integral element of the culture of modernity. That culture of modernity is, however, not uniform. Instead, it has several distinct societal variants that are connected to key ideas of modernity. This is well documented for the basic idea of individual and collective freedom, and it is plausible to assume that it applies to sphere-specific freedoms and responsibilities, i.e. in the field of science, as well.

From a sociological perspective that is informed by theories of functional differentiation of modernity, the project compares the ways that scientific autonomy and science's societal responsibility are treated in the novels from the U.S. and Germany, and whether scientific autonomy endangered by societal forces such as the economy or politics is stressed over scientific autonomy endangering other societal spheres and the individual's conduct of life. In a second step, science novels that are written by Indian authors and set in India are included in the comparison in order to assess how and in what form, in the wake of the subsequent formation of multiple and connected modernities, these allegedly western-based notions of scientific freedom appear in the context of a non-Western modern culture.

The presentation attempts to show how science novels can constitute an apt perspective to exemplify cultural and institutional aspects of science in 'classic' and 'late' modernity. Its focus is to utilize some of the insights gained from these narratives as an epistemic offer for social-theoretical explanations that reflect on the 'post-truth' climate in many contemporary societies.

Entrants to Brazilian Higher Education in 2014: A Longitudinal Analysis of Students Retetion in the System

In the last thirty years the enrollment fee in Brazilian higher education went from 1.5 to 8.3 million. The dropout phenomenon followed the rise of the tertiary system in the country, since more than half of the students don't graduate at the predicted time. The dropout or withdrawal can be analyzed according to the career, the institution, and the higher education system as a whole. Studies indicate that various reasons can cause the departure decision, and it may express strategic choices, lack of social and academic integration, as well as socioeconomic difficulties. This research aims to identify and describe the higher education dropout phenomenon, focusing at the cohort of entrants in the year of 2014 (N=2,886,138). A longitudinal study following the students retention between the years of 2014 and 2017 in the Brazilian higher education system has been done, using the database available by the Censo da Educação Superior (higher education census). We highlight the subsequent results: 1) 65% of the entrant were found at the system during 4 years, 19% graduated at the period, 14% was no longer at the higher education system in 2017, and 2% left between 2015 and 2016 but resumed by 2017; 2) men left proportionally more at the analyzed cohort, as well as the students arriving from public high school; 3) public higher education institutions retained a bigger proportion of students when compared with the private ones, especially for-profit institutions. Finally, we found that the dropout phenomenon in higher education, when the whole system is considered, presents distinct characteristics from the dropout study according to the career or institution. These specificities should be considered at the researches about withdrawal, efficiency, dropout and retention in higher education.

The CRC @ 30: Violence Against Children in the Caribbean

In 2019, we celebrate the 30th anniversary of the adoption of the Convention of the Rights of the Child (CRC), by the United Nations. This paper examines the protection rights of children in the Caribbean. Using primary and secondary data, the author examines the progress made to adhere to the protection rights set out in the CRC. The paper focusses on Haiti and Jamaica as examples of countries of different levels of development. The data analyses revealed that while there has been some legislative progress made to protect children in both countries; children remain at risk of violence in public and private spaces. The paper also examines the violence that children mete out to their peers and to themselves. Jamaican and Haitian children live in environments of high levels of violence at home, school and in the community. Children in poorer families, urban poor communities and crime-prone rural areas are more likely to be exposed to and be victims of high levels of violence. For example, corporal punishment at home remains culturally acceptable in both countries. Thirty years after the adoption of the CRC, hundreds of children do not enjoy the benefits of protected and safe environments as mandated by the CRC. Cultural change, active implementation of several policies and programmes, swift justice and legislative reform are needed to ensure the fulfillment of protection rights of the children in the Caribbean.

Social Capital Effects on Temporary Employment Status: Focusing on Immigrant Husbands in South Korea

Immigrant wives' economic adaptation in Korea has been studied extensively in multiple dimensions, while employment security of immigrant husbands has not been fully examined, even if they are more likely to have a job than female immigrants. This study aims to reveal how social capital is associated with the employment status of male immigrants, an important component of structural integration. We attempt to test bridging and bonding capital effects on male immigrant husband's secure employment. A multiple logistic regression model was fit to predict the odds of the temporary employment status among immigrant husbands with social capital variables including co-ethnic network and inter-ethnic network indices and participation in co-ethnic, local, and religious gathering, using the dataset from the National Survey of Multicultural Families 2015. Results suggest that participation in gathering with Koreans or having a larger network with Koreans is negatively associated with temporary employment. Interestingly, having obtained the current job through either Koreans or co-ethnics lead to higher odds of temporary employment caeteris paribus. We bring attention to male immigrants as members of society who can be easily ignored by the public and everyday dimensions. Governmental programs and services should be designed with consideration to bridging capital to foster an environment where immigrant husbands can build up social networks with Koreans. Meanwhile obtaining a job through an informal channel can place male immigrant spouses in vulnerable positions.

EL Futuro DEL Trabajo Profesional O EL Trabajo DEL Futuro PARA LOS Profesionales EN Tiempos De ¿Post-Capitalismo? // the Future of Professional Work or the Professional Work in the Future in Times of Postcapitalism?

Los cambios acelerados en los procesos sociales de trabajo están directamente vinculados con las transformaciones del capitalismo en esta fase globalizada y líquida (Baumann, 2003), dentro de la lógica del moderno sistema mundial (Wallerstein, 1979), que está mutando aceleradamente hacia alguna clase de modelo postcapitalista, aún sin definirse claramente.

Existen numerosas evidencias de cambios en la estructura productiva y social, que algunos autores han caracterizado como "capitalismo cognitivo" (Vercellone, 2009, entre otros) y otros han comenzado a hablar de postcapitalismo (Mason, 2016), mientras que ya se habían planteado visiones de una nueva realidad donde el orden global se concibe como un Imperio con una Multitud que lo pone en jaque (Hardt y Negri, 2001).

Lo que este trabajo se propone realizar es analizar estas situaciones en el contexto de las modificaciones que supone la emergencia de trabajos profesionales globalizados, particularizando en América Latina

----

Accelerated changes in social work processes are directly linked to the transformations of capitalism in this globalized and liquid phase (Baumann, 2003), within the logic of the modern world system (Wallerstein, 1979), which is mutating accelerated towards some kind of post-capitalist model, even if it is not clearly defined.

There is numerous evidence of changes in the productive and social structure, which some authors have characterized as "cognitive capitalism" (Vercellone, 2009, among others) and others have begun to talk about post-capitalism (Mason, 2016), while that visions of a new reality had already been raised where the global order is conceived as an Empire with a Multitude that puts it in check (Hardt and Negri, 2001).

What this work intends to do is to analyze these situations in the context of the changes involved in the emergence of globalized professional work, particularizing in América Latina

La Formación De Las Fuerzas De Seguridad En Argentina: ¿Hubo Impacto De La "Seguridad Democrática"? // the Formation of Security Forces in Argentina: Was There an Impact of "Democratic Security"?

Argentina tiene cuatro fuerzas de seguridad federales, que dependen orgánicamente del Ministerio de Seguridad, creado en 2010. El análisis de este trabajo se centrará en ellas, si bien existen veinticuatro policías provinciales más, una por provincia.

En cada una de las fuerzas existían distintas situaciones con respecto a cómo se formaban los agentes. Por supuesto, todas habían desarrollado instituciones educativas para la formación de los aspirantes a oficiales y suboficiales de las fuerzas y, en algún caso, cursos de formación y/o entrenamiento para los agentes rasos.

En particular, en este trabajo se buscará describir y analizar los esfuerzos de mejoramiento de la calidad de la formación de los agentes de las fuerzas de seguridad, a partir de la creación de instituciones universitarias específicas para cada una de las fuerzas y la obligatoriedad del paso de todos los futuros agentes por distintas instancias educativas dependientes de los institutos universitarios de las fuerzas de seguridad.

Argentina has four federal security forces that depend organically on the Ministry of Security, created in 2010. The analysis of this paper will be centered in these federal forces, despite Argentina has twenty-four more police corps, one by each province.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

This fact, assumes different kinds of situations regarding selection and training agents of each of them. Of course, all had developed educational institutions for the training of candidates for officers and non-commissioned officers of the forces and, in some cases, courses of training or training for rank-and-file agents.

This work will be searched to describe and analyze the efforts of improving the quality of training of the agents of the security forces, the creation of institutions specific to each of the forces and the obligatory nature of the passage of all future staff by different educational dependent instances of the university institutes of the security forces.

HERNANDES, EURÍDICE* (DIREITO FGV, Brazil)

The State Regulation to Make Consumers Behavior More Sustainable: A Case Study of Plastic Bags Prohibition in São Paulo

The present work aims to analyze the prohibition of plastic bags in São Paulo, to assess if the State's regulatory activity can influence a change on citizens' mindsets towards a more sustainable consumption. The idea is to verify how the interaction between the State, citizens and companies can contribute to the transformation of cities into an "ecologically balanced environment", linked to the fulfillment of the United Nations Sustainable Development Goals (SDGs).

From a legal perspective of state action at local level, it is pointed out the possibility of government interference in economic activity in order to shape consumption behaviors. In the present case, initially the objective was to suppress the distribution of plastic bags in commercial establishments; however, during the legislative process the initial design was eventually relaxed, allowing plastic bags that had at least 51% of the material from a renewable source. Nonetheless, it is noteworthy that these authorized bags have become a means of awareness about the local solid waste policy - a relevant public policy to deal with the garbage problem in a metropolis such as São Paulo.

Thus, Law 15.374 / 2011 - SP is perceived as an initial legal effort to make São Paulo rethink the way it deals with plastic consumption; acting as a window of opportunity for other unsustainable habits to be questioned. The case also highlighted the legislative action as a gate for the process of building an ecologically balanced environment, managing to galvanize not only the State, but also civil society and business. One arrangement that corroborates with the SDG logic, which emphasizes that achieving sustainable development necessarily entails an articulated action between citizens, companies and government at their different levels.

HERNANDEZ GUTIERREZ, JULIA* (University of Louvain, Belgium)

Institutional Nightmare: Humiliation and Bureaucratic Complications As Practical Barriers of Citizen's Access to Health and Justice Rights in Mexico

From an empirical research about the experience of citizens when requesting rights related to health and justice in Mexico, it was found that the real access to these rights is conditioned by Mexican public institutions on the fact that individuals have to "fight" for them, on enduring mistreatment and humiliation provoked by public employees (as doctors or advocates), and on overcoming bureaucratic obstacles that are not always justified. In other words, some elements that explain the gap between the theory and the practice of fundamental rights in Mexico, at least in the case of health and the access to justice, are the complex bureaucratic barriers that are imposed between a citizen and his or her rights, as well as the humiliating, rude and intolerant treatment present in public hospitals or in justice agencies. These elements, as manifestations of "institutional violence", can discourage a common citizen with health issues or being a victim of a crime in his/her seek of medical care or justice. These findings can contribute to explain why these rights are recognized in Mexico by law but, in the experience of an ordinary citizen who approaches certain institutions, the distance to access them is conceived as impossible to overcome, and that is why only a few citizens, accompanied by experts and having more resources that allow them to resist institutional violence, are capable in practice of making their rights fulfilled.

HERRERA, JEANIE* (Universidad de San Carlos de Guatemala, Guatemala)

Confianza y Políticas Sociales Para La Reducción De La Pobreza: Una Mirada Desde Las Mujeres Guatemaltecas

La pobreza es un problema de carácter estructural que condiciona el desarrollo integral de la persona, cuyo impacto puede repercutir entre generaciones. En Guatemala, al igual que en diversos países de América Latina, se han impulsado estrategias orientadas a la reducción de la pobreza y pobreza extrema, especialmente en el marco de cumplimiento de compromisos internacionales. Se presenta un análisis de la política social en Guatemala y los principales programas sociales implementados para la reducción de la pobreza. Para el efecto, se reconstruye la evolución histórica de las estrategias de protección social en el país, identificando aquellas que se han mantenido en el tiempo, y el impacto de las mismas en la reducción de la pobreza y pobreza extrema, así como en el cumplimiento de los compromisos nacionales e internacionales de desarrollo. En ese marco, se analiza desde la sociología de los cuerpos y emociones, la relación entre el accionar estatal, la confianza en las instituciones públicas y los principales mecanismos de soportabilidad social y prácticas del sentir desde la mirada de las mujeres (beneficiarias de los programas de transferencias condicionadas), consideradas por el Estado poblaciones en condiciones de vulnerabilidad social.

HERRERA LEIGHTON, ANAIS* (Universidad de Chile, Chile)
MENESES RIVAS, FRANCISCO JAVIER (Universidad de Chile, Chile)

Buen Clima En El Aula: Un Camino Hacia La Tolerancia.

Uno de los pilares fundamentales de los derechos humanos es la igualdad entre las personas y el derecho a no ser discriminado por raza, género, etnia, orientación sexual ni otra condición. Sin embargo, este derecho aún no es garantizado en todas las democracias, siendo expresión de ello los crímenes de odio, los altos niveles de discriminación y la elección democrática de presidentes con discursos de odio. En este contexto urge la intervención del Estado en los niveles de intolerancia, siendo la escuela un espacio idóneo para ello. En la investigación sobre actitudes tolerantes algunos autores se han centrado en características individuales, evidenciando que las mujeres y los hijos de personas con mayor estatus ocupacional, capital cultural y/o nivel educativo poseen una actitud más positiva. Otros estudios han analizado la asociación positiva entre tolerancia y algunas características de la escuela, como el clima escolar y las discusiones en el aula. En consideración de estos aportes, este estudio busca evaluar qué características de la escuela son capaces de disminuir las diferencias entre distintos alumnos respecto a sus niveles de tolerancia, para encontrar medidas que se puedan aplicar como política pública para fomentar ciudadanos más respetuosos por la diversidad. Con este objetivo, se utilizaron los datos del estudio ICCS (2016) correspondientes a Chile, que incorporan 5.081 estudiantes de 8°grado anidados en 178 escuelas, y se estimaron modelos de regresión multinivel con interacciones y pendientes aleatorias. Se concluye que un buen clima en el aula (i.e. buenas relaciones profesor-estudiante y entre estudiantes) es capaz de disminuir la diferencia en la tolerancia entre hombres y mujeres (aumentando la tolerancia de los hombres) y que, tanto la actitud de los estudiantes de la escuela hacia la tolerancia, como la apertura a la discusión en el aula, poseen una asociación positiva y significativa con la tolerancia.

HERRERA-USAGRE, MANUEL* (Pablo de Olavide University,)
MARQUES-PERALES, ILDEFONSO (Universidad de Sevilla, Spain)

Dropping out and Going Back: The Effect of Social Origins, Family Circumstances, Previous Educational Choices on School Transitions in Spain

There is a large body of literature addressing the impact of different class, family circumstances on educational choices (Boudon 1974; Breen and Jonsson 2000;

Haveman et al. 1991; Jæger and Holm 2012; Lindemann and Gangl 2019). For decades, the Mare model (Mare 1981) offered one of the most comprehensive and successful methodological approaches to the literature on family background and educational trajectories. Analyzing the effects of time-varying characteristics of individuals, families and institutions, as children and adolescents move through school (Mare 2006), Mare et al. empirically demonstrated how educational attainment should be seen as a process rather a single fact. However, the use of binomial logistic regression was recently questioned (Holm andJæger 2011) and other models have been suggested. Applied to a large Spanish longitudinal data set of the youth population, this study tests a multinomial model of educational and work careers that takes previous paths, parental education and a set of family stress event and situation that the students have recently experienced. Results show that, firstly, parents' tertiary education affects more in early transition points than in the transitions to higher education. Secondly, family stress situations, such as serious family conflicts, births, deaths or severe diseases, as well as economic stress situations, such as family bankruptcy, job losses or parents' long term unemployment, may significantly affect educational trajectories of Spanish youth. Thirdly, there are differences in the way that those situations affect young men and women. The results give some support to the hypothesis that origin effects should be seen as a dynamic multi-dimensional phenomenon rather than a single and static situation as just taking only parents' incomes, as well as educational and class attainment into account is.

Field of Power and New Symbolic Market in Post-Dictatorship Brazil: The Performance of Social Scientists

The analysis of the configuration of a new market for symbolic goods, constituted after the end of the military dictatorship in Brazil, structures the broader research theses that have been developed and that will permeate this paper. The results of three different investigations will be presented:

1. The role of social scientists in the elaboration of the concept of university in the period and its social function;

2. The performance of academic elites in the area of social sciences in the sphere of state;

3. The expansion of legitimization circuits of social scientists and their performance in non-state networks.

These different forms of action of social scientists in Brazilian society demonstrate changes in the composition of the career in confluence with the reconfiguration of the field of power and the state in that period. These aspects are referred to as distinct ways of understanding the role of the scientist and the degree of autonomy he has when participating in the definition of society and the legitimate form of his organization.

An aspect to be emphasized is that the symbolic market in relation to the performance of the academic suffers a displacement to other spaces: from centered on the state to circuits of legitimization of civil society in a broad sense. If the scientist was accused of participating in the things of the state, giving answers and directions to the social directions, he starts to be impelled to act in institutions of multiple formats (private research institutes, foundations, policy-making centers, Think Tanks, non-governmental organizations). What is of analytical interest in this variation is how the practice of the scientist begins to be shaped by the symbolic meaning attributed by the field of power, which begins to discredit the state organization in favor of the idea of the market as 'social modernization' to be instituted.

HIGGINS, KATIE* (University of Sheffield, United Kingdom)

'the Manchester Man': Wealth Elites in North-West England

Outside of London, north-west England reportedly has the second largest concentration of wealth elites in the UK (Hennig & Dorling, 2012; Hennig and Dorling, 2014). These local elites populate the regional rich list, receive the most esteemed honours, sit on the most prestigious boards and act as trustees for the most influential institutions. This presentation will draw on ethnographic research with the wealthiest residents of the region to examine their biographies, strategies for succession, and economic norms and practices. Feminist scholars have criticised totalising, singular or static understandings of capitalism populated by rational actors driven solely by the pursuit of profit and accumulation (see, for e.g.: Rofel and Yanagisako, 2019; Ho, 2005). Following this argument, the paper aims to contribute a more detailed understanding of local wealth elites' contextually situated capitalist worldviews, moral positionings and motivating sentiments.

HIGUCHI, KUMIKO* (Osaka University of Economics and Law, Japan)

Reconsidering the School Non-Attendance Movement in Japan: Improving Poorly Designed Education

Due to an increase in school non-attendance in Japan, since the 1990s local governments and parents association have created educational facilities for students who do not attend school. However, the Ministry of Education has not accredited these schools.

In 2016, the Securing Equal Educational Opportunity Act was signed into law, and these facilities are now recognized as quasi-public schools. This was a milestone year for non-attendance students, their parents, collective action groups, and their supporters.

This study examines these superficially "liberating" educational facilities to clarify their educational characteristics and the underlying inequality. For verification, this study uses various types of data: three nationwide quantitative surveys I have conducted from 2007 to 2016, qualitative surveys to some local government, a zine which has been published by the parents of school non-attendance since 1997, some government documents and historical records.

The presentation will be divided into three parts.

First, I describe the inequalities between poor and rich students and local and urban students. Private facilities that provide alternative education are more expensive than public schools, and these facilities have mainly been established in urban areas. Subsequently, local students find it difficult to access these facilities due to poor transportation networks in their communities.

Second, from a historical perspective, I detail the underlying principles of group education and modern families that reinforce inequality. These facilities cater to parents who have sufficient money for their children's education and can take their kids to and from the facilities. Under this assumption, single parents, low-income families, and families in local areas have been marginalized.

Third, to diminish these problems, referring to policies and practices used in other countries, I propose an alternative system based on individual needs.

Does Religion Immunize Against or Stimulate Conspiracy Beliefs? Relationships between Religiosity, Spirituality and Various Scientific As Well As Conspiratorial Interpretations of the Covid19 Pandemic

Covid19 has shaken the whole world. People try to make sense of this crisis in various ways and construe it differently. Scientific argumentations as well as religious interpretations and conspiracy theories are circulating in society. My research goal is to better understand and explain them. The underlying question is: *How is the religiosity and spirituality of people related to their interpretations of the Covid19 pandemic?*

I answer this question within a theory-led empirical analysis. My theoretical framework is based on the literature on conspiracy theories and (religious) factors influencing them as well as on research in the sociology and psychology of religion on the effects of different dimensions of religiosity and spirituality on views and interpretations of the world.

Building on this, I – at the Cluster of Excellence "Religion and Politics" at the University of Münster and in cooperation with the "Research Institute for Social Cohesion" in Leipzig – conducted a comprehensive online study in Germany from July to October 2020 with nearly 2,000 respondents.

On the one hand, people are surveyed about their religiosity and spirituality: e.g., to what extent they see themselves as spiritual but not religious or vice versa, how often they pray or meditate, or what their beliefs and images of God are. On the other hand, they are asked about their views and interpretations of the Covid19 pandemic: e.g., whether they trust above all on science to fight the pandemic, whether they see the pandemic as a punishment from God or secret powers at work, etc.

Through statistical analyses (correlation analyses as well as multiple regressions) I investigate the relationships between the religious as well as spiritual variables and those concerning the interpretation of the pandemic. All in all, by evaluating current primary data I would like to contribute to a highly relevant topic.

Mind the Gaps: Examining Youth's Reading, Math and Science Skills across Northern and Rural Canada

In Canada, policy concerns about future skills shortages have increased in recent years. Governments at all levels are seeking new research on the supply and development of skills to identify barriers, adapt to changing technological demands, and trigger policy levers for vulnerable groups and regions. Northern and rural regions of Canada are particularly prone to skills shortages, as they have different resource dependencies, demographics, distance to postsecondary schools, size, network structures, and high levels of youth out-migration. A new body of sociological research is finding that northern and rural youth, and in particular, low-SES youth, face difficulties accessing higher levels of postsecondary education and lucrative fields of study such as the STEMs. However, existing research has yet to systematically measure the skills proficiencies of youth in these regions nor have we understood the factors which might account for regional differences. As such, our study draws upon multiple cycles of Statistics Canada's Youth in Transition Survey, Cohort A linked to the Programme for International Student Assessment (PISA) scores to investigate how location of residence impacts skills proficiencies at age 15, the extent to which skills gaps vary across math, science and reading proficiencies, and which factors explain regional and skill type variations. Overall, our results point to three key findings. First, we uncover an urban advantage (northern and southern) in reading proficiencies. Second, our findings reveal that southern, urban youth outperform youth from all other locations in their mathematics skills. Finally, in terms of science, southern youth experience significant advantages over all other youth. Much of the skills differences are attributable to parenting styles, parental socio-economic status, student academics, and school differences in SES, but our findings further reveal that the relative impact of each of these factors is different across skill types.

HILSCHER, ANNETTE* (Institut für Sozialforschung, Germany)

Caught between Reflexivity and Self-Exposure

In the lecture the following questions should be investigated: who researches to what, or "may" research to something; when does reflexivity serve to validate the results, when will the self-exposure-limit be exceeded; These questions are discussed on the basis of a research project on anti-black racism. The aim is to combine intersectional and racism-critical research approaches with current ethical debates on research with vulnerable groups and to develop a position of its own that follows the primacy of the material collected.

HILSCHER, ANNETTE* (Institut für Sozialforschung, Germany)

Individual and Collective Resistance to Anti-Black Racism

In the context of my dissertation, modes of behavior of black people in order to deal with experiences of social disregard were identified: practices of individual coping as well as collective resistance. The work is based on an understanding of the subversive resistance of weak groups, according to James C. Scott.

Depending on the social space, two central manners were revealed: the practice of communitisation in the peri-urban area and the practice of individualisation in urban centers. For the type of communitization, reciprocal care relationships within the black community are characteristic. Collectivity characterized by a strong caring morality is understood here as the sharing of the common suffering and assuring one's own normality. Although not explicitly declared politically by the actors, communitization with like-minded people is considered to be resistant. African women, who belong to this type, attract attention, for example in the form of fashion shows, buffets with African food and participation in district festivals. In contrast, the type of individualization is characterized by a largely self-sufficient lifestyle. People of the type individualization are resistant in that they acquire knowledge, take legal action in the case of suspicion-independent person control and organize themselves within the framework of self-help organizations.

In the course of the lecture, the perspective of sociogenesis will be taken and the question of why individuals opt for a primarily collectivist or individualistic treatment of discrimination experiences will be examined. The concept of self-efficacy expectations according to Albert Bandura is used. The material collected shows that experience gained in other areas, such as partnership, voluntary work, housing and the labor market, can be transferred to dealing with disrespect experiences. The question is, therefore, which biographical experiences that have had a positive or negative influence on the formation of self-efficacy expectations, guide today's action.

Addressing Child Poverty through Local Initiatives in Japan: The Roles of Children's Cafeteria for Single Mothers and Children

This research aims to identify the roles of children's cafeterias (*kodomo shokudo*) for single mothers and their children in Japan. These cafeterias are places where children can have a free or low-cost meal, initiated by individuals in local communities. They address child poverty and social isolation of vulnerable families by building social connection between them and the communities. The number of such cafeterias is increasing across the country due to increasing awareness of high rate of poverty of children and single mother households in Japan. However, the process of building social connections and support mechanism through the cafeterias have not been adequately investigated, with most of the existing research focusing on organizers rather than participants. Accordingly, this study seeks to determine the role of children's cafeterias and the process of building social connections from the subjective perspective of participating single mothers and children. Semi-structured interviews were conducted with five mothers and five children who participated in K children's cafeteria in the northern Tohoku area, Japan. The modified grounded theory approach and social capital theory were adopted to analyze the data. The results showed that the mothers and children had been building and strengthening their personal social capital within the community and their families by participating in children's cafeterias.

The Mechanism of Entrance into Family Employment in Japan: From the Perspectives of Gender, Family and Labor Market

1Aim: Although the rates of self-employment and family employment have been declining in view of long-term tendencies from the 1960s to the 2010s in Japan, the mechanism of entrance into family employment has not been analyzed with statistical models. Therefore, this study aims to clarify this mechanism from the hypothetical view of the gender differences of self-employers, the rate of unemployment and childrearing.

2 Methods: This study uses the data of the Japanese SSM surveys (the national surveys of Social Stratification and social Mobility) of 2005 and 2015. Both surveys were conducted with the stratified random sampling method, and their populations were Japanese residents. My analyses target the work experience of respondents under the age of 40. I apply discrete logit models to "the entrance into family employment" separately for men and women. The main independent variables are "Occupation," "Industry" and "Firm size" for the respondents, their father, mother and spouse. The other variables are "Unemployment Rate" and those regarding children.

3 Results: First, concerning the gender difference of self-employers, the results show that male self-employers tend to hire all their family members as family employees, although this tendency has weakened on their daughters during the economic development period (1954-1973). However, female self-employers do not have this tendency from the beginning. Second, regarding the rate of unemployment, the results indicate that men tend to become family employees when the rate is higher, while with women this tendency is when the rate is lower. Third, concerning childrearing, the results imply that women become family employees even at the time of childrearing. Finally, I would conclude that the weakening of the patriarchal ideology is a cause of the declining rates of self-employment and family employment. There seems to be ambivalence towards the inequality of gender and work-life balance within family employment in Japan.

HIREMATH, SUMANTH* (Dept. of P.G. Studies & Research in Sociology, India)

A Sociological Study on Marginalization of Indian Women in Mass Media: A Critical Appraisal

In the 21st century, the media has undergone a great change with the growth of Information and Communication Technology (ICT); the reflection of Indian women in the mass media is also facing various transitions. The paper illustrates an outlook image of Indian women in mass media especially television advertisements. Qualitative research methodology has been used in analysis with substantial secondary sources.

Most of the advertisements portray women in structured gender roles rigidly as home-makers and representing them as sexual objects. These advertisements generally focus on the woman's beauty and seductiveness, contrary to feminist ideals. They also portray women as progressive, financially sound, bread-winners, change-makers, independent, having family responsibilities. Women are portrayed in a wrong manner and in most of the cases which are unrealistic. Whether it is advertisement of any cigarette or soap or of soft drinks, half-dressed woman with her male counterpart is seeing enjoying the charm of smoking or soft drink

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

acts, where a woman is quenching her thrust in a semi-nude dress in a swimming pool are basically the projection of warped image of woman. India which is very patriarchal, the audiences preferably see a woman more as an object of sensation and in other term the media persons also intend to project them as the object in order to promote products or services.

Television being an important audio-video mass media leaves maximum impact on viewers. Hence, it is expected that with the flow of modernization, television advertisements in India should change their approach in case of image of woman. Presence of women empowerment should be felt by the media and viewers with a positive depiction of women's image, which leads to social development.

Perceptions of the Teaching Profession Expressed By Graduate Academics of the National Autonomous University of Mexico

In the third phase of the *Study about the Excellence of the Graduate Professors of the National Autonomous University of Mexico* (UNAM), we applied an interview guide to 34 university teachers (2017-2018). The paper has two parts. In the first - as a theoretical framework – we will synthesize the principal ideas from some researchers from Spain, Australia and Chile, about the characteristics of good teachers. In the second we will present the categories obtained with the open question: Which characteristics you can identify about good teachers? expressed by the academics interviewed. This are: Knowledge; Adequate conditions for flexible learning and connection with students; Diversification of procedures for teaching, Motivate participation; Responsibility and Compromise; Achieve a high level; Openness and innovation; Communication; The formal classes are only one of the aspects of teaching activities; Science is a collaborative work; Be aware of the learning level of the graduate students and Problems they encounter in the university teaching profession. We consider that the theme proposed is actual and significant and useful to university academics with as long and prominent trajectory and also for new professors and researchers.

Social Responsibility and Academic Profession

Academics have a central role in the production, transmission and dissemination of knowledge, which are the substantive functions historically assumed by universities. However, both institutions and academics have been questioned about the fulfilment of these tasks and their impacts on society. For some groups, an academic profession with greater leadership, commitment and social responsibility is needed. This paper is part of a research project, carried out at the National Autonomous University of Mexico, whose main interest is to analyse the concept of excellence in graduate professors. One of the dimensions of the study was to explore about the benefits that research brings to society. For that purpose, we interviewed 21 highly qualified researchers. The results showed that, in general, academics are concerned about compensating what society has given them through the university, in terms of economic, human, and symbolic resources. The interviewees considered this can be done through different ways, such as teaching, not only in higher education, but also in other educational levels, the linkage with productive sectors and enterprises, the development of new technologies, prototypes and patents, the solution of relevant social problems, and specially the production of useful knowledge. In a way, researchers already accomplish one or more of these aspects; however, we think that, although these professionals have an important social function, it is necessary to develop a stronger relation with society as well as a better dissemination of their work.

Same Level of Education Same Wage Returns? an Analysis over Time and across Occupations in Germany

Recent studies broach the issue of wage differentials due to educational investments in occupational contexts. Empirical findings show that employees with the

same educational level obtain not the same wages (e.g. Haupt 2016) and refute assumptions of human capital theory. Further, studies highlight the link between education and occupation as decisive factor for wage returns (e.g. Stüber, 2016).

We contribute to the discussion about wages and education by examining varying wage returns *within* an educational level *across* occupations for West-German men working full-time between 1976 and 2010. Our analyses focus on vocational education and training (VET) with and without Abitur as well as university education. Disclosing variance patterns in returns to education for employees with the same educational attainments working in different occupations is the paper's main objective.

Our analytical approach is threefold: First, we derive theoretically, why wage returns vary *within* educational levels and *across* occupations. Second, we assume the variation in wage returns to be higher the higher the educational level is. Third, we investigate the development of variations in wage returns for VET and university graduates.

For our analyses, we estimate a two-stage Multi-Level model using the Sample of Integrated Labour Market Biographies (SIAB). Our results reveal that holding a VET degree and Abitur increases the variation of wage returns compared to those with a VET degree without Abitur. Beyond that, we find significantly higher between-occupation variance in wage returns to education for university than for VET graduates. Considering the developments over time, we uncover fluctuating variation of wage returns for VET and slightly decreasing variation for university graduates.

HOENIG, BARBARA* (University of Graz, Austria)

London, Berkeley, Toronto: Evocative Environments for Women Sociologists, 1950-2000

The London School of Economics, the University of California at Berkeley, and the University of Toronto were important institutional centres for the formation of sociology, though in different phases of the second half of the 20th century. The thesis of this paper is that these centres as 'evocative environments' were particularly susceptive to women and that they also illustrate how sociology cognitively was able to self-reflexively integrate their critique of the discipline. It is suggested that for explaining the susceptibility of sociology, and the apparent success of individual women sociologists, it is useful to take structural characteristics of its university system, but also the influence of political reform and social movements in a wider sociocultural context into account. Empirically the scientific career of Canadian sociologist Dorothy E. Smith is examined as a case study that nospans these three institutional contexts of sociology. Moreover, a transnational comparison of university environments can show how favourable social factors became more present and sustainable at Anglophone academic centres than in German-speaking Continental Europe. Investigating women sociologists' structural conditions of successfully becoming and keep working as a sociologist thus can provide more general insights in how external factors became important for the history of the discipline.

Non-Governmental Organizations and the Spaces of Refugee Politics

In our paper, we analyze the relationship between political, spatial and organizational transformations of the regulation and enablement of asylum. *Politically*, the relevance and number of actors involved has changed profoundly. Migration and asylum politics have been characterized by a continuous increase in non-state and semi-state actors (Uçarer 2014), which some observers have described as a "privatization of refugee protection" (Ferris 2003) or "NGOization" (Karakayali 2014). Today, there is a wide variety of organizations within the field, differing significantly in their political positions, reach, organizational structures, and strategies. *Spatially*, the multiplication and geographical spread of crises and conflicts have brought about new challenges for the refugee regime on the one hand, and clear shifts in political levels on the other. Local, national, regional, and global scales are intertwined in altering ways. Translocalization and transnationalization are as much part of the picture as are re-nationalizing, re-bordering and specific local regulations. This is as a challenge for both people forced on the move, state and non-state actors engaged in the strategies of regulating, enabling, hindering, or facilitating those movements. *Organizationally*, our research addresses these transformations looking at a broad variety of non-governmental organizations engaging in the politics of asylum. We focus on NGOs involved in lobbying and campaigning on different scales in order to grasp the re-figurations of the political and spatial arrangements of forced migration. Organizations such as IRC, ECRE or *Pro Asyl* are constitutive components of the asylum regimes within which they operate. Their intermediary positionality is associated with flexible and varying

　　　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

opportunities of intervention, at times marginalized, and at times powerfully allied. These positionalities go along with strategies of addressing specific or multiple socio-political scales. Hence, we can conceptualize the political practice of NGOs as continuous spatial interventions in the contested "geographies of power" (Featherstone 2008) of asylum politics.

HOERNING, JOHANNA* (Technische Universität Berlin, Germany)

Spatial Binaries and the Global Perspective

This paper aims at discussing critical epistemologies that account for a perspective beyond methodological nationalism and conceptual Occidentalism. Both refer to social contexts within which knowledge is produced – and these contexts are just as much spatial as they are social. The prime context for western modernity, socially, politically and conceptually within the social sciences, has been the nation state. It may still be a pervasive, politically regulated and regulating context for people's lives, but as primary analytical and heuristic category, though, it is flawed not only because of processes of globalization and transnationalization. Historically as much as contemporarily, as postcolonial critics have indicated, it is rather the category of empire, which grounds social processes as much as social theory (Go 2016). The paper raises the question how our analytical categories indicating a spatial and contextual division of the 'world' relate to current processes of social change and our underlying concepts we use to describe and explain those processes and divisions. Several binaries imply spatial divisions that allow for an understanding of different meaningful contexts that shape the 'world' as such: North-South, East-West or Orient-Occident, but also urban-rural are very much related to normative notions of development, modernity, progress etc. and suggest that within these binaries the 'world' is comprised in its entirety (Hoerning 2019). Those binaries need to be scrutinized as spatial, normative, and analytical divisions and in their relation to one another. Questions raised here are: What kind of spaces are indicated by those categories and what type of categories are they? What can we see when looking at the world through these binaries? What is obscured? In how far are these divisions related to local, regional, national, and global inequalities?

Constructing Careers, Constructing the Self: Young Europeans' Professional Mobility to Singapore, Tokyo, and Sao Paulo

This presentation adopts a generational lens as to examine the mobility of highly educated European millennials beyond Europe, a region that has long been understood as the core in a core-periphery framework. Using qualitative data from ethnographic observations and semi-structured interviews with more than 85 European informants of 19 different European nationalities in Singapore, Tokyo, and Sao Paulo the study demonstrates that the young Europeans lack the status and the security net which their expatriate forebears, the senior generations of Europeans in these three global cities, hold. As such, discourses of privileged Europeans – who can claim Europeanness, which is often conflated with Westernness, whiteness and the notion of being elite yet also differs by the respective Asian or South American contexts – are challenged in the transition of the European community from an 'expatriate community' to a more diversified community of increasingly self-financed young European (aspiring) professionals in the three metropoles. Faced with somewhat precarious living and working conditions as self-initiated expatriates in the host societies and as junior employees in their companies, these young Europeans maneuver social and romantic relationships, opportunities for and limitations to career building and their unstable legal situation in the host countries. The analysis suggests that migration to the global cities of regions that have often been labelled peripheral enables the young adults to construct a coherent narrative of their multiple identities as European millennials, citizens of the world and middle-class professionals. At a time when Western hegemony is increasingly challenged, these millennial Europeans' view of the world has shifted. The longitudinal study design reveals that despite initially rather short-term plans – or no plans beyond the move itself at all – many end up to stay as flexible, risk-taking, independent professionals in and across their Asian or South American destinations.

HOGSBRO, KJELD* (Aalborg University, Department of Sociology and Social Work, Denmark)

Exploring Institutional Settings for People with Cognitive Difficulties

It is essential when dealing with and trying to understand people with some kind of cognitive disorder to acknowledge how difficult it is to manage such disorders. The calculations and adjustments to situations and expectations that 'or-

dinary people' do without having to think much about it, seems to be infinitely complicated for people with cognitive disorders. The emotional implications of this situation might be stress, uncertainty, anxiety, anger, sense of guilt, loneliness and nostalgia sometimes in an ever shifting spectrum of feelings related to situations, interactions and memories. In such cases the reactions and behaviour of people become incomprehensible when looking at it from an 'ordinary' conception of the situation. When interviewing, you have to change your perspective and define the situation from the perspective of another cognitive map.

Professionals are positioned in a field of discourses and regulating text which defines their obligations towards the clients as well as it defines the problems and the solution to the problems. Their conception of the problems and challenges is both a product of the close contact with clients on the one hand, which might sustain an intense communicative action, and on the other hand an instrumental communication relying on norms (how do you normally understand those issues), performance (I want to show you that I am an educated professional) and strategic considerations (this is the conception that works). These contradicting demands create specific dilemmas in the everyday world interaction of professionals and residents at residential homes.

The vocal presentation will present a few cases from a field study which highlights the challenges and findings illustrating this essential problematic found in our research.

WG06-711.1

HOGSBRO, KJELD* (Aalborg University, Department of Sociology and Social Work, Denmark)

The Premises and Potentials of IE As an Applied Sociology

The ambition of helping people to find ways to improve their situation characterises the whole history of applied sociology from Weber and forth. But the actors and the levels of governance the researchers found relevant to engage were different. To Weber and the tradition for 'social engineering' the nation building was the important goal and the politicians were the important actors. To the traditions for social work, clinical sociology and urban anthropology which aroused in the milieus around University of Chicago, the improvement of local communities were the important goal and street level professionals and activists were the important actors. Institutional Ethnography has to a certain extent got its roots from the last traditions. But still Institutional Ethnography has an implicit ambition of not only developing local practices but also addressing profound issues of modern institutions as such which varies due to differences in national/cultural context and target groups. Thus the tradition has references to social engineering and evaluation research as well as action research and practice research. But what is the difference? What might define IE as a distinguished and distinctive approach to the critique and development of modern institutions in different contexts? In other words: how do we identify the uniqueness of IE and it's potentials? The paper tries to define the essential premises of Institutional Ethnography and its contribution to the development of modern institutions in different contexts.

The Positioning of Alternative Spirituality within the Religious Field of Contemporary Societies

Using comparative survey data on religion and alternative spirituality from eight countries collected in connection with the International Social Survey Programme 2018, this paper investigates the following questions: 1) What proportions of the population of these countries practice holistic body-mind-spirit methods such as meditation, Yoga, complementary health methods and spiritual healing? To what extent do people who are engaged in such activities see themselves as religious and/or spiritual? 2) To what extent do alternative spirituality and traditional (Christian) religiosity overlap, i.e. how many respondents combine church-religiosity and alternative spirituality? 3) How do alternative spiritual seekers differ from conventionally religious people on the one hand and from the non-religious on the other hand in regard to the evaluation of the role of religion in society, attitudes towards religious others (members of different religions, atheists) and interreligious marriage? 4) How do alternative spiritual seekers differ from conventionally religious and from non-religious people in terms of sexual-morality and gender-role attitudes? The analysis starts from the assumption that the size of the alternative spiritual milieu may vary considerably between countries, but that the pattern of attitudes should be similar when comparing the three main groups of the religious field. Alternative spiritual seekers should be more open to religious diversity and interreligious relationships, and they should represent a more permissive sexual-morality and more egalitarian gender roles than conventionally religious and non-religious people.

Comparing Health of Migrant and Native Populations: Testing Intercultural and Longitudinal Measurement Equivalence of the SF-12 Using Structural Equation Modelling

Response-sets belong to reoccurring problems in migration research. Cultural factors, time-varying effects and survey design lead to response biases. It could be shown that depending on the region of origin, migrants tend to extreme or centred responding behaviour. Macroscale changes in attitudes towards disclosure of personal information influence acquiescent biases. Therefore, the question arises whether comparability of outcomes can be assumed, especially within instruments regarding subjective feelings, when differences between migrant and native populations are the variable of interest. The aim of the study is to test for intercultural and longitudinal equivalence of health related quality of life in form of the Health Short Form 12 - items scale (SF -12), trying to answer the question whether this instrument is useful to compare health of migrants and native Germans over time. The study contributes to the ongoing discussion on measurement equivalence of the SF -12 by including variables concerning integration and assimilation, employment, family status and varying types of migration and years since migration to the analysis.

Using a Multiple Group Structural Equation Modelling approach analyzing longitudinal data of the German Socioeconomic Panel (SOEP), we test the validity and measurement equivalence (configural, metric and scalar invariance) of the latent construct 'health' over time and between (non-)migration groups. In addition, different item functioning can be detected for a series of covariates. The study concludes in recommending a reduced version of the SF-12 to improve the avoidance of measurement artefacts when comparing the health of migrants and native Germans.

Labour Market 'Flow' and Social Investment Policies: A Gender Equality Culture Problem?

Social investment policies have gained prominence among policymakers and academics since from the 1990s (Morel et al., 2012). According to Hemerijck (2015), social investment policies are expected to address the problem of increasingly flexible career trajectories and labour markets by making transitions in the labour market during the lifecourse smoother. In particular, family and labour market policies are expected to act as "social bridges" reconnecting workers to the labour market, thus easing their lifecyle transitions and securing better employment stability when it is at risk (Hemerijck, 2015). But does social investment really make the labor market 'flow' better? With this study, I focus on work-family reconciliation policies and women's labour market participation. By arguing that social investment strategies should be context-sensitive and tailored to different structural and institutional configurations in order to be suitable and effective, this study focuses on Japan, South Korea, Italy and Spain -- four particularly interesting cases for analysis, as they all enacted important family policy reforms in the last decade starting from a very conservative, male breadwinner-oriented stance. Despite the obvious geographical and cultural differences, this group of countries shares in common dual labour markets, traditional family values, and a late start in welfare development, making this comparison particularly relevant in disentangling important institutional complementarities that contribute to a smooth labour market 'flow'. Results suggest that a high commitment to social investment policy does not suffice by itself in guaranteeing a better labour market 'flow' in latecomer welfare states. In other words, social investment reform has no linear relation with female employment, and contextual institutional complementarities (Draebing & Nelson, 2017) might count as much as the reform itself. In particular, a better labour market flow seems to be linked to how gender equality culture improves, in education and in the labour market.

Age Discrimination in Accessing Services and Goods: A Form of Exclusion from Social and Economic Participation.

Modern societies can be regarded as service economies and consequently having access to, e.g. financial or transport services is essential for social and economic participation. Among other barriers, one restriction in accessing and using services is direct and indirect discrimination because of "old age", which contributes to the social exclusion of older people. One way to remove such barriers is to implement anti-discrimination legislation.Although a general framework on non-discrimination exists within EU law, the binding community law only requires the Member States to prohibit age discrimination at the labour market (Directive 2000/78/EC). Consequently, there are different legal situations on the national level regarding age discrimination in accessing goods and services.

From a social constructivist perspective, the present study explores various aspects of age discrimination in a cross-country comparison between Austria and Ireland using different qualitative methods. Via analysing the legal framework, the related socio-political debate among stakeholders and the actual experience of older adults with age discrimination the aim is to show how different socio-legal contexts shape the experience of older people with age discrimination, which in return can affect the older persons experience of ageing.

Results: Content analysis of expert interviews, focus group discussions and document analysis indicate the fragmentation of the debate around age discrimination, which - from a macro-perspective - exposes older adults to discrimination, as this creates "hot spots" and "blind spots" within policies and legal protection.

One potential result of this selective perception is that only combating some forms of discrimination and overlooking others, labels the latter as "acceptable". Furthermore, this may signalise an "official" hierarchy of values and since certain problems affect certain age cohorts, also devalues the problems faced by other age groups and neglects the need for "subtyping" of anti-discrimination policy.

HORIGUCHI, RYOICHI* (Université Kindai, Japan)

L'Histoire Vécue Et La Vie Retrouvée Des Lépreux : Une Pratique De l'Église Dans Un Sanatorium Pour Lépreux

Cette étude a pour but, en premier lieu, de comprendre quel rôle l'église a joué dans un sanatorium pour lépreux, l'objectif étant que les malades puissent se rétablir spirituellement, et, en second lieu, de montrer la possibilité d'une intervention sociale efficace pour améliorer leur état de santé mentale.

Ce travail a été élaboré sur l'analyse des faits exposés par les témoignages retrouvés dans le périodique de l'église protestante *Akébono*, publié entre novembre 1952 et décembre 1982. Ce périodique a été trouvé dans le sanatorium de *Nagashima-Aiseien* fondé en 1931 dans une petite île de la préfecture d'Okayama au Japon. Ces données ont été complétées par des entretiens avec d'anciens patients que j'ai pu recueillir sur place l'année dernière.

Tout au long de leur vie, les malades ont souffert d'une blessure psychologique intense liée à une triple cause : une forte stigmatisation sociale, une exclusion de leur commune natale, et une vie solitaire au sanatorium après leur séparation familiale.

À cela s'ajoutait la nécessité d'un traitement permanent souvent difficile à supporter pour une maladie restée néanmoins incurable (en effet, même après les années 1940 date du début des traitements efficaces par antibiotiques, ils n'ont pas cessé de souffrir de leurs lésions nerveuses, de cécité ou de difformités corporelles engendrées par les séquelles de la maladie).

Dans le processus de rétablissement spirituel, l'église et sa communauté ont apporté non seulement une « guérison » pour chaque malade, mais aussi fourni des éventuelles réponses à leurs questionnements. Grâce à leur confession et leur foi, ils ont trouvé une issue à leur souffrance. L'acceptation d'une autre « histoire » les a libérés de leur passé et, en même temps, leur a permis de vivre dans la dignité humaine et l'amour de Dieu.

HORN, MARGARETH* (The Norwegian University of Science and Technology, Norway)

KOROTKOVA, NATALIIA* (Norwegian University of Science and Technology, Norway)

The Role of Trust 4.0 and Communication 4.0 in the Age of Digital Organizations

Kurzweil (2005) predicted that in 2045 the technological increase will lead to a technical singularity when progress will be so rapid that it outstrips humans` "ability to comprehend it". This rapid digital transformation is challenging the organizational theory that was based upon the primary supposition that organizations are the best way to solve specific marked-based trust coordination issues.

Digitalization illuminates the necessity of "trust" as one of the main conditions for effective collaboration among individuals, groups, and organizations. Therefore, the revolution Industry 4.0 requires Trust 4.0 and Communication 4.0 that need to be tailored to the volatile environment.

Organizational research may focus on the primary, secondary, or tertiary environment and elucidate the interaction between technology and organization. Distributed technology is challenging the fundamental assumptions about the nature of companies, and its traditional functional and managerial manners. For instance, Norwegian Government is implementing a proof of concept to identify what gains and values distributed technology could introduce in their digitalization program. Our focus is to analyze how technology in general, and distributed in particular, is able to improve communication inside and between teams both

in government and private businesses; and how trust mechanism is managed. Nowadays, people have to communicate and interact via machines, and they, therefore, need to trust these utilized systems.

However, many organizations are still reluctant to utilize the latest technologies due to a general lack of trust in both technology and people designing them. "People trust people, not technology". This lacking trust makes digital transformation fragile and dependent on a new type of communication, Communication 4.0, that tightly integrates all stakeholders via all communication channels, and thereby, facilitates transparency, acceptance, and credibility. Importantly, communicators and trust brokers aim to reduce uncertainties and stimulate earlier technology adaptation through effective orchestration of bidirectional communication flow in the business ecosystem.

HORNER, BRIDGET* (University of Kwa-Zulu Natal, South Africa)

Negotiating Students Photographic Images and Texts

The space of Higher Education in South Africa, 25 years into democracy, lies contested at the centre of conflicted interests for students. Protests for equity in education and for quality amenities have contributed to the negative portrayal of students in campus spaces. This negativity is fuelled by images of students in social and print media, which polarises them as both victims, and as perpetrators of the damage done to university property.

This article documents the methodological and analytical learnings from a research project undertaken in an attempt to disrupt the dominant visual and oral discourse of students. The study arose out of an unfolding methodology utilising collaborative methods for both data production and data analysis. Whereby photographs of students in informal spaces on campus, that were meaningful to them, were co-produced and the resultant images that best reflected being a student in Higher education in post-apartheid South Africa filtered through by group discussion. The text and image emerged as primary data sources that both visually represented student's thoughts in content but in the dissecting of the text through presentational analysis the social context of their thoughts as well. This method of conveying meaning through both visual images and through text contributed to deeper understanding of the significance of campus spaces in the process of being and becoming a student in Higher education.

Migrant Care Professionals in Japan: EPA (Economic Partnership Agreement) with Indonesia, the Philippines and Vietnam

This research investigates the challenges of migrant care professionals who came to Japan from Indonesia, the Philippines and Vietnam by the EPA (Economic Partnership Agreement) framework. Ethnicity and professional theory are potentially used to understand the current issues. Japan has a population with the longest life expectancy of any country in the world. Previously, family members have been tasked with taking care of the elderly and those with disabilities. However, today, the roles of families have changed, and care is provided by non-family members. As a result, the long-term care insurance system was implemented in 2000 to accommodate to such changes. Under the system, certain services are provided by qualified healthcare staff. However, to realize an appropriate quality of life for older people and those with disabilities, the shortage of care workers is the most urgent problem, so Japanese society has been accepting candidates for foreign nurses / care worker since 2008 through the EPA framework. As of the end of August 2018, the cumulative number of people accepted exceeds 5,600 in total from the three countries; Indonesia, Philippines and Vietnam. However, foreign care professionals candidates face many challenges such as difficulty to pass the national exam and cultural difference between Japanese clients. In this research, I will examine the issues surrounded by foreign care worker candidates by indicating the condition of professional and ethnic identity.

Japan's Self-Initiated Expatriates: Transnational Career Competency of Business Women Overseas

The purpose of this study is to illustrate distinctive patterns of highly–skilled Japanese businesswomen. Particular focus is placed on their career-competency which have been developed through transnational stages, started from Japan and then participate in foreign firms. I have ascertained the grounds for their preference and formation of their career goals by in-depth interviews with some Japanese female professionals working overseas. Samples of this study can be categorised as self-initiated expatriates (SIEs), in terms of their preferences and

experiences of foreign labour markets, leaving behind their home where they attained considerably high level of academic background. Albeit there have been volumes of researches into Japanese business expatriates in various metropolitan areas, they have not focused on female expatriates. Japanese male expatriates generally spend three to five years of overseas assignments and return to Japan and their career must be completed in Japan, but female SIEs never prefer to return, even though they express their discontent with living or work conditions in host community. Their conventions and preferences differ from typical patterns of Japanese expatriates' lives. It may not be a new trend as this type of female expatriates existed since several decades ago, but their presence has become quite visible, and the changed social conditions have positively effects upon their opportunities in overseas position.

Decolonizing Sociology for Addressing Climatic Concerns in Bangladesh

Recognizing the origin and development of sociology from the West, the major objective of this paper is to explore the role of sociology in University of Dhaka (UD) in addressing the climatic concerns in Bangladesh. I apply the content analyses to explore the reasons for the gap between sociological perspectives and climatic concerns. Sociology as a discipline is not adapted with local culture and environment due to its imperial expansion in terms of theoretical perspectives and methodological dominance in the UD. Most of the reading materials are written in English on Western context and they are not helpful for students in understanding local climatic issues and concerns. Furthermore, the higher studies of faculty members in Western universities create further complicacies while most of their PhD supervisors are Western and hardly hear the name of Bangladesh. They mostly apply their own theoretical and methodological persepctives in understanding the climate concerns in Bangladesh without proper knowledge about the linkage between nature, change, and local people. This Western persepctive is currently connected with the dominant development paradigm like neoliberalism. This imperial domination creates the epistemological differences between scientific and local knowledge. Because of this type of domination, sociology in Bangladesh fails to develop its ground and is not much helpful in addressing the climatic concerns. To recover from this type of domination, it is important to redirect the sociological perspective from imperial expansion and this needs to be developed by the theoretical and methodological approach grounded in local culture, environment, and development important in fighting against the climate change effects. However, the project is not an easy task; it needs local movements in alliance with the global south and can be collaborated with the others who may have the similar understanding about decoloning sociology for addressing climatic concern.

HRISTOV, JASMIN* (University of British Columbia, Okanagan, Canada)

Land Violence, Security, and Development in Latin America

There is a mounting evidence of a global trend characterized by violence and repression against land and environmental defenders in the context of expanding agroindustries, mining, and infrastructure projects. In 2017, at least 207 land activists were killed worldwide according to Global Witness. The expression of this trend is particularly acute in Latin America - the most dangerous region for land-rights defenders, given that more than 60 percent of defender deaths in the world take place here even though Latin America represents just over 8 percent of the world's population. Struggles for control over land-rights and land-use have become particularly acute since international institutions such as the World Bank (WB) began to promote market-led agrarian reform (MLAR) in Latin America aimed at converting land from social property into a private transferable commodity. This process has generated massive land dispossession of small-scale farmers, indigenous, and Afro-descendant communities, which in turn has encountered massive popular resistance and a resurgence in rural movements. Despite this reality, almost exclusively, the problems of land-grabbing and violence have been treated as unrelated and examined separately by different clusters of literature – on one side, development and agrarian studies, and on the other, scholarship on violence across the disciplines of criminology, political science, and conflict and security studies. By focusing on a type of violence pervasive in resource appropriation and rural proletarianization (or to use Araghi's (2009) term 'de-peasantization'), this paper introduces the agrarian dimension of an emergent theory of pro-capitalist violence. The paper exposes the correspondence between modalities of violence and certain configurations of economic and security legislation to demonstrate how state and parastatal violence function in tandem with objectives set up by local and international institutions, hence challenging long-standing assumptions that capital accumulation can only be realized peacefully under the presence of lawful institutions.

LOS Limites DEL Empleo Formal EN LOS Call Center De Mexico ´

Los call center subcontratados de México se han expandido en los últimos años por varias regiones del país de manera que actualmente cerca de 200000 trabajadores, según fuentes empresariales, están empleados en este tipo de establecimientos. Varias investigaciones han subrayado algunos rasgos que se asemejan a los encontrados en otros países como la alta rotación de la mano de obra, una mano de obra cada joven pero cada vez más diversificada, un control del trabajo basado en métricas, la escasa presencia de sindicatos, el recurso al outsourcing de la mano de obra y, tal vez con menos énfasis, una cierta heterogeneidad de los call center que matiza los rasgos más recurrentes del trabajo y el empleo en el sector . En este trabajo nos interesa subrayar precisamente la heterogeneidad de las condiciones de trabajo y empleo en centros que varían desde una organización formal similar a la de otros sectores, hasta una absoluta informalidad en call center que no tienen nombre y no contemplan contratos, ni prestaciones para los trabajadores en un ambiente de discrecionalidad absoluta. En este contexto heterogéneo se enfatizan asimismo las diferencias de ingreso entre los operadores de los call center bilingües y el resto. En la ponencia describimos los rasgos mencionados con base en trabajo de campo realizado entre los años 2010 y 2011 en Tijuana, Ciudad de México y Monterrey y nuevas entrevistas en las dos primeras ciudades en el segundo semestre del año 2019. Además se intentan explicar las causas de esta variedad de formas de funcionamiento, examinar las consecuencias que tienen para los trabajadores y reflexionar acerca de las tendencias futuras, dada la política del Gobierno actual que se propone regular de forma más estricta los procesos de outsourcing en la economía mexicana.

Life Satisfaction of Migrants in China: The Two Dimensions of Household Registration System and Stress

Previous research has reviewed the effects of domestic migration on life satisfaction in China but exclusively focuses on the differentials between urban residents and rural migrants, neglecting either rural residents or variances within migrants. In this article we investigate whether and how individuals' migration status affects their life satisfaction, by simultaneously examining the type of *hukou* and the consistency between residence and *hukou* address. Based on the longitudinal survey data of China Family Panel Studies (CFPS), we find in addition to urban-rural *hukou* divide, the distinction between local *hukou* and nonlocal *hukou* also plays an important role in determining people's general satisfaction. Surprisingly, while urban locals possess the most favorable socioeconomic status, they have the lowest satisfaction. We also explore whether and how changing *hukou* from nonlocal to local influences migrants' subjective well-being.

Restrained Labor: A Study on the Modern Indentured Labor System Among the Ethnic Minority Yi Migrant Workers in the Pearl River Delta Area

This paper investigates a unique employment practice adopted by the Yi ethnic minority workers in China's Pearl River Delta area. Instead of seeking jobs on their own like other migrant workers, Yi workers choose to follow co-ethnic labor contractors, who arrange transportation, accommodations and jobs for the workers and in return charge a commission from the workers' hourly wages. Despite its exploitation, this employment practice is commonly adopted by the Yi workers. This study offers an examination of this employment model, discussing how it functions in practice, the factors that contribute to its existence, and its impacts on the Yi migrant workers. We identify three major driven factors behind the existence of this employment practice: (1) the extreme poverty back home and the multiple barriers that the Yi workers struggle to overcome on their own leave them no other choices; (2) Yi workers are under high risk of unemployment due to the fluctuations in the labor market, and this employment practice is efficient in organizing temporary labor and helps the workers minimize the cost of unemployment; (3) and the jiazhi (clan) culture in the Yi community creates strong emotional ties between the workers and the labor contractors, which makes the employment practice seem like less about exploitation and more about mutual benefit. We further discuss the negative and persistent impact of this employment practice on the Yi migrant workers.

The Persistence of Institutional Discrimination and Migrants' Housing Access in China

China is in the midst of an urban revolution with hundreds of millions of migrants leaving villages for cities. Due to the socialist legacy and the discriminatory Household Registration (*Hukou*) System, migrants in Chinese cities have been treated as second class citizens and have been denied urban welfare benefits such as subsidized housing. Consequently, migrants have largely been left out of the spectacular housing success in China, and their poor housing conditions have been documented by existing studies. However, most existing studies are cross-sectional, and it is not clear how migrants' housing consumption has changed over time and whether their status in the housing system has changed in the 21st century. Using Migrant Population Dynamic Monitoring Survey of China (2010 and 2017) in China, this paper aims to examine migrants' housing consumption over time in the 21st century and study whether and how the driving forces have changed. Analyses show that despite some improvements in housing consumption over time, it is clear that migrants continue to suffer housing discrimination, which continues to exclude them from the dream of homeownership and accessing housing subsidies. In addition, migrants' housing access are shaped by not only conventional sociodemographic factors (such as age, gender, household size, marital status, education and household income) but also factors unique to migrants such as their *hukou* status, their duration in cities, migration distance, and reasons for migration. The latter tend to become more important over time.

Exploring Gender Role of Women in Seasonal Climate Change: A Comparative Study on Bangladesh and Japan.

Seasonal climate change is one of the prime concerns for both countries; Bangladesh and Japan. Bangladesh has a long history of flood occurring from heavy rainfall during monsoon season. The water-level and flooding have been affected by the country's upstream regional meteorological condition. The last devastating flood Bangladesh experienced was in 2017 during monsoon. In contrast, Japan experience baiu-zensen (seasonal raindrop) and typhoon almost every year, both of which have a significant relation with Pacific Ocean's meteorological condition. The last devastating monsoon flood Japan experienced was 2018. Both countries went for structural protection to control seasonal flooding. Policy makers from both countries have a great concern on sustainable flood management approach while Bangladesh is far lacking in the process due to gaining its' economic progression.

Japan reached as an advanced industrial country while still holding the traditional roles of women in social life. While Bangladesh still has a significant lack in gender equality. Comparing roles of women in flood management under the seasonal climate change in both countries may not only differentiate the scenario of gender role situation of women but also might have a lesson to advance the flood management policy specially for Bangladesh.

First, the study will search meteorological reasons going beyond the political boundaries that are responsible for seasonal climate change especially flooding in two countries. And the second is to present contextual description regarding the coping capacity of women in seasonal climate change; special attention will be given how women resist against seasonal climate change particularly during flooding; flood management policy from both countries using comparative analytical tools will also be taken under consideration. First approach will concentrate on empirical logic based on meteorological variables while the second one will focus on comparative analysis based on secondary literature.

HUERTA MUÑOZ, LAURA* (Universidad Autónoma Metropolitana Azcapotzalco, Mexico)

Por Qué Una Sociología Latinoamericana De La Salud Mental

Mientras en países angloparlantes la sociología de la salud mental es un campo consolidado, en América Latina la salud mental es un área de estudio marginal, lo cual implica un inconveniente para el desarrollo de modelos explicativos sobre el sufrimiento humano y las formas en que se manifiesta, atendiendo no sólo las causas sociales del mismo sino también cómo éste afecta la vida social misma. Por qué es necesaria una sociología latinoamericana de la salud mental puede responderse, en primera instancia, aludiendo a la propia definición

de salud mental, que supone la capacidad de superar las dificultades de la vida cotidiana, siendo que los contextos materiales de vida son diferentes en cada sociedad, y pese a ello los criterios diagnósticos de los trastornos mentales aspiran a la universalidad y son empleados de manera estandarizada en distintos contextos socioculturales. Cuál es la validez del uso de estos criterios en el contexto latinoamericano, cuáles son las formas del malestar individual y de qué manera inciden en el malestar colectivo y cómo ello afecta las condiciones estructurales de vida son preguntas necesarias que deben realizarse para entender esta problemática. Proponer líneas de investigación desde una comprensión latinoamericana supone un reto epistemológico, cuya aportación podría redundar en el beneficio de la sociología en general, y de las sociedades. Empero, hay una serie de obstáculos que complican la posibilidad de modelos explicativos en la región, comenzando por la falta de teorías latinoamericanas sobre la salud mental y la falta de institucionalización de este campo de estudio. Este trabajo explora cuáles son los obstáculos por vencer, los retos epistemológicos a enfrentar y las aportaciones potenciales que la sociología latinoamericana puede dar para la comprensión del sufrimiento humano y la resistencia a él.

HUERTA MUÑOZ, LAURA* (Universidad Autónoma Metropolitana Azcapotzalco, Mexico)

Symbolic Violence Exerted from Scientific Psychopathology Field

When talking about mental health and mental disorders it's necessary to consider that the symptoms (which are the unit of analysis of scientific psychopathology) are complex configurations that involve biological, psychological and social dimensions. In terms of the social dimension, social relations include not only interpersonal exchanges or institutional ascription, but also power relationships between those who define what is "normal" or "abnormal " and its cultural context, as well as between those who suffer from mental conflicts and those who do not.

Since abnormality is defined by criteria of what is acceptable and desirable in each cultural context, the definition of abnormality (as symptom or disorder) implies a sociopolitical function within scientific psychopathology field. In this sense, the scientific language of mental disorders, descriptive psychopathology, implies moral relations and symbolic power. Within descriptive psychopathology, underlying assumptions about the norm or normal, protect relations of power where the ethics of the expert, recognized as scientific rather than moral, are legitimized as categories for classifying symptoms and people, placing the mentally "insane" in a position of subordination in relation to the expert and to "normal" or "mentally healthy" people.

This study, based on a documentary research, proposes that scientific psychopathology can influence the subordination of people and therefore the deepening of relations of domination by labeling as abnormal those behaviors, thoughts and emotions that deviate from the establishment determined by the dominant group, on the one hand. And, on the other hand, it points out that the process of individualization has led to the definition of psychological problems as individual and private, when their social dimension comprises broad social problems, derived from mechanisms of social inclusion, domination and quality of life; therefore, this field can legitimize power relations and status quo for the benefit of the dominant group.

An Image of Leisure Sociology: "996" Phenomenon in China

"996" phenomenon in china refers to working 12 hours a day and 6 days a week. This phenomenon is bringing a series of problems to the socio-economic and cultural life: Firstly, the health of sound in body and mind of workers is not guaranteed. Secondly, the desire for money is hindering people's "becoming" and "socializing", making a person "one-dimensional man". Third, the pursuit of speed principle in the unconsciousness is producing pressure and anxiety. Fourthly, technological progress has blurred the boundaries of time and space, transforming human perception, real existence, aesthetics and ethics by a false sight. Fifth, people's life time and living space distribution are wearing away. Sixth, the phenomenon of "996" query the relevant national legislation for as a "concept of governing a state'"---- "people-oriented".

This social phenomenon is not only the epitome of the rapid development of China's economy in the past 40 years, but also a mockery of the "people-oriented" principle as the "concept of governing a state".

The core idea of leisure sociology is "to become" and " to socialize", guiding workers develop freely and comprehensively through gaining more free time, and to enhance the inner temperament and strength of human beings through leisure as a given spiritual home.

Based on the theory of leisure sociology, this paper explores the causes of "996" phenomenon and the harm it will bring to individuals and society.

Determinants of Work Intensity in the Post-Modern World of Work

In times of social acceleration processes, work intensity is currently a widely discussed and researched topic. There are many indications that high work intensity can be a health hazard for employees. Limiting these potential health risks is a central challenge for OSH stakeholders. For this reason, in-depth analyses of the determinants of work intensity are indispensable for the design of healthy workplaces. Existing studies predominantly concentrate on the consequences of high work intensity rather than exploring its determinants. Thus, the aim of this study is to analyse associations between organisational conditions (e.g. industrial sector, size of enterprise), working time (e.g. length of working time), working conditions (e.g. Insecurity, leadership behaviour) and individual characteristics (e.g. sex, education) on the one hand and work intensity on the other. The analyses are based on the BIBB/BAuA Employment Survey 2018, a cross-section representative for the German working population and covering approximately 20,000 employed individuals. In order to check the robustness of the results, analyses are also carried out using the BAuA-Working Time Survey 2015 and the European Working Conditions survey 2015. Ordinary least squares (OLS) regressions show that work intensity is a multifactorial phenomenon. In particular, excessive working hours, poor work-life balance, disruptions at work, restructuring and low leadership quality are associated with an increased work intensity across all surveys. The results indicate that labour intensity is a condition that can be designed. For instance, managers should create a supportive work environment that is characterised by an appropriate level of demands, adequate feedback and social support.

HÜNTELER, BETTINA* (University of Cologne, Germany)

A New Perspective on Family Demography – Changing Compositions and Individual Positions in Multigenerational Families

This research employs a holistic approach to investigate the development of generational placements over the individual's life course in Germany for multiple cohorts. Demographic processes of several generations and the resulting dynamic intergenerational structure of multigenerational families are explored and explained.

With data from the German Ageing Study for the birth cohorts 1923-30, 1931-38, 1939-46, and 1947-54, the timing, sequencing, and duration within three generational placements, namely being a child, parent, and/or grandparent, up to the age of 60 is examined.

Sequence and cluster analysis identified seven different patterns of n=5,144 individual trajectories over the pooled sample: Most individuals experienced three-generation-families in which they were simultaneously children and parents, or parents and grandparents, but with varying durations within each of the roles. The other clusters differ with regard to the existence of children and grandchildren and the timing of the parental deaths, ranging from four-generation-families to childless individuals without any generational placement after the loss of their parents. Logistic regressions revealed that a cohort effect was present especially concerning the timing of the parental deaths and onset of family formation. Women were more likely than men to be part of clusters characterized by an earlier entrance into parenthood. Additional analyses of the cohort differences, such as cross-sectional and longitudinal entropy, confirmed and further specified variations between family composition and generational placements over time.

Employing a holistic perspective on generational placements not only mirrors known historical demographic developments, such as the so-called Second Demographic Transition. It also unveils the large variation in the composition of families in Germany within and between cohorts and the highly dynamic opportunity structures of intergenerational support for individuals.

Older Canadian LGBTQ Adults' Experiences of Discrimination over the Life Course

Our research considers older Canadian LGBTQ persons' everyday experiences of aging and social inclusion/exclusion. Framed by age-relations and queer theory, our study entailed in-depth interviews with 30 LGBTQ persons aged 65-84 (average age of 71). Participants were recruited from across Canada and were interviewed twice either in person, by telephone, or by Facetime or Skype for between 2.5 and six hours (total of 113 interview hours). Fifteen participants identified as female and 15 identified as male, including five transgender women and one transgender man. There was diversity in the participants' sexual orientation, ethnicity, race, education, income, partner status, and health and functional abilities. The data were analyzed thematically.

The majority of the study participants reported having experienced discrimination and/or social exclusion because of their gender identities and/or sexual orientation over the life course. In particular, participants described how they had been poorly treated by family members, friends, church groups, the military, government officials, health care professionals, employers and work colleagues, and complete strangers, to name just a few. They noted that the types of discrimination and exclusion that they had encountered had shifted over the life course and discussed the impact of changing social norms and laws. They expressed concern that homophobia and transphobia might be amplified in later life because of societal ageism and articulated a sense of growing vulnerability as they aged. Many participants felt that they were simultaneously invisible and hyper-visible in Canadian society as they navigated intersecting forms of discrimination and social exclusion. We discuss the implications of these findings in light of the extant research and theorizing.

De La Respuesta a La Gestión De Desasatres: Dinámicas Institucionales y Cognitivas En El Proceso De Reconfiguración Del Complejo De Protección Civil En Argentina

La comunidad de expertos acuerda en que los cambios en la frecuencia e intensidad de los eventos extremos son el resultado de la combinación del cambio climático de origen antropogénico y la variabilidad climática natural. Este consenso va cristalizando tanto en políticas científicas como en políticas vinculadas a la protección de la población. Entre estas últimas encontramos las recomendaciones de organismos internacionales de producir un cambio de paradigma: más que estrategias de "respuesta" ante eventos extremos, instan a desarrollar políticas de gestión integral del riesgo implementando diversas estrategias que permitan anticiparse a la ocurrencia de emergencias y desastres para prevenir sus impactos.

En la actualidad, el paradigma de la respuesta predomina entre los organismos que integran el Complejo de Protección y Defensa Civil de la Argentina. Sin embargo, la investigación que iniciamos en 2016 nos permitió registrar un proceso de transición –no lineal ni uniforme– hacia el paradigma de la gestión del riesgo de desastres que incorpora a la información meteorológica y climática como un elemento relevante en la toma de decisiones. Especialmente, el rol que adquiere dicha información se vincula a la lógica de la anticipación propia del enfoque de "gestión" donde los pronósticos son un *input* esencial para construir el escenario futuro. Asimismo, identificamos nuevas estrategias de articulación entre organismos con trayectorias histórico-institucionales muy diversas. En este trabajo nos proponemos dar cuenta de este proceso de transición a partir de un abordaje etnográfico de la Defensa Civil de la provincia de Buenos Aires, provincia con mayor población del país.

Tracing Geographies of Exclusion: Building Alliances through Narratives of Belonging and Disbelonging

This essay considers the physical and imaginary borders that have created the ground for the socio-spatial exclusion of Roma, Egyptian, and Ashkali in Kosovo. Specifically, it deals with the injustices that these groups face and the relations that produce them. Focusing on stories of expulsion and belonging and tracing these stories through tales, oral history, songs, poetry, and paintings, I show experiences of nostalgia, community, becoming, disbelonging, and racism through decades. This paper is part of larger project with local organizations and Roma, Egyptian, Ashkali, and Albanian activists in Kosovo that aims to document stories of local communities living in segregated neighborhoods. This work highlights not only stories of exclusion but also ways how these communities have adapted and resisted oppression and segregation and the potential for alliance. I embed these stories in the context of Kosovo marked with increased ethnic/racial tensions and economic precarity to show how some of the struggles overlap among these marginalized communities while others are specific and deeply shaped and determined by local contexts and history; thus, making visible geographies of exclusion. These narratives of Roma, Egyptian, and Ashkali regarding belonging complicate notions of inclusion and exclusion traditionally accepted in the housing and urban studies literature as well as by policymakers in Kosovo. More importantly, they are a testament of the oppression experienced by these communities that has often gone undocumented. Building on the (un)common geographies of exclusion, I consider the pathways towards building alliances across communities.

What Else Is There? Making Visible Narratives of (Dis)Belonging through Arts-Informed Research

This essay considers the socio-spatial exclusion of Roma/Romani in Europe. Specifically, it deals with the experiences of belonging and disbelonging of Roma women and girls. Tracing these stories through tales, oral history, songs, poetry, and paintings, I show experiences of sexism and racism throughout decades as well as alliances and friendships within and across communities. In addition, by using arts-based research and fictional writing, I challenge ideas of legitimate sources, legitimate knowledge, and academic knowledge that are pervasive in the metropole. At the same time, this essay aims to bring together Roma and non-Roma scholars to work on the same goal of decolonizing knowledge. As such, I bring to the fore of discussion and theorizing about inequality pervasive in Europe, the work of many Roma feminist writers and my own experience as a non-Roma scholar to find contradictions between the narratives and the archives of the oppressor and the oppressed. These contradictions show what is missing and what else is there. At the same time, I also challenge the borders of these categories altogether. Finally, this paper is a project of self-reflection that brings to discussion whiteness by making it an object of study. In doing so, I question what I/we know and what I/we refuse to know. I argue that engaging in an exploration of what is unseen and unheard in the most familiar settings is one way of undoing the cycle of silence and building common alliances.

Jóvenes Activistas En Brasil: Protestas Recientes (2013-2018), Redes Sociales y Memorias

Este artículo explora cómo jóvenes activistas de la ciudad de Salvador (Brasil) participaron del reciente ciclo de protestas políticas, de 2013 a 2018, partiendo de junio de 2013 hasta las demostraciones callejeras en 2018, en el contexto electoral presidencial. Hasta este momento, 19 jóvenes activistas fueron entrevistados, distribuidos en tres grupos diferentes: un grupo de izquierda más tradicional, en su mayoría jóvenes del movimiento estudiantil organizado; un grupo de derecha liberal y conservadora, activistas dispersos o afiliados a partidos políticos; y un grupo de activistas culturales de las periferias de Salvador, con una perspectiva más autonomista hacia la política partidaria. Esta investigación aborda comparativamente: cómo fueron convocados y en que protestas participaron; cómo las redes sociales y las nuevas tecnologías impactaron sus entendimientos de política y su movilización; cuáles son perspectivas políticas acerca de la democracia y del autoritarismo; y que memorias colectivas utilizan para interpretar el presente y proponer soluciones políticas. Análisis preliminares apuntan: un alejamiento de los jóvenes de las periferias de la polarización callejera entre derecha e izquierda; una apropiación intensa de las redes sociales y canales de video especialmente por los jóvenes conservadores, que frecuentemente relatan un proceso de "despertar" político por la internet; y referencias históricas bastante diferentes entre estos grupos: mientras los jóvenes de izquierda consideran la dictadura militar como clave para entender el presente brasileño, los jóvenes activistas culturales periféricos enfatizan las herencias de la esclavitud y los jóvenes conservadores rescatan el Brasil imperial como un ejemplo de institucionalidad estable.

Against All Odds: A Study of Enabling Factors in Early Childhood for Cognitive Outcomes

Most studies in social stratification research focus on the risk factors associated with lower educational outcomes of children/young people from disadvantaged backgrounds. This paper takes a different angle by focusing on the enabling factors which lead some children from poor families to achieve cognitive outcomes higher than their peers. The paper adopts a multidimensional and a life-course perspective by analysing a multiplicity of factors which affect early and later childhood experiences. We use the Growing Up Study (GUS) in Scotland, a large longitudinal study which follows the lives of thousands of children and their families from birth through to the teenage years. Economically disadvantaged children are defined as those children whose families' equivalised income falls in the bottom income quintile(s). The outcome analysed is children's vocabulary score at three time points, i.e. when aged 3, 5 and 10. The results of our preliminary analyses based on logistic regression modelling, show that, after controlling for other socio-demographic characteristics, the factors which enable children from poor families to achieve vocabulary scores above the median are: living in a rented or owned house rather than in social housing, living in rural areas and smaller towns as opposed to large urban areas and being exposed to stimulating activities and a calm atmosphere at home. Longitudinal analyses of the data also show that, over time, economically disadvantaged children experience a steeper improvement in their vocabulary score than their peers which suggest that school might play a crucial role in unlocking the potential among the disadvantaged children. Unsurprisingly, we also found that children who experienced economic disadvantage only once between the ages of 3 and 10 have higher chances of achieving high vocabulary scores than children who experienced disadvantage multiple times, confirming the negative consequences of prolonged exposure to poverty.

Referral Networks and the Search for Low-Wage Care Work in Nicaragua: Power, Inequality, and Resistance

In Nicaragua's low-wage labor market, many women are employed informally as care workers. This paper examines the referral networks through which care workers find employment, drawing upon interviews with workers and employers in Leon, Nicaragua. Referrals come from a wide variety of tie types, with friends and neighbors the most common source of referrals. Building and mobilizing referral networks requires constant sociability, as job information often is shared during chance encounters in public. Referral networks arose to meet the needs of a labor market with few formal institutions for matching workers to jobs; they encourage residents to know their neighbors, form long-term relationships with a sprawling web of friends and acquaintances, and manage others' impressions of themselves. But referral networks also reinforce employer power over workers in a labor market where workers are already vulnerable, and it reinforces women's disadvantaged position in the labor market and in the wider Nicaraguan society. Though referral networks are pervasive, some job-seekers actively resist their power, through their search behavior and their narratives. Young women are especially likely to resist, but they pay a price for doing so, and eschewing referral networks does not guarantee escape from the gender inequality in Nicaragua's labor market. Resistance to the reputation game also reflects generational shifts: For older respondents, referral networks and care work offered a chance for mobility or security; for younger workers, they present a trap.

Reconversion Strategies of Cultural and Social Capital Among Migrants: Bulgarian Schools of Language and Culture Outside Bulgaria

In this paper, I will examine the strategies developed by Bulgarian immigrants living in Spain in order to promote the learning of Bulgarian language and culture among their children. Starting from the incorporated cultural capital brought by immigrants in the form of habitus (Bulgarian language and culture), I analyse how this devaluated cultural capital in the migratory context is effectively reconverted in other forms of cultural capital (objectified and institutionalized) through the development of non-formal and formal courses on Bulgarian language and culture. In this analysis, I will show the articulation between the contexts where so-called second generation of Bulgarian migrants learn Bulgarian language and culture, and the reconversion strategies of different forms of social and cultural capital. Thus, starting from the incorporated form of cultural capital brought by Bulgarian migrants (Bulgarian language and culture) and its role towards strengthening bonding social capital between family members and close group of compatriots, I will show how this devalued form of cultural capital is effectively reconverted into objectified and institutionalized forms of cultural capital through the diversification of social networks and new forms of social capital (bridging and linking). The main aims of the paper are: (i) to show the relevance of diversifying social networks in order to revalue the incorporated form of cultural capital; (ii) to raise awareness towards the relevance of mother-tongue learning in the migratory context; and (iii) to show the role of women in the production and reproduction of reconversion strategies of different forms of social and cultural capital.

Volunteering Among Immigrant Youngsters & Refugees: An Alternative Path Towards Well-Being

Based on the results identified through the empirical research carried out as part of the European Project Jucivol (acronym of Junior Citizens Through Volunteering), in this paper I will analyse how and to what extent the promotion of volunteering activities among young migrants and refugees (18-30 years old) may constitute a way to foster social and entrepreneurial competences that, in turn, will encourage their participation in civil society and their social inclusion. In order to carry out this analysis, I will first provide an overview of the main socio-demographic characteristics of these young migrants and refugees (countries of origin, age, year of arrival) in the five countries where the project has been implemented (Spain, France, Slovenia, Italy and Cyprus). Second, I will identify the main motivations and obstacles faced by these youngsters in order to become volunteers (e.g. lack of information, misconceptions). And third, I will analyse how the implementation of volunteering projects developed by young migrants and refugees in the Spanish context has provided new means to achieve personal fulfilment and a sense of belonging to the society where they live. The main aim of the paper is twofold: on the one hand, this analysis will show the similarities and differences in the ways in which young migrants and refugees experience the challenge of integrating into a new sociocultural context; and, on the other hand, it will show how participation in volunteering activities constitutes an important asset for the well-being of these youngsters.

Can Sociology of Law Transform the Legal Profession in Latin América: Bringing Sociology of Law to the Classroom

What is the role of sociology of law in the transformation of the legal profession? The legal profession and legal education have been relevant topics of research for the sociology of law. Research on the legal profession in the region has shown important traditions of activist and alternative practice of law, but also that it is dominated by traditional views and perspectives of law that separate it from society. This can be traced back to legal education, where socio-legal research has consistently shown that positivistic perspectives continue to be uncontested. There are, however, some initiatives on how to intervene legal education and thus transform the legal profession in Latin America. This paper aims to analyze the intervention that has been implemented in the Seminar of the Legal Profession in the law degree at the Centre for Economic Research and Teaching (CIDE). This seminar has been an opportunity to integrate the empirical studies on the legal profession and education into a law degree and an opportunity to bring forward necessary discussions on ethics, but also on the main challenges of the legal profession.

La Responsabilidad Social Universitaria En El Contexto De La Política Educativa. El Caso De Una Universidad Pública Mexicana

En México, el concepto Responsabilidad Social Universitaria (RSU) se ha venido construyendo y diversificando en años recientes. Actualmente contamos con definiciones diversas en función de la disciplina que las propone y de la corriente teórico-política de sus autores.

La ponencia pretende mostrar cómo una universidad pública estatal mexicana asumió un posicionamiento ético-político-filosófico de la RSU con el cual posteriormente tránsito a la autodenominación que asumió como lema institucional: ser una Universidad Socialmente Responsable. Esta interpretación se revisa en el contexto de la política educativa del gobierno federal (2012-2018), particularmente en el sentido de ampliar considerablemente la cobertura educativa en la entidad, lo cual generó una serie de problemas que, sumados a rezagos estructurales, colocaron en riesgo la sustentabilidad de la institución.

Entre los hallazgos se mencionan como la institución, en aras de asumir su responsabilidad social y cumplir con las metas del gobierno federal para obtener un mayor presupuesto, actuó al margen de procedimientos y de la racionalidad técnica que impone la misma autoridad educativa federal, creando unidades académicas y programas educativos que demandaron la contratación de una gran cantidad de docentes para atender a los nuevos estudiantes. Todas estas decisiones se tomaron al amparo de su autonomía, aunque no siempre con el respaldo, el acuerdo, ni la autorización presupuestal de la Secretaría de Educación Pública lo cual aceleró la crisis en la que se encuentra inmersa la institución. En síntesis, interesa mostrar como la universidad al asumir dicha postura e intentar cumplir con las metas y presiones del gobierno federal, detonó una serie de impactos negativos en el terreno organizacional, cognitivo, formativo y social para la misma.

La metodología empleada fue de corte cualitativo-hermenéutica, se llevó a cabo una revisión documental de los planteamientos teórico-conceptuales de F. Vallaeys, de los informes institucionales y de algunas noticias periodísticas.

Strategic Agreement As Form of Stakeholder Collaboration in Risk Governance

For risk governance coping with issues such as nuclear power or climate change, it is necessary to establish a collaborative network or deliberative dialogue among multilevel stakeholders with different interests and values. Previous studies have assumed that the most ideal form of collaboration is based on "rational consensus" proposed by Jürgen Habermas, which means a complete and unanimous agreement by all parties for the same reasons.

On the other hand, in recent studies of governance and resilience it is argued that governance systems need not only cohesion and stability but also variety and flexibility in order to adopt rapid changes in complex social-environmental systems. For example, international climate change agreements must create sta-

ble and predictable rules but also must change themselves in response to new progress of scientific knowledge and unexpected environmental circumstances (Duit et al. 2010).

The Habermasian model of collaboration does not seem to be compatible with such requirements because it tends to idealize a final and full agreement of values and to underestimate difference of positions and flexibility of frameworks. Is there any alternative conception that can handle and reconcile the unity-difference tension and the stability-flexibility tension?

The purpose of this paper is to examine the model of "strategic agreement (strategische Verständigung)" proposed by Alois Hahn (1989) and Niklas Luhmann (1991) and to show that it is more appropriate model of stakeholder collaboration for complex risk governance than Habermasian model. According to zhahn and Luhmann, strategic agreement is "consensus fiction" which enables the continuance of communication where people's value judgments diverge. It is not a final agreement but a temporal and changeable settlement. In this way, conflicting parties can create provisional underpinnings for collaborative dialogue.

Locally Accepted and Gender Sensitive: Gender Equity Center's Engagement with Disaster Affected Communities in the Great East Japan Disaster, 2011

This paper deals with community engagement by gender equity centers in response and preparedness for disaster in Japan. It tries to examine how community-based disaster management and gender equity sectors generated together 'locally accepted and gender sensitive' disaster management through the experience of response to the Great East Japan Disaster (2011).

It was only after the Great East Japan Disaster when gender equity center started to work with the community-based disaster management organization (CBD-MO). Gender equity center, also called as women's center, is an outreach facility funded by the local government, and is often managed by civic group of women. While CBDMO, conventionally established under each neighborhood association, is the lowest and essential unit of disaster response and preparedness. About 160,000 organizations have been formed nationwide covering about 80 % of all households.

CBDMOs is highly gendered organization. Retired men are the main committee members. Women of the same generation also participate, but they are seldom engaged in decision-making because of strict gender divisions of labor that characterize this generation. Younger generations with more egalitarian gender attitudes are generally not very interested in it. As gender division of labor and patriarchal tendency intensified after disaster, it wasn't easy for gender equity canters in the affected areas to deliver gender sensitive support and assistance. Community is a double-edged sword. It can protect the vulnerable members, or can also oppress, exclude them in disaster situation, following the prevailing pattern of power and resource allocation.

Based on two sets of interviews with 15 staff members and activists of gender equity centers in the affected areas of the Great East Japan Disaster, one conducted in 2011-12 and the other in 2019, this paper illustrates the process of locally accepted and gender sensitive disaster management is generated.

Disadvantaged but Where: The Social Embeddedness of the Influence of Social and Cultural Capital on Individual Participation in Adult Non-Formal Education

The paper aims at exploring how the influence of social and cultural capital on the individual participation in adult non-formal education and training is embedded in wider social country settings. Theoretically, the paper builds upon a synthesis of ideas from Bourdeu's theory of the reproduction role of education (Bourdeu and Passeron, 1990) and the bounded agency model (Rubenson & Desjardins 2009). While Bourdieu's theory emphasizes the crucial importance of individuals social and cultural capital for their educational attainment, the bounded agency model is based on the premises that the structural conditions play a substantial role in forming the circumstances faced by individuals and limit the feasible alternatives to choose from, and therefore they can "bound" individual agency.

At methodological level, the paper makes a secondary data analysis on the Adult Education Survey (2011, 2016) for about 25 countries by using descriptive statistics and regression analyses. The preliminary findings clearly demonstrate that disadvantaged people (those with low education and from lower social background) participate less in adult non-formal education and training than people with higher education and from high social background. However, the influence of social background and level of education is different depending on the country in which adults live. The paper fits into the literature that defends the need for an integrated approach to participation in lifelong learning, which incorporates the

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

influence of factors at different levels - micro, meso and macro (e.g. Boeren 2017). In contrast to this body of literature though the offered analysis focuses specifically on non-formal education and training and demonstrates the need for adapting this approach to this type of lifelong learning. Our findings provide suggestive evidence that adult education could function as both means of reproducing existing social inequalities and of mitigating and even eliminating them depending on country's institutional settings.

IMANI JAJARMI, HOSSEIN* (University of Tehran, Iran)
SHAHHOSSEINI, MAHROO (Institute for Social Studies and Research, University of Tehran, Iran)

The Role of Institute of Social Studies and Research (ISSR) of University of Tehran in Shaping Urban Policies in Iran 1968-1979

There is a common belief among Iranian governmental top officers that sociological studies are so general and many of them are unpractical. Although the historical facts show different picture and there are some evidences that social scientists had tried to identify and to analyze the real problems of the country and to suggest practical solutions for policy makers and top bureaucrats in the state.

Sociology in Iran like many other places in the world has a theoretical orientation but after the establishment of Institute for Social Studies and Research (ISSR) in 1968, the Iranian sociologist who worked in university of Tehran (UT) started to do research and studies for ministries and governmental organizations. The pioneers were people who graduated mainly from European universities especially France and they wanted to have an Iranian version of CNRS, the famous French research center.

The first researcher- sociologists and their students did many research projects in areas like municipalities' expenditure, the workers problems in factories, social impacts of land reform policy and the social problems of Tehran, the capital city of Iran. Some of them had close relationships with the Shah and the Queen of Iran and some were among well-known political opponents. Because of good relations with European and American countries there were researchers from the North in ISSR who helped Iranian counterparts.

The article wants to focus on the urban studies of ISSR and their answers and suggestions for practical problems during the years of 1968-1979.

Moving from Deficit-Based Approaches to Emancipatory Strategies in Argentina: Changes Continuities, and Challenges

While in several European countries, such as France, in the framework of the neoliberal turn of educational management, policies adressing educational inequalities evolve towards an individualization of the targeting and the maximization of the potential of students (Frandji et al., 2007), some Latin American countries, such as Argentina, can be a counterexample. At the beginning of the 2000s, Argentina set up an educational program inspired by Jacques Rancière's pedagogy, which advocates equality as a starting point. By distancing itself from the deficit-based approaches to inequality, the Integral Program for Educational Equality aims to reinforce a belief that seemed blunted by circumstances: "everyone can learn".

In this paper we propose to approach targeted policies addressing education inequalities with two main axes: the conceptions of inequalities in the regulatory texts and the translations of these texts in concrete practices. We insist on the interest of differentiating the policies and the discourses that speak or justify them. In the case of the PIIE, disruptive discursive with compensation policies have been accompanied by pragmatic continuities, embodied in devices, tools or people.

The purpose is based on our doctoral thesis in which we study how are constructed, set up, and evolve Argentinean educational policies addressing inequalities. Our methodological corpus is composed of regulatory texts, evaluations and any type of descriptive document of the policy, 13 interviews with senior officials at the central level, an interview with the Minister of National Education, the participant observation of working arrangements and the collection of interviews with three provincial teams, interviews with school principals and teachers benefiting from the program in 14 schools, and 280 texts from Pedagogical initiatives (or school projects) developed and implemented by the schools beneficiating from the program.

INGRASCÌ, OMBRETTA* (University of Milan, Italy)

Corruption Practices from a Gender Perspective. the Case of Italy

The paper deals with the relationship between gender and corruption by focussing on the Italian case, which is very interesting for a number of reasons. First, it shows higher levels of corruption compared to other democratic and developed countries (Gambetta, 2018). Second, notwithstanding the growth of female participation in the labour market and politics, women still strive to reach leadership and power positions in the public arena. Third, although women are less charged and sentenced with corruption if compared with men (Istat, 2018), in the last five years they have been involved in significant grand corruption scandals.

Given this picture the paper explores how gender has shaped corruption practices (both petty and grand) in Italy by employing a feminist theoretical approach that deals with men and women not as homogeneous groups, but as expressions of multiple identities (Madureira, 2009; SciencesPo 2016). Moreover, it takes into account other variables concerning male and female actors involved in corruption practices, such as their socio-demographic, educational and cultural backgrounds, their job title and position in public or private organizations, and their modus operandi (i.e. the relationship with their accomplices and crime victims, the object of corrupt exchange, etc.).

The analysis is grounded on a mixed-method approach that combines quantitative and qualitative data: statistics on corruption and women's participation in labour market; judicial files related to case studies where both men and women were charged with corruption; and, in-depth interviews with Public prosecutors and LEAs involved in investigations on corruption.

Finally, the analysis suggests that it is necessary to overcome the 'fairer sex theory' that has been traditionally proposed to understand the gender gap in corruption (David Dollar et al., 2001; Swamy et al. 2001) and to put forward a more thoroughly understanding of the complex and ambivalent link between gender and corruption (SciencesPo 2016).

Re-Reading My Ethnographic Field Notes

Reconsidering certain interview situations that took place a long time ago – in this case, when I interviewed three generations of women in Jewish displaced person families in the early 1990s – I re-read my ethnographic protocols of the interviews in one family to understand the different positions my interview partner and I had taken as I remembered them. I was ambivalent about re-reading my field notes and then realized that while I had clearly written down what was important with regard to my research topic from my interview partners' point of view, this did not guide my analysis of the interview situations at the time. In my analysis and writing, I was rather engaged in an internal argument with my interview partner's position which I wanted to resolve in line with my thinking. I would like to discuss the strong emotions implied when we do research on topics we are biographically involved in, the power relations reflected in our analysis and writing, and the confrontation with our selves in research.

Gendered Effects of Perceived Discrimination Among Early-Career French Lawyers.

In many Western countries, law practice is characterised by strong gender inequalities that appear early on the career track. In order to account for the persistence of gender inequalities in law, most studies have focused on organizational barriers to women's career advancement. Although previous research has suggested that women's career paths and full integration into the profession are conditioned by discrimination, little research exists on how gender discrimination relate to lawyers' individual work experiences. This study prolongs a long stream of research on gender inequalities in the legal professions, with a focus on the under-researched French case. But rather than taking a 'view from above', which looks at how organisational changes affect the distribution of career opportunities for men and women, it takes a 'view from below', with a focus on the perception of gender discrimination by those who have recently entered the legal profession and who are most likely to be affected by those organisational changes.

Drawing on the quantitative analysis of the data we collected from a survey administrated to 982 Parisian early-career lawyers, we inquire into the relationship between perceived discrimination, job satisfaction, and intentions to leave the profession in the first part of the legal career. Results show that perceptions of discrimination relate differently to the job satisfaction of male and female lawyers as for career advancement, work-life balance and job control issues. Likewise, different aspects of job satisfaction account for quitting intentions, since promotion prospects matter more than work-life balance for women, while this latter is an element that is relevant for men. By adopting a 'view from below' on early-career

lawyers' individual work experiences, the article sheds new light on the construction of gender inequalities in legal careers, in a context marked by increased demands for gender equality and by de facto persistent inequalities.

Gendered Models of Professionalism and Perceptions of Discrimination Among Early-Career Lawyers.

Evidence suggests that globalization and firm restructuring are reinforcing gender inequalities in the legal profession of many countries, mainly through the reconfiguration of compensation structures and the strengthening of male-centred work patterns and career profiles. The reinforcement of this male-centred model of professionalism has severe implications for female lawyers. Research on impediments to women's integration and career progression in the legal profession have shown how professionalism is used within law firms as a normalizing career device to legitimise the lack of a career path to female professionals, and the differentiated assignment of men and women to the most powerful and rewarding career paths. While many studies have focused on these macro work-organizational processes and their influence on the gendered segmentation of the legal profession, in this work we focus on micro level dynamics, namely through the exploration of individuals' work experiences. In particular, we look at professionalism and its relation with individual perceptions of gender discrimination.

Drawing on the quantitative analysis of the data we collected from a survey administrated to early-career lawyers in France (N=982) and in the French-speaking part of Switzerland (N=366), we investigate first whether the early stages of a legal career are characterised by competing gendered models of professionalism, and we look then at how these alternative models relate to perceptions of gender discrimination. Results show that in both countries there are gendered models of professionalism. Moreover, in the case of women, models of professionalism are related with perceptions of differential treatment, indicating that female lawyers are aware of the fact that they are still perceived as being deviant from the established male-centred professionalism models. Our analysis takes a renovated looks at models of professionalism in law practice through the lens of discrimination perceptions, shedding new light on the dynamics of gender inequalities in legal careers.

Development Alternatives of Indigenous Peoples in Resistance in Extractivist Contexts. Bolivia Case

La Amazonia y otros ecosistemas únicos como el bosque seco chiquitano están en llamas rebelando el rostro salvaje del modelo económico que impera en nuestros países cuya base es la extracción de recursos naturales hasta el agotamiento. Bolivia entre agosto y septiembre del 2019 ha perdido por los incendios más de 5'000.000 millones de hectáreas de bosque y el fuego continua, han sido afectados áreas protegidas y Territorios Indígenas en más del 70%. La pérdida de flora y fauna es incalculable los actores más impactados son los pueblos indígenas que albergan cerca del 70 % de los recursos forestales en sus territorios. Pero, el modelo económico expresado en la Agenda patriótica 2025 promete continuar sin límites, busca: la ampliación de la frontera agrícola, la producción de soya, etanol además de producir carne para exportación, sin duda lo sucedido en la chiquitania es el comienzo. Por otra parte, dentro de este plan económico se encuentra la construcción de carreteras, represas y otra serie de megaproyectos. Ante esta situación se han ido gestando movimientos de resistencia por parte de pueblos indígenas, se ha creado la Coordinadora Nacional de Pueblos Indígenas para la Defensa de los Territorios y Áreas Protegidas para hacer frente a la vulneración y avasallamiento de sus tierras. Desde la resistencia los distintos pueblos indígenas afectados se están articulando y cada vez se suman más movimientos. ¿Cuáles son estas alternativas de desarrollo que plantean? ¿Qué estrategias de resistencia están desarrollando? ¿Cómo estos guardianes de los bosques crean nuevas narrativas y alternativas al modelo económico imperante?

Linguistic Integration of Young Migrants and Descendants of Migrants in Portugal

This paper intends to analyze the process of learning the Portuguese language by young immigrants and immigrants' descendants living in Sintra Municipality (Lisbon Metropolitan Area, Portugal), in order to understand how this process influences their social integration. In Portugal, there are several institutional programmes provided by the Government offering Portuguese language courses to facilitate the immigrant integration process. Several voluntary and face-to-face programmes like "Portuguese as Non-Maternal Language" (PLNM) (2006), and "Portuguese for All" (2008) have been available in the country for some years now. Other programmes like "Online Portuguese Platform" (2016) and a "Portuguese Teaching Network Abroad" (2016) have enabled potential immigrants to have contact with the Portuguese language before migration.

However, according to Sintra official data in 2018 (Sintra Municipal Immigrant Integration Plan for 2018-2020), language continues to be a barrier for young immigrants and descendants of immigrants enrolled in basic and secondary schools in this municipality. Besides, as it has been recorded, PLNM programme is not having the expected effect, and therefore more support should be given to those immigrants with Portuguese language learning difficulties.

Drawing from 45 qualitative interviews to young immigrants and immigrants' descendants in Sintra, this paper analyses their narratives in order to understand what should be done to improve the effectiveness of Portuguese language learning. Besides, since the language and the culture of the country of origin is an important element for the social integration of immigrants and descendants, it is also addressed which actions and programmes this municipality has done to preserve and promote their culture and language.

Compensatory Advantage in Early Educational Attainment Process: Do Advantaged Families Compensate for the Impact of Negative Events on Achievement?

The notion of compensatory advantage states that individuals from advantaged backgrounds are able to mobilize resources to compensate for the effects of negative events happened in the early life course on the subsequent attainment in later life. In order to test this notion of compensatory advantage, I use panel study of elementary school students (grades 1 through 6) and their parents conducted from 2015 to 2018 by the Benesse Educational Research Institute and the Institute of Social Science, University of Tokyo. I use regression discontinuity (RD) and propensity score matching (PM) methods. The Japanese educational system is based on the strict cutoff date for admission to elementary school based on students' birth month. The same cutoff date is applied nation-wide without any exception. RD method takes advantage of the cutoff date, assumes that students born in the months just before and after the cutoff date are randomly assigned, and compares the educational achievement (grades) among these students. Born youngest in the cohort is considered a negative event (treatment) which should affect grades in elementary school.

The analyses document that both students from advantaged and disadvantaged backgrounds have higher risk of being at the bottom of achievement level (low grades) when they are the youngest (born just before the cutoff) in their cohort. The relative risk of being at the bottom, however, is much lower for students from advantage backgrounds compared with those from disadvantaged backgrounds. Consistent with the prediction of compensatory advantage, advantaged families are able to compensate for the impact of negative event (born youngest in the cohort) on educational achievement. This study will further examine the potential mechanisms of the compensatory advantage by focusing on the quantity and quality of interactions between parents and students both prior to entering elementary school and during elementary school days.

School to Work Transition of Second-Generation Immigrants in Japan: Is the 'Institutional Linkage' Still an Equalizer of the Labor Market Chances Under a New Migration Society?

This paper aims to unravel whether the Japanese system of school to work transition can integrate second-generation immigrants into the Japanese labor market. Globalization produces a massive population dynamics across the world, and Japan is not an exception as a destination society for migrants from other

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Asian societies. The number of immigrants in Japan has increased, and they have their children in Japanese society. The size of the second-generation immigrants has also gradually got more extensive than before. A considerable majority of them get Japanese education and find the first job in the Japanese labor market, and the school to work transition process for them represents how they can experience socio-economic integration in Japan. It is a debatable issue whether the Japanese institutions can incorporate immigrants. However, previous researches on the school to work transition considered almost nothing about an emerging ethnic diversity in Japan. In this paper, we primarily focus on the effect of the 'Institutional Linkage,' which is a crucial concept of the research on the school to work transition. It refers to the long-lasting relationship between schools and firms, and prior studies have repeatedly confirmed that Japanese young people can find reasonable job offers through schools in terms of status attainment regardless of their socio-economic backgrounds. This paper is the first one examining the difference in the effect of the institutional linkage between the second-generation and Japanese citizens with nationally representative quantitative datasets. Analyses find inequality of utilizing the institutional linkage between ethnic backgrounds. Also, immigrant youth in Japan are less likely to get positions in large firms than Japanese one even though the immigrants use assistance from the school. Japanese school to work transition system equalizes the labor market chances among Japanese youth, but it generates inequalities among ethnicities at the same time.

Human Rights for Children: Sociocultural Differentiation, Resistance and Unity

The starting point of this study was the meeting of research on the different socioeconomic and cultural conditions in which children live on three continents in different countries (India, Philippines, Sweden, Romania, Scotland, Brazil, Argentina and Jamaica). We adopted as problem-based conceptual two keys: the first set in the fundamental rights of children in which the limits and possibilities of the guarantee and realization of rights are presented as well as the ways in which the new generations have resisted the overtures of exclusion and marginalization; the second is guided by the idea of sociocultural differentiation and unity shown by studies that depict the similarities and differences of living conditions of children in different contexts. The scientific discussions that articulate the two keys reveal aspects related to the analysis of children's rights, the performance of public policies and the materialization of the normative in certain contexts and their precariousness in different focuses of incidence of the analyzed societies. We highlight the social struggles, for the improvement of the living conditions of the new generations, taking into account the elementary role of social protagonism, which is both an inalienable right and a challenge, from the perspective of participation in decision-making spaces towards political self-organization of children and young people in different parts of the world. The analyzes presented in this study are supported by meta data obtained through empirical research. We contest the inequalities that permeate the political-legal instruments and social conditions of life of children, especially the poorest, directing our criticism to the causes and factors that prevent the realization of rights and the implementation of public policies that overcome social inequalities.

Understanding the Experiences of Adolescent Mothers in Rwanda, Stigma Faced, and the Implications for Key Capability Outcomes

In Rwanda, the age of sexual consent is eighteen years of age, with sexual activity with minors criminalized by law. Yet in the first eight months of 2019, more than 15,000 cases of pregnancies amongst under 18s were recorded by the Ministry of Health. The National Commission for Children reports that there are many more sexual abuses cases that do not result in pregnancies; the Rwanda Investigation Bureau reported that only 3,317 cases have been filed in the justice chain. The government of Rwanda treats the issue of rising adolescent underage pregnancy as an issue of gender equality, child protection and human rights, and is seeking new ways to work on this issue. Yet despite a consistent rise in numbers of adolescent girls starting childbearing before they reach the age of eighteen, the state of the evidence about their experiences remains thin. There is limited documentation about the ways that inequalities both impact which girls experience early pregnancy, and what the consequences are for their life trajectories.

This paper draws on 25 in-depth case studies with adolescent mothers in five research sites across Rwanda. Epistemologically, this research moves away from a criminal justice framing that treats adolescent pregnancy as an issue of abuse, and centering instead on girls' capabilities and the way these are mediated by intersecting inequalities. The study identifies the ways that different inequalities, such as household income and rural/urban differences, shape the experiences of adolescent mothers in relation to key capability domains including access to education, economic opportunities, and psychosocial wellbeing. Contributing more nuanced and detailed understanding of the experiences of adolescent mothers, the findings of this research have useful implications for policy and programming which more effectively promotes the rights of adolescent girls.

A Social Theory of Differentiation and Integration

In this presentation, I reconstruct Simmel's sociological theory as a social theory of differentiation and integration. In Über sociale Differenzierung (1890), he examintd the indivisible relation between the social differentiation and the expansion of each social group. He developped the idea in Soziologie (1908). Although he did not use the concept of integration, his idea can be interpreted as a social theory of differentiation and integration. Social integration and social differentiation both involve the reorganization of social boundaries. Simmel (1909) examined in the essay "Bridges and Doors" about coming and going between the boundaries of different groups or societies. If the door overcomes the distance between the two banks, which is now visualized and measured by the bridge, then the door, in a clearer form, expresses that separation and union are only two aspects of the same act. i develop Simmel's ideas and connect them to John Urry's sociology of mobilities. In your mobile lives, social differentiation and social integration occur reciprocally and simultaneously. By reconstruciting Simmel's sociological theory as a social theory of differentiation and integration for the mobile lives, I will show a better understanding of apparent paradoxes of the contemporary societies which seem at the same time deeply divided and globally connected.

Watching TV, Reading, and Cultural Capital in Contemporay Japan

In August 2018, I conducted a web survey, of which the questionnaire was answered by 3090 adults living in Tokyo. Its questionnaire is designed to be comparable to two different surveys: the Japanese SSM (Social Stratification and Social Mobility) survey, which has been conducted every 10 years since 1955, and the survey for *Culture, Class, Distinction*, conducted in the UK. The questionnaire includes questions about tastes regarding visual arts and music, frequency of cultural practices, political attitudes, social values, class identity, educational backgrounds, and so on. Using these data, I applied Multiple Correspondence Analysis (MCA) to the structure of the reading culture and the tastes of TV programs in Tokyo. Then I examine the relationship between the fields of reading and of TV and different cultural practices as supplementary variables. I also used modalities related to social class as supplementary variables. The results show the uniqueness of the Japanese context regarding the function of cultural capital in different contexts. In both of the fields, cultural capital functions as an opposite attitude towards usefulness of culture.

Brazilian Family Policies in a Comparative Perspective: Unequal Protection from the Cradle

In reviewing Brazil's current social security system, it is apparent that there are significant gaps between benefits, beneficiaries and the budgets of family policies. This paper details different policies, specially for mothers and families with small children in Brazil, accounting for inequalities in social protection offered to different socioeconomic strata. For example, income tax deductions (an indirect income) for dependent children are more valuable on average than the Bolsa Familia Program (BFP) benefits for children in poverty and extreme poverty. Higher income families receive greater state support and have had access to it in Brazil since 1924, almost 80 years before the BFP was introduced to support lower income families. Additionally, the tax deduction is available until a child turns 21 (or 24 if in post-secondary education), while BFP only covers the child until age 18, demonstrating that the social inequalities in the youth transitions are reinforced in the public policies. Furthermore, fewer than a quarter of Brazilian children were born to a mother with maternity leave protection in 2010, since the access to leave is available for women in formal work, but almost half of the labor force is in informal work, demonstrating that the labour market inequalities experienced

by parents affect the children's welfare since birth. This paper aims to analyse the gaps, limits and contradictions in family policies in Brazil, discussing their impacts in the protection of families, especially in the motherhood and early childhood.

Gender-Class Inequalities through Generations in Brazil: The Children's Point of View

This paper aims to analyze the effects of parental stratification from the children's point of view. The impact of parental stratification on new generations is a central aspect of research in social reproduction. Studies on child welfare have been addressing the challenges of differentiating individual, familial and social indicators. It is proposed to build a multilevel model to measure child outcomes considering these three levels (child, family and community). The measured outcomes is the child's educational success, as well as his or her participation in paid and domestic work. Individual variables include age, gender and ethnicity of the child; family variables include social class, cultural capital, and gender inequalities in paid and domestic work (including the distribution of care work among parents); at the community level, political-spatial inequalities are considered based on municipal welfare indicators that reflect the access to public policies and the uneven living conditions of the population. The objective is to analyze how gender and class are reproduced and transformed intergenerationally in families, considering the interaction between inequalities in the individual, familial and collective dimensions.

ITURRA, JULIO* (Centre for Social Conflict and Cohesion Studies, Chile)

Objective Position, Subjective Social Status and Perception of Economic Inequality: A Comparative Analysis of 37 Nations.

The way that individuals perceive their position in the social hierarchy has been an important topic of research in sociology. The study of social inequality from a subjective approach, has shown that the perception of individuals in relation to their own social status is explained, in part, by individual characteristics such as income, educational achievement and occupation. In the same way, it has been shown that economic inequality and the level of wealth of the national context affect the perception of individuals regarding their social position (Evans & Kelley, 2004; Lindemann & Saar, 2014)

Empirical evidence suggests that, in contexts of greater economic inequality, the subjective status of individuals tends to be lower due to the socioeconomic differences between the lower and the higher status groups. Based on a social comparison approach (Evans & Kelley, 2017; Festinger, 1954), the literature on subjective social status has paid less attention to the role of the perception of economic inequality on the relationship between objective position and subjective social status, which leads us to ask: how does the perception of inequality affect the relationship between objective position and subjective social status? Based on this question, the central hypothesis argues that the association between education, income and occupation, with subjective social status, is positively moderated by the perception of inequality. To answer this question, multilevel models were estimated using data from the 2009 ISSP "Social Inequality IV" module for 37 countries.

In line with previous evidence, the results suggest that the perception of economic inequality is relevant in terms that it positively moderates the relationship between the objective position and subjective social status. These results are particularly salient for individuals with lower educational achievement, lower income and less skilled occupations.

Re/Defining 'Essential Work': The COVID-19 Pandemic an High-Skilled Venezuelan Migrants in Argentina's Gig Economy

The COVID-19 pandemic has challenged the way labour is valued in advanced capitalism. With governments worldwide implementing national lockdowns to control the spread of coronavirus, low-paid low-status work has come to the forefront of the pandemic response as 'essential' labour. 'Key workers' were initially glorified as national heroes. National publics were confronted with the uncomfortable reality that under hostile migration regimes migrant workers often occupy undesirable and poorly rewarded 'frontline' positions, regardless of their education level or skills.

To initiate a discussion on the effect of the current crisis on the valorisation and valuation of 'essential work', this paper presents a case study of Venezuelan migrants in Argentina. Since 2014, over 3.5 million Venezuelans have migrated across South America. Unlike Venezuelan migrants in neighbouring

countries, Venezuelans arriving in Argentina were predominantly university-educated professionals. Invited by a right-wing government that promised to acknowledge their credentials, they were initially represented by the Argentine media as 'deserving', 'educated', 'qualified' migrants. Yet, landing in recession-struck Argentina, the majority entered jobs in the informal and gig economy. With the pandemic, workers in the taxi, delivery, and social care sectors were attributed 'essential workers' status and their labour gained new visibility.

Yet how does such new 'worth' measure up against the 'low-skilled' work-related risks 'essential workers' encountered, but which most 'high-skilled' workers did not have to face during the pandemic? What do Venezuelan 'high-skill' migrants' symbolic and material perceptions of the political, economic and social implications of their shift from 'high-' to 'low-skilled' but 'essential' workers tell us about social stratification after COVID-19? To discuss these questions, the paper presents the findings from interviews and a survey conducted among Venezuelan migrants in Argentina between October2020-January2021. It traces if and how migrant representations and self-perceptions have changed or persevered with the revaluation and/or revalorisation of essential labour.

IVANOV, DMITRY* (St. Petersburg State University, Russia)

From Globalization to Post-Globalizatiom: Super-Urban Enclaves of Augmented Modernity and Prospects of Social Development

The paper presents an attempt to reconceptualize social development and to measure its level for societies facing the post-globalization when neoliberal globalist policies are in decline and globalizing networks and flows paradoxically are not really global but rather localized in super-urban areas.

The super-urban areas outperform national economies they belong to and therefore open new dimension of inequality – disparities between the super-urban points of access to flows of resources and the surrounding regions. The largest 300 metropolitan areas contain only about 20% of the world's population but they generate nearly half of the world's GDP.

Attracting resources of all kinds and generating new social structures, large cities and megacities become centers of new sociality creation. There is social life as an existence full of cyber-physical experience. Different social realities are mutually penetrated and take form of *augmented reality* integrating physical and digital, material and symbolic, modern and 'postmodern' components of human life. There is an augmented sociality while small cities and rural communities are losing resources which are 'washed away' by outflows of human resources redirected towards super-urban hubs. Globalization was expected to be planetary spread of Modernity institutions but now we are faced rather with localized displacement of conventional social structures of Modernity by intensive life in a regime of *Augmented Modernity* in the super-urban areas while in the rest of communities social life is on the decline and tendency towards an *Exhausted Modernity* can be seen.

Globalization promising structural homogeneity and cultural unity is over and the nations' prospects of social development depend now on number, size, and influence of super-urban enclaves of augmented modernity which generate new forms of sociality, provoke new social problems and provide new solutions. To measure that new potential of social development the index of super-urbanization is presented.

RC16-201.4

IVANOV, DMITRY* (St. Petersburg State University, Russia)

Herbert Marcuse's Critical Theory and Dialectics of Modernity

The dialectical negation and utopianism had enabled H. Marcuse's critical theory to reveal the direction of modern society transformation in the 20th century. Hegelian paradigm 'Thesis – Antithesis – Synthesis' takes form of dialectical negation in Marcuse's development of notion of freedom: Reason – Eros – Post-technological rationality.

By the end of the 20th century the concept of post-technological rationality became affirmative discourse for the system of postindustrial capitalism, but dialectical pattern 'system – anti-system outsiders – new form of sociality' revealed by Marcuse is still relevant. This pattern can be seen in virtualization of society and its consequences.

Virtualization is replacement of things and real actions by images and communications. Virtualization was the anti-system movement in the 1980-90s when digital technologies enthusiasts created virtual networks escaping control of reified institutions. But now that 'Great Escape' of cyberpunks, hackers, pirates, and copyleft activists has been absorbed by the system. Social life is alienated into virtual realities of branding, image making, and digital networking. The current cycle of Modernity dialectics is negation of virtualization by turn to 'new materiality' and then its negation in post-virtualization as a rise of augmented social reality.

Dialectical negation now is driven by movements representing the new utopia: authenticity revolt against virtuality. The newest forms of commodification and protest in urban spaces are converging and making social life an existence full of cyber-physical experience. Different social realities are mutually penetrated and take form of augmented reality integrating physical and digital, material and symbolic, modern and 'postmodern' components of human life.

The next phase of dialectic of Modernity is rooted in the contradiction between 'augmented Modernity' emerging in the global cities and 'exhausted Modernity' in small cities and rural communities which are losing material, symbolic, and human resources 'washed away' by flows directed towards super-urban areas.

Urban Construction of Young Disobedient Workers: Struggling to Labor

"Struggling to Labor", which is a tentative title of visual ethnographic work on progress, will show a story about struggles and resistances of young precarious workers. They worked at an apparel industry in a global capital city Tokyo as part-time workers and faced lay-off notice suddenly. Since it seemed "absurd" and "unfair" to them, they formed labor union and began to their struggle for their lives. Based on fieldwork with video camera for 8 years since 2008 to 2016, this paper describe the their practice of labor union, embedding in some urban spaces. Where do young workers "use" urban spaces in their labor union practice? How interactions of these spaces and human actors make them "labor" and obedient? To answer these questions, their labor union practices can be articulated to three urban social spaces. 1)Distribution center: infrastructural space for urban fashion industry, in which young workers worked hard in vulnerable conditions. "Unreasonable" dismissal has multi meaning for them, not only losing their daily bread, but also deprivation relations with work mates and their own dignity. 2) Office of Individual-based labor union: In this space, young workers would try to translate their vivid experiences and anger at the work place to institutional discourses such as labor-management relation acts. Through the process, they could become the subject in labor laws and tried to take back workers rights. 3)Cafe and Street: non-linguistic actions are mattered here. Dance on urban streets, and sewing clothes in a cafe were a kind of expressions their pain and anger. In this point, visual documentations and ontological analysis on these material practice is essential to understand their lived-experience. In this collective action yearning for daily bread and dignity, to analyze the dynamic configuration of urban social spaces and workers is to essential for sociological inquiry.

The Impacts of Wartime Mobilization on Forming the Postwar Stratification System in Japan: Based on the Reconstructed Life History Data of Social Stratification and Mobility Surveys

During the World War II, a large number of Japanese men were drafted in military service or forced to work for military factories. How could this massive wartime mobilization contribute to forming the stable postwar Japanese society? This paper explores the influences of wartime mobilization on career mobility of Japanese men, using 1955, 1965 and 1975 Social Stratification and Mobility (SSM) surveys. The SSM surveys have been conducted at 10 years intervals since 1955 in Japan. The available data have now included life history information of respondents born from 1886 to 1985. This paper, first, attempts to reconstruct life history data of respondents that enable us to analyze the relations between wartime experiences and careers. The analyses of the life history data, then, reveal that there are clear age differences in wartime experiences among birth cohorts. It is shown that highly educated men of 1916-20 birth cohort tended to be forced to work for military factories or drafted. After the war, they tended to shift the workplaces more often and achieve better occupational status. Furthermore, multivariate analyses of occupational attainment indicate that educational levels and father's occupations strongly influence patterns of occupational transitions from wartime to postwar period among people who experienced wartime mobilization in their twenties or thirties of age. Using these results of analyses, this paper argues that fluidity of highly educated men from wartime to postwar time contributed to forming the stable postwar stratification system. In addition, this paper discusses how the quantitative research on cohort differences contributes to biographical research.

"If They Tear Down All the Villages, You'll Have No Future Here Either." Understanding the Obstacles on the Way to Post-Fossil Energy Production in Germany

In the Lausitz, a region on the German-Polish border, more than 80 villages have been sacrificed to profit from one of the largest brown coal deposits in the world which provided jobs to over 100.000 workers. During the 20th century, the region represented a model of modern industrialization and full employment which led to unpredicted economic success. After 1990, importing brown coal from the Global South led to a fierce deindustrialization. Less than 8.000 jobs in mining survived, and the labour market adopted features of post-industrialism with part-time work and a growing service sector. Young people tend to leave in search for better opportunities.

Our research looks at the Lausitz as one of the centers of European fossil energy production where growth rates have been declining for 30 years. In this context, we ask what alternatives actors aim at, and how social groups face these multiple crises.

On the one hand, trade unions, fossil entrepreneurs as well as the far-right party AfD interpret the economic transformation as an oppressive dictate by the federal State. Some suspect "green" and progressive groups behind it, willing to sacrifice the region's economic wellbeing to an "imagined" climate change. On the other hand, the federal State issued a commission which reached a broad compromise through a multipartite decision-making process to end fossil energy production by 2038.

Based on empirical material from labour market data, qualitative interviews, and documents from this "Commission on Growth", we trace how fossil energy production has become a highly contested field, with many leaving and a growing part of this former socialist region turning to political answers of the far right. More and more, economic and ecological crises are juxtaposed, and social wellbeing is connected to a time when growth rates and industrialization held the promise of social advancement for everyone.

JÁCOMO, LUIZ* (Universidade de São Paulo, Brazil)

Between Sacred and Public Space: Disputes and Conflicts over the Uses and Practices in Consolação Cemetery, São Paulo.

In this paper, we analyze the judicial dispute that occurred due to the proposal of the São Paulo City Hall to hold movie sessions with horror films in Consolação cemetery. São Paulo's oldest cemetery and one of its main tourist attractions, the Consolação Cemetery is commonly recognized as an open-air museum, like other famous and well-frequented cemeteries such as the Père-Lachaise in France and the Recoleta, in Argentina. Opposing the aim to expand cultural activities through screenings, some members of civil society appealed to the prosecutor of the State of São Paulo to interrupt the event, request that was accepted, forcing the filmmakers to project the films on the outside walls of the cemetery. In the petition, the self-named group Neighbors in Defense of the Consolação Cemetery (NDCC), mainly formed by traditionalist Catholics, argued that the proposal to transform the place of the dead into a recreation area desecrated the space and disrespected the dead. To address this issue from a sociological perspective, I conducted semi-structured interviews with key actors involved in this conflict: members of the public administration directly involved in organizing the event; artists responsible for the screenings and interventions in the cemeteries of São Paulo; and members of the traditionalist Catholic group, in addition to analyzing the decisions handed down by the Judiciary Power. The information gathered allows us to conclude that the dispute was between a secularized conception of cemetery spaces, understood by the administration as areas of leisure and recreation; and a religiously oriented conception from the NDCC and other concessionaires, a view that eventually overlapped in the judiciary judgment.

JÁCOMO, LUIZ* (Universidade de São Paulo, Brazil)

Sacred, Public and Private Spaces: New Proposals for Occupation and the Legal Juxtaposition of Sao Paulo City Cemeteries

In 2014, the municipal Legislative Power of Sao Paulo approved the Urban Developing Plan with the new guidelines for the occupation of the city. The document included notions guided by the right to the city, one of the campaign subjects of the mayor, a Workers' Party affiliated. An important change was the classification of the public cemeteries, which came to be considered as territories of "parks and green areas". With this change, 22 cemeteries spread throughout the city, with a total area of 3,600,000 m², were also destined for leisure, sports and culture. In the following years, the City Hall began to finance plays, music shows, film pro-

jections, yoga classes, cycling and hiking, activities that were questioned in court by civil movements who understood these actions as profanation of the sacredness of cemeteries. The judiciary accepted the request to interpret the cemeteries as holy places, and embargoed part of the activities. Later, in 2017, the newly elected opposition candidate began the process of privatizing cemeteries, which would be managed by private companies. In this process, cemetery areas would come into existence under a regime of legal juxtaposition: public space, for the Legislative Power; sacred, in the view of the Judiciary Power; and a private area, according to the proposal of the Executive Power. For this communication, I bring the results of the research that I have been conducting since 2016 with the agents involved in this process: public managers, cultural producers, members of civil society, people attending culture and leisure activities, and cemetery officials. I intend to address the strategies used for the realization and continuity of cultural projects, the arguments against the activities and the perspectives of these agents on the regime of private administration of cemeteries.

JAFFER, AMEN* (Lahore University of Management Sciences, Pakistan)

Made in Waste: Labor, Life and Value in Lahore's Recycling Economy

The extraction of value from the more than 6000 tonnes of solid waste produced in Lahore everyday is a major sector of the informal economy of Pakistan's second largest city. Along with physical labor, this material transformation of waste also requires considerable intellectual and political labor in order to change the social ontology of stigmatized objects to valuable commodities. This paper demonstrates that such labor requires specific social systems for organizing relations between human actors as well as with physical matter. Importantly these systems are in part located outside relations of capital as they are not only concerned with organizing production and appropriating value but also have to offer mechanisms to deal with stigmatization and provide refuge and belonging to the highly marginalized groups that work in this economy. Drawing upon fieldwork in a number of scrapyards in Lahore, I demonstrate that those who work in these businesses enter into complex social arrangements that connect them to each other, to scrap dealers and recycled material through labor, exchange, friendships, contracts, loans, and collective activities such as cooking and consuming food as well as leisure pursuits such as playing cricket, smoking hashish and listening to music. The scrapyard for them is not just a space to sell or work on reclaimed material but also a place where they live and sleep, where they form important relationships and where they seek refuge. It is actually an entire way of life that permeates minute details of the everyday and shapes almost every aspect of the lives of the men and boys who are associated with it. In this paper, I use evidence from the workings of life in scrapyards to explore the distinctive forms taken by social relations in the informal economy and their significance for the creation of value.

JAFFER, AMEN* (Lahore University of Management Sciences, Pakistan)

The Sociality of Islam: Everday Life in South Asian Sufi Shrines

Sufi shrines in South Asia present an interesting paradox for the category of popular religion. They are celebrated as the mystical dimension of Islam that is characterized by ecstatic practices and specialized knowledge (Schimmel 2006) but also viewed as an example par excellence of 'popular religion'; it is seen as an institution which is shaped by the beliefs and cultural practices of 'ordinary' people. Sufi shrines thus offer a unique vantage point to understand how seemingly paradoxical elements of religion are organically reconciled in everyday life. Drawing on an ethnographic study of Sufi shrines in the Punjab region of Pakistan, this paper demonstrates that this resolution can not be achieved in the cognitive processes that structure systems of belief or even in ritual practices but takes place in the far more mundane terrain of commonplace social activities and relationships. Even though the social life of Sufi shrines may appear extraneous to its sacred attributes, I argue that it is here that the sacred is made one's own. It is during everyday conversations and exchange of stories, collective preparation and consumption of food, drink and drugs and in establishing quotidian relationships with saints, devotees and shrine visitors that individuals develop intimacy and familiarity with gods and learn a language for addressing them directly and frankly. Such ordinary interactions produce deep and meaningful entanglements with Islam that do not follow a ritual script but are rather molded according to the particular and ever changing circumstances of life. Drawing on this case study of Sufi shrines, this paper argues that the category of popular religion can be enriched by focusing its attention on the everyday dimensions of life in religious institutions.

Building Social Indicators for Abu Dhabi Statistical System: An Empirical Approach

The development of the cultural sector is growing in the United Arab Emirates. Since several years, Abu Dhabi develops competitive intelligence process in expanding its cultural influence by promoting cultural institutions, exhibitions, events and festivals, preserving and sustaining the Emirati cultural heritage. The culture sector is perceived as one of the powerful levers for a long-term economic and social development of the emirate. Several major cultural institutions have been created recently such as the Louvre Abu Dhabi, the Cultural Foundation AD,(and others that will open soon such as the Guggenheim Museum AD, Abu Dhabi Performing Arts Centre). These new institutions are meant to play a major role in the future economy of the country. In the next decades, the UAE are expected to become a new international cultural hub for knowledge, culture, leisure and tourism with a worldwide impact.

Yet, the social impacts of culture in Abu Dhabi are still barely explored. What are the characteristics of social participation and cultural consumption that are specific to Abu Dhabi? Through what methodologies and concepts the interactions between cultural offerings and their audiences can be explored and assessed? How do the relevant statistical indicators should be developed in order to support the evidence-based decision making?

This paper will analyze how Abu Dhabi cultural sector is increasingly being influenced by the development of qualitative and quantitative cultural indicators that can then be used for establishing an internationally compatible Abu Dhabi social and cultural statistical system. For this, this research will examine the articulation between the generalized international statistical frameworks (EU, UNESCO), and the Abu Dhabi context. One of the methodological challenges of this articulation consists in how the local context determines both how the cultural statistics are structured, and how the cultural indicators are composed for the production of a coordinated statistical system.

Designing Tolerance in the United Arab Emirates: Building Urban Commons through Subjective Aesthetic Experiences and Universal Design

The rapid social and economic change of the United Arab Emirates (UAE) raises new questions related to multiculturalism and tolerance. Since the last two decades, the modernization of the UAE has attracted numerous foreigners and expatriates. With more than 200 nationalities living together in the same country, the UAE has now become one of the most multicultural and globalized country in the world. This new foreign population is now surpassing the Emirati national populations that may now feel as a minority in their own country. In 2019, the 'Year of Tolerance' has been officially declared by the UAE government. This new policy aims at establishing the UAE as a new model of inclusive society in the Middle Eastern region. For this, the UAE has undertaken major urban changes by building several cultural institutions in order to enhance ethnical and cultural diversity. New landmark buildings such as Louvre Abu Dhabi, Guggenheim Museum, Dubai Future Museum, Masdar Abu Dhabi and Dubai Expo-2020 aim at building urban commons through subjective aesthetic experiences, where contemporary architecture, universal design and the arts seek to incarnate the new spirit of the UAE.

This paper will analyze how political strategies deployed by the UAE government increasingly use sustainable and universal design to build new urban commons in cities like Abu Dhabi and Dubai. This research will particularly analyze the social impact of contemporary architecture and design in the construction of common space for a multicultural society. For this, we will investigate the role of design in contemporary society by exploring the social purpose of architecture in the creation of an inclusive society in a country where the population contrasts in the most extreme aspects.

Emerging Market Multinationals: Challenging Global Economic Dominance Patterns?

The rise of emerging market multinationals has caused considerable academic attention, raised political concerns, and triggered policy reactions in the core of the world economy. The paper addresses the question to what extent the rise of

emerging market multinationals represents a challenge for global economic dominance patterns. It is argued that answering this question requires a systematic theoretical and empirical contextualization of the strategies of the new powerful actors from the Global South. Hence, based on regulation theory, the dependency approach and the global production network perspective, emerging market multinationals are combined to analyze the context of the specific productive economic regimes. Empirically, the paper compares the outward expansion of Latin American multinationals from Brazil, Mexico and Chile to the international expansion strategies of Chinese companies. It is concluded that specific productive economic regimes explain the differences in the outward expansion strategies of emerging market multinationals and their respective impact on global economic dominance patterns. This helps to understand why Chinese multinationals indeed challenge global economic dominance patterns but Latin American Multinationals do so not.

Migrant Domestic Women Workers in Gulf Countries: A Study on the Experiences of Workers from Kerala, India

Migration, domestic work and women stand together as interrelated terms. A recent study has shown that around ninety percent of domestic workers in Gulf countries hail from India, Philippines, Bangladesh and Sri Lanka. They consist of maids, cooks, waiters, valets, butlers, laundresses, gardeners, gatekeepers, stable-lads, chauffeurs, caretakers, babysitters, tutors and secretaries. A large number of Muslim women from Kerala with low educational background due to grinding poverty who have lot of aspirations to bring up their families out of misery, choose use migration to foreign countries as an opportunity to better their lives. In this mission, they are choosing Gulf Countries as their destiny to take up domestic work for their livelihood. The reason for choosing Gulf Countries is due to cultural compatibility and attractive remuneration. However, they are facing various problems viz., isolation, belittlement, underpaid, overworked, severe punishment for minor mistakes, physical abuse and sexual exploitation. Sometimes, they are forced even to commit suicide.

In this paper, an attempt is made to discern the socio-cultural background of domestic servants and to document their experiences. The data for this study were collected from the secondary sources like Government Reports, Journals, magazines and Books and primary sources like in-depth-participant observation and personal interview with the domestic servants who have returned to India permanently after working a long period in the Gulf Countries.

WHO HAS the Right to Claim and Possess Property? the Stigmatization of Squatters in Eviction Court Records in Porto Alegre

In Brazil, as in many other countries, access to housing can be translated as entitlement to citizenship itself. Nonetheless, to enjoy such civil privileges and rights, it is not enough to ensure housing, but a very specific *form* of housing. On the one hand, I argue in this paper that often times in Brazil the acceptable tenancy has become closely associated with private and individual ownership. On the other hand, I claim that models based on squatting, even if guaranteed by current legislation, has been criminalized by the public sector. More specifically, in this piece, I am interested in exploring what Ananya Roy (2003) calls "paradigms of propertied citizenship" and how it applies to the Brazilian case. Under this paradigm, private property ownership is considered as the "proper" and adequate tenancy mandate. Therefore, certain prerogatives are only assigned to homeowners while squatters and other informal tenants are not entitled to full inclusion. To explore the discrimination and segregation that squatters of privately owned and public buildings face in Brazil (what in Portuguese are called *ocupações)*, this paper analyzes eviction court records filled in Porto Alegre. I conduct a discourse analysis of the court records registered in the city between the years of 2001 (when the City Statute was published, creating several progressive legal tools to facilitate access to land and housing in the country) and 2018. While reviewing the discourse performed by judges when ruling eviction cases, I found that those judges are mobilizing political ideologies that condemn alternative tenancy regimes favoring other property models and, thus, they are defying fundamental and constitutional concepts in their decisions. Finally, I also concluded that the displacement of such marginalized groups by the courts represent a violation of people's constitutional right to housing and other basic rights.

School Ready Minority Children or Schools Ready for Minority Children? – Danish ECEC Teachers' Work of Assessing and Assuring "School Readiness" Amongst Minority Language Children

During the last two decades, increased globalization and migration has changed Early Childhood Education and Care (ECEC) institutions into one of the most important integration arenas for children with minority language backgrounds. Simultaneously, the strong focus on a creating a more cohesive transition between kindergarten and school, has caused the school's academic focus to further its influence on kindergarten curriculum. This paper investigates the implications of "school readiness" and the characteristics of accountability circuits set in place to ensure «adequate» language proficiency amongst kindergarteners with minority language backgrounds. The paper is based on an institutional ethnography, starting in the standpoint of ECEC teachers. I asked 11 Danish ECEC teachers to provide detailed descriptions of their experiences with preparing minority language children for the transition between ECEC and school. Based on the ECEC teachers' accounts, I explore tensions between competing discourses regarding "school readiness", as well as conceptions of social class and culture in education. Two main findings stand out as important. First, the government policy documents' definition of a "school ready child" appears synonymous to what I call a "standard monolingual majority child". Second, the government holds ECEC teachers and parents responsible for assuring children's "school readiness", rather than holding school administrators accountable for meeting the needs of the minority population. I continue by discussing what the ECEC teachers' everyday work say about ECEC and school's role as integration arenas for minority children and their families. I finally call for the field of sociology to take a further interest in the importance of empirically studying ECEC's role as an integration arena for children and families of migrant backgrounds, as it is one of the first and most important meeting grounds between individuals from minority populations and the welfare state.

The Ongoing Land Titling Programme in Nagpur's Informal Settlements: A People-Led Alternative to India's Housing Challenge

In India, the central and state governments have, over the years, announced various housing programmes for the people to address the housing challenge. While some are aimed at the upgradation or redevelopment of informal settlements, others have focused on the provision of tenure security and land reservation for the urban poor. This paper presents these schemes (especially those relating to Nagpur, and the state of Maharashtra) in brief, to build on the contextual understanding of the situation. In more detail, the paper presents people's needs with regard to housing, emerging from a quantitative study of 3,864 households across Nagpur. It also presents an alternative, whereby people have cemented their access to adequate housing with access to land ownership titles. This has emerged as an outcome of people's collective struggles towards tenure security for over 15 years in Nagpur, a movement that is still ongoing still the last eligible person receives land ownership rights. The state is a significant one for the study, as it is estimated to contain the highest percentage of urban poor households in the country.

Along with findings that can help address the housing crisis, the paper also presents emergent challenges that need to be kept in mind, to ensure that vulnerable urban populations are able to access adequate and affordable housing in larger numbers and find ways to sustain and draw motivation from participatory and inclusive efforts towards the right to housing for all.

When Youth Lead Change: Tracing the Journey of a Promising Youth Collective in Mumbai, India

This paper elaborates on the assertion of young people's citizenship. Youth for Unity and Voluntary Action (YUVA), a non-profit development organisation working in India to help disadvantaged groups access their rights, has been working to enable marginalised youth self-determine the course of their lives through collective action. This involves the right to associate, participate and undertake action at different levels, from the individual level, to the family-unit, community, society, city and beyond. The process of collectivisation has driven change, and the paper highlights the case of the formation and strengthening of one such youth group, Malvani Yuva Parishad, in Mumbai, and the setup and action of associated city-level groups to highlight change and impact.

Influence of New Technologies on Traditional Leisure Practices

The evolution of new forms of science and technology has emanated as deep-rooted influencer, replaced leisure culture and generated new forms of social interaction, inter-relationships and institutional structures. Traditional forms of leisure-time activities such as dancing, visiting fairs, folk dance and folk theatre, outdoor games, visiting relatives and friends as well as reading, painting, playing music have been altered beyond recognition. Exponential increase in changing patterns of technology have transformed ritualistic linkages of leisure. Digital age has also led to creation of new hobbies: web designing, blogging being classic example. Science and technology have provided our societies highest level of comfort in form of online games, interaction via social media by use of social networking sites such as Skype, Facebook, Instagram, etc. The mobile technology boom in recent years has revolutionized the industry and opened the doors to a new generation of gamers. One good example is Ludo which is played across the globe. Outdoor play time is increasingly replaced by sedentary device-based gaming time. Some opine that technology has ruined leisure but it is just that the traditional activities have merely changed which have always been pursued over the years. The patterns of leisure and recreation have moved to a different medium.

This article provides a glimpse of coverage of the impact of new digital technologies on leisure. This article tries to explore if technology influence the nature and diversity of economic, social, interpersonal and leisure patterns of people. This will help to elucidate the process of evolution of digital and communication technology and understand systematic perspective on how culture significantly determines leisure.

JAIN, AYUSHI* (The India Nutrition Initiative, TATA Trusts, India)

Government's Claims and People's Realities: Miyana Community's Experiences of Disaster Management during 2017 Gujarat Floods

Culture in the context of disasters can be understood as the ideas, customs, practices, and societal and behavioural trends in association with how disasters are perceived, spoken about and dealt by the people in a given society. Perceptions vary and methods of understanding what are disasters and what it is to live with them, are highly diverse. However, the interactions between culture and disaster management policies and practices have not received adequate attention in disaster discourse. It is observed that the marginalised continue to lack access to tools for equal representation while development processes ignore the cultural specificities of communities, which are replicated in disaster management frameworks.

The present research endeavours to deconstruct the Gujarat Floods in 2017, from the perspective of Miyana Community, labelled as a criminal tribe during the colonial era. It explores the causes and impacts of floods through the narratives of the community and its experiences of the state's "disaster management". The qualitative research employs exploratory and descriptive approaches to discern the underlying assumptions of the state and narratives associated with Miyanas' cultural and livelihood practices and how it continues to influence their relationship with the state and determine their position in the current socio-economic and political realm. By attempting to account for Miyanas' experiences of exclusion as a workforce struggling with traditional livelihoods practices in a rapidly urbanising society, the study calls for a re-evaluation of normative development policies.

The study uses a postcolonial critique and examines how colonial practices have influenced culture and governance to sustain the marginalisation of certain communities. Therefore, the study emphasises on the need for exploring normative policy practices through a postcolonial lens to discern the structural flaws that have perpetuated the idea of the "Others" and consequently have acted as a limitation to policy outcomes in disaster management practices.

Examining Intersectionality of Gender, Age, Class and Techno Leisure

The advent of 21st century has witnessed rapid rise of consumerism. This has been aided by the proliferation of technology. Technology has always been playfully adapted for leisure-time activities. Twentieth century inventions like automobiles, home appliances, machinery and the like liberated the common man from the drudgery of time taking activities and provided him more time for leisure. With the increase in free time, technology found a way to control the leisure time activities. Most technological developments in the area of leisure have been the result of attempts to simplify technologies previously used outside of the realm of mass consumption. Today techno- leisure tools have changed the way leisure time is spent by the people. This is especially true for the younger population and more for girls. However, technology has isolated the girls on one hand and

liberated them on the other in the confines of their social space. The paper will examine the intersectionality of gender, age and social class in respect to techno leisure tools. The result of case studies of 60 girls belonging to lower class and upper class in two age groups (under 15 and 15-21 years) will be discussed seeking to answer the question of how techno-leisure tools have impacted the leisure patterns of girls in a developing world like India.

JAIN, RASHMI* (University of Rajasthan, India)

Migrant Women and the Intersectionality of Caste and Gender

In India the large scale migration of laborers from North India particularly from the states of West Bengal, Uttar Pradesh and Bihar has led to violent opposition against them in various parts of India, such as Maharashtra, Assam, Karnataka and Punjab prompting regional disparity and party politics. States like Maharashtra have been raising the issue with political parties for reserving jobs for locals. There have been many instances of anti-migrant harangue. Women as a sub category of migrant population also face the similar opposition.

Gender is a substantial cross cutting axis of inequality, with women across groups and communities experiencing disadvantages relative to men, mostly shaped by social norms that devalue women's contribution to the household. Caste is another axis which marginalizes women in the work front. The migrant women working as domestic workers face the double stigma of caste and gender and they often are traumatized by the employers. The paper will attempt to examine the intersectionality of caste and gender amongst migrant women in Jaipur, the capital city of Rajasthan, India.

The Global Chains of Reproduction and Affection: The Adoptive Triad in International Adoptive Families

Spain has more than two decades of experience in international adoptions, but despite being the second country, behind the United States, which has adopted the most adoptions, it is still young in this field in social and personal experiences as in academic studies. Open adoption, the theme chosen to be analyzed in this contribution, allows contact between the three vertices of the adoptive triad: adopters, adoptees and the biological families.

Within the new family forms, all possessing peculiarities with respect to the 'hegemonic family' model, the adoptive family bases its union on choice and affections and not on consanguinity relations (Rodríguez and Jareño,2015). But the biological component does not disappear from the families, since, as established by current legislation, minors must know their status as adoptees and have the right to have all the information about their origins. Until Act 26/2015, of July 28, on the Protection of Children and Adolescents, Spain did not recognize or regulate the practice of open adoption despite the disparity of cases and circumstances in which adoptability declarations occurred. in the different countries of origin of the adopted.

The methodology used to know the perceptions, attitudes and behaviors of Spanish adopters that have adopted internationally has focused on two primary sources of data. The first one is the Survey 'Adoptive families and their lifestyles' (Rodríguez and González,2014) answered by 230 adopters; and, the second source corresponds to the fieldwork carried out in the doctoral thesis' Families in transition. Sociological study of international adoptive families in the province of Alicante 'which has forty life stories made to adoptive parents and mothers (Jareño,2014).

The results and conclusions of this research show the evaluation and implementation of the open adoption as a tool for the construction of identity as adoptive families and for the management of social stigma.

JARMOUNI, RACHID* (University Moulay Ismail, Morocco)

Towards a New Paradigm for Political Work in Morocco: The Challenge of the Institutional Model

A large number of commentators and the masses in Morocco (2019), started to be convinced of a kind of political absurdity in this country; the electoral processes do not reflect the real choices of the population, the government is not strong and harmonious, achievements do not even touch the real needs of the Moroccans daily life. This indicates that choice of making change inside the current institutions remains minimal because most, if not all, strategic decisions are not taken by the partisan actors, rather, the royal institutution / *Makhzan*. The interesting part in this description is that even after the transitional period with the new constitution in 2011 and the arrival of the party of justice and development (PJD) to leading the government, and the ups and downs in managing the political scene, today,we can notice a regression in the reform path as the dominant royal

institution remains taking hold of the main sources of power (wealth, authority, knowledge, and values) which confirm a kind of reproduction of authoritarianism in another form that can be called neo- authoritarianism where the deep state works on reinforcing the status-quo as if the other political actors are imprisoned in a vicious circle or in an "impossible transition". This paper adopts a new concept of the political work labeled "the new paradigm of political work" that does not mean a revolution or a rebellion against the situation, rather, it is a peaceful, civilized, and patriotic work that adopts democratic methods in political work, in the sense of practicing the political work but according to new rules that go beyond what is institutional and close to the concept of social movements. This has pushed me to conduct my research where I base my conclusions on a focus groups with many political and civil society actors.

JAROCHINSKI SILVA, JOÃO* (UFRR, Brazil)
BAENINGER, ROSANA (Unicamp, Brazil)

Venezuelan Exodus As a Phenomenon of South-South Migration

The migratory flow originated in Venezuela destined to several countries, mainly Latin Americans, is the most expressive human mobility in the Americas in contemporary times. This flow has as its characteristic that the reality at the origin is the determinant for the movement, leading to being categorized as forced migration, survival or crisis flow. However, part of these analysis disregards that such mobility is also related to the scenario of South-South migrations.

Mobility within the global South is intensely embedded in the perspective of international migration, including numerically, reinforced by the anti-immigration practices in the so-called global North, which helped in creation of displacement networks and constitution of migratory measures within circulation among the peripheries of the international economic system. This more general feature does not remove specific elements from each flow but highlights some common elements within the circulation of these localities.

Through this perspective it is possible to approach the creation of transnational dialogue networks of migrants, as well as the establishment of mechanisms for linking them with their place of origin, whether through information and remittances, as well as social networks and by migrant collectives, which are fundamental to understand the migratory projects even in a context where expulsion is a central element in the decision to migrate, like that of the Venezuelans. Also, the South-South dynamic allows observing how much the migratory flow is capable of impacting relations between states.

In this sense, the paper proposes to analyze the migratory context originated in Venezuela from a South-South perspective in order to understand the determinants for the definition of destinations in migratory projects, assessing the impact that networks and forms of border management and selectivity have in the decisions of these migrants.

Do Economists Have a Sense of Justice?

As understanding increases about inequality dynamics, justice dynamics, and their link, it becomes clear that a central question pertains to the proportions of individuals who do not possess or experience the sense of justice and whether this justice-obliviousness is related to other individual characteristics. One key subset consists of economists, who have argued, as Hayek put it, that "differences in rewards simply cannot meaningfully be described as just or unjust" and for whom the Ideal Economist is said to be justice-oblivious. But are economists really bereft of the sense of justice? This paper uses models and methods from justice research to examine economists' justice life. Moreover, because the view that justice has no place in assessing income distributions may have attenuated since Hayek, we analyze factorial survey data collected from a sample of 43 social scientists (almost all of them economists) in 1991. The results are unambiguous: First, all but one of the respondents provided justice evaluations about the fairness or unfairness of the hypothetical earnings of fictitious workers, indicating that they possess and exercise the three fairness faculties – forming ideas of justice, distinguishing between justice and injustice, and distinguishing between unjust underreward and unjust overreward. Second, consistent with the Hatfield Principle that justice is in the eye of the beholder, economists disagree with each other about what is fair – the respondent-specific just reward functions indicating disagreement on the principles of microjustice, and the respondent-specific just reward distributions indicating disagreement on the principles of macrojustice. The variety of algebraic and statistical tests we conducted on both the just reward functions and the just reward distributions suggest that at least this sample of economists possess and exercise the fairness faculties. Far from being justice-oblivious, they seem no different from everyone else routinely studied in justice research.

ROSENZWEIG, MARK (Yale University, USA)

Precarious Permanent Residence and Family Dynamics: The Case of U.S. Conditional Legal Permanent Residence

Of the million green cards the United States grants each year almost one-fifth are conditional (195,973, or 17.4% in FY 2017). Conditional green cards expire in two years and recipients become deportable unless they file for conditionality removal and gain approval. Most conditional visa recipients are spouses of U.S. citizens in marriages of less than two years' duration (95% in 2017). To remove the conditionality restriction, special forms must be filed with the government within two years of the date of conditional permanent residence. Government publications indicate the proportion approved and denied from among the forms filed, with denials ranging from 4% to 11% in 1992-2016. However, the proportion denied among filers does not inform about the proportion of conditional permanent residents who lose legal residence. This is of course because not all recipients of conditional green cards file for removal of conditionality. Failure to file may be due to loss of interest in U.S. residence or fear that the application may be denied. To understand the decision to file, it is important to understand the benefits of legal residence, which include the ability to confer derivative citizenship on young children if the parent naturalizes before the child turns 18. Of course, legal residence is a prerequisite for naturalization. We use longitudinal data from the New Immigrant Survey 2003 cohort to contribute to the understanding of this neglected form of precarious permanent residence and lapse into deportability. First, we provide for the first time estimates of the proportion of new conditional legal residents who become unauthorized, over 35%. Second, we analyze the relationships among the decision to file for conditionality removal and naturalization. Third, we assess the effects of the existence and characteristics of the children of conditional LPRs on the decisions to file for conditionality removal and naturalization.

JAWANDO, JUBRIL* (Lagos State University, Ojo, Lagos Nigeria, Nigeria)

Still in Search of Uhuru: The Decent Work Agenda (Dwa), the African Workers, and the Post-Colonial African State

The African worker plays a significant role in envisioned development of the African continent but their plight has been both a product of the historically conditioned challenges of development on the one hand and the contradictions of the post-colonial state as well as the influence of globalisation on the future of work. Though many have discussed the disempowerment of the African worker within an earlier epoch, one way to situate their plight in contemporary times is to interrogate it against the backdrop of the conceptualisation of the International Labour Organisation's Decent Work Agenda (hereafter, DWA) introduced in 1999. This paper highlights and interrogates the domestic context within which African countries have – or, have not – implemented the DWA. It will argue that while African governments as represented in the African Union (AU) have taken significant steps in endorsing elements of the DWA on the floors of the AU and in its treaties, the story has been significantly different in many member-states' countries. Using the example of Nigeria, this paper will argue that the post-colonial African state have been able to exit its responsibility to the African worker through its selective implementation of the DWA. Workers are daily being retrenched, downsized and made to suffer untold hardship in the hands of capitalist employers who look for cheap labour in order to maximize profits. While recapping the failures of the state and implementing policies to protect employment and reduce unemployment, the conclusion also does not shy away from highlighting the serious critique of the African labour movement environments for some of its inactions to protect its members.

JEHLES, NORA* (University of Applied Sciences Cologne, Germany)

Target Missed? the Effects of the ECEC Expansion Policy on Social Inclusion in the German Multi-Level System

As a „conservative" welfare regime, Germany has a longstanding tradition of „service-lean" welfare provision (Esping-Andersen). This changed after the expansion of Early Childhood Eduacation and Care (ECEC), especially after the year 2000 when educational programmes were also implemented for children younger than three years of age. The discussion is often framed by social investment arguments: ECEC boosts the future educational attainment of children and thus prevents social exclusion.

The three levels of authorities, the federal government, state and especially the local authorities are in charge for the expansion of early childhood education services. Because of that, the effects of the three levels are analysed.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

The first question is, if the social investment aims of the reforms are reached or if there are differences between migrant and non-migrant children in the usage of ECEC in the dimensions generel use, begining and segregation (dimensions of inequality in ECEC). The second question is, if there are differences in the usage of ECEC between the different municipalities and the third question is, if there are correlations between other structural characerstics of the federal states and communities (e.g. financial situation of the municipality)

Official data from the German statistic on children and youth will be analysed using descriptive univariate and bivariate quantitative methods. This data set comprises all children who use any kind of ECEC in Germany.

The results show that migrant children use ECEC less often and at a higher age than non-migrant children. Moreover, the use of ECEC is segregated due to the concentration of migrant and non-migrant children in different ECEC providers. Since the introduction of the legal right to a childcare place from the child's first birthday in 2013 the differences in the dimensions of ineuqality increased. Furthermore there differences in these dimensions in the federal states and the municipalities.

JENSEN, KATHERINE* (University of Wisconsin-Madison, USA)

Racializing Refugees: The Racial Logics of Asylum in Brazil

In 2018, there were over 3.5 million pending asylum claims globally—more than any previous year on record. While Brazil saw only 872 asylum claims in 2010, this number reached over 150,000 by 2018—a roughly 17,000% increase in under a decade. In 2018, Brazil became the sixth largest recipient of asylum claims globally. What happens as officials evaluate asylum seeker claims for refugee status? Based on an ethnography of the asylum-screening process in Brazil, this paper examines how the state employs varied tactics of racial exclusion as it screens those in search of safe haven.

Immigration policies are key in the manufacturing of racial domination. Scholars investigate legal status as a crucial line of social stratification—a vital category by which rights and resources are distributed. In doing, a specific status, such as the refugee, is presented as having a single politics. Audiences tend to universalize "the refugee" as a singular, generic figure. Rarely do we crack open the varied conditions and relations of difference hidden within refugee status. When scholarship addresses how racial exclusion matters for asylum policy, it presents asylum as a racializing status in and of itself, obscuring how asylum racially differentiates and stratifies amongst those who seek and obtain refugee status.

In contrast, this paper shows how differentiating state practices of racialization emerge within legal statuses, rather than only between them. It uncovers how officials racially differentiate and stratify as they process and evaluate those in search of safe haven—even amongst those determined to be refugees. By investigating asylum processually, this paper illuminates the cognitive, interactional, and practical dimensions of racial exclusion in asylum. In detailing how racialization diverges even amongst those who obtain refugee status, this paper underscores how we cannot fully capture how racial domination works in asylum through questions of legal status alone.

The Intersection of Mental Disorder and Opioid Use Disorder Among Adolescents in the United States

The United States accounts for less than 5% of the world's population but over 80% of the world's consumption of opioid pain relievers. In 2015, 91.8 million (37.8%) U.S. civilian, noninstitutionalized adults used prescription opioids; 11.5 million (4.7%) misused them; and 1.9 million (0.8%) had a use disorder. Opioid overdose deaths have continued to increase over the last few years. In 2016, 3.6 percent of adolescents ages 12-17 reported misusing opioids over the past year. In 2017, more than 70,000 people died from drug overdoses, making it a leading cause of injury-related death in the United States. Of those deaths, almost 68% involved a prescription or illicit opioid. Substance use disorders (SUDs) are commonly co-occurring with depression, and opioid use in particular in those with serious mental disorders is nearly double the general population. Alarmingly, approximately one out of five adolescents in the United States has a diagnosable mental health disorder, and nearly one third shows symptoms of depression. Despite the continuing epidemic of opioid misuse and mental health disorder, research on the intersection of these two among adolescents is limited. Informed by the social determinants of health (SDH) framework, we examined the association of individual, interpersonal, and community level variables on nonmedical prescription opioid (NMPO) use among adolescents who also experience mental disorder. We used data on adolescents aged 12 to 17 years from the 2017 nationally representative National Surveys on Drug Use and Health (NSDUH). Using multivariable logistic regression models, we estimated whether self-reported mental health disorder is associated with higher odds of opioid use disorder (OUD), ad-

justing for both individual-level and community-level characteristics. We expect this study to have important implications for co-occurring mental disorder and opioid use disorder research, prevention and policy.

Human Rights and Inhuman Wrongs: Affliction of Women in India

Human rights of woman are inalienable, integral and indivisible part of universal human rights. Sex is an immutable characteristic determined solely by the accident of birth. The denial of any right on the basis of birth is against the justice of any society. The secondary status of women in Indian society coupled with continued gender discrimination puts question mark to women's human rights and life with dignity. The term '*Garima*' is the Hindi counterpart of the term dignity. Hence, the concept of dignity is not new to Indian society. However, in practice, India's record in the field of human rights is not satisfactory. It is distressing to mention that only 63 per cent women participate in decision making as per the data provided by NFHS-4. In recent years, media has become one of the important instruments of the social change as it has the potential to cover large population. The issue of women's rights can easily be tackled by media not only in creating awareness among women regarding human rights but spreading message related to gender equality in society also. But unfortunately, 25 per cent Indian women do not regularly exposed to any media as revealed by NFHS-4. In this context, the study is based on secondary data borrowed from Census of India (2001 and 2011) and NFHS (3 and 4). The key concern of this paper is to suggest that the history of women has been a history of silence, now it is high time to break their silence as gender equality is not a women's issue, it is a human issue, and it affects the whole society. Exposure to media content related to human rights awareness is necessary, which is well recognized as a *sine qua non* for gender equality.

WG05-707.3

JHA, ANIL* (Central University of South Bihar, India)

The Antinomies of Gender Equality in India

Indian women are forced to accept their lowering of human dignity and existing gender inequality as a *fait accompli*. As the emotional, sexual and psychological stereotyping of female begins with her birth, she could not develop self-confidence and self-reliance, which are cardinal to gender equality in particular and social development in general. The data provided by NFHS-4 confirm strong preference for sons. A total of 19 per cent ever married women in India want more sons than daughters compare to only 4 per cent ever married women who want more daughters than sons. As a result of such outlook, the child sex ratio (0-6 years) has been continuously declining in India since 1961; it has declined sharply from 976 in Census 1961 to 945 in Census 1991 and further 927 in 2001 to 919 in 2011, the figures reveal a growing masculinization of child sex ratio in India. Education is essential for all and especially significant for women as educational achievements of women can have ripple effects within the society and across generations, but, there exists a gender gap in male and female literacy rates, which was recorded as 21 and 16 percentage points in 2001 and 2011 respectively. In this background, the present study deciphers the nature, extent and incidence of existing gender inequality in India based on the available data of Census of India (various issues); and NFHS-3 and NFHS-4. It highlights forms and manifestations along with debilitating effects of gender inequality throughout the life cycle of women. Apart from proposing some solutions for converting the equality of women from *de jure* to *de facto*, the paper also tries to capture the specific challenges encountered by women.

Sustainable Human Actions and Sustainable Development: Pathways, Perceptions and Technologies for Transition

Environment and sustainable development remain the key issue for human beings across the two millennia. Human beings and their actions remain in the center of the ever deteriorating environmental quality left for human being surviving and also for those who haven't been born as yet. With ever changing technology the challenges seem to have compounded. With primitive technology and low population the pressures on environment and resources were never felt. The capacity to meet ever growing needs are subject to technological advancements which have been ever dynamic since the industrial revolution. The world economy has grown manifold and the focus remain on growth for most of the countries however with sustainability always debated. It is another matter that how far these debate by the researchers and policy makers are reaching to the common man in developing countries and how it matters to them. This bring in the questions of human needs linked with human actions taken in both developing and developed countries. This paper will dwell upon the economic objectives, social realities and objectives and the ecological constraints mainly focusing on developing countries. In the

21st Century, one would wonder and strive towards at the same time whether technological innovations for sustainable resource utilization and make strides by the taking the advantages of awareness generation among large sections of population using social media. Without better environmental stewardship, the present growth centered development will be undermined. The actualization of sustainable development will have to take into account the values, knowledge, technology among other things including resources. The questions like what kind of development is sustainable will be to be viewed in different geographical settings in combination with technological level.

Difference Among Similarity: A Study on Macau Students' Adjustment Experiences in Taiwanese Higher Education Systems

Adjusting to a new educational and social environment can be a stressful process. The study was designed to answer a critical question that whether or not Macau students have adjustment issues while studying and living in Taiwan. To this end, instead of studying cross-country problems of international students, the current study focused on cross-region issues by surveying Macau students who pursued higher education in Taiwan. Specifically, it aimed to explore the relationship among social support, self-efficacy, individual backgrounds and Macau students' adjustment. A total of 663 Macau students were surveyed in Taiwan nationwide. Based on the research findings, the answer to the question is "yes." Macau students, even studying in a Chinese context, did have social and psychological adjustment issues. Hence, the research sheds light on better understanding the cross-region students' adjustment issues as well as provides practical guides for relevant governmental departments in their policy regarding oversea students.

"Treating" Illegality: Exploring the Dialectical Relationship between Health Care and Border Control in Houston, Texas

Over 11 million undocumented migrants in the United States remain ineligible for health care coverage, all of whom contend with the challenges of illegality and health disparities. Using ethnographic and interview methods, I explore how illegality shapes and gets shaped by undocumented migrants' experiences with one of the largest medical districts in the country. I find that the health care system not only enforces the exclusionary terms of legality, but it also regulates migrants' illegality, and by extension, exploitability. Centering on the experiences of low-income undocumented men whose experiences are representative of those from which this study is based, I discuss the consequences of: (1) the bureaucratic mechanisms set in place to *deny* undocumented migrants basic medical care; (2) the function of informal, medically unaccredited personal care homes in *detaining* the most ill; and (3) the ways in which the current configuration of immigration and health care legislation allows for migrant death and facilitates their erasure from the US nation-state (i.e., *deportation* by death). Underlying each operation, from denial and detention to deportation, is a regulatory logic focused on protecting and promoting capitalist interests, both in terms of maintaining the exploitability of migrants' labor power and redirecting state costs associated with migrant illness. Extending Peter Conrad's theory of medicalization, this research illustrates how illegality itself can become a subject of medical control without ever being defined a medical problem.

Between Religious Pluralism and Intolerance: Being a Young Muslim in Spain

The Muslim population in Spain is a minority, although in the last two decades there has been a gradual increase, mainly due to immigration from the Maghreb. The sons and daughters of this generation of Moroccan and Algerian workers, fundamentally, are already largely Spanish citizens.

This work investigates and analyzes the changes that have occurred in the religious experience between one generation and another. Through in-depth interviews and focus groups, we analyze the perception that young people have about their way of being and / or feeling Muslim, as well as the changes regarding the religiousness of their parents. The factors that are producing these changes, such as gender relations, access to education and Spanish citizenship, are analyzed.

The population universo is the young Muslims residing in the town of Alicante. The results of the investigation show the resignification of being a Muslim for the youth of the "bridge generation", conditioned by the factors indicated, as well as by the global social and political situation in which there are two simultaneous movements: one of expansion and recognition of the religious pluralism and the right to freedom of expression, and another, of intolerance towards the different and of identity rigidity.

National Laboratories in the Economic South: A Way of Supporting Local Development. the Case of Mexico

Economic South Countries should be less concerned on the technological gap with respect to the developed world and more on the local technological development. The gap may or may not be reduced, what is more important is the own technological advancement of local enterprises in the South. This is how National Laboratories were born in countries which initiated that trend. France and the Great Britain did it to protect local science and technology to be used for the development of their own constituencies. Likewise, Mexico's National Laboratories are dedicated to the production of STI to enhance the quality/productivity of Mexican enterprises. They also are producing high quality human resources to open new labs and/or to improve the general level of institutions dedicated to STI. We present a brief account of the Mexican National Laboratories belonging to the National Autonomous University of Mexico which represent about half of all labs, as a sample of labs dedicated to enhancing STI in an Economic South Country.

Slummification of Social Interest Housing on the Edge of the City

The announcement by the National Institute of Statistics and Geography in 2011 that there were 5 million "abandoned" properties in Mexico caused quite a stir, in a country with a great shortage of housing. The figures continued to echo in many conferences on housing, and programs have been applied to reduce the number of empty and abandoned properties, especially in social interest estates built on the edges of cities, where many of the empty properties are found. In the Metropolitan Area of Guadalajara approximately 40% of the city's abandoned housing is in these areas.

Though the urban developments they live in are new, many of the inhabitants on the edge of the city live in a constant battle to limit the rampant slummification around them. With a significant proportion of the properties empty and falling into ruin, and where public space is used to dump garbage in the open air, and clandestine graves containing human remains are not uncommon, people have adopted strategies for living in this part of the city where the State is not to be seen.

The vicious circle of empty property leading to its abandonment and dilapidation, creates a hostile environment, that makes more people leave their homes which in turn leads to even more abandonment. But in spite of the unfavorable conditions of urban development and housing they live in, the inhabitants have developed strategies to stay. The present work explains slummification and the survival strategies of people living on the edge of the city.

Integration or Stratification: Social Dynamics of Migrants in Southern European Countries and the Impact of the Great Recession

This article explores the social class integration proccess of migrants in Portugal, Spain, Italy and Greece for the period 2006-2018. Although previous studies have analyzed the social integration proccess of migrants in southern European countries and others has focus on the impact of the Great Recession on the integration process, to the best of our knowledge there are not investigations that have made a comparative analysis of the impact of the crisis for a time expand that includes the after crisis period. Southern European Countries provide us a good comparative case study for several reasons. Firstly, all the countries have similars proportions of migrants for the whole period and represents the countries where the crisis hit harder. Secondly, this countries are very relevant for a comparative case study because they have different legislation for migrants' regulation, different regulation for Diploma translation, different migration history and different composition of migrant population according to their origin. For the data analysis, we run multilevel multinomial logistic regression for indentifying the social position of migrants according to their country of origin, gender, level of studies, labor experience in the host country, country of residence and other contextual factors. To asses the social dynamics of migrants during the whole period we use the Goldthorpe & Eriksson Social class classification and the ISEI socio-economic index. The data used for the investigation comes from the European Union Labour Force Survey pooled for the years 2006, 2008, 2010, 2012, 2014, 2016 and 2018. Our previous results confirms that migrants have been more resilient to the crisis in all countries, despite being overrepresented in the lower social classes. By nationalities, while immigrants from enriched countries (EU13 and North Americans) are located in the first social classes, those from impoverished countries (especially Africans) show the worst social integration.

Examining Relational Work at Three Different Homeless Shelters

Background and Purpose: How do people in homelessness and poverty change their lives and get back on their feet? Discussions around this issue can be controversial. Since welfare reform, there has been a major shift in the ways many nonprofits assist the poor and homeless. Instead of dealing solely with needs in the short term, many organizations are turning to a variety of practices aiming to get people out of poverty or homelessness over the long-term, which we have called "relational work," defined as interpersonal engagement that lasts over a period, including classes, mentoring, counseling, or any form of ongoing group. In this project, we examine three residential shelters, focusing on how they affect residents' biographical trajectories.

Methods: The methods used for this study consist of case study research and narrative biographical interviews. First, using a form of case study research (participant observation and interviews), we analyzed the three institutions regarding the extent to which they use case management, are faith-based in their practices, use the community as therapeutic means, and enforce a daily structure of activities. Second, employing theoretical sampling, we conducted seventeen narrative interviews at the first, twelve interviews at the second, and nine interviews at the third homeless shelter.

Results and Implications: We find that while the first (faith-based) shelter is working with intense relational work, this happens less often at the other two shelters. The second shelter engages in case management with all residents, and has a daily structure and focus on community, but without much focus on deeper issues. At the third shelter, involvement in relational work and case management is minimal with less focus on community, structure, and religion. Second, we found that these differences between the shelters influence residents' biographical trajectories. Finally, we discuss benefits of and controversies around relational work and governmentality.

Informal Childcare Vs. Formal Childcare and Its Impact on Maternal Employment in Germany and Poland

One of the crucial sources of gender inequalities are those observed at the labour market. Over the last decades, the share of women in the workforce has increased in many developed countries (Ortiz-Ospina & Tzvetkova 2017). But still, in many of them gender employment gaps are significant, particularly among parents of preschool children (OECD 2019). The impact of public childcare on maternal employment has been already widely studied (see e.g. Schober and Schmitt 2017; Haan and Wrohlich 2011; Havnes and Mogstad 2011). However, there is little research on the determinants and effects of informal childcare on maternal employment and its relationship with formal/public childcare in different cultural and institutional contexts and for different socio-economic groups. Existing empirical evidence on the effects of informal childcare on female labour supply is inconclusive (see eg. Brady and Perales 2016; Arpino, Pronzato and Tavares 2014; Maurer-Fazio, Connelly, Chen, and Tang, 2011; Gray, 2005 Erhel et al. 2013; Raeymaeckers et al. 2008; Kreyenfeld and Hank 2000).

The aim of our study is to analyze (1) whether informal childcare complements or substitutes formal childcare, considering different cultural and institutional contexts and socio-economic backgrounds of families (2) how it affects maternal employment and job satisfaction in these contexts among different socio-economic groups of women. For comparison between different cultural and institutional contexts we have chosen Germany (universal entitlement, high quality of formal childcare, moderately gender-equal society accepting formal care) and Poland (no universal entitlement, rather low quality of childcare, long tradition of informal care, lower acceptance of formal care). We rely on the Generations and Gender Survey for Poland and for Germany for our analysis, which includes many detailed questions regarding the use of formal and informal childcare. We use regression techniques with interaction effects and we include instrumental variables to address the issue of reverse causality.

Multiple Expulsions: A Case Study of the Precipitation of an International Humanitarian Migration Crisis in Europe

Between 2015 and 2016, over a million refugees arrived in Europe, thus becoming the largest recorded humanitarian crisis since World War II. Yet crises like this are undertheorized. This paper draws on a top-down migration systems framework to analyze how intervening circumstances in origin, intermediate, and destination countries eventuate in a crisis. Using the 2015 European Migration Crisis, the paper argues that reiterative multiple expulsions produced the unprecedented phenomenon. Beyond the current case study, a multiple expulsions framework can be applied more broadly to past and present humanitarian migration issues to better respond to and mediate ongoing and future crises.

National Higher Education Internationalization: How Policies in the UAE and Russia Shape Incoming International Student Mobility

With the emergence of non-Western countries on the international education market that are interested in attracting students from around the world, this paper takes a macro-level approach to understanding how strategic development policy shapes educational mobility to the Global South. The author draws on interviews with forty-two experts in the UAE and Russia to comparatively examine how higher education institutes implement national higher education internationalization policies. Specifically, the author analyzes how policies determine who international students are and how they determine who or what is recruited. Although the UAE and Russia are relatively new to the international education market, the author argues that higher education internationalization policy is a powerful political-economic tool and that if effectively wielded, it may shift flows of international students and skilled migrants toward the Global South in the coming decades. Implication from this study may be more broadly applied to other countries with growing international student populations and are equally as important for traditional host destinations who are looking to maintain their competitive advantage in the market.

"without the Dead We Are Nothing": The Study of Religious Knowledge Production within the Black Atlantic

This paper discusses how religions of an African matrix offer critical theoretical reorientations for how we might study the sacred lifeways of groups at the social margins, especially for how practitioners of such traditions employ their cosmic orientations to transform social inequities. The paper relies on oral history and field research data collected among practitioners of Palo Monte/Mayombe (Palo) in eastern, Oriente Cuba. Palo is a fusion of Taino and Kongolese inspired knowledge systems and rituals based in part on engaging ancestral spirits through local plants, animals, and skeletal remains of the dead. It is this priority of engaging the local social ancestors through material products of the land that create a sense of home within the Black Atlantic portion of the African Diaspora. In this way, Palo provides invaluable insights for how we might accomplish Tomoko Masuzawa's call to [be] "historical differently" in the study of religion. Here, I suggest, that the lived realities of Palo practitioners' challenges' us to not attempt to rehabilitate Western European and North American paradigms of understandings of religiosity, but instead to accomplish what Charles H. Long suggests as "a hermeneutic of deciphering [which] might reveal an authentic language and religious meaning within the cultural, historical, geographical, and religious space called the Americas."

Violence and Smuggling Markets: Exploring the Governance of Illicit Trade between Brazil and Paraguay

Different states' laws and law enforcement capacities meet in border areas. The legal and regulatory differences, the distinct police and administrative capabilities involved, as well as the degree of commitment of state authorities, create rent potentials that are central to border dynamics and the frequent instability that prevails in border regions. Latin America's border regions have long experienced high rates of violence. This has been traced to the smuggling of legal and illegal goods and to the peculiarities of military and police enforcement of the movement of people and goods. In Brazil, most violence connected with smuggling is concentrated in municipalities on Paraguay's border. Those levels of violence, however, have been highly volatile over time. This paper therefore asks why do some Brazilian municipalities on the Paraguayan border experience large variations in levels of violence across time while others do not?

I propose that the answer lies in the characteristics of hybrid governance arrangements established in border regions among both state and non-state actors. I argue that violent conflict in smuggling markets is influenced by the intensity of competition amongst claimants over a given market, and the incentives and capacity of potential regulators to meet the demand for market governance that this competition implies. Using case-study analysis of Brazilian municipalities on the Paraguayan border, and applying a property rights framework, I assess the ability of state and non-state actors to mitigate violence by enforcing property rights and contracts in illegal markets, and to peacefully resolve disputes.

Intergenerational Class Mobility in Urban Argentina over Birth Cohorts and Educational Levels

In Argentina, which might be labelled an early-late industrializing country, previous evaluations on temporal and educational class mobility were called into question when dealing with birth cohorts for integrated surveys within a limited time nospan. Hence, we now propose a new exploration of the strength and patterns of intergenerational class mobility based on what might be considered true birth cohorts, resting on nine surveys from 1961 to 2014/5. While gaining in temporal scope, unfortunately these dataset had to be restricted to the largest urban concentration of Argentina, the Buenos Aires Metropolitan Area, which includes around a third of the national population.

Our preceding studies had observed that temporal and educational association of class origins and destinations tended to show an invariance of social fluidity, or a stronger origin-destination association from older to younger birth cohorts or from lower to higher educational levels. That is, the persistent inequality hypothesis, first proposed by Blossfeld and Shavit (1993), seemed to be supported. And

when new exercises based on decomposition and counterfactuals analyses of the role of education were performed, in spite of a relevant educational expansion in the country they have not practically challenged the previous basic findings. Results for Argentina, closer to the first studies by Erikson and Golthorpe (1992), are not in line with several other studies for early industrialized nations (Breen and Luijkx 2004 conclusions, Breen 2009), while no common patterns seem to emerge for late industrialized countries (Ishida and Miwa, 2011).

This new approximation, resting now on true birth cohorts –taking into account some preliminary explorations for period effects-, will allow us to carry out a review of our earlier findings supporting the persistent inequality hypothesis.

Digital Media Governance and Higher Education in Haiti: Contexts, Practices and Pedagogies at Haiti State University

Recently, digital media have come to play an essential role in higher education in Haiti. The circulation of digital media from multiple sources have been used in academic contexts as a teaching and a learning strategy. Open access platforms like the Classiques des Sciences Sociales, Open Edition, Érudit, or Persée have open the door to new learning and pedagogical practices in the Haitian context where library resources are scarce. Around a decade ago, the governing body of Haiti State University started institutionalizing a virtual pedagogical platform with the explicit purpose to transform learning and teaching practices at the university. Digital media make up the core of this platform. This platform constitutes therefore an important part of the institutionalization of digital media at the university. Observation showed that more and more lecturers are using this platform as a supplement to in-class teaching and, related to this digital media has become a primary source of documentation for many students.

This research focuses on the institutionalization process of digital media of in higher education in Haiti in a context the necessary infrastructures lack or not available. It aims to analyze the social, political and administrative mechanism that support this process. It analyzes the ways by which this process materializes in the transformation of learning and teaching practices at Haiti State University and the role played by actors like professors and students in this process.

It is based on observation, content analysis, and series of interviews with professors, students, and key actors involved in the implementation of digital media at Haiti State University on topics related to the practices of digital media in the academic contexts, and their reflexivity as well.

Un Análisis Sociológico De Los Procesos De Constitución Del Territorio En y La Creación De Riesgos De Desastre En Puerto-Príncipe, Haití

A lo largo de la historia de la República de Haití, la ciudad Puerto-Príncipe se ha constituido como el centro de la vida social, económica, político-administrativa incluso demográfica del país. En la actualidad la ciudad junto con las aglomeraciones generadas entorno a ellas albergan a alberga a casi un 25% de la población total del país en un contexto de edificación precaria, de pobreza urbana y de falta de regulación urbanística efectiva. Al mismo tiempo, a causa de su ubicación geográfica, el territorio de la ciudad está expuesto a múltiples amenazas naturales.

Esta ponencia estudia la relación los procesos de constitución del territorio en y la creación de los riesgos naturales en Puerto-Príncipe.

Basada en la tradición teórica de la sociología del desastre y una metodología mixta fundamentada en el análisis de documentos institucionales, mapas, fotografías, observación, datos históricos y demográficos y entrevistas, demuestra cuatro elementos. 1) Los primeros elementos de expansión urbana del siglo XVIII se han impuesto como modelos a partir de las cuales se iban a transformar el tejido y extensión territoriales de la ciudad a lo largo de siglo pasado. 2) El proceso de evolución de la ciudad se ha hecho a partir de un proceso de doble territorialidad donde la constitución del territorio urbano resulta de un conflicto permanente entre una territorialidad legal-político-administrativa y una territorialidad social. 3) La deficiencia estructural de planeamiento urbano se presenta como un factor de la producción de riesgos territoriales. 4) El territorio urbano constituido a partir de las prácticas sociales propicia, en muchos casos, la producción de la vulnerabilidad frente a los riesgos naturales. Visto la multiplicidad de las prácticas territoriales vividas, la vulnerabilidad a la base de la producción de los riesgos de desastres se encuentra desigualmente distribuida en tejido territorial de las dos aglomeraciones urbanas.

JOSHI, MADHURA* (Savitribai Phule Pune University, India)

Higher Education in India in the Times of Globalization

India has the third largest higher education system in the world in terms of number of institutions and about 70% of its higher education institutions are privately managed despite the lack of national vision, direction, data or legislation on private higher education in India. The phenomenal rise of the private institutions proves to be one of the key developments in higher education in India. This has severely affected students, institutions and employment. Immediately after independence, due to the limited resources and funding the states supported greater participation of private sector in higher education in order to counter the challenge of accessibility. At this point of time, privatization was considered as a step towards democratization of higher education. However, the post globalization and liberalization period in India has witnessed a significant transformation in the nature and ownership of the higher education institutions as well as the role of the state. Mainly the politicians of various parties have established their educational institutions during this period. Today, in spite of the low quality and degraded standard of education, poor infrastructure, absence of qualified teachers, huge amount of capitation fees, the number of private institutions is increasing unprecedently. In this context, the present paper attempts to conduct a sociological analysis of these processes of privatization and its consequences within the larger social scenario. How has privatization which was believed to be a step towards democratization of education resulted into reproducing hierarchical structures in education system? How did privatization of education in India led to commercialization of education, which transferred education from service to commodity? These are some of the questions explored here. It also throws light on how these processes of privatization and commercialization of education have contributed in creating more inequalities in education and also in job market.

Mapping Platform Worker Organisation and Contestation: A Global Perspective

Research into platform work has developed rapidly, and one of the most vital and engaging areas of study looks at platform worker resistance. To date, this research has mainly comprised in-depth case studies (eg Chen, 2017; Wood et al., 2017) or small-N comparative studies (eg Tassinari and Maccarrone, 2019). Our paper builds on these foundations by developing a broader, trans-national framework of comparison.

We present initial findings from exploratory research mapping platform worker organisation and contestation globally. Utilising online data sources, we have compiled a database of several hundred cases of platform worker contestation, documenting features such as the platforms involved, type of work, type of worker organisation, the issues/ grievances triggering resistance, and repertoire of contestation.

This approach allows for much broader comparisons than previously possible. To date, we have documented contestation from the 30 biggest platform companies. While extension of the database depends on further funding, preliminary results suggest institutional contexts play a greater role in shaping forms of platform labour protest than other distinctions such as sector. Furthermore, certain types of grievance – notably pay – appear more likely to lead to strike action than other concerns such as regulatory or legal issues. We will also discuss methodological challenges of constructing large-scale data sets in this area.

Living with a Global Pandemic: A Study of People's Experiences of Covid-19 in Sweden

This article presents an analysis of data collected in Sweden in April and May 2020 through an online survey concerning experiences of the Covid-19 pandemic. The aim of the article is to examine people's worries and concerns about the pandemic in relation to their socioeconomic background, social capital, health and wellbeing, judgments of national measures implemented to control the pandemic, and perceptions of the most serious threat in the current situation. Worry is a common response to threat, and it is closely related to psychological distress. The theoretical framework of the study resides upon the concepts of risk, social capital, and communication. Through multiple regression analysis and multiple correspondence analysis, we found that higher levels of worry were closely connected to judgments that the national measures taken to control the pandemic were wrong, and that Covid-19 – the illness itself – was a greater threat than its financial or social consequences. These views were also associated with a more advanced age, chronic illness, lower levels of social capital (in terms of support and feelings of loneliness), and feelings of sadness and depression. This presentation points to the need for further qualitative analysis of the pandemic's psychological consequences, or what has been termed an epidemic of fear.

Precarious Societies. the New Society in the Neoliberal Times

A nivel global, las sociedades se encuentran sujetas a una colonización económica capitalista que centra como dinámica de coordinación la competencia, la aceleración y la desigualdad. Este proceso involucra el ejercicio de una serie de prácticas en la reproducción de sus estructuras, estructurando nuevas violencias, expulsiones y relaciones de poder. En este contexto, la precariedad del trabajo y la vida se vuelven determinantes en la reproducción de los regímenes de gobierno, la estructura social de clases y los modelos de dominación precedentes. En esta presentación planteamos una propuesta referente a la que denominamos "sociedad precaria", en la cual tratamos de dar coherencia y una articulación conceptual a los procesos de precarización social bajo el neoliberalismo en la sociedad chilena. Para ello, repensamos la tesis acerca de la centralidad del trabajo, considerando los resultados obtenidos por los estudios del trabajo en Chile en el siglo XXI, considerando la precariedad del trabajo como uno los elementos centrales en la constitución de las sociedades contemporáneas. Realizamos un trabajo de síntesis que problematiza la precariedad como una relación y situación inducida política, espacial y temporalmente. Visualizamos su carácter estratégico en las sociedades neoliberales, en tanto despojo y depredación de la seguridad, protección y bienestar social, pero también en tanto mercantilización de la vida. Además, planteamos los resultados de 6 años de investigación empírica que refuerzan la tesis propuesta, considerando las narrativas y subjetividades emergentes en el trabajo precario en Chile, así como las relaciones de poder que nos permiten hablar de una nueva configuración social en la periferia capitalista. Finalmente, planteamos considerar la(s) precariedad(es) como una oportunidad para la sociología en desarrollar su carácter público, re-introducir el concepto de sociedad adorniano y promover desde los estudios del trabajo y la teoría social, una comprensión multidisciplinar de las sociedades contemporáneas.

Revisiting Anti-Systemic Movements in the Global South: Struggles Against Exploitation and Struggles Against Exclusion

For reflecting the reality of social movements in the global South under global capitalism, we need to draw on a new theoretical approach that attempts to explore what kind of themes in mobilizations located in different countries and regions are linked to each other. In particular, "anti-systemic movements" have been used as one of the key concepts of world-historical analysis to explain struggles that engage and oppose the dominant capitalist structure. Anti-systemic movements have categorized around two main ideas: "labor-socialist" movement and "nationalist" movement (Arrighi, Hopkins, and Wallerstein 1990). However, most of the anti-systemic movements in the global South have overlapped two dimensions or they have not been organized into two categories (Amin 1990; Wallerstein 1995). Toward developing an alternative analytical framework, this study develops a more *inclusive* concept focusing the primary themes of movements, "exploitation" and "exclusion," to examine the nature of anti-systemic movements. On one hand, struggles against exploitation are movements that challenge the processes of exploitation. These struggles have mobilized people to demand an end to their absolute or relative poverty, austerities, and economic grievances and to resist their local economic elites. On the other hand, struggles against exclusion are movements that contest processes of exclusion from local/domestic/international communities and polities. The processes of exclusion have been structured mainly by racism and ethnic discrimination and this has proved one of the prime causes of national liberation conflicts in the global South. These struggles encompass political and cultural struggles over sovereignty and limited autonomy, socio-political marginalization, ecological issues, displacement, gender/sexuality inequality, and minority status and rights. Furthermore, this study asserts what is crucial to determine is how diverse themes of anti-systemic movements affect each other and interact with the structures that they are transforming.

JUNGMANN, ROBERT* (TU Berlin, Germany)

Organizing Collective Action: A Practice-Based Perspective

Concepts of collective action in social theory have strongly focused on established collective actors, above all on organizations and nation states (see e.g. Coleman 1990, Meyer/Jepperson 2000). The proclamation of stable collectives causes social science and society to break off too early to ask about alternative social forms of collectivity. This is especially true in rather fluid times today (Bauman 2003). A framework that introduces a gradual understanding of collective action with the collective actor as the end point of a gradual continuum has so far been lacking in the debate on collective action in social theory.

The presentation formulates such a gradual concept of collective action grounded in Giddens (1976, 1979, 1984) understanding of agency, recent debates between movement and organization studies as well as the classics. It allows us to distinguish collective action from any social and coordinated action without referring to stable collective actors only. Collective action is conceived as an assemblage of activities actively bond together in time and space to a high degree (Jungmann 2019). This assemblage is informed by a similar framing and is recognized as the cause of an effect. This concept relies on a practice-based understanding of constituting collective action. Analyzing collective action means to determine the social practices in which this assemblage is produced and reproduced in practice by competent activities of situated actors that refer to the rules and resources of diverse contexts of action (see Giddens 1984: 25). This framework can be linked to Giddens understanding of social systems and to practice-based concepts of organizations as specific systems (Barley 1996, Ortmann et al 2000, McPhee/Zaug 2000). It opens up a practice-based perspective to understand subtle forms of organizing collective action beyond acting as a stable, organizational actor.

La Sociología De La Poesía Como Estrategia Para Abordar Las Relaciones Entre Centro y Periferia

El propósito de este trabajo es presentar los resultados de una investigación doctoral en curso sobre la trayectoria del poeta e intelectual brasileño Ferreira

Gullar. Algunas de las preguntas que enfrentamos en la investigación son: ¿Existe una sociología de la poesía? Si este proyecto es viable, ¿cuál podría ser el estado de los poemas y los libros de poesía como fuente de investigación? ¿Esta misma fuente tenía un valor heurístico aún no aprovechado por la sociología? El argumento que se presentará a través de la comunicación es que el libro de poesía es una fuente relevante para observar algunos de los vínculos sociológicos más insospechados entre la organización de la sociedad y su universo simbólico. Por lo tanto, siempre que se pueda comprender el significado de esta fuente como una unidad, articulándola con una explicación integral de lo social, el libro de poesía es una herramienta que puede cristalizar con considerable expresión, claridad y plasticidad algo fluido, leve, intangible y fugitivo de los contextos en los que está inscrito. Entonces los poemas y los libros de poesía pueden ser una fuente interesante para la sociología y las ciencias humanas, a través de los cuales el vínculo íntimo entre cultura, lenguaje y comunicación, así como entre ellos, el individuo y la sociedad. Para teorizar este amplio argumento, abordaremos las relaciones entre el centro y la periferia, sacando algunas reflexiones producidas por el análisis de la trayectoria de Ferreira Gullar y su primer libro de poesía renegado, Um pouco acima do chão. Este análisis fue interesante para revelar nuevas y poco evidentes posibilidades sobre las conexiones del centro y la periferia.

Vestigios, Apropiaciones y Disputas Narrativas Sobre Un Parque Arqueológico En La Ciudad De Ouro Preto – MINAS Gerais, Brasil

A la manera del historiador Baxandall y los procesos de legitimación artística estudiados como Pierre Bourdieu en las Reglas del Arte, se analizan documentos académicos, institucionales, imágenes de archivo e imágenes producidas en las impresiones del trabajo de campo, buscando las intenciones y motivaciones que generan el reconocimiento y la legitimación del Parque Arqueológico de Morro da Queimada como patrimonio cultural integrado con la ciudad de Ouro Preto, provincia de Minas Gerais, ciudad colonial brasileña patrimonio del mundo por la UNESCO desde 1980. Para esto se toma en cuenta las dimensiones históricas, político-institucionales, sociales y culturales del Parque Arqueológico originadas en la ocupación urbana de una próspera ciudad minera de principios del siglo XVIII. Con este fin, sus vestigios se toman no solo en sus ruinas, sino en el discurso y los sentidos imputados en diferentes momentos y por diferentes agentes para representar al Parque como un lugar en el pasado y presente del patrimonio cultural. Este trabajo muestra a través de un estudio de caso cómo las diferentes generaciones y clases sociales tienen diferentes gustos y prácticas culturales sobre un patrimonio cultural local. A lo final, la análisis identifica una interseccionalidad de las relaciones de poder para construir lo reconocimiento social para el patrimonio local, incluido el gobierno local, las instituciones sociales y el vecindario del patrimonio.

What Is Seen to be 'Troubling': Portraying Parenting in Migration in Academic Publications

In this paper we set out to examine how narratives of parenting in migration are constructed in academic discourse in Lithuania. We aimed to highlight the scripts of 'good parenting' in academic publications, while drawing on the language of troubles (Ribbens McCarthy et al., 2013; Ribbens McCarthy et al., 2018) we contribute to analyzing the attempts to give names to the reshaped parenting as being 'troubled' and 'troubling'. Building on the analysis of academic publications of Lithuanian researchers presented in two databases (national and international) since 2004, we determined that the scripts of 'good parenting' permanently re-appeared in portraying of migrants' parenting, namely, child-parent physical co-presence; emotional proximity and claims to prioritize child's well-being in all aspects of family life, the issue dictated by moral imperative for parents to 'put children's needs first'. We give empirical evidence how different social contexts of parenting (in host country, in transnational settings) and intersection of these contexts with gendered expectations differently have sought to link parenting practices with 'troubles'.

Cameras and Insecurities: The Relationship of Young Adults and the Labor Experiences in Audiovisual

The present research aimed to understand the relationship of young adults with work in the audiovisual field. For that, 5 young women and 5 young men, aged between 20 and 29 years, were interviewed about their experiences, challenges and expectations that permeate their insertion and permanence in the

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

audiovisual labor sector. Despite the back and forth in search of work and/or professional qualification, the trajectories are somehow located in the city of Sorocaba, in the interior of São Paulo, Brazil. The research was based on four main questions: Who are these young people? What are your experiences? What challenges have they faced/face? What are your expectations? However, these questions have shown that the narratives of these young adults are permeated by insecurities, but also by the desire to hold camera in hand to do their work. Finally, this research presents 10 narratives permeated by desires, challenges, uncertainties and we seek to understand their singularities, ambiguities and similarities through the theoretical contributions Sociology of Youth and Sociology of Work.

KADOBAYASHI, MICHIKO* (Japan Women's University, Japan)

Benefit Finding in Cancer"Tobyoki"

In Japan there is a culture that the people suffering from serious diseases write *tobyoki* through their experiences and publish them as books.

Half of the authors of *tobyoki* suffer from cancer, and cancer *tobyoki* has remarkably increased in number since the 1980s. I've been examining the content of such *tobyoki* chronologically since the 1960s, and find that the content of *tobyoki* today is largely different from that in the past years when it was said "cancer is equal to death" and "the patient should not be informed." At present, truth-telling is generalized, and cancer is not regarded as a special disease. In the age of "post-open awareness", the authors of *tobyoki* can recognize their own death, so they arrange their dying process and their death for themselves. Many authors try to understand the situation as it is correctly to face their diseases independently and positively. Furthermore, it is noticeable that many of them write about their "benefit finding", saying like "cancer isn't necessarily negative". This time I found seven different kinds of "benefit finding" in one hundred volumes of cancer *tobyoki* published from 2006 to 2019. The seven categories are as follows. ⬜gratitude for others ⬜happiness in living a normal life ⬜recognition of living a life sincerely ⬜awareness of the meaning of one's own existence and willingness to contribute to others ⬜change of an outlook on life and a view of life and death ⬜self-growth ⬜thanks for what they got due to their cancer

Mental Health in Brazilian Amazonian States

Background: In Brazil, there is no open access information system with mental health indicators, which hinders epidemiological studies and scientific production to support mental health policy decisions. The situation greatly impacts places already suffering from under-assistance in health, such as the Amazon region. This study aimed to survey the scientific production on mental health of the Brazilian Amazonian populations.

Methods: We use data from the Global Burden of Disease (GBD - 2017) on health problems that indicate mental disorder: anxiety, depression, alcohol and drug use. We compared national data with the nine states that is part of the Brazilian Amazon. We also made a survey of the scientific evidences in the Amazon region and offering postgraduate programs in universities and local research centers.

Results: GBD data show that the indicators of illness and risk of death due to mental illness are higher in the average of the Amazon states than the national average. The Pubmed and Virtual National Health Library (BVS) systematic review survey identified only six papers. About the production of knowledge, only two research groups dedicated to mental health in the region is registered in CNpQ database. There are only seven mental health postgraduate programs in five states of the region.

Conclusion: There is an open field for advancing scientific research in mental health in Brazil. The lack of an information system with mental health indicators makes epidemiological surveys difficult across the country. Information is even more precarious in areas where Unified Health System has been historically underdeveloped, such as the Amazon. Allied to this, the small number of studies and research groups dedicated to the theme, further aggravates the invisibility of the mental health issue in the Amazonian populations.

Resilience to Climate Change in Industrial Shrimping in Bangladesh: Assessing the Comparative Role of the Stakeholders

Over the last few decades, global shrimp aquaculture industry has grown considerably and experienced important transformations in coastal regions in the Global South. However, the shrimp industry in Bangladesh, in spite of being a major contributor to agricultural GDP and export earnings of the country, is not fully developed yet and is often plagued by numerous environmental challenges including frequent climate disasters. In order to address local climate perturbations, the shrimping industry assumes a wide range of individual, communal, and institutional level resilience activities. Drawing on primary data from three shrimping communities in Bangladesh, using the conceptual lenses of climate vulnerability and community resilience, and taking a qualitative approach of research, this paper examines the extent to which the responses from various stakeholders can be regarded as effective resilience strategies in the shrimp in-

dustry in Bangladesh. A triangulation of methods, comprising content analysis of secondary sources, ethnography, and qualitative interview, was used in collecting data on the shrimp industry in Bangladesh. All collected data were analyzed qualitatively. Findings of this research suggest that there is a clearly visible resilience gradient in the shrimp aquaculture industry in Bangladesh: individual shrimp farmers and households play a pivotal role in resilience enhancement, while other stakeholders including community, state, and civil society organizations have moderate-to-little involvement in aiding resilience in the sector.

KALASHNIKOVA, ANNA* (, Russia)

The Architecture of Justice and Equality: From the "Ideal Polis" of Plato to the "Radiant City" of Corbusier

An idea of realizing the principles of justice and equality by means of the spatial organization of human life was expressed by outstanding philosophers, politicians, writers and architects since antiquity.

Plato's "ideal polis" consists of three concentric zones, each of which is inhabited by representatives of one of the three castes constituting the social structure of an ideal society. Such organization of urban space precisely ensures clear separation of concerns of the urban population and promotes social order.

In the novel "Utopia" by Thomas More, the idea of social and material equality of citizens is reflected in the unified image of the city, consisting of similar streets and houses, and inhabited by equally dressed people, whose life is tied to a particular place, occupation and time routine.

English philosopher Ebenezer Howard in his model of "garden city" argued that large cities killed individuality and personality, while small settlements in the open country could create favorable conditions for human development and society as a whole.

In the 1920s, in post-revolutionary Russia, the concept of a new form of housing – "house-commune" – was developed and implemented by representatives of Russian Constructionism and Architectural avant-garde.

In his projects of "radiant city" Le Corbusier dreamt of creating a new improved society and building an "earthly paradise".

Modern researchers discuss the concepts of "city of justice" and "spatial justice" in the framework of the so-called "spatial turn" in the social sciences (e.g., Lefebvre, 1974, 1996; Harvey, 2009; Soja, 2010; Philippopoulos-Mihalopoulos, 2010, 2013).

This paper discusses the following range of issues: what are the possibilities of architecture to form and translate social ideals, to control social life and to humanize social relations; how the spatial organization of human life promotes the realization of an idea of equality and the principle of justice in human society.

KALAVAR, JYOTSNA* (Georgia Gwinnett College, USA)

I'm Here, You're There: Stress & Transnational Support of Elderly Mother By Adult Offspring

Providing support between generations in a transnational family context is understudied in the aging literature. This study focused on examining transnational support among Asian Indian immigrants in the United States whose mother resided in India. Specifically, this study investigated the stress experiences and stressors experienced by adult offspring when providing transnational support to elderly mother in India. A sample of 131 adult offspring participated in an online survey to examine the relationship between self-reported stressors and transnational support. The average age of respondents was 45.77 years (SD=9.7), the sample had more females (56.5%) than males, and a majority of them were married (88.4%) and Hindus (80.2%).

To supplement this survey data, information was gathered from two focus groups that provided context and deeper understanding of the issues involved in providing transnational support. Daily stressors in the context of transnational support included feeling helpless, the formidable geographic distance involved, and finding time in a busy schedule. Concerns about providing routine care to mother, addressing medical emergencies, and feeling helpless from a distance were commonly expressed. To assess subjective stress experienced by adult offspring, ten items from the Subjective Burden Interview (Zarit, Anthony & Boutselis, 1987) were selected. Results will be discussed in the context of caregiver stress experienced remotely, and the implications of this for immigrant adult's health and well-being. Situated at a geographically distant location, these adults reported being caught in a tug of war between responsibilities towards one's own family in the United States and care of elderly mother in India.

The challenges of providing transnational support for older adults carry implications for the health and well-being of both elderly mothers as well as adult offspring. Understanding the complexity of transnational care may inform social policy formulation, and the importance of understanding transnational caregiver stress within the medical establishment.

Collectivisation and Social Inclusion in Globalizing India: A Study of Participatory Irrigation Management and Farmers Producer Organisations in India

This research paper is aimed at throwing light on the entire trajectory of the process of collectivisation and social inclusion with respect to 'Irrigation Management Transfer' through 'Water User Association' and development of Farmers Producers Organisation in state of Maharashtra in India. With the advent of the neo-liberal regime in the early 90's and thereafter the shift from farm-based to non-farm based economy has not only widened the gap between the haves and have-nots but also created immense pressure on the existing resources of land, water and the bio-diversity on the whole.

The practice of collective participation, organization, mobilization and planned usage of the available resources adopted by the farming community in the state of Maharashtra, is a combined effort of the individuals and the grass root level civil society organizations. On one hand, it has benefitted the society by creating a pro-poor water policy environment while on the other it has increased people's resilience towards drought. The Water User Associations and Farmers Producers Organisations work in collaboration and develop collectivisation through convergence approach for resilient agriculture and for sustainable development.

With an effort to understand the initiatives of local farmers, such as the creation of people's council, users' groups and association for sharing and handling existing resources, this paper attempts to highlight the role of distributive justice and social inclusion in the given area of study, using a combination of evidence based policy research and social action for innovative solutions and people centred advocacy efforts in India.

Female Nurses' Attitude Towards Prevalence of Depression Among Oldest Old Persons in India

India has the second highest population of elderly people in the world, projected to rise to 12% of the total population by 2020. 20% of doctor's visits, 30 % of hospital days and 50% of bedridden days are ascribed to elderly patients. Today depression is one of the commonest causes of disability in the elderly. 10 percentage of population are taking antidepressant medications as well as psychotherapies and cognitive behavioural therapy (CBT). The various consequences due to depression are reduced life satisfaction and quality, social deprivation, loneliness, increased use of health and home care services, cognitive decline, impairments in activities of daily living, suicide, and increased non suicide mortality. Female Nurses are two-thirds of health workforce in India. The roles of these nurses are evolving and changing. Female Nurses perform elderly health assessment, actively support oldest old patients care and families in all settings, create innovative models of care, and enhance work processes to improve access for ageing society. The present study is made to assess the prevalence of depression and female nurses attitude towards the factors influencing depression among the oldest old population in Tamil Nadu, India .Forty-seven nurses took part in the study. The present study had shown the prevalence of mild depression among the oldest old was 57% and that of severe depression was 43%. The prevalence of depression had a significant association with education, occupation, income, spouse status, smoking and history of chronic illness. So the results reaffirm that there is a high prevalence of depression among the oldest old population in India and adequate measures should be taken to detect this psychiatric disorder in elderly outpatients by specialized geropsychiatric services by female nurses. Emphasize more on depressive disorders in aged is the demand of the current scenario in India

Expanding Social Protection to Informal Economy Workers in the Neo-Liberal Environment: Lessons for Trade Unions in Africa

The current global capitalist architecture socio-economic production system has produced and reproduced inherent structural and systemic economic enclaves with manifestations of informality in Africa. There exists evidence of high incidence of informality in Africa with staggering statistics ranging from 70-80 percent. Despite numerous reforms implemented by national governments and cooperating partners; expansion of the Bismarckian system to include informal workers in social protection coverage presents enormous policy and practical challenges. Evidently, there is a significant difference regarding employment benefits between formal and informal workers. These disparities between informal

and formal employment makes African countries as an obvious case that urgently needs a strategy to facilitate a transition towards formal work arrangements for those in the informal economy through enhanced social protection programmes. The improvement and extension of social protection is one of the key tenets of the ILO decent work agenda; and trade unions as a key tripartite social partners remain at the heart of ensuring social protection is guaranteed for all the workers. This paper will focus on the current experiences of the trade unions' attempts at expanding social protection to the informal economy in Africa. It will draw lessons on how trade unions in Africa can appropriately intervene in dealing with the design of policy options and implementation of social protection programmes for informal workers. The paper also unveils the general design principles and recommendations around organising the informal workers through the provision of social protection coverage that are innovative and can enhance trade union membership growth, renewal and survival in contemporary challenging neo-liberal times.

Politician 2.0 and the Formation of Ideological Networks: Bolsonaro and the Brazilian Right on Facebook

Many analyzes insist that Bolsonaro became president of Brazil in a surprising way. Some emphasize that the attack on the knife he suffered touched public opinion, strengthening his candidacy. Others point out that the massive circulation of fake news almost didn't get him elected already in the first round. By its accidental character in the first case, and by its element of military strategy of Blitzkrieg in the second, the hypotheses blind to the fact that Bolsonaro built his candidacy for years. In 2014, he filled a request with the research institutes to have his name included among the options in the polls. Not applying for PP, he joined the PSC until he reached PSL in March 2018. Feeling the political change in Brazil, brought by "Jornadas de Junho", he had created his Facebook account, the main social network in Brazil, on June 14, 2013. The movements were strategic to run for president. Beyond the partisan issue and the instrumentalization of Facebook, Bolsonaro had to build alliances to win the 2018 election. As they did not take place in a partisan way, we have to pursue them in other spheres of social life. Thus, we will observe Bolsonaro´s alliances through the growing centrality of his Facebook page, highlighted in several social groups unhappy with PT governments. To do this, we mapped Bolsonaro's networks on his Facebook page using the Netvizz app. Inasmuch as these groups were organized, such as the MBL, or disorganized, as social actors driven by diffuse feelings against the political system, the alliances were heterogeneous: ideological (liberalism, monarchism, etc.), cultural (armament, punitivism, etc.), economic (agribusiness, financial sector, etc.), and so on. They shaped Bolsonaro's ideas in 2018.

KANAI, MASAYUKI* (Senshu University, Japan)

Rationality and Subjective Wellbeing in Different Institutional Contexts

There is a vast literature in cultural psychology that argues cultural variations in the meaning of happiness. For instance, Uchida and Kitayama (2009) examined "cultural folk models" of happiness and unhappiness in the US and Japan and found significant cultural differences in ascription of happiness and coping actions to unhappiness between the two cultures. Rationality would play a key role in these cultural folk models in some cultures whereas other institutional mechanisms such as religion could also be a component of folk models in other cultural contexts. Thus, this exploratory paper finds out possible patterns of cultural folk models in several East and Southeast Asian societies which have little been investigated so far and identifies conditions or institutional contexts where rationality plays a primary role in ascription of happiness and unhappiness. Data from a cross national in-depth interview in Japan, Korea, Taiwan, Mongolia, and Indonesia are used in the analysis. The number of interviewees in each country ranges from 12 to 24, and the interviewees were selected from quota in gender, age, urban/rural and current happiness level.

Indigenous Island Life and "Dos and Don'Ts" Rules in the Tourist Landscape of the Isle of Pines (New Caledonia)

Isle of Pines, a special collectivity of France situated in the southwestern corner of the Pacific Ocean, is one of those emblematic and archetypal places of tropical island tourism (Bernardie-Tahir 2005). In places without nickel deposits (economy of Caledonian territory is based on its mineral resources) tourism is seen as a lever for sustainable development. The reception of tourists – visitors seeking for leisure vacation experience – is a very important aspect for the tourism industry, as well as for members of the community of the Isle of Pines. Nevertheless, the special rules and custom of indigenous Kanak community may be seen by tourists and international investors as a constraint of tourism development. The compliance with the rules, customary "dos and don'ts", and the integration of local community and customary lands is a *sine qua non* condition for the social success of the project (Gay 2009). The failure in Club Med holiday village investment on the Kuto peninsula in 1970. and Le Meridien hotel successful development in Oro Bay in 1990. are emblematic examples of cooperation full of challenges. Especially that the indigenous Kanak community has a desire to strike a balance between their traditions and development of tourist activities. As tourism development brings many social, economic and political changes, the presentation – based on the ethnographic research which have been led in New Caledonia since 2014 – will examine the challenges of expansion of tourism on the Isle of Pines and "dos and don'ts" rules in the tourist landscape of this Melanesian island. How was this activity developed and how is it managed on a customary indigenous island territory? What is the state of its development on the island and what challenges lie ahead?

Piloting Entrepreneurship Education: University Entrepreneurship Hubs Confusing the Organizational Continuity?

Both innovation studies and sociology of higher education claim that radical changes, such as transformation of the university system or emergence of a new mode of knowledge production, are taking place. Contesting these views historical analyses and empirical studies of the current era show significant continuities in the university organization claiming that the professed changes are moderate at best. In this context, the present paper improves understanding of organizational experimentation in entrepreneurial education pursued in what Burton Clark called "the enhanced developmental periphery" of the traditional research university. The paper applies a promising systems-theoretical approach developed in sociological organization studies to analyze university management's decision-making communication on the topic mentioned above. Aligning this work with Niklas Luhmann's organizational analysis the paper investigates how conditions of politico-economic environment are observed and interpreted by the university leadership, and how these are translated into administrative-managerial decisions within the university organization.

The paper analyzes novel organizational forms that have recently emerged at the university–society interface within traditional research universities. The focus is on the university's administration office, which is analyzed in terms of how its subunits (such as research, education and public relations administration) process the increasing expectations about enhancing entrepreneurship education within the university. In particular, the paper observes the ways in which the administrative branches selectively use available information to absorb uncertainties in decisions about the new forms of extracurricular entrepreneurship education that are in tension with traditional disciplinary credit programs and activities. Empirically, the paper addresses the evolution of two university entrepreneurship hubs located at the Universities of Helsinki and Oulu, in Finland. With the help of these case examples, the paper points to both continuities and discontinuities in the university's administrative-managerial arrangements with important bearings to wider organizational dynamics of change within the university system.

Body Inclusive Methods: Creating Lived Knowledge Spaces Inclusive of Difference and Social Transformation When Working with Racialised and Gendered Groups.

Body inclusive methods: Creating lived knowledge spaces inclusive of difference and social transformation when working with racialised and gendered groups.

This presentation refers to body inclusive arts methods used in various research projects to gain insights on gendered and racialised encounters in private and public places. These methods support and enhance the feminist theories about the value of lived experiences (Collins, 2009) and the doing/performativity of gender (Butler, 1988) as well as the racialization of spaces (Mirza, 2018; Reynolds 2013; Ahmed 2007; Valentine, 2008; Puwar, 2004) while resisting the binaries of mind and body (Grosz, 1994; Hooks, 1994). It explores what alternative spaces the body inclusive methods of movement, mapping and Forum Theatre, create to promote self-awareness, social transformation and inclusion. Furthermore, research findings will shed light on how gendered and racialised bodies are inhabiting, communicating in and contesting public places. This presentation will draw examples from the participatory performance methods of the artist/researcher in three collaborative projects, Youth Matters, 2016 (Reynolds & Zontini) with a mixed gendered group of young people; PASAR, 2017 (Erel, Reynolds & O'Neill) with a group of Black mothers; and from her current PhD data collection with a young women's group from migrant trajectories.

Job Instability and Fertility Intentions of Young Adults in Europe: Does Labor Market Legislation Matter?

Total birth rates have fallen dramatically in many European countries during the last 40 years. Postponed marriages and childbirth delays due to global changes in values only partially explain this decline. One of the main reasons for this decline is the rise of job and income instability caused by labor market polarization. The growth of a flexible job market has decreased job certainty and stability that are crucial for childbirth planning for young adults. This paper aims to uncover the impact of job instability on fertility intentions of young adults in Europe focusing on the employment protection legislation (EPL) in the countries. The empirical analysis is grounded on the European Social Survey data of 2004 and 2010 waves for 27 countries. The results from the multilevel modeling show that job instability measured as temporary employment, informal work and unemployment decreases fertility intentions among European youth. Unemployed young adults tend to plan less for having their first child under the rigid labor market system. Unexpectedly, young people in temporary or informal employment decrease their fertility intentions in countries with low EPL.

Climate Change Induced Social Exclusion in India

The environment has become one of the most important issues of time and will continue to be well into the future. The challenge is to find approaches to environmental management that give people the quality of life they seek while protecting the environmental systems that are also the foundations of our well being. There is a very clear cut relationship between environment and social exclusion. In this paper focused on the overall impact of Climate change on the livelihood of the some sections of the society. Paper also discussed the social exclusion raises, at any rate verifiable, inquiries regarding the distribution of income, wealth and power in society. Individuals from the socially excluded group might be caught in naturally harming ways of life due to their financial and social conditions. Social exclusion can involve the systematic denial of entitlements to resources and services, and the right to participate on equal terms in social relationships in economic, social, cultural or political arenas. Exclusionary processes can occur at various levels – within and between households, villages, cities, states, and globally.

Current paper is tried to draw the linkages between change and Exclusion. And discuss the linkages and the different forms of exclusion and also trying to discuss the socioeconomic, environmental and cultural factors and institutional practices related to climate injustices. This paper also discussed the brief issue of climate change and policy intervention at international level as well as local level in the context of India. This paper also discussed the need of policy intervention at local and international level related to 'climate change and Exclusion' as an issue of importance.

The Post Millenial Financial Crisis - How Much Did It Affected the Social Environment?

Noone denies that the global financial crisis, which evolved at the second half of the first decade of the 21st century and lasts in fact up to day, has provoked several changes to social structure.

The contemporary welfare regimes tend to deviate far away from the eternal pursuit for social justice and equality. Everyone can state that the gap in the wealth distribution among states and citizens is continuously rising. A small number of people hold nowadays an amount of wealth equal to the total GDP of numerous countries. This could have been avoided if the working conditions had not been worsen globally, because of the crisis. Work is also a social right and not just a privilege for the elite or for the "Golden Boys/Girls".

The main role of a democratically organized state is to provide to its citizens equal opportunities, aiming to improve their standards of living. Subsequently, the urge for more participation, mutual understanding for social diversity and intersectionality is the exact parameter that can characterize a society which covers its members' needs and a state which translates well into opportunities its citizens' abilities to create and flourish.

Crisis seems to have had a negative impact on what we have known as the welfare state. It needs to be reminded that the social protection and the ability for everyone to climb the social ladder are the proper indexes of a healthy society, acknowledged as such by every financially developed state. Education for all is always the carrier of change and the hope for the next generations.

Thus, the promotion of social dialogue is a "sine qua non" condition for the restoration of a positive social environment, since we keep aspiring to a better future.

RC10-121.8

KARALIS, GEORGIOS* (Greek Bar Association, Greece)

Up to Which Extent the Post Millenium Financial Crisis Aggravate the Social Inequalities?

None can logically deny that the global financial crisis, which evolved at the second half of the first decade of the 21st century and lasts in fact up to day, has provoked several changes to social structure. Thus, societies worldwide have been affected in such a way that it is actually under scientific consideration whether or not the current social reality will eventually cause the amendment of sociological notions that always used to be treated as something constant and stable.

Recent sociological studies have already shown that the mitigation of financial exchanges among countries, so that local economies would be protected from the globalisation tides, has rapidly led to a sui-generis "state self-protectionism" expressed also by a deterioration in the domain of the social exchanges. The socioeconomic theory of liberalism is again the case, though in an exactly opposite way, if compared to the "laissez faire - laissez passer" conception. At last, a worsening of the functionality of state institutions seems imminent. The necessary respect towards them has been lessening so much that the quality of justice and democracy has been constantly worsening.

Furthermore, less respect of well founded and functional state institutions, which emerged gradually after Renaissance and Enlightenment so as to put an end to social inequalities, is prone to cause respectively a lack of respect as far as human rights and equal opportunities are concerned. Additionally, the ongoing wars in specific areas of our planet have caused a continuous rising of migration flows directed to the neighboring regions. Consequently, the financial crisis has given the chance for extreme opinions to be heard in Europe; even inside the G8/G20 countries i.e. the most financially developed. Social rights nowadays are in danger, treated like being an elite privilege, whereas Rule of Law implementation is a social need being attacked.

KARNER, CHRISTIAN* (University of Lincoln, United Kingdom)

Using "Ibiza-Gate": The Multiple, Competing "Truths" Surrounding a Political Scandal

This paper builds on a tradition, stretching back to Michel Foucault et al.'s I, Pierre Rivière, of studies capturing post-hoc interpretations of events for a variety of purposes. Within nationalism studies, this has seen ground-breaking work (Brass 1997; Judson 2006) on the discursive construction of politically motivated accounts of violent episodes (with hard-to-discern causes) for the purposes of dividing and mobilizing populations along ethno-national lines.

The incident whose discursive "aftermath" is examined here is what is now known as Ibiza-gate. In May 2019, news broke, implicating undercover journalists, of a video-recording of a pretend-Russian oligarch's niece in conversation with the former head of Austria's Far-Right Freedom Party (FPÖ), Heinz-Christian Strache, and his party-colleague Johann Gudenus. Recorded in Ibiza in 2017, the video revealed a discussion of potential exchanges of political favours for (financial) support for the FPÖ. The ensuing scandal saw Strache's (i.e. then Austria's Vice Chancellor) and Gudenus' resignations, the collapse of Austria's coalition-government, and snap-elections in September 2019.

Analytically, this discussion examines a range of discursive-argumentative strategies (i.e. defensive-deflective-conspiratorial; accusatory; 'explanatory') by a variety of political actors: by Strache and Gudenus themselves, and the FPÖ more widely; by the coalition-partner ÖVP and Austria's Chancellor at the time, Sebastian Kurz; by Austria's opposition parties; and by key-media, including Austria's most popular (tabloid) newspaper, potential influence over which Strache had specified in the video as key to the FPÖ's future success.

Particular attention is paid to implicated topoi (e.g. of corruption, national unity, external threats) and "self-other representations" (e.g. Krzyzanowski and Wodak 2009). Beyond topoi as often circular argumentative structures underpinning claim-making (Reisigl and Wodak 2001), the analysis also reveals subtle connotations: arguments that do not need to be asserted explicitly but provide taken-for-granted background assumptions underpinning competing political positions.

From Supporters to Activists. the Case of the Young Poles Supporting the Right-Wing Movement

The aim of this paper is to analyse the motivations and the biographical paths of the young activists of the right-wing populist parties and organisations in Poland. For the last decade the role and impact of the populist right-wing has noticeably increased both in Poland and many other western democracies. The existing data, including electoral polls, show clearly that a disproportionately large number of the right-wing supporters are people younger than 35 years old. The theoretical approaches find the possible explanation of this phenomena in: opposition to neoliberal order and its elites (Fraser 2017), dissatisfaction with globalization, as well as the shifting of the dispute line from economic to cultural issues (Appadurai 2017; Kalb 2009; Ost 2007), yet they overlook the biographical conditions and motivations, making some people more active than others.

Responding to this shortcoming, in order to understand the configuration of the biographical and structural circumstances leading some young people to the political involvement and actions, we reached to the biographies and conducted 20 biographical narrative interviews with the young people involved in the right-wing movement in Poland. In the paper, we are going to present the initial results of the analysis and focus on the three transitions. First, from the indifferent and neutral bystander to the passive supporter, understood solely as a voter. Second, from the supporter to the activist, understood as an individual initiating and participating in actions aimed at realisation of the right-wing goals. Third, from the activist, to the ex-activist, who has undergone a biographical metamorphosis and became sceptical towards right-wing values.

The results presented in the paper are part of the research project: "Right-wing populism among young Germans and Poles: Analysis of biographical motives for supporting right-wing parties and organizations" founded by the German-Polish Science Foundation.

Physical and Virtual Mobility in Europe: Comparing the Uncomparable

Political education of young people in Europe has predominantly relied on physical exchanges. The Council of Europe (COE) maintains two educational youth centers, equipped for hosting face-to-face seminars and trainings; the European Union funds hundreds of thousands of youth activities every year, the majority of which are intercultural face-to-face youth exchanges.

Despite their success in hosting, funding and organising physical youth exchanges, both European institutions have tried – and, so far, failed – to establish online mobility experiences as a complementary, yet equivalent alternative. Whether in the form of virtual youth exchanges (EU), the shape of MOOCs (COE), or the format of virtual learning environments (EU & COE), online mobility has stayed much below its alluded and even glamorised potential.

In our contribution, we will investigate the approaches of the two European institutions to online learning mobility, and identify core reasons for the failure to establish online learning mobility as an equal alternative to physical learning mobility.

Youth Movements: Mediation, Defiance, Assimilation?

Young people, as individuals as well as in movements, have always been subjected to a polarised response from media and politics. In a nutshell, they are either heralded and elevated, or dismissed and ridiculed. Fridays For Future, however, seems largely impervious to either of these typical reactions – despite the enormous attention they have attracted over the past months.

In our contribution, we will explore reasons for the teflonic nature of the movement to attempts to adulate, co-opt, dismiss, downplay, glorify, slate, or stilt them. What is different at this moment in time, and/or what are they doing differently compared to previous youth movements?

"a Movement in Movement": Rethinking the Links between Alter-Activism and Institutional Politics

In 2016, nearly ten years after the emergence of the first protests against the confessional system of governance in post-war Lebanon, the anti-sectarian movement which had favored an alter-activist mode of engagement, left its "comfort zone" and resolved to run for the first time in municipal elections. This study examines this turning point and the subsequent reconfigurations of this youth-led grassroots movement during the 2018 parliamentary elections. Drawing on a participatory methodology which relies on the activists' self-analysis of their action, it analyses the activists' efforts to make their voices heard in the ballot boxes and examines the challenges they were confronted to after they ventured in the realm of conventional politics. This paper first sheds the light on the movement's innovative way of blurring the lines between institutional and street politics. It reveals how the anti-sectarian activists engaged in electoral politics while maintaining their alter-activist culture and succeeded in disrupting the Lebanese electoral scenes, challenging the old-ways and imposing more democratic rules to the election games. Comparing the municipal and parliamentary elections, the second part of this study then highlights the different tensions that emerged within the movement, discusses the reconfigurations they led to and invites to rethink the links between direct and representative democracy in a state of political instability.

Transforming RURAL Governance for Sustainable Devleopment through 7 STAR Rainbow Scheme and Svc - a Case Study of Nangal Bhikhu Village of District Palwal

The Panchayats have been empowered with greater devolution and decnetralization with the 73rd amendment Act. Article 243 G of the constitution relates to panchayats by vesting them with the authority to prepare plans for the socio-economic development for effective Rural Governance. A top down approach has

not been considered adequate to address the rural change. Therefore, the Government has moved from traditional approach to the developmental paradigm to local governance by involving all stakeholders through participatory process.

To incentivize the PRIs to perform better at the local level, government of Haryana launched a 7 Star Rainbow Schemes with the focus on improving the functioning of Grams Panchayats by involving various stakeholders. This scheme led the development of a village on the basis of various selected parameters in a sustainable way to change the village into a model village. The best performing village panchayat is assessed on 7 colour coded parameters i.e. Sex ratio, Education, Hygiene & Sanitation, Peace & Harmony, Good Governance, Environment preservation and Social participation. The objective of this scheme is to encourage the Gram Panchayts on these parameters to show case themselves as a model panchayat.

In fact, this process has been proven to unlock the developmental potential of the local people by intensifying the pressure to the Panchayats to work more effectively and respond to the needs of the people at the grass root level.

The present paper is based on primary and secondary data. It highlights the importance of 7 Start Rainbow Schemes and SVC in transforming the Rural Governance at the grassroot level on the basis of a study conducted in Nangal Bhikhu village of district Palwal.

Addressing Transnational Emigration of Youth from Punjab in Light of Environmental Factors: Bringing Farmers from Margins to the Center

In the traditional discourse of push-pull factors in transnational migration, imperceptible yet gradational environmental factors are often overlooked. In this paper, we explore environmental and socio-political factors that come together or intersect in order to create a complex set of circumstances that 'force' the youth of Punjab (a North-Indian state), mostly belonging to the traditional farming community i.e. Jat caste, to migrate abroad. Punjab came to the forefront of agrarian milieu of India during the Green Revolution in 1960s and 70s. The introduction of high-yield crops and chemical fertilizers catapulted Punjab's agriculture to the top and turned India from an importer of wheat to an exporter. But, in the past few decades, the collapse of agriculture in Punjab accompanied by receding water table, extortionate indebtedness, unusual cancer rates (attributable to contaminated water and soil), have brought forth the catastrophic repercussions of non-traditional agricultural practices. The people most affected by it are, evidently, farmers of Punjab, a majority of whom are toiling to survive. Such calamitous conditions have instigated a 'fight or flight' scenario – to which the Jats of Punjab, particularly youth, are responding by migrating en masse to other countries. A large number of indebted farmers have even resorted to committing suicides. Even though, at present, the mass migration of Punjabi youth to other countries is not acknowledged as a consequence of environmental and agricultural degradation, we contend that it is in fact one of the major causes. In our paper we, by bringing farmers to the center of discourse, discuss how previously overlooked factors, social and political, have instigated a virtual exodus of Jat youth out of Punjab. We, then, attempt to project the effect this out-migration will have for Punjab in future and provide solutions to resolve the aforementioned issue.

Transitioning Masculinities: Transnational Migration and Masculine Subjectivities of Young Punjabi Men

This paper is a part of my ongoing dissertation project in which I explore the notions of hegemonic masculinities for young Punjabi men and the role transnational migration plays in constituting the same - first as aspiration, then as practice. I focus on young men (16 to 34 years of age) from North Indian state of Punjab belonging to a "higher" caste called Jat. Jats are traditionally farmers and landowners but, owing to the "failure" of agriculture in the post Green Revolution era, have shifted their focus to transnational migration. Young Jat men, in particular, are migrating en masse to countries like Canada - mostly as international students. In this paper, I explore the transnational experiences of these young men and how Jat masculinities are renegotiated, reproduced, and transformed by transnationalism. More specifically, I investigate what Jat hegemonic masculine ideals are at different intersections of space and time and how men strategize their masculine performativities to achieve that ideal in each of the following stages: 1. Before migrating to Canada; 2. In Canada as international students; and/or in transition from temporary to permanent residence; 3. After obtaining permanent residency in Canada. Drawing on in-depth interviews with young men in Punjab (who aspire to migrate to Canada) and Punjabi student-migrant men in

Canada, I map the transition in masculinities and evaluate the overarching role of caste-visibility, embodiment, and material culture in operationalizing "new" Punjabi/Jat masculinities in the transnational space.

Analysis of Differences in Leisure Practices Among Men and Women in the City of Meerut in India

Leisure as an activity is quite a recent phenomenon in India.Traditionally it is not viewed as a necessity while working full time. However ,leisure is vital for an individual , as it provides opportunities to relax ,enjoy , explore new avenues and develop creativity .It enables people to better express themselves thus facilitating increased interaction with other people, helping teaching as well as learning from others hence expanding their horizon of ideas and knowledge.

Today people take out time to visit tourist locations and pilgrimage. Such places are quite popular in India due to rich culture and heritage. Contrary to the popular notion leisure is not static but dynamic in nature ,similar to the social context of male and female interaction .Using this as the background , i have analyzed the differences in leisure practices among men and women in city of Meerut in India. Primary sources for data collection are hundreds of questionnaires and numerous of case studies , and secondary sources include various Journals , websites and articles.

MEDIA Reporting on Atrocities Against Dalit and High Caste Women - a Human Right Concern

The depiction of Dalit in India media be it films, television serials, news, visual advertisement, posters, banners, print media is of great concern for social science researchers and policy makers. With recent influx of atrocities against Dalits, role of media has become quite significant in disseminating information in the society in sanitized and responsive manner. But today media is more interested in news related to celebrities' life, pseudo atrocities against high class women intended to create hype or mailing masala type of news for increasing TRP. This misguides common people and wastes their time. Reporting and presenting crime in correct manner, bringing out loopholes in law and order, as well as governance of the country is equally called forth pillar of democracy, always exclude or provide negligible space for Dalits .Objective of my study is to analyse role of media in reporting and following cases of atrocities and providing space for them. For my study we have considered reports on Bhagana , Bania Kheda, Dabra and Nirbhaya case .After analysis i can say media reporting and following is biased ,and they did not portray true picture of cases, questioning the character of victim, ignoring role of police officials in such cases. The protest march and rallies never get space in state level pages of newspapers, TV channels. These protesters are also not invited for discussion on the concerned issues. While in the case of Nirbhaya media, political leaders, social activists were on road demanding for justice.

Anthropogenic Water Scarcity in South Africa – Causes and Solutions

Water is at the core of every country; its economy and the well-being of its citizenry. Water scarcity is one of the most pressing problems confronting the well-being of humankind in the twenty-first century. Scarcity of water and drought are complex phenomena that can be analysed differently from social, political, meteorological, hydrological and agricultural perspectives. However, technical and popular understandings of water scarcity have tended to be simplistic. There has been the tendency to direct attention to the lack of supply of water due to natural forces rather than look at human-induced land and water use practices and at socio-political considerations. Real causes of scarcity can be obscured leading to inappropriate solutions. In this paper I argue that anthropogenic activities negatively influence both water quantity and water quality, and are thus the prime causes of water scarcity in South Africa. With the dawn of the Forth Industrial Revolution (4IR), there are debates on whether it is going to bring about positive change or the opposite – an increase in social problems, social strife, poverty and inequality. As a solution to anthropogenic water scarcity, I offer the technologies that come with the 4IR as a solution on how water management, access and provision in South Africa can improved. I argue that if these 4IR technologies are embraced and employed, we stand a better chance at achieving water security.

A Woman Worker Life Story Rooted in the City History. a Case Analysis.

For years, Łódź has been the second largest city in Poland. At the turn of the 19th and 20th centuries, Łódź experienced the fastest demographic development in Europe, with a growth index of 2006.3%. The city was assigned different characteristics. "Polish Manchester", a "promised land", a "city of work", a "red Łódź" (a term used mainly by the ideology of the People's Republic of Poland, but referring to the history of workers' movements at the beginning of the 20th century), a "city of women", a "bad city", (in which in the second half of the 19th century, besides wealth and luxury, shocking poverty nested, and attempts at coexistence of various nationalities and social groups coexisted with ethnic, religious and "class" aversion eruptions"). In recent decades, the city has gained a new label of "academic city" with 100,000 students, and a few years ago a famous actor called it "city of bums". Each of these characteristics is related to specific social phenomena and processes behind which there are biographies of different social groups. In my presentation, I will necessarily focus on a selected aspect. It will be the history of Łódź as a textile city, i.e. the city of women workers. It will be presented in a case study (biographical narrative interview with a textile woman worker) and completed by particularly unique sociological research conducted at the turn of the 1940s and 50s, and a series of documentary films devoted to women workers, which were made in 60s, 70s and 80s. . The story of Łódź women workers is almost faded out of awareness part of the city identity removed from the city space not only by closing down factories but also by changing its topography.

Intersectional Colonialities: Feminist Perspectives on Inequality and Development

This paper repositions the discourse on gender and development by bringing the subaltern discourse into global dialogue. Specifically, it reviews contributions deriving from intersectional, postcolonial, and decolonial feminist scholarship. Established by women of color, these feminist schools derive from different world regions but share in common a relational ontology and a liberatory epistemology. First, intersectional feminism was forged by Black women in North America to interrogate the connection between patriarchy and racism. This perspective provides scholars with a categorical framework to detangle the relationship between intersecting identities and inequality, but identity politics and whitestream cooptation have hindered its emancipatory potential. Second, postcolonial feminism emerged in South Asia and Africa as a critique of Western feminism and postcolonial theory. This perspective acknowledges that subaltern women are not heard while emphasizing the fluidity of culture and identity, enabling scholars and professionals to build solidarity in shifting terrain. Yet its emphasis on cultural relativity and assumption of postcolonial progress has obscured systemic power dynamics that reproduce coloniality around the world. Third, decolonial feminism is rooted in the feminist discourse of Latin America which largely focuses upon the collusion of patriarchy, coloniality, and capitalism in the world system. Although this perspective offers critical insight into the geopolitics of knowledge production and the necessity of creating alternative socialities that reject colonial caste logic, there is a need to problematize transnational socialities that are capable of responding to global forces. Employing a process of critical reflection and dialectical synthesis, this paper concludes with a set of subaltern development principles for scholars and professionals who are working on issues pertaining to inequality, power, and social change. As I argue, subaltern feminist worldviews are essential for improving ethics in development research and practice.

What Counts and Who Is Accountable? an Examination of Medical Student Assessment

Graduating medical school permits entry into a position of power and responsibility. A report commissioned by the General Medical Council (GMC), the regulatory body for doctors in the United Kingdom (UK), looked at how prepared for practice UK medical school graduates feel. Many newly-qualified doctors reported that they felt unprepared for the clinical environment. In the UK, as in other parts of the world, clinical 'competence' is confirmed through use of a dominant assessment method, Objective Structured Clinical Examinations or OSCEs. The GMC plan increased regulation for UK medical schools on the processes in their graduation OSCEs from 2024.

Drawing on student experiences, clinician examiner experiences and on my own experiences as both, I developed my 'problematic' for this study, where assessed methods of competence for graduating medical students inadequately represent the messiness of clinical practice and non-standardized patients these students encounter as newly-qualified doctors.

Using an institutional ethnographic approach, I used observation, formal interviewing, informal chats and textual analysis over the course of academic year to explicate the work involved in OSCEs. In tandem, I traced how and where this work is organized to happen as it does. The dominant discourse was the 'work of standardization'; the need to standardize organized and became the focus of the assessment, displacing clinical practice and patients. I trace back to the ruling relations of the GMC, mapping a textually-mediated 'accountability circuit'. I demonstrate what counts institutionally – an objectively and quantitatively 'quality assured' assessment within an accountability agenda promoting an ethos of 'accountability centered care' for the students. The work processes to deem students 'competent' to graduate within the discourses of accountability and patient safety, brought students to the assessed world of scripted and standardized patients, removing them from real clinical practice and real patients, as they begin work as newly-qualified doctors.

RC05-60.5

KEATON, TRICA* (Dartmouth College, USA)

Police Violence and Race in a Colorblind France

State-driven urban policing in a colorblind France is rooted in colonial practices and routinely targets and terrorizes people of color who have long been relegated to segregated and economically poor neighborhoods in urban centers (Keaton 2006, 2013; Guénif Souilamas 2006; Wacquant 2009; Fassin 2011; Jobard and de Maillard 2015; Picker 2017). As the French Ombudsman's 2017 report on policing shows, 80% of young "black" and "Arab" men have been stopped by the police at least once in the past five years. However, colorblind equality before the law is constitutionally ensured and has material effects in French society, even as lived reality is anything but colorblind (Calvès 2004; Beauchemin, C., Hamel, and Simon et al. 2015; Thompson, 2016; Beaman 2017; Fleming 2017; Smith, 2019; Keaton forthcoming). French republicanism advances a discourse of race-free equality that erases difference, but it also perpetuates intersectional racial inequality, exclusion, and everyday police racism (King 1988; Crenshaw 1991; Essed 1991; Yuval-Davis 2011; Cohen 2012). Police violence includes public humiliation, insults, repetitive identity checks, sequestration, beatings, allegations by young men of rape-by-baton or finger, and death while in police custody. Yet, abusive policing rarely results in the conviction of increasingly militarized perpetrators whose neo-liberal militarization serves to shield the government from social movements, challenging the system. While families are devastated by the killing, maiming, and emotional damage that result from police violence, it has also galvanized them into activism. What remains is a racially fractured France in which policing engenders fear, hatred, and a logic of running from the police to avoid not arrest but brutality. Drawing on interviews and fieldwork conducted in 2014-2018, this paper examines these issues through a lawsuit against eleven police officers accused of police violence and how community activism shifted the typical outcome of acquittal. Due to word count, references upon request.

Chasing Shadows: Towards a Theory of Gender and Corruption in Vietnam

While there are many forms of corruption, to women, petty corruption, or the everyday abuse of entrusted power by low- and mid-level public officials and community leaders, is most visible as they try to access basic goods or services in places like hospitals, schools, police departments, land management agencies, and when they apply for jobs. This is particularly true for ethnic minority women living along the Sino-Vietnamese border who are increasingly required to negotiate with development bureaucrats vying to control the Vietnam's borders for trade and tourism. Managing petty corruption – or what many call "chasing shadows" – is rarely captured in formal measures of corruption, or in anti-corruption campaigns. When it is, data suggests that men are more likely to be asked to pay bribes, while women are more likely to fall victim to sexual extortion. While international development and humanitarian aid organizations have begun to focus on this disparity, the scholarly literature on its relationship to gender equality, education and development has yet to emerge.

Women's intersectional social, political and economic positions in society shape their experiences with, definitions of, and strategies for dealing with corruption. Nevertheless, the gender and corruption literature tend to ignore or devalue these experiences, and rarely does it suggest a policy framework for understanding corruption itself as a gendered institution tied to the development regime.

Drawing on 'southern theory' (Connell, 2007) and 'decolonizing methodologies' (Smith, 2005), this critical ethnography reveals how corruption and development are co-constructed as gendered institutions along the Sino-Vietnamese border in Vietnam. This paper uses the lived experiences of one Hmong family as they negotiate access and control over land, education, health care, and their livelihoods, reveals how corruption is shaped by transnational connections, and (re)produced in interaction with global development regimes.

Labour Environmentalism As a Paradigm of Unionism Re-Invention: Participation of Portuguese Trade Unions to the National Climate Jobs Campaign

The emergence of new social challenges are always opportunities for social actors to rea-just and adapt to the new and changing environment, or to re-invent themselves and their struggles to incorporate new dimensions imposed by changing environments. Our current global, national and sub-national contexts are faced with a multitude of crises among which two are of particular relevance and challenge to workers: that is the double challenge of global warming and un-employment or underemployment. In such context of double challenge faced by workers, their livelihood and their communities, unions and labour movements, just like any other social actor, are re-inventing themselves to incorporate climate issues to their struggles for the protection of workers and their jobs. Such re-invention is manifested through the growing numbers of calls, by unions and labour movements, for the creation of climate-friendly jobs as well as just transition to a low/post-carbon economy that respect workers and the environment. Those calls, it should be noted, are more and more voiced out in the context of multi-actors networks involving both unions/labour as well as communities, faith-based, NGOs as social movements among others. This presentation relies on the extended case method, and simultaneously uses the social movement unionism as theoretical framework and the environmental labour studies as a disciplinary framework to render account of such metamorphosis and re-invention of unions and their struggles, based on the example of the participation of the Portuguese trade unions confederation (CGTP) to the national climate jobs campaign led by climate justice movements.

Trading Time, Producing Place: Struggles over Store Trading Hours in Johannesburg, South Africa, 1960s-1980s

This paper examines struggles around attempts to introduce late trading hours in shops in Johannesburg, South Africa from the 1960s to 1980s. The extension of trading hours in retailing required to accommodate shopping time has become a fundamental condition of retail work across the globe now. Based on extensive archival research and interviews, this paper tells the history of battles around late trading hours in Johannesburg to chart how the value of time shifted and to show how working hours and social time affected labour politics and constituted city space. As a sector employing women workers, the debates over late trading (and therefore late working) hours implicated ideologies of gender, race and class, which mutated over the decades. They raise questions about ideologies of race and work and how these worked out constitutively in place. Practices often seen as germinating with northern firms and moving (via 'globalisation') to the South – and doing so in the 'sociological present', in fact, were being discussed, contested and put into practice in Johannesburg, and thus through concrete relations in place as global transnational practices circulated in earlier periods.

This paper proposes, then, to engage the themes of this panel contrarily – by offering a story of the historical struggle in the city of Johannesburg by retail workers which comes to explain contemporary forms of precarity. It argues for analysing workplaces not as bounded units, but instead as articulated social relations in space and time (Massey 1994). Trading hours are a critical site integrating workplaces and urban space precisely because they define the parameters of city shopping, affective spaces of street and leisure, the 'consumer' and the 'public', and do so by specifically linking consumption to labour through 'time', as specific workers bear the burden of working, travelling and living under 'asocial' temporal orders.

KERBER, DIANA* (Technical University Dortmund, Germany)

La Transnacionalización De Los Constructos Normativos De Justicia y Responsabilidad En El Campo De La Migración De Mujeres Brasileñas

En tiempos de globalización las organizaciones no gubernamentales (ONGs) son importantes actores en la defensa de los derechos humanos y un campo fértil para la actuación del Trabajo Social. Un foco de intervención que ha llamado la atención de ONGs tanto en Brasil como en el exterior son los problemas oriundos de la migración de mujeres brasileñas hacia el exterior. En la perspectiva de la sociología del conocimiento, la propuesta de trabajo busca presentar un análisis del "conocimiento de problematización" (Poferl, 2016) de actores de ONGs brasileñas que fundamenta el proceso de problematización de la migración de mujeres brasileñas hacia el exterior, relacionando el conocimiento de esos actores al conocimiento institucionalizado del Trabajo Social brasileño.

El trabajo empírico se concreta a partir de la Grounded Theory, un estilo de investigación fundamentado en el pragmatismo y en el interaccionismo simbólico que tiene el sujeto de la interacción como actor central para la aprehensión de la realidad. Para ello se realizaron entrevistas con actores de ONGs de Brasil.

A partir del principio de que actores colectivos interpretan la realidad a partir del conocimiento oriundo del contexto nacional en que viven, se percibe que, en la medida en que los actores de esas ONGs vivencian otros contextos nacionales, como por ejemplo, a través de la migración, ese conocimiento se va transnacionalizando, y con ello también su conocimiento de problematización. Una de esas formas de conocimiento de problematización transnacionalizada son los constructos normativos de justicia y responsabilidad, que están directamente relacionados con la implementación de políticas públicas.

KERBER, DIANA* (Technical University Dortmund, Germany)

The Transnationalization of Knowledge of Problematization of NGOs Actors in the Field of Brazilian Women's Migration

In times of globalization, non-governmental organizations (NGOs) are important actors in the defense of human rights and a fertile field for the performance of Social Work. A focus of intervention that has attracted the attention of NGOs both in Brazil and abroad are the problems rising from the migration of Brazilian women abroad. Based on the perspective of the sociology of knowledge, this paper aims to present an analysis of the "knowledge of problematization" (Poferl, 2016) of actors of Brazilian NGOs that underlies the process of problematizing the migration of Brazilian women abroad. In the analysis work this knowledge of problematization of these actors is related to the institutionalized knowledge of the Brazilian Social Work.

Empirical work is based on the Grounded Theory (Glaser/Strauss 2010), a research style based on pragmatism and symbolic interactionism that has the subject of interaction as a central actor for the apprehension of reality. For this, interviews were conducted with actors from NGOs in Brazil.

Assuming that collective actors interpret reality from the knowledge that comes from the national context in that they live, it is clear that as the actors of these NGOs experience other national contexts, such as through migration and networking with NGOs from abroad, this knowledge of problematization becomes transnational. While networking with NGOs from abroad can be seen as a breakthrough in the intervention of transnational problems, on the other hand, a number of boundaries can be identified due to the different ways of constructing social reality.

Organizing Youtube: Collective Action on the Platform

Platform-based work has become an increasing phenomenon around the globe in the last decade. It has established new work processes such as crowdsourcing or algorithmic management. On digital platforms, work is often conducted remotely and under precarious conditions. Remote platform workers, who possess little chance to interact with each other, have so far seemed unable to organize by trade unions.

There are indicators, however, that organizing on such platforms is possible. Our case study, which supports this argument, suggests that new union strategies are required to make collective action feasible. On the Google-owned video platform YouTube over 20,000 individuals have formed a "YouTubers Union," an association of content creators and their supporters. The group's goal is to enforce transparent and stable working conditions for creators whose income crucially depends on YouTube's algorithmic infrastructure and fluid terms of payment. Group actions included a "warning strike" and publicity campaigns (shit-storms) to make its outrage visible on the platform. Communication is conducted largely through a Facebook group. As a result of its efforts, the movement was

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

able to form a joint initiative with the German trade union IG Metall and achieved meetings with YouTube to negotiate about rights and working conditions on the platform.

Our case study is based on interviews, participatory observations and a digital ethnography of the content creators' organizing processes between October 2018 and November 2019. Taking the example of the YouTubers Union and using a power resource approach as a framework, we want to present which levers could be successful for struggles of content creators on YouTube, and which risks and contradictions exist at the same time. Finally, we would like to discuss how the findings of the case could be transferred to other forms of platform work.

A Study of Government Responses to COVID-19 and People's Experiences of the Pandemic in Brazil

The objective of this paper is to examine how people's perceptions concerning measures taken by the Brazilian government to contain the progress of the COVID-19 pandemic are related to their experiences during this period. The analysis is based in part upon data from an online survey concerning experiences and emotions during the pandemic collected in Brazil between May and July 2020 by an international RC36 team that has been working on this issue. The Brazilian government has taken a denialist stance concerning COVID-19 ever since the pandemic erupted. As a consequence of this situation, the country has faced high rates of contagion and mortality as well as adverse effects on the economy and social security. Initial analyses of the data indicate that most respondents do not consider the measures taken by the national government to contain the pandemic to be appropriate. This data is accompanied by a high level of distrust regarding the ability of of national leaders to successfully deal with crises. These perceptions are generalized among participants, and they are independent of gender, social class, age, and level of education. The data revel a moderate relationship between the level of confidence in government measures to contain the spread of the new corona virus and the level of anxiety experienced during the pandemic. This suggests that the way in which the government has positioned itself in respect to the crisis elevates people's concerns and worries about the COVID-19 pandemic. Further analysis is needed, however, to conclusively demonstrate this trend.

I'm Going to Change the Meat Game: Perceptions of Vegetarians and Non-Vegetarians Concerning Reducing Meat Consumption

The meat industry is regarded as one of the largest producers of damage within the capitalist system. The consequences of meat production constitute risks, either greater or lesser, to human, animal, and environmental health. Several studies have shown that a greater awareness of these effects has brought about transformations in many people's diets. Motivated by health, ethical, or environmental issues, many people have decided to abandon meat consumption altogether or make it more flexible. This presentation addresses this scenario by posing the following questions: How do perceived consequences impact the decision to stop or decrease meat consumption? Are vegetarians, flexitarians (those who choose to reduce meat consumption to some degree), and omnivores motivated by the same concerns? What meanings do people ascribe to their choices and attitudes? The answers to these questions were elaborated on the basis of data generated by survey replies and in-depth interviews. Our survey was distributed at nine vegetarian restaurants in Curitiba, Brazil. Of the 60 volunteer respondents, 16 agreed to additional in-depth interviews. The participants included vegetarians, flexitarians, and omnivores. Initial results show that flexitarians and omnivores are very similar regarding their motivations for decreasing meat consumption, with a predominant emphasis on maintaining one's own health. Vegetarians have more complex motivations, with a strong emphasis on animal welfare, especially among vegans, but also on individual health. The environment appears to be an important motivation in all cases, but it rarely is the predominant one, perceived more as an added benefit of one's actions. I also detected the strong influence of neoliberal logic involving the individualization of responsibility, especially through consumption. In most responses, the adoption of new individual consumption habits was pointed to as resolving internal conflicts and as a way in which to change the meat production system.

KHAN, MD. MEHEDI* (Department of Population Sciences, University of Dhaka, Bangladesh)

Changing Family Demography and Emergence of Aged Care Law and Policy in Bangladesh

Family demography is going through some remarkable changes in the recent years in Bangladesh, the 8th most populous and a 'Medium Human Development'

country. The correlates of these changes can be identified as declining total fertility rate(TFR) and family size and increasing urbanization-modernization, life expectancy, number of older persons, migration of both men and women, number of widowed/divorced/separated men and women, participation of women in labour force. These changes have brought transformations in socio-cultural and demographic milieu of traditional family which have hampered care and maintenance of the emerging increased number of older persons within family context. In this context, among other initiatives, government has enacted a law named 'Parents' Care Act 2013' and a policy named 'National Policy on Older Persons 2013' to legally ensure care and maintenance of parents by children within the family. It is apparent that family has changed to the extent that government has enacted this law and policy to provide care for parents by other family members. An exploration of the state of the changing family demography and necessity to enacting laws and policy to ensure care and protection of older persons within family context in Bangladesh is proposed here.

Understanding Internal Migrants in India: The Need for Integrated Research

Understanding internal migrants in India: The need for integrated Research
According to a study by UNESCO-UNICEF, 2013, despite the fact that approximately three out of every ten Indians are internal migrants, internal migration has been accorded very low priority by the government, and existing policies of the Indian state have failed in providing legal or social protection to this vulnerable group. Further, while discussing internal migrants in India to 'key destination areas', migration from the 'lead source states' of internal migrants to areas like Northeast India or migration from Northeast India, particularly from state like Manipur to Delhi and Bangalore or other states is neglected or not studied within the larger framework of internal migrants in India.

Against these backgrounds, the paper would address the concerns of migrants from the Northeast India, with focus on Manipur; in the National Capital Region, who have of late come to the city in large numbers in pursuit of higher education and other employment opportunities. The paper would also point out the need to see the question of 'others' settled in the Northeast, particularly Manipur. The question of 'outsiders' who migrated to the state of Manipur has now become a subject of intense debate wherein the 'outsiders' are seen to have 'captured' opportunities which, otherwise would have belonged to the 'sons of the soil'. The paper would propose the need for framing origin oriented policies which would help mitigate involuntary/imaginative migration so that the people from the migrating state are benefited while, also proposing the need of formulating policies for the migrants in the place of destination, which would reduce the concerns they face in the city.

KHATAM, AZAM* (The City Institute, Canada)

Desperate Tenants and Ghost Buildings: Crisis of Housing Affordability in Tehran

Housing has become a highly contested issue in urban politic as steep increase in house prices has continued since 1980s. Real estate speculation, as Lefebvre projected in 1970, has became "the principal source for formation of capital" in many countries ([1970] 2003:160). Housing crisis is global and is embedded in different socio-economic and political contexts; as such it contributes to different forms of inequalities in various urban landscapes. This paper examines the socio-economic impacts of *hyper commodification* of housing, or extreme rule of real state over housing in Iran, in a context where capital moved to housing sector facing with highly unsecured economic context resulted from US economic sanctions.

Looking at speculative investors in housing market as key delivery agents of new homes in Tehran, this paper examines how transformation of housing regime in Iran in the 1990s, marked by the removal of populist housing policies like rent control, distribution of subsidized land and government support for housing cooperatives, changed the centrality of the poor and middle classes in Iran's national housing policies. I explore the ways in which political and military elites engaged in rampant land grabbing and mass production of housing, benefiting from deregulated intensification of residential zone and address the results of such over-investments in housing in a sanctioned mafia economy in forms of unprecedented tenant push-out trends in a city encircled by five hundred thousands vacant new units. How housing market has saved itself from crash in such imbalanced and speculation environment remains to be explored.

Discourses and Practices of Democracy and Development in Southeast Asia

Singapore represents the Southeast Asian model of development first, democracy later; a model that gained ground in the Southeast Asian region, mainly in Malaysia, Indonesia, and Thailand and subsequently, a variation of that model was adopted in China. The discourses of development first, democracy later was crafted in Singapore mainly by the ruling elites who were able to enlist a section of the academics to espouse a similar paradigm. Part of the success of this model was underpinned by the rapid economic growth in the region under illiberal political authorities. And being emboldened by the economic success, the intellectual elites began to question the necessity and even relevance of democracy in the region in the decade of the 1980s and the 1990s. The financial / economic crisis that hit the region in 1997-98, not only led to a politico-economic meltdown, it also produced a "paradigm crisis". Situating the Southeast Asian politico-economic drama in its politico-historical context, the paper examines the relationship between development discourses with the changing politico-economic realities of the region. Special attention is given to the globalization of the debates over the link between democracy and development and its metamorphoses in view of the looming environmental crises and the infusion of new technology-led growth in the Southeast Asian region.

Survival Activism: Primary Healthcare Practitioners and Health System Activism Against Environmental and Social Threats in Brazil

Brazil currently faces a political crisis as strong right-wing forces drive the country to new thresholds of discrimination, authoritarianism, economic and environmental crisis. Government social protection programmes and health services face serious and continuing cuts. Family doctors, community health workers and primary healthcare teams who represent the frontline of the Unified National Health System (SUS) are under major stress, facing professional and personal impoverishment.

Basic determinants of health have suffered as air, water and occupational exposures have increased (Bombardi 2019, IBGE 2019). The recent devastating fires in the Amazon have destroyed forest, worsened air quality, and contributed to the genocide of the indigenous population. Cuban doctors working in Brazil were withdrawn following the 2018 election worsening care gaps, especially in the most disadvantaged poor, urban, rural and remote locations. In September 2019, Porto Alegre announced redundancies for 1800 Primary Health Care Workers. Changes to the National Primary Care Policy have diminished the role of Community Health Workers. Care is to be centralized in the hospitals, losing the historic primary health focus central to universal health coverage (Harris 2017).

Primary care has become the frontline for care and resistance to the erosion of SUS and universal health coverage. Daily assaults in the mainstream media and fake news proliferating through social media contribute to a deteriorating environment for scientific knowledge, education, and research as well as everyday healthcare work. Family doctors and primary healthcare workers have turned to everyday social activism in order to cope. As the socio-political environment for health has deteriorated, simply taking a stand and continuing to work in the most disadvantaged areas constitutes a form of resistance. We might call this kind of activism **survival activism,** working with poor and remote communities to resist, empower and organize to defend the basic necessities needed for life and health.

RC09-116.1

KHOO, SU-MING* (National University of Ireland, Galway, Ireland)

RAGHAVENDRA, SRINIVASAN (National University of Ireland,Galway, Ireland)

Theorizing Intersectional Dynamics of Inequality: The (im) Possibilities of Categorical Equalization

This paper provides ground work for converging analyses of material and recognitive/existential inequalities. It considers the effects of racism and sexism, as well as the puzzling way that attempts to redress racism/ sexism to attain racial and sexual justice can be interrupted and interrupt each other, while failing to interrupt economic liberalism and socioeconomic inequalities. The 'horizontal' or multidimensional aspect of inequalities makes it problematic to attain/ maintain a 'bivalent approach' to recognitive and redistributive justice (Fraser 1997).

Wallerstein sees racism-sexism is a restorative / conservative stabilizing force that contains and deflects the contradictions of material inequality in a 'zig-zag' mobilization of the recognitive turn (1991). Stewart and Arnim (2007) suggest that 'horizontal inequalities' can be escaped via investments in 'human capital' and 'a culture of achievement'. They argue that interventions are needed, targeting 'human capital accumulation' and economic disadvantage if 'groups' are to catch up (with other groups).

However, these assumptions are very problematic. The paper considers the complicated and resilient structuring of zig-zag effects of race and gender, by thinking through current questions of gender emancipation in post-Catholic Ireland and problems of growing economic and racial polarization in post-Apartheid South Africa. It reconsiders root problems of binary, category-based conceptions as epistemic problems of dominance and marginalization that can be reformulated, but not dismantled (Maré, 2014; Phiri and Matambo 2019).

The paper posits a structural and dynamic relationship between vertical and horizontal inequalities. Under democratic conditions (within which xenophobic, racist, misogynistic and homophobic ideologies are present), there is a tendency for challenges to vertical inequalities to be transformed, through a process of zig-zag ideological mobilization, into forms of horizontal identification (Wallerstein 1991), such as nationalism which incorporate, encapsulate and divide solidaristic potential for mobilizing justice, by refracting political demands through the lens of unconsented contracts of domination (Khoo 2015).

Sociopolitical Impact of Participatory Budgeting in Ukraine

The model of participatory budgeting is spreading around the globe. Its core idea is that members of a local community decide where to allocate public funds while authorities implement this. Literature assumes that this brings numerous benefits: from a higher quality of life to a more vibrant community life and a more efficient citizens-authorities relations. In Ukraine, within three years, over 150 communities have already introduced some form of participatory budgeting, which allows to assess its impact. Therefore, this inquiry aims to evaluate the sociopolitical impact of participatory budgeting on local communities and self-governments in Ukraine. Primary data is comprised of budget-related legal regulations of 136 communities, formal answers to freedom information requests provided by local authorities of 141 communities, self-reported statistics of two e-voting platforms, and transcripts of 23 expert interviews with public officials and civic activists of nine communities. Of the overall realized sample, nine communities were chosen for case studies using a contrast sample: within three clusters defined by population size they represent the maximum, minimum, and median participation rates in voting for participatory budgeting projects. Further, an array of mixed methods was applied: statistical analysis of data provided by local authorities and obtained from e-voting platforms, as well as content-analysis of legal regulations and expert interviews. The findings show that some individual communities demonstrate evidence of a significant impact of participatory budgeting. It raises the quality of life with relation to security, utilities, social security, public health, public transport, public space, ecology, leisure, sports, education, and civic engagement. Regarding its impact on local residents, it raises civic activism, civic education, empowerment, inclusiveness, and social cohesion. Concerning its impact on local authorities, it improves the skills of public officials, the interaction between citizens and authorities, the quality of democracy, the quality and efficiency of local self-government.

Farmers, Autonomy and Biodiesel: What Can We Learn from Brazil's Experiment with Biodiesel for Rural Development Policy?

Brazil's National Biodiesel Production and Use Policy (PNPB), structured to support smallholder family farmers, promised rural development and social inclusion outcomes whilst maintaining several elements of productivist agriculture. By 2011 a peak of up to 100,000 smallholder farmers were participating in the PNPB and yet by 2015, this had dropped less than half with only 45,000 remaining. By 2018, the Brazilian State had largely turned away from the biodiesel experiment and quietly started the process of the dis-vestment from the sector and the social inclusion focus. However, before the state had turned away, the smallholder farmers themselves were opting out, co-opting the resources from the program and resisting involvement. This paper will explore (a) what can be learnt from smallholder farmers experiences of the PNPB in terms of agricultural policies for social outcomes and (b) in imagining agri-food transitions how might the *autonomy* of smallholder farmers inform our starting point?

Mental Health and Social Service Use of Families with Mentally Ill Parents

Background: Children of mentally ill parents have a higher risk to develop a mental illness when compared with the general population. The use and the costs of health and social service use of this target group is not well investigated.

Methods: As part of a multicenter randomized trial, use and costs of health and social services were assessed for a sample of 298 children with mentally ill parents (N = 192) in six regions of Germany. Service use was assessed by the German version of the children and adolescent mental health service receipt inventory (CAMSHRI) and the client sociodemographic receipt inventory (CSSRI) for parents. Total and service specific costs will be calculated for 12 months by diagnosis status and service user status. Cost drivers will be identified by regression based cost functions.

Results: Study results indicate that children of mentally ill parents use a broad spectrum of mental health but also social and educational services. Costs for children with a psychiatric diagnosis are significantly higher than for those who are not diagnosed as mentally ill. While psychiatric inpatient services account for the highest share of costs for children with a psychiatric diagnosis, school based costs account for the highest share of costs for those without a diagnosis. Regression based cost function indicate that functional status of the child is the main cost driver followed by the severity of the parents mental disorder. The service use and the cost of the mentally ill parents do not affect service use and costs of children.

Discussion: The use of a broad spectrum of health and social care services even if not diagnosed as having a mental disorder may suggest the need for prevention programs for the target group of children of femilies with mentally ill parents.

KILIAS, JAROSLAW* (Institute of Sociology, Warsaw University, Poland)

The ISA 1949-1970 – the European Semiperiphery and the Spread of Americanized Western Sociology into the East European Peripheries

The paper deals with the first two decades of the International Sociological Association, presenting it in the context of World System and/or academic dependence theory. It bases on ISA and Polish archive material, as well as on published Western and East European texts which dealt with the academic relations between both parts of the continent. It shows how ISA emerged, being in fact European (i.e. not only based in Europe, but actually dominated by West Europeans) organization, which possessed resources (economical, organizational and intellectual) that enabled it to acquire relative independence and counterweight the American hegemony. The ISA officers showed unceasing interest in establishing and maintaining contact with the rest of the world, including Communist countries. Although their academic functionaries claimed to have their own, Marxist variety of sociology, they did not possessed any factual resources to balance the Western influence. Therefore, the Western Europe and the ISA became a sociological semiperiphery, instrumental in the spread of the (Americanized) Western sociology through the "second" and the "third" world.

Challenging Students in Japan to Create Their Own Business: Establishing an Student Entrepreneurship Development Program at a Liberal Arts University in Tokyo

The opportunity to have promising students build things should be a core component of a successful education, yet many schools in Japan rarely teach entrepreneurial skills, leaving students ill-prepared for the future. The following research examines an innovative program offered by a prestigious liberal arts university in Japan designed to encourage the spirit of entrepreneurship among select Japanese university students. The first option for Japanese college students involves pursuing tradition management system of lifetime employment, seniority systems, enterprise unions, and the Japanese business culture, which stresses a group-oriented, risk-averse orientation. The path to entrepreneurship is unavailable, and rarely considered as a viable option for many of the brightest students in Japan. Working in conjunction with an international study abroad agency, this study provides a programmatic portrait of an education program that emphasises collaboration, creativity, and computational literacy considered essential skills for the future economy and characteristics of many successful entrepreneurs today. Japanese students identify entrepreneurial opportunities, create a business plan, securing financial backing, and coordinate growth in the presence of mentors. Towards this end students consider a local business challenge, visit a local incubator, and learn how to pitch ideas and develop basic financial skills for their futures. This intensive pilot program abroad will examine from the top down and bottom up the processual mechanisms that facilitate the changing culture and conduct of student education around entrepreneurship and preparing students to diagnose and proffer solutions into the 21st century.

KIM, JIYOUNG* (, France)

Unequal Conditions of (in)Formal Employment Relationship in Restaurants. Example of Kitchen and Hall Serving Workers.

In France, the hotel-restaurant industry suffers from the lack of qualified labour and high turnover, because of hard working conditions as well as relatively low wage. Based on interviews with 27 hall serving, 11 kitchen workers and 23 entrepreneurs, I will focus on how (in)formal employment relationship takes form through unequal temporalities experienced by workers, while legislation participates in the institutionalisation of casual temporary job contract, at least since 1982. The restaurants where they work are all situated in the Canal Saint-Martin neighbourhood in Paris, known for its young and trendy image going hand in hand with the gentrification since 1990s. The owners call their restaurant a "canteen", offering a simple but fresh meal, explaining the non-professional character of its workforce.

However, the sociological characteristics of workers in the hall and the kitchen differ so that they are lead to forge different professional relations with their employment. In fact, the former, sometimes undocumented, belong mostly to ethno-racial minorities coming from Global South. Although they tend to work more than full-time, they risk being paid under the table for a long time. Claiming for a contract could bring about a conflict or a dismissal. In other words, a standard working form doesn't always keep up with a formal employment relationship. On the other hand, waiters and waitresses, mostly white higher-education students coming from middle class, work with a specific goal: pocket money, saving for a future project as an artist, etc. Considering it as a temporary or supplementary job, they are less concerned about their employment conditions. If necessary, they negotiate with their employer, in order to be eligible for the unemployment allowance, for example. While entrepreneurs bypass or use effectively the law, workers have to deal with unequal temporalities of uncertainty, interiorising loyalty and precarity.

HABUCHI, ICHIYO (Hirosaki University, Japan)

Romantic Behavior of Young People Living in Rural Japan Network and Trans-Locality

We present two topics—how regional differences affect the romantic behavior of young people, and how the networks centering on Social media usage by the rural youth influences their romantic behavior. The hurdles in the movement of people, goods, and services have decreased due to the development and motorization of the transportation network, and advanced computerization has led to disappearing geographical barriers in communication; in this context, what kind of relevance does regionality have on the romantic behavioral patterns of the youth? We use quantitative data from (1) the 2014 nationwide survey and (2) the 2018 survey of the Aomori Prefecture. We examine the first question using data from (1). We assume that C.S. Fisher's proposition regarding friendship-selection in his subcultural theory is valid for romantic relationships as well. However, we couldn't find the linear difference of romantic experiences from the survey data of (1) due to the effect of DID population ratio. Instead, we observed the impact by the number of friends and found that romantic behavior is determined not by region, but by the number of friends one has. Next, we analyzed data from (2) to answer the second question. This survey was conducted in the non-metropolitan areas of Aomori Prefecture. We clarify a correlation between romantic experiences and sex, age, employment status and their experience of move. Considering this, how can one retain the "network capital" (Elliott and Urry 201) of rural youth beyond their place of residence? We would like to discuss a retention of intimacy beyond physical distance among Japanese youth.

KIRAKOSYAN, LYUSYENA* (Virginia Tech, Brazil)

The Impact of the Rio 2016 Paralympics on the Lives of Disabled Brazilians

Paralympic movement leaders, sporting mega-event organizers, and para-athletes in Brazil and elsewhere have made frequent claims about the potential of the Paralympics to raise awareness about the abilities of disabled people and subsequently change society's perceptions of them and promote their social inclusion. However, how disabled people themselves view and experience the Paralympics and resulting social inclusion is far less explored in the media and academic literature. This paper analyzes the views of disabled Brazilians on such claims regarding the 2016 Paralympics and the Games' impact on their lives. The online qualitative survey with this group was conducted almost a year after the Rio mega-event and explored the following issues: a) in what ways the Rio Paralympics affected the perceptions and attitudes of broader Brazilian society towards disabled people; b) whether or not disability sport is a tool for social inclusion and equality and why; c) how well para-athletes bring visibility to the challenges disabled people face outside of sport and; d) whether or not the media's attention on the sporting performances of para-athletes was positive for disabled people in general and why. Because disabled people are not a homogenous group with the same experiences of discrimination and deprivation of their rights, their statements varied across the spectrum, from optimistic to skeptical. In line with the findings of a study about the 2012 London Paralympics (Braye, Dixon and Gibbons 2015), the survey participants also articulated that while the Paralympics could be positive within the context of sport, disabled people in general rarely experience broader benefits.

From a Colonial Language to an Official Language: Understanding Second Language Acquisition Challenges in Kenya

Reports from the Kenya National Examination Council (KNEC) continue to reflect a downward trend in the performance of English as a subject across Kenya. This is taken to imply that the root cause to this perennial problem is yet to be identified. As pointed out by Adger Christian (2007), better information and understanding of how language works and how people learn languages is solely needed. In Kenya, English serves as the official language and is used as a medium of instruction in education institutions. English is taught as a subject in schools from nursery to Universities. As a subject, English is examined during the last year of primary education and high school. Research findings point at several factors that are attributed to poor performance; teaching styles, learning styles, effective curriculum, policies, projects, personality, motivation, attitude, environment etc. It may seem that by focussing on the teacher's teaching styles and other activities, we minimize the factors that contribute to poor performance. Data collected from high school learners reveals a complex interaction of social, educational and personality factors that influence the learners ability to process L2 (English) knowledge under the conditions of use come into play. How do these factors interact, what challenges arise from such interaction, and how does this interaction affect teaching and learning?, are questions this paper strives to answer.

Ride Hailing Apps the Union Way: The Re-Making of the Atgwu's Agency

This presentation analyses the Amalgamated Transport and General Workers' Union (ATGWU)'s transformation processes and its mobilisation of power resources to respond to the entry of platform ride hailing companies into Kampala's informal public transport industry. We examined how strategic choices were made to meet these new challenges and to utilise the union's power resources differently. We also analysed the lessons learned and the ongoing challenges this strategy generated for the union. Since 2015, SafeBoda, Uber, Bolt and other ride hailing platform companies have all actively vied for an increasing share of Kampala's boda boda (motorcycle taxis) and car taxis operations. At this same juncture in time, the ATGWU and its affiliated mass membership organisations (including those representing boda boda riders) were transitioning towards a more fully integrated formal-informal organisation. This rapid growth in membership numbers propelled the union to explore digital tools which could support its transformation and provide it with a means to collect membership dues efficient-

ly, enhance accountability, mobilise members and continue its growth through organising informal workers. This exploration led to an important development; an app for Kampala Metropolitan Boda-Boda Entrepreneurs (KAMBE), one of the ATGWU's affiliated associations, whose features included a membership registration form, union member bio data storage, a membership mobile money payment option, and, significantly, ride hailing services. This presentation is informed by data from in-depth, semi-structured interviews with union representatives, union focus groups, by reports of workshops and seminars conducted with the support of Friedrich Ebert Stiftung, by reports of activities undertaken by the union, and by additional participatory research fieldwork. The ATGWU case study has important implications for workers struggles and collective action together with the nature and revitalisation of trade unions vis-à-vis the platform economy.

The Debates on Global Sociology: The 'Unity and Diversity' of Interpretations

This work is devoted to the debates on global sociology, its history and the usage of the concept in sociological literature. The research concentrates on a historical overview of various approaches and ideas which are traditionally identified with the stated notion. The article makes a retrospective analysis of the debates on global sociology and focuses on a historical and sociological reconstruction of its theoretical field. The essential features of each of the available interpretations are highlighted. The analysis of the main ideas and the current trends were presented: from the first mention in the literature to the current state of the researched idea. The two main periods of the discussion were defined (1982 – 2006 and 2006 till nowadays) based on the evaluation of crucial moments in the history of the researched idea.

The main aims of this presentation are 1) to present a brief history of global sociology as a phenomenon 2) to define crucial points in this history and, as a result, 3) suggest a periodization of the debates. These steps must be performed in order to demonstrate the foundation, transformation, and modern contours of the discussion and the variability of the meanings from a historical standpoint. For the implementation of such tasks it is also necessary to analyze the ideas associated with the global sociology notion. They are researched with the help of the classical historical and sociological methods. Such an approach will help to better understand the origins and nature of the discussion. It also allows us to consider the historical aspects of the research field in order to understand the current state of the debates in global sociology.

Who Should be Ideal English Speakers? ~Japanese Male College Students' Experiences in Australia~

In the belief that Japanese students can acquire 'native-like' English-language ability when they are assimilated into 'native' English worlds, students are encouraged to participate in study abroad programmes (Kubota, 2016). In addition to the linguistic aspects, recent research offers critical insights into the intersectionality of gender and ethnicity/race of English speakers, who are idealised by English learners. In Japan, in particular, previous studies have critically examined the English learning processes and motivation of Japanese female students, who were stereotypically portrayed as the agencies in thrall to the allure of a romance with 'native' English speakers who are white Western men (Kitano, 2020; Nonaka, 2018; Takahashi, 2013).

Compared to the female romantic desire illustrated through media, some previous studies have examined that Japanese men's desire, which was underpinned by the Japanese governmental policies on English-language learning, has been linked to seeking hegemony over the West and a superior position to other Asian nations/countries at the same time (Kato, 2015).

Acknowledging this background, this presentation introduces Japanese male college students' experiences (N=3) in Australia. With thematic analysis of the interviewees' narrative data retrieved from semi-structured in-depth interviews during and after their sojourn, the presentation shows that two interviewees' notions of ideal English speakers were highly gendered and linked to the desire to seek hegemony over the West. During their sojourn, they hesitated to communicate with non-Western and non-Japanese interlocutors speaking English. One interviewee's narrative showed that his desire to communicate with English-speaking interlocutors, regardless of whether they were 'native' or 'non-native', expanded his language activities during his sojourn.

This presentation concluded that the aforementioned different results stem from diverse notions of ideal English speakers prior to sojourn, and the concept of intersectionality is a significant element to widen students' English learning activities abroad.

Authoritarian Politics of Legality in the Field of Migration: The Case of Turkey

Turkey is the country that hosts the highest number of refugees in the world. It is also considered as a salient example of the current authoritarian shift, due to the high speed of social, political and legal transformations taking place in the country, in particular following the declaration of the state of emergency in 2016. Through the critical study of the legislation and in-depth interviews with national and international NGO workers active in different cities of Turkey, the paper aims to study the dynamics of migration policies in Turkey. It wants to investigate in which ways the authoritarian politics of legality and the migration policies mutually affect and strengthen each other. It will also discuss the EU-Turkey Refugee Deal and its role to foster international support for the stability of authoritarianism in Turkey.

Is Populism Good to Think? Making Sense of an Illiberal Era

This paper explores the analytic purchase of populism in making sense of illiberal politics in the era of neoliberalism. The title borrows from Claude Lévi-Strauss's claim that the natural species chosen to be totemic emblems are selected "not because they are 'good to eat,' but because they are 'good to think'." Populism must be seen in relation to democracy and it is in this relationship that the idea of populism does or does not prove itself to be "good to think." In addressing this relationship, three topics will be addressed: (1) the first queries the debates pitting those who see populism as a negative force on democracy, those who see it as a positive force, and those who stake out a middle ground; (2) the second examines the relationship between populism and authoritarianism; while (3) the third asks if neoliberalism is the cause of the populist ascendance. Using comparisons of three populists in power—Trump, Orbán, and Salvini—the paper concludes by indicating how civil sphere theory can contribute to our understanding of how to deploy populism as a tool of analysis.

KIZILOVA, KSENIYA* (World Values Survey Association, Austria)

Forms and Trends of Political Participation in Global Perspective

The paper provides comparative cross-regional analysis of patterns and factors of conventional and unconventional political participation in Europe, Eurasia, Asia, Arab World and the Americas in over-time comparison in 1981-2015. It is analyzing the longitudinal direction of conventional political participation like voting or signing a petition on the one hand and of unconventional political participation like joining a boycott, participating in demonstrations or join strike on the other. The main survey data base of this paper is the World Value Survey in its 7 waves conducted between 1981 and 2020. The paper is looking at the increasing or decreasing trend of specific forms of political participation in different world regions. The paper proposes a multivariate model of conventional and unconventional political participation, which is considering the influence and impact of social structure, social capital, political interest, political involvement and support for democracy on conventional political participation on the one hand and on unconventional political participation on the other. The main research question is if we can speak of one specific trend of political participation which is the same in all world regions or if we have to speak of regional patterns of political participation, which are specific for certain world regions, as well as if these global or region-specific patterns are relatively stable or changing over time.

KJÆMPENES, WENCHE* (UiT The Artic University of Norway, Norway)

Social Closure or Shared Jurisdiction?

In this presentation, I examine how jurisdictional openings are created and fought for by professions. To incorporate the complex context within the professions as a collective group operates, I argue that a five-actor framework that brings together Burrage et. al.'s (1990) actor perspective and Abbott's (1988) perspective on inter-professional competition is useful. This framework enables the systematization of empirical data while at the same time incorporating other theoretical perspectives (Kjæmpenes 2013) and advance understandings of how occupational expert groups and professions operate in a new work field. I support the arguments with examples from the Norwegian fish health field, and show how complex the processes are that take place in order to reach shared jurisdiction between professions.

The Norwegian state has a strong interest in fish health through disease and food control, as well as control of the threat posed by the use of antibiotics. Today, large multinational companies are powerful players in the industry. It is in this context of interplay between actors (industry, professions, occupational expert groups, universities, and the state), that shared jurisdiction in fish health between veterinarians and aqua medicine biologists has taken place.

New European Union (EU) regulation on human and animal directly affect the interrelationships between professions in Norway. To combat antimicrobial resistance, the EU wants to achieve a harmonized and more restrictive and proper use of antimicrobials in animal husbandry. It has responded to the situation with legislation that monopolizes the role of the veterinary profession in animal and fish health (Regulation (EU) 2019/6). In order to safeguard the interests of societies and develop good risk management in animal health, EU monopolize the role of veterinarians in the field. Is social closure the best strategy to combat the use of antibiotics? Why not take a closer look on shared jurisdiction between professions?

KLAGES, ANNA-LISA* (University of Applied Sciences Würzburg-Schweinfurt, Germany)

Doing Civil Society through Visual Culture Practices in Uganda - Moving the Discourse from Individual Empowerment to Collective Idenitity Construction

Projects and initiatives within this understanding of civil society seek to empower marginalized individuals. In the context of women empowerment for example, one strategy applied in urban centers in Uganda is to teach marginalized women to become craftspersons and producers of jewelry or wickerwork. Thereby, strategies applied often emphasize a. the economic benefits for individuals and their families (poverty eradication), and b. the preservation of local material cultural heritage through the production of so-called traditional cultural crafts. In this sense, civil society is perceived as the realm of NGOs that support projects and do good in order to create a better society for all, while preserving alleged local cultures. Research indicates that common perceptions of civil society fall short to grasp the complex structures and societal dynamics indigenous to Uganda's communities, and that the preservation of the cultural heritage in form of crafts-making includes cultural practices and collective meaning making processes and thus move beyond the application of techniques.

The presented paper draws on the author's Ph.D. research on the linkages between civil society and visual culture practices in Uganda. Preliminary findings of literature study and empirical research indicate that above mentioned (re-)presentation of civil society with a focus on structured programs aiming at the empowerment of marginalized individuals seek to use culturally sensitive approaches through applying practices of visual culture. However, the analysis of the available data suggests that artisan-collectives established outside of the foreign-dominated NGO-realm find different meanings in their joint creative work, thereby appropriating meanings associated with civil society and visual culture production.

The findings point towards a dilemma of the civil society discourse that is still dominated by Western subjects, leaving little space for in-between narratives and subaltern approaches to visual and cultural expression in civil society narratives, and that simultaneously provide avenues for endogenous approaches.

Scrutinizing the "Code of Silence" in a Situation of Corruption: Testing a Team Mechanism of Deviant Behavior

A core feature of corruption that has been pinpointed in previous studies is the favoritism of particularistic over universalistic norms (Merton 1940, Graeff & Kleinewiese 2019). In our study, we test if (external) threats to a workgroup, such as organizational restructuring, lead to an increase in social cohesion (e.g. team spirit) and, ultimately, result in a higher probability of deviant (e.g. corrupt) behavior. For scrutinizing this mechanism, we refer to studies such as those by Waytz et al. (2013) and Dungan et al. (2014). These studies are related to the "code of silence" as a major driver of consenting to (and, therefore, indirectly supporting) deviant (e.g. corrupt) behavior of other team members.

In order to test this neglected aspect in the explanation of group- and organization-oriented deviant (e.g. corrupt) behavior, we apply a vignette-based factorial survey to a sample of firefighters in Germany. By taking the multilevel nature of the data into account, it can be shown that external threats to the team reduce the likelihood of reporting a corrupt act, suggesting that particularistic norms are preferred over universalistic norms.

Student Dropout in the First Two Years of Graduation: The Case of the Federal University of Rio De Janeiro

In recent decades Brazil has undergone changes that affected the system of access to public higher education significantly. The two main changes were the creation of a centralized admissions system and a quota reservation system for students from different social groups. Research shows that these policies have begun to change the profile of those who access Brazilian higher education. However, the major challenge that presents itself, once a more heterogeneous public begins to enter Brazilian higher education, is the permanence of students at this level of education. This is a key issue since the main educational outcome of interest in the higher education system is graduation of these new groups. In order to understand who graduates, we focus on those who don't. The purpose of this study is to search for the dropout patterns of a major Brazilian university. Our data allow us to assess the socioeconomic, gender and race patterns of all students entering university in 2014. Given the hierarchy of the data structure, we will apply a multilevel logistic regression model (where the student is level 1 and the course is level 2) to a cohort of 4500 students who entered the first semester of 2014 at the Federal University of Rio de Janeiro. Performance controls will be used at the point of entry into the university, such as the National High School Exam (ENEM) score, never used before in Brazilian research on this subject.

The Ecla-Bnde Center and the Building of a Generation of Intellectuals Engaged in Planning the Brazilian Development

This paper reconstructs the history of the partnership between the Economic Commission for Latin America (ECLA) and the Brazilian National Bank for Economic Development (BNDE), which originated the ECLA-BNDE Center, an institution based in Rio de Janeiro that operated between 1960 and 1967. Despite its brief existence, the office had a great influence. It was responsible for training, in the Course on Problems of Economic Development, taught in several regions of the country, a generation of technicians in "planning for the development". The Center also functioned as a gateway to ECLA's ideas and writings in Brazil and as a *locus* of knowledge production on economic development. Hence, it sought to impact both the governmental spheres and the academic world. Based on the combination of remaining documents, newspaper stories and testimonies offered by ex-members of the Center the article describes in detail its activities and to retrace the processes of genesis, expansion, and closure of the partnership. The article ends with a discussion on the effects of the dissolution of cooperation and dispersion of office staff, divided between exile and the tasks of creating, in Brazil, new redoubts for ECLA's influence. The reconstruction of this experience allows telling about the institutional arrangements that sustained the circulation of the knowledge produced by ECLA and seeing how these ideas were modified while moving. Diving into this case allows to illustrate how the encounter with the national specificities pushed ECLA into adopting comparative frameworks for its analysis and how the building of a sociology of the development around ECLA was, thus, motivated by the need to understand the effects on the development patterns of the political and social diversity within the region.

Beautiful Capital: Is Physical Attractiveness Nature or Rational Investment?

This paper scrutinizes the determinant mechanism of beauty in Indonesian society. The literature has revealed diverse social consequences of physical attractiveness. Still, it has been left unsolved whether beauty is naturally determined or intentionally achieved. Data were collected in 2018 Opinion Survey on Local Governance in Indonesia. A representative sample in Java was chosen and analyzed with 3,212 respondents. Interviewers evaluated respondents' beauty and skin brightness on five-point scales. Key findings include, first, that education and income increased skin brightness. Second, while skin brightness did boost beauty levels, education and income also raised it. This implies that different socio-economic status groups use different strategies of investment in beauty capital, which is changeable and controllable. Therefore, beauty depends, at least partly, on individual attainment.

Inequality of Well-Being in Asia: A Comparative Analysis of Happiness in Eight Countries

This paper poses the research question of whether well-being inequalities exist in East and Southeast Asian countries. Layard (2005) proposes the "big seven" drivers of subjective happiness, but Asia may have more complicated and diverse mechanisms. We therefore compare eight countries in East and Southeast Asia using a case study approach and hypothesize differentiated levels, variances, and drivers of happiness between the two regions. Data are collected via a survey (N = 8,166). Happiness is measured by Cantril's ladder of life. Key findings include, first, that there are well-being inequalities among East and Southeast Asian countries because East Asia experiences relatively low and unequal happiness. Second, East Asia shares happiness determinants such as marriage and income, while Southeast Asia has no such common drivers. This reveals that there are geographical, rather than economic, differences in happiness in Asia. Such findings can be obtained only by comparing countries using an integrated perspective. Perhaps this article's most important contribution is that we can draw no single picture of happiness in Asia, but must develop potential Asian models of well-being.

SARAÇ, MELIKE (Hacettepe University, Turkey)

Change in Sex Ratio at Birth in Turkey: Any Hints for Son Preference?

Unless there is any external intervention, the sex ratio at birth as the outcome of a biological process is expected to vary within the interval of 102-106. In societies where son preference is quite salient, there is external medical intervention to the process determining the sex of the child. Studies on the countries of Far East and Central Asia resort to a three-factor model to explain increasing sex ratios at birth in these countries. The first factor in this model is the "*supply factor*" which is the availability of technologies used to identify the sex of the foetus. The second, "*demand factor*" is related to son preference in a given society, and the third, which is called the "*squeezing factor*" is the low level of fertility that forces parents to sex preference. Turkey seems to be a country that all the three factors meet at the time of fertility decline. In this sense, the objective of this study is to find some hints regarding son preference in Turkey by analysing changes in sex ratio at birth based on the number of living children, birth cohort, birth order and the sex of previous children. Data are from the demographic surveys conducted in the period of 1993-2013. The results show that the sex ratio at birth remains within biological limits in Turkey at overall level, however in cases where the first child is a female, the ratio rises to 120 for the second birth, and further up to 135 for the third child in case the first two children are both females. These results show that with declining levels of fertility in Turkey families alter their fertility decisions, and increase the number of children they have in order to have at least a male child, in line with the stopping rule.

Hybridization Process of Premarital Practices in Turkey

In the process of rapid socioeconomic changes in Turkey, the structure of premarital practices such as asking for girl's hand in marriage, betrothal, engage-

ment, henna night, trousseau exhibition, bachelor party, religious ceremony and wedding has been changing over time from traditional to modern. The main research question of the study is as follows: "How the direction of premarital practices changes over time? In this sense, the study aims to make a clarification whether the direction of changes of the premarital practices towards modernization or hybridization. To answer the research question, the study uses the data from 2006, 2011 and 2016 Family Structure Survey conducted by Ministry of Family and Social Policies and Turkey Statistical Institute. All the analysis in the study were conducted on the basis of survey years from 2006 to 2016 and marriage cohorts from pre-1950 to 1996-2000. Together with descriptive analysis, a series of logistic regression analyses were also performed in the study to understand the direction of the changes in premarital practices. The preliminary findings of the study put forward that the frequency of all the premarital practices is on the rise in Turkey by both survey years and marriage cohorts. However, this is not an absolute disengagement from traditional practices, it is just a transition to a variant of modernization that keeps the traditional veins into the premarital practices. In other words, Turkey experiences a hybridisation process that traditional and modern practices exist together in premarital practices. This variant of modernization process appears to be in line with the arguments on hybridized adoption of modern practices as proposed by Development Idealism Theory suggested by Arland Thornton.

Authoritarian Populism and Restructuring of the Agri-Food System in Turkey

This paper will explore the social and economic impacts of changes in agri-food policies under an authoritarian populist regime in Turkey. Since the late 1970s, Turkey has adopted a neoliberal restructuring program that included economic liberalization under authoritarian politics. The neoliberal restructuring plans included integration with global commodity markets, changes in food production, processing and retailing. This process favoured mid-to large scale farmers producing for domestic and global supply chains, radical changes in support pricing and purchasing programs, and dismantling of agricultural cooperatives. Results of these changes led to further depeasantization in the countryside. Since the early 2000s, we see a new trend towards right wing authoritarian populism, typical to other newly industrialized countries. During this era rural-urban migration intensified, and the agri-food system further integrated with the global supply chains. In this process anti-elitist and nativist discourses served to divert the resentment of peasantry and working class against neoliberalism of the earlier era while pursuing the integration of the agri-food system with the global economy. What was particularly notable was the seeming hegemony of this regimes among subordinate groups and in rural regions. This paper will examine the intersectionality of actions and priorities of domestic bourgeoise, transnational capital industrial and financial capital and political elites and the politics of opposition within the context of authoritarian populism.

Digitalization in the Coordination of Elderly Care in Germany and Sweden: The View of Actors

The coordination of healthcare (HC) and long-term care (LTC) services for the elderly is a major issue in all societies. The elderly´s complex care needs involve a number of different actors and professions. In this context, communication and collaboration are major challenges. E-health appears as promising solution for improving processes and quality of care. For a successful implementation, it is necessary to take on board all relevant actors in the field. However, there are significant institutional and organizational obstacles to such improvements, which also vary between countries. This contribution investigates how different actors in the field view the potential of E-health for the coordination of elderly care, which barriers they identify and how these should be tackled. Considering the situation in Germany and Sweden, two cases are compared which are at different stages of implementing E-health.

Following a comparative whole-systems-approach combined with actors' perspectives, E-health is conceptualized as key aspect of functional integration providing tools to facilitate communication within and between different actors and sectors (Valentijn et al. 2015).

Data originate from 27 expert interviews with representatives of organizations which are active in elderly care in Germany and Sweden. Method of analysis is Mayring´s Qualitative Content Analysis with a focus on structuring data.

Preliminary results indicate that most actors assess data sharing and online communication as promising to increase continuity and efficiency of elderly care. Nevertheless, even in the context of E-health coordination problems are (re-)produced including persistent structural problems at the system level and problems related to technological and social innovation. Supporting care coordination, E-health applications need to be inclusive or at least compatible for information sharing across all actors and sectors involved in care provision.

Racist Mobilisations and Sexualisation in the 'refugee Debate' in Germany

Ever since the "long summer of migration" in 2015, refugees have been at the centre of a public debate in Germany and have frequently been discussed in negative terms. This applies to a particular strand of the debate in which the racialisation of sexism gains discursive sovereignty, with a racist interpretation and delegation of sexual violence.

To explain this phenomenon, we will begin by sketching attitudes to immigrants in the Federal Republic of Germany (West Germany) and the German Democratic Republic (East Germany) since the end of WWII, considering Germany's colonial past and the period of National Socialism. Taking into account the results of postcolonial and critical whiteness studies (Hall 1987, Stoler 1995, Tucker 1996) and by considering the functionalisation, social categorisation, and racially motivated rejection of immigrants, together with the relevant legislation, we can throw light on this current discursive figure from a historical perspective. Using selected examples such as the events in Cologne on New Year's Eve 2015/16, we will show how the racialisation of sexism works, and the meaning attached to it by supporters of the far right. The latter are keen to externalise sexualised violence, which absolves their own 'people' and at the same time there is a broad tendency in the public to accept such interpretations, which creates a fertile ground for racist and authoritarian ideas.

Thinking about Sustainability through a Critical Perspective on Everyday Practices

In my contribution, I will present a critical perspective on everyday practices grounded in my ethnographic research on food practices in Bolivia. I argue that the everyday food practices of the privileged middle class in the Bolivian city of Cochabamba oftentimes reproduce colonial power relations. The analysis of these practices is based upon a Bourdieusian theoretical perspective. As the concept of the *habitus* suggests, everyday practices are structured by the immediate and wider socio-political context. In order to take into account the postcolonial context, I bring Bourdieu together with Quijano's *coloniality of power*. Thus, the *habitus* is structured by the continuation of colonial power relations even after the end of formal colonial rule. I argue that Quijano's notions of the materiality of exploitation as well as the colonial structuration of the imagination can be consistently combined with the Bourdieusian habitus. In order to ontologically bring out the role of everyday practices within larger societal structures, I embed this theoretical perspective in critical realism as developed by Bhaskar. Following critical realism, everyday practices are surface phenomena driven by underlying structures and mechanisms. Thus, a critical analysis of everyday practices requires an understanding of such underlying structures and mechanisms, such as bureaucratic systems or markets. This shapes a different way of thinking about the (un)sustainability of everyday practices: A transition towards sustainable practices requires a critique of underlying structures as well as the development of alternative practices that challenge these structures.

Methodology of Social Research As an Expertise to Provide Precise Environmental Knowledge

Methodology of Social Research (MSR) is an expertise that environmental sociology can provide environmental knowledge. Precise knowledge is useful for governments and NGOs to make better policy and better solutions and for citizens to do more pro-environmental behavior (PEB). However, it's sometimes difficult to distinguish between well-designed social research and lay research.

In this presentation, 1) the role of social research for providing environmental knowledge, and 2) some issues on conducting well-designed surveys in Japan are discussed.

By conducting a survey for random-sampled people, we can see how people concern about environmental problems, whether they support their government's policy and what kind of PEB they do. We already have many findings on what promotes PEB. We can carry out not only cross-national research like ISSP but also a trend analysis on longitudinal data. For example, according to surveys conducted by Japanese government, people want the government to focus more on social welfare and economic boost rather than on taking care of environmental issues for many years.

When the survey is conducted properly, it's a well-designed research to provide precise environmental knowledge. Unfortunately, in Japan, some surveys are carried out inappropriately. Nevertheless, those surveys aren't well-designed, sometimes more than a little people respond to them. Because in Japanese educational system, not every people learn the MSR, so they tend to trust a research conducted by "a lay researcher" as well as they don't care about the importance of the MSR. Based on the data provided by lay research, for example, policy makers might lead citizens to a wrong way.

MSR is an expertise environmental sociologist have as a useful tool for providing an environmental knowledge properly, so we need to put more emphasis on the importance of MSR and try to get rid of lay researches.

Challenging the Course of the Civilising Process in the Constitutional Framework of the Rule of Law: Poland Since 2015

Challenging the course of the civilising process in the constitutional framework of the rule of law: Poland since 2015

Referring to Norbert Elias's concept of the process of civilization, I will examine the political program of the Polish Right after 2015 as a form of a civilizing offensive. Although the prevalent tendency is to perceive right-wing populism as a phenomenon related to decivilizing processes, I will argue that in Poland, the conservative-national Right has launched a civilizing offensive, expressly addressing the aspects of contemporary culture which are labeled "liberal" as a threat to social coherence, interdependence and self-constraint. I will focus on the right-wing critique of the rule of law as a civilizing mechanism. By analyzing the constitutionalist and political discourses in Poland after 2015 related to the reform of the judiciary, the LGBT rights and abortion, I will map the constitutive elements of the image of the "left-liberals" as a carrier of de-civilisation construed by the Right. My goal is to offer an understanding of the constitutional effects of what could be termed an anti-liberal civilizing process.

How Youth in Rural Ghana Became "Cadres"? - Life Story of Actors in Popular Movement Under 1980's Military Rule-

This presentation focuses on actors from rural Ghana and aims at discovering the subjective meaning of popular movement from their perspective.

The case examined in this paper is movement so-called "revolution" during 1980s in Ghana. In 31st December 1981, Flight lieutenant J.J.Rawlings and young officers made a coup and established left wing military government Provisional National Defence Council (PNDC). PNDC set up grass root institution to let ordinary people participate to decision making and take initiative to fight against corruption at each community level. Those who involved in this institution called themselves as 'cadres' and various activities were carried out under their leadership. Especially in the rural area, it became self-help movement of collective effort for improvement of their environment. Youth started holding community meeting, organized vigilante group against armed robbers, and mobilized people to establish school, dam, cooperative farm, community clinic and so on.

Three former cadres are picked up in this presentation. Life-story is used as an approach to trace the process how they became 'cadre' with focusing on their intention and motivation before, during and after the movement. The presentation doesn't intend to treat them as collective subject but treat them as individual, aiming at engaging with key concepts in today's movement study in African context: personalized commitment, individualistic subjectivity, and fluid identities. Their different story allows us to get insight of complicated dimensions and multiple meanings hidden under the phenomena which is usually observed as one event. At the same time, we can also find some common pictures. Those who reacted to the movement in very initial stage, in most case, were those who were not happy with authoritarian system of traditional community. They subjectively interpreted "revolution" as opportunity to execute their own project to bring a change, not just be involved into government-lead project.

Intergenerational Relations in Transnational Families: Connected Despite Distance?

Intergenerational support is an important characteristic of family relationships, especially in times of globalization, transnationalisation, and aging societies. Today, very few families live permanently in the same household or under the same roof. Instead, adult family generations are generally characterized by multi-locality, raising the question of solidarity patterns. However, most studies have mainly addressed intergenerational relationships of the native population, whereas migrant and transnational families have often been neglected or limited to a specific (ethnic) group. Yet, against the background of contemporary multi-ethnic and transnational societies, empirical studies of intergenerational relations of migrants are particularly crucial. This is especially true since experiences caused by migration as well as the situation in the host country can greatly affect intergenerational relations, not least in respect to support patterns.

Therefore, this contribution examines the extent to which family solidarity depends on the local and ethnic background of the generations. Research questions are: Does multi-locality inhibit intergenerational solidarity and cohesion? Which specific solidarity patterns can be identified in regard to population groups (natives vs. migrants) and within various migrant groups?

The empirical analyses are based on the new representative study "SwissGen – Intergenerational Relations in Switzerland". The survey was conducted in 2018/19, including more than 10,000 respondents from 18 to 100 years in all three parts of Switzerland (German, French, and Italian Switzerland). The analyses prove that adult family generations are strongly connected through social interaction and cohesion. However, in addition to cultural variations in Switzerland, we can observe that migration strongly affects intergenerational cohesion, conflict, and ambivalence. This especially applies to aging family members – and in particular to aging family generations living in different countries. Furthermore, we also find specific patterns of different groups of migrant and transnational families according to types of migration, duration of stay, citizenship, and country of origin.

Unequal Prospects? the Expectations of Receiving and Leaving Inheritances in Europe

Support among generations is, along with the intergenerational transmission of education and concomitant unequal opportunities and insecurities, an important characteristic of family relationships in contemporary societies. Although various forms of functional solidarity between generations have been frequently well researched, little is yet known about the influence of social inequality on intergenerational solidarity. Moreover, the majority of past research overlooks this complexity of the intergenerational transmission for social inequality. Therefore, the paper addresses this research gap and examines the determinants of inheritances in the context of social inequality by analyzing the expectations of receiving and leaving inheritances from a transnational perspective and on three levels: individual, family, and society. The analyses focus on the questions of (a) who expects to receive an inheritance, (b) who expects to leave an inheritance, (c) the link between receiving and leaving such transmissions, and (d) variations between countries.

Our analyses are based on pooled data of the Survey of Health, Ageing and Retirement in Europe (SHARE), including 14 European countries: Austria, Belgium, the Czech Republic, Denmark, France, Germany, Greece, Ireland, Italy, the Netherlands, Poland, Spain, Sweden, and Switzerland. The findings prove that inheritances are an important feature of intergenerational support across Europe. However, the situation varies widely across countries, both for receiving and leaving an inheritance in the future. Moreover, the multivariate analyses offer evidence of class-specific patterns and thus highlight the perpetuation of social inequalities over generations. We find strong connections between intergenerational solidarity and social inequality. Members of higher classes are much more likely to expect the receiving but also the leaving of a bequest. This especially applies to large sums. In addition, those who expect to receive a considerable inheritance in the future are also much more likely to expect to pass on wealth to the next generation.

Locating "the Market": The Case of Garbage Collection and Recycling in India

This paper bridges economic and environmental sociologies, first, by turning upside down standard conceptions of "the market" as located in formal corporate forms. Using a case from Delhi, India, where public-private partnerships have been formed promoting truck-based garbage collection and incineration instead of existing systems for informal recycling, I show how mainstream economic sociology's tendency to focus on "modern" formal "markets" can obscure practices and institutions that are in fact more environmentally sustainable and socially just. In this case, the classic Polanyian insight that states engender markets is evidenced by the fact that new markets for garbage were produced by Indian national legislation that sought to make garbage systems more robust and streamlined, offering new sources of revenue for corporations. Moreover, international incentives such as UNFCCC carbon offsets and World Bank recommendations resonated with local leaders' own motivations to "clean up" the city (in an aesthetic rather than environmentally sustainable sense) and to issue large contracts (Kornberg 2019). The creation of these kinds of internationally legible institutional forms, however, obscured the enormous yet informal economy of garbage collection and recycling. Based on social relations of various forms and sensitive to its own global commodity chains for materials such as plastics, the informal recycling economy had processed up to 40% of the city's waste, diverting garbage and providing millions in Delhi alone with a living. I argue that this situation sheds light on the fact that making economic sociology relevant to environmental sustainability involves theorizing greater institutional hybridity, following Polanyi in particular. Specifically, recognizing greater variation in the meaning, materiality, and relational structure of "markets" is important for identifying the specific features that might enable or constrain urban sustainability.

Migrant's Belonging and Identity Formation in Host Countries: Analysis of Factors Shaping Integration

Successful integration of immigrants into new societies and labor markets is considered a key for reducing xenophobia and lessening anti-immigrant sentiments in receiving countries, as well as creating cohesive and better functioning societies. From the perspective of host countries, open identity of migrants and their sense of belonging to their host country and community is important for the integration. Since Latvians are one of the most mobile European nations (about 10% of the population emigrated within 20 years), theoretical and empirical analysis of the concepts of belonging, identity formation and integration attract significant attention by social scientists.

The aim of this paper is to highlight identity formation and integration aspects from the perspective of different groups (by age, ethnic background, gender) of Latvians living abroad. Formation of the sense of belonging is a rather complicated process. People who leave homeland and move abroad develop new feelings to places and social groups and simultaneously overcome the internal contradiction between the willingness to blend-in and the wish of staying unique and different from the rest. Based on quantitative longitudinal data, we explore how migrants integrate into local communities and how emigrants' identities and attachments to different countries change with time – do they retain their national identity, do they integrate in terms of belonging and identification with the host community, or do they develop a new global or European identity? Special attention will be paid to the way how Latvian migrants negotiate their identity in the context of 'liquid' migration and transnational living.

The analysis is based on the data collected in two large-scale web-based surveys: the first in 2014 (ESF grant "Latvian Emigrant Communities", n=14068) and the second in 2019 (Latvian Council of Science grant "Exploring Well-being and Social Integration in the Context of Liquid Migration" No. lzp-2018/1-0042).

State Violence and the Knowledge Situated in Migration – Challenges for Critical Scholarship

Critical scholarship on racist police violence in Germany and on institutional racism in the German criminal justice system are incipient fields of academic knowledge production, developing thanks to vibrant grassroots organizing around these topics, and often explicitly rooted in it. In the recent years I have conducted fieldwork with West African asylum seekers under pending deportation in Germany in a research project aligned with this scholar-activist tendency / scholarship emerging from activism, analysing state violence and racist criminalization. This paper reflects on the challenges of academic knowledge production conducted with persons and groups made vulnerable by excessive state violence. Adopting a materialist understanding of knowledge production, it argues that the (methodological) centering of the perspective of migration, of the knowledge of those directly affected by racism – people of colour and migrants – must be conceived in broad terms. Researchers positioned in the academia – and in activism – cannot only epistemologically prioritise this perspective on institutional / structural racism but must seek to also to materially contribute to the empowerment of the communities they research with. This requirement brings with it inevitable dilemmas concerning limits, access to resources and broader power relations. Looking at my own fieldwork and research project as a case study, the paper reflects on these dilemmas, but also on the political gains and new perspectives produced in this kind of research.

Social Stratification and Inequalities in the United States: Rethinking the Legacies of the Long Nineteenth Century

Recent debates in development and American studies have been reassessing the role of territorial expansion in U.S. ascendency in the long nineteenth century. Using a major new database, we engage these debates to evaluate and specify more precisely how global elites intervened in the formation of the U.S. continental system—and how these interventions shaped patterns of inequality and selective migrations in an era of territorial expansion, resource extraction, and industrialization. This paper draws upon our World-Magnates Database—a standardized collection of information on the wealthiest individuals in the world-system from 1500 to 2017—to reassess key social science assumptions about capital accumulation in the *longue durée*. Our data, identifying the specific activities through which these world-magnates became deeply embedded in U.S. continental expansion, highlight the importance of three interrelated processes at work in this period: (1) the violent organization of extraction; (2) the transport revolution and the ascendency of the railroad; and (3) the industrialization of warfare. The forward and backward linkages implied in these developments, the American Civil War, the twilight of the plantation system, and the genocide of indigenous populations in the western territories, are part and parcel of this trajectory. Alongside Schumpeterian theories of innovation and monopolization, we use our data to trace the ways in which the innovations driving expansion were inherently exclusionary, with the goal of bringing exclusion back in, alongside exploitation, as a key feature of social inequality and capitalist accumulation. Such a perspective, we argue, allows for a better understanding of the contemporary legacies of social stratification, migration, and empire.

La Discipline De L'instinct: La Jeunesse De Machado De Assis

Ma recherche prend pour objet la période de 1860 à 1870 et la consolidation de Machado de Assis comme critique théâtrale et littéraire, ainsi que ses débuts dans la poésie et le théâtre. Cette période comprend le processus de stabilisation sociale de l'écrivain, dans le sens d'être le moment de la stabilisation professionnelle au sein de la bureaucratie d'État, ainsi que la période au cours de laquelle il se marie, un moment important car, dans une société esclavagiste et fils d'un père noir, sera déterminant pour le processus de "blanchissement" pour la circulation dans les espaces d'élite. Deux facteurs importants seront les objectifs: la relation avec un groupe de poètes d'origine portugaise, tels que Faustino Xavier de Novais, un ami que Machado de Assis a connu rencontré en 1858 et avec qui il a accroché des relations d'amitié et des échanges d'affinités esthétiques, arrivant à éditer un magazine de collaboration écrivains brésiliens et portugais, *O Futuro*, entre 1862 et 1863, et Francisco Gonçalves Braga, l'un des premiers modèles poétiques de l'écrivain brésilien; et le mariage avec le frère de Faustino Xavier de Novais, Carolina Xavier de Novais, en 1868. Au-delà des relations avec les d´autres Portugais,

je crois que ces deux éléments sont essentiels pour comprendre les positions esthétiques de Machado de Assis et révèlent le timbre de sa stabilisation sociale, affichant la trajectoire de l'ascension sociale qui aboutira à son mariage avec la veuve portugaise, élément déjà conditionné par sa position en tant que critique et sa stabilisation professionnelle en tant que membre du second rang de la bureaucratie fédérale brésilienne.

Self-Reliant, Philanthropic Startup Citizens? Exploring the Relationship of Startup Culture and Citizenship in the Nordic Welfare State

In this paper, I inspect the formulations of risk, uncertainty and failure in the discourse of Finnish startup entrepreneurship and consider their implications on Finnish citizenship. I frame my analysis with discussions on post-industrial citizenship in the Nordic welfare state.

In the knowledge-based, service-oriented economy of 2010s Finland, startup entrepreneurship and new ventures have become increasingly important for national competitiveness. The success of notable Finnish startup companies and the renowned startup event Slush has helped define Finland as a place of innovative startups, which has spurred discussions on Finnish startup culture and its development. Varied selection of popular guidebooks and nonfiction literature discussing the nature of startup entrepreneurship in the Finnish context has emerged in the 2010s.

Coincidently, it has been noted that, with the introduction of incentive thinking and workfare models, the citizenship of the Nordic welfare state is shifting in the postindustrial era. Currently, proactivity and self-reliance are emphasized as ideal traits of citizenship, which echoes the neoliberal ethos of entrepreneurial citizenship. Citizens are viewed as active participants instead of passive objects of interventions. Mirroring this, risk-taking abilities and withstanding uncertainty are defined as central abilities in the startup discourse.

Drawing on my empirical work on Finnish startup guidebook and nonfiction literature, I argue that the startup discourse taking shape in this literature constructs a citizenship in which risk, uncertainty and failure are internalized by the subject and turned into a resource. This resonates with the discussions on postindustrial citizenship that accentuates flexibility and entrepreneurial capabilities.

Simultaneously, however, the meaning of community, goodwill and nationalism are highlighted in the Finnish startup discourse, which produces a citizen who both embraces risk-taking and uncertainty and who is eager to give back to the community. Therefore, the notion of risk-taking is intertwined with the Finnish discourse of nationalism and egalitarianism.

Actor-Relational-Approach (ARA) and Systems of Social Work in Finland and Kazakhstan

Actor-Relational-Approach (ARA), developed in the field of planning theory by Luuk Boelens, combines Actor-Network-Theory (ANT) with Urban Regime Theories and theories of Associative Democracy. ARA is a pro-active alternative, re-assembling of spatial planning in an actor-oriented way, including several stakeholders and actors. ARA working scheme consists of following seven steps:
Interpreting the problem by determining the focal actors and unique core values
Actor identification and actor analysis
Opportunity maps and developmental possibilities
Bilateral talks and round tables
Cases and pilots
Practice development and general outlines
Democratic anchoring
In this study, we utilize ARA to examine and evaluate a case of current 2018 – 2020 collaboration project FinKaSo. The aim of the project is to develop social work education in Finland and Kazakhstan. Additionally, the goal is to support modernizing social services in the case of Kazakhstan. This study aims to increase understanding of how the project activities may find their way in the systems of education and social services in two, seemingly very different countries.

Reflection in Action – Reflective Practitioner in the Digital Era

In 1983, Donald Schön published a title: *The Reflective Practitioner, How Professionals Think in Action*. His book has become a wide-read classic across disciplines and fields of practice. Furthermore, Schön's long-term collaboration with Chris Argyris has resulted into many influential publications especially in the fields of management and organization studies. Their lifework, both practical and theoretical has focused on concrete daily challenges of organized activity. The themes of their studies include considerations relevant to individual, group as well as organizational activity. In fact, the focus is how these all interact. In terms of reflection and reflexivity, Argyris and Schön have modelled the complex feedback processes in these interactions. Their specific interest has been to learn more about how to achieve organizational effectiveness, and how various feedback processes play their role in them.

In this practice-oriented, theoretical paper, the work of Argyris and Schön is scrutinized in terms of its relevance in the current digital era. Following the idea of Schön's book, the aim is to study how professionals think in action in the digital era. In order to update the profile of a reflective practitioner to match the digital era, the work of Argyris and Schön is contrasted with current research, for example insights provided by science and technology studies, focusing on digitalization.

KOTTMANN, NORA* (, Japan)

"We Are All One Extended Family in This House!" Shifting Boundaries of Housing and '(Post)Familial' Relationships in Japan.

Not getting married and starting a nuclear family is increasingly common around the globe. But not only notions of 'family' and relationship worlds are diversifying, so are living arrangements: Living alone, but also sharing housing is becoming more and more common (Heath 2018; Jamieson/Simpson 2013) – especially in urban areas. For investigation the shifting boundaries of housing and '(post)familial' relationships and their reciprocity, Japan can serve as a great case study: Experts are anticipating the emergence of a 'Hyper-Solo-Society'; living alone is becoming common (mostly among women) and a commercialized shared housing market is emerging. However, the absolute majority of unmarried adults are staying at their parents' home and the rates of cohabitation are extremely low.

Based on qualitative data from an ongoing field study in Tokyo (interviews and participant observations), this paper addresses the following questions: How are housing and '(post)familial' relationships interrelated and which importance do the former have for individuals, their life and their doing relationships? How are dwelling spaces perceived, used and constructed with regard to understandings of 'family'? Focusing on members of a housing project with approximately 60 individuals who call themselves an 'extended family' (*kakuchō kazoku*), the findings reveal: Housing – and depictions of dwelling spaces like differing notions of privacy, trust, belonging, sharing, feeling home – are highly interrelated with various '(post)familial' relationships and their doing. 'New' spaces are actively – and in some cases supported by stakeholdersfrom politics or economy – created and done by people living 'new' or rather unconventional relationships – some of them being called 'family', some not.

The Role of Social Ties in Young Migrants' Integration Strategies in the EU

The dynamic processes of European mobility pose numerous challenges to the social integration strategies of young European migrants. The paper examines migrants' experiences in several life domains and tries to establish patterns of life strategies of mobile individuals. It focuses on migrants' agency for maintaining, breaking, creating, accumulating and mobilizing social ties in manifold layers of context in the place of departure and the place of arrival. Social networks created at home are under the pressure of new ones formed in the countries of arrival. Old friendship ties wane with time if not backed up by common mobility experience, and new friendship ties arise from interactions at various social places in the host country - workplace, neighbourhood, and leisure activities. The sought-for life balance is impacted by the images of 'here' and 'there' and 'beyond'.

The paper examines the role of social ties in the diverse integration strategies of migrants drawing upon data from a qualitative study under the framework of GEMM project funded under the EU Horizon 2020 Program. We use a rich data set of interviews-in-depth with 154 migrants coming from two countries traditionally sending migrants (Bulgaria and Romania) and two countries which recently

became 'sending' countries (Italy and Spain) and arriving in the receiving countries of the UK, Germany, Italy and Spain. Besides the causes and consequences of the different sending and receiving contexts, we consider the impact of social inequalities on structuring young people's friendship ties in terms of migrants' educational and skill level, gender and family status.

Community Justice and Feminist Care Ethics: The Experience of Women Community Agents in Mathias Velho, Canoas, Brazil

Over the past decade, several projects on community justice have been implemented in Brazil under the execution of the National Program for Public Security and Citizenship (PRONASCI). The Violence Prevention Center, located in the Mathias Velho neighborhood, in the city of Canoas, Rio Grande do Sul, stands as one of them. This study aims to understand, on a local level, how nine women trained as community agents in Mathias Velho have shaped their role under a critical feminist perspective. This study used ethnographic research and qualitative data analysis, with the methodological approach being based on grounded theory. In short, the main results indicate a twofold process on the formation of the women's role as community agents. First, they largely resort to a discourse of care as a way to assert their positions, which mainly reflects the idea they should care for the community. Second, the presence of care work is highly connected to their perceptions of state institutions as flawed and inefficient, and to the non-use of law in their activities. These phenomena are then analyzed under the debate of feminist care ethics. In relation to this specific case, the overloading with unachievable expectations for their work and the use of conservative discourses have resulted in the women seeing themselves primarily as care, rather than legal, workers. This, in turn, reproduces rather than challenges sexist social structures. In short, this study stands as an ethnographic attempt to understand the relations between care work and the absence of law in the role formation of women community agents. It provides a feminist analysis of the use of care as a main strategy for achieving community justice, and uses a field-oriented approach to identify how it can be critically evaluated under the debate of ethics of care.

Exploration of Tibetan Buddhism through the Social Constructionist Approach

James Beckford, in his book "Social Theory and Religion", proposed a "modest" social constructionist approach to religion [2003: 3].

According to him, religion is a social phenomenon, which, when explored by stiff scientific concepts and definitions might appear as limited and incomprehensible. Therefore, in order to properly understand religion, its role and place in the society, he proposes to analyse cultural and social accounts that influence religious experience, values and activities. Moreover, the components of social negotiation process dedicated to religious definition and meaning.

Relating to his approach, I would like to discuss the example of Tibetan Buddhism practised in exile by lay and ordained practitioners. Drawing conclusions from a four-year field study conducted in India and Nepal among Tibetan Buddhists I would like to evoke the subject of religious transformation and change. Discuss how old Buddhist tradition changes under the influence of globalisation and culture of hosting countries. Deliberate on the subject of negotiations taking place between members of two social worlds (lay and monastic) dedicated to construction of their Buddhist reality. Referring to these issues, I would like to answer the question of what is Tibetan Buddhism for those who practice it in exile.

Rainbow Republicans: Unpacking Identity and Community for Conservative LGBT People in the United States

This paper explores the identity of politically conservative members LGBT people, specifically interrogating why political narratives that characterized the 2016 presidential election might have been more appealing to LGBT conservatives than the Democratic policy proposals aimed specifically at increased equality and protection for the LGBT community. These members of the LGBT community are predominantly white, upper-middle class, and male, and are motivated by a desire to maintain a particular social, political, and economic status quo and belief in anti-redistributive ideologies, despite their advocacy for greater LGBT equality and inclusion. I argue that these predominantly homonormative LGBT people,

who are folded into nationalist discourses, benefit from a perceived social acceptance of the LGBT community as a whole. In particular, there may be a propensity to identify with threats posed to national identity over one's LGBT identity. Understanding the affinity of conservative LGBT people with their Republican peers over other members of the LGBT community highlights many of the problems with political advocacy organized around a community as diverse as that of LGBT. Such advocacy has often prioritized the needs of certain members of the community over others, failing to account for the matrix of domination that informs people's experiences of marginalization.

How Is Social Class Lived? Conducting Interviews from a Phenomenological and Biographical Perspective

Class analysis scholars have been prolific in studying social reproduction and mobility. These studies usually utilize quantitative strategies to examine trajectories from a life course perspective and show strong results regarding the macro-social analysis on how social classes shape material conditions and, ultimately, social destinies. However, how is class belonging actually lived by its members? How are social inequalities produced and reproduced in everyday life? The present paper aims to reflect on how to conduct qualitative interviews from a phenomenological and biographical perspective within the framework of class analysis. Three main guidelines are proposed and developed: (a.) The focus of the interview should not be the facts in the life trajectories, but the actors' sense-making of their decisions and everyday activities; (b.) which should be addressed through lived-experience descriptions; (c.) in search of understanding concrete ways of human existence or, in other words, understanding the Other in the variability of sociocultural life-worlds. Types of questions and topics of interest to be included in the interview are exemplified.

The Authoritarian Bias of Labor Reform in Brazil and Unfulfilled Promises

The presentation aims to analyze the impact of the Brazilian recent labor reform on market and labor relations and the new proposals of labor regulation with an increasingly authoritarian bias. After two years of its implementation, the promised results of the reform have not being delivered, especially in boosting economic growth and generating employment. Informality, even lowering the level of rights, continues to advance. The achieved results are to weaken the unions and make it difficult to access the mechanisms of labor right protection. In short, the changes in the legislation have deepen the precariousness of work and have left workers in a situation of greater vulnerability and insecurity. The lower level of social rights, in an environment of structural workforce surplus, tends, consequently, to generate low-income activities and long hours, contributing to establishing a process of continuous disruption of the labor market. The authoritarian bias of ultra neoliberal policies is present in the new rounds of reforms, among which stand out: 1) Economic Freedom Law; 2) labor and union reform, based on a "Notable Commission"; 3) "Yellow Green Card" with social security capitalization system. The authoritarian bias tends to weaken the institutions of workers' representation, expanding the freedom of capital in determining the conditions of hiring, use and remuneration of labor. The presentation, on the one hand, will show a set of indicators to analyze the impacts of the reform. On the other hand, it will analyze the new proposals that change the regulation of work.

KREISSIG, VOLKMAR* (TU Dresden, Moldova)

Governance and Participation in German/Austrian/Netherlands/Swiss Model Versus Anglo-Saxon Model – Can Models Guaranty More Successful Governance? Is Participation of Stakeholders Able to Prevent Miss-Management and Capitalist Exploitation?

The presentation is based on during 25 years made empirical studies of governance and participation in different countries.

The German/Austrian/Netherlands/Swiss model allows not only share- but also stakeholder oriented participation in governance systems. Employees participation and internal firms knowledge can influence decisions better adapted to markets and stakeholder needs. But models only do not guaranty per se better governance and protection of stakeholder interests. Decision making failures and ignorance of stakeholders interests are not excluded by the model. German "diesel scandal", failed taking over of US, British and other firms brought big German firms losses on share markets and not calculated risks. Despite of stake holders and employees participation knowledge based influence opportunities by the works councils and union members in the decision making processes studies have shown.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

A model with wider opportunities of employees- and stakeholder-participation is not per se more resistant against failures in decision making, does not guaranty protection against autocratic and ego-maniacal leadership as well as corruption. There is a need of more common sense thinking and public information as well as of transparency in strategic decision making processes. There are often not enough self-management impulses to optimize decisions and to orientate firms policies to prevent short term maximal profit goals. Stakeholders and employee representatives could more active participate in governance. Individual and collective reasons for active influence have studied in future. The orientation of firms policies should be on long term social compulsory profits and strategies which are pee-engaged to world wide environment protection, descend work and fair trade strategies. The realization of North-, South-, Cancun-, WTO-, UN-climate change and biodiversity summits targets need participation and more engagements of stakeholders and employees on enterprise governance level, new firm strategies and long term profit orientations.

KREISSIG, VOLKMAR* (TU Dresden, Moldova)

Participation, New Governance and Social Trust

There is a need for change of conditions for growing trust:

Participation and new governance has to be implemented by development of new social trust criterion's.

Development of new future oriented paradigms will be connected with new governance indicators and mechanisms.

There is a need of solution of bundles of environmental, social and economic global problems.

Political global solutions need new mechanism and networks of governance actors which are necessary influencing governance on enterprise, regional and global levels.

There has to be developed new scientific social and political ideas connected with new forms of governance dealing with global challenges of present and future. Only short term profit thinking is destroying future of humanity life and leading economies into new crisis's. Last financial crisis has shown that financial systems are fragile and not adapted to the new social demands.

Global political conflict solution mechanisms have to be compromised with local and regional governance systems and indicators. Just looking for simple shareholder values and short term profits is not enough to come to new qualitative growth oriented firms policies.

Trust and confidence building measures are working as system how connected with early warning and solutions network. For instance mechanisms as KSZE, Car-producers-networks, energy and water supply networks can get connected with new e-commerce-systems and optimizations on different levels, units and mechanism's.

There should be implemented more responsibility of developed industrialized countries, of individuals and communities for supporting developing countries and people leaving there.

Criteria of social trust in this fields are: safety for future bases of life and humanity as well change of conditions of human life in harmonizing with other life conditions (water, air, earth, energy.)

'Family', 'Care' and 'Transnationalism': Obstacles in Transnational Perspective of Adult Sibling Studies

Transnational studies lie at the heart of modern research of family and migration. At its core, it explores how relation transforms in situation when relatives are separated from each other. Drawing on existing theoretical debates and empirical study of 12 dyads of adult blood siblings who live separately in different city in Russia or in Russia and abroad, I will discuss the "strengths" and "limitations" of transnational framework in the context of study of sibling relations.

Firstly, what does 'family' mean in the context of transnational family studies? During the last decades, numerous researchers in family studies were re-describing and extending this concept but in transnational studies we again return to very narrow vision of family: main actors in transnational family studies are grandmother/fathers, spouses and depended children or adult children and their depended parents. Cases of translocal adult siblingship can extend our understanding of theory and practices of transnational families.

Secondly, transnational family studies focus on notion of 'care' to describe of material and emotional flows between members of transnational families. "Care" substitutes other notions and reduce all diversity of kinship relations to practices of care. It may be enough in situation of transnational parenthood because care is main function of parents. But does care play key role in relations between adult siblings? Is notion of care enough to analyze these relations? And if we say 'yes', isn't this the instance of conceptual inflation of notion 'care'?

Thirdly, discussing notion of 'transnational', we usually refer to sustained ties which are created/maintained across the national and regional borders (Faist, 2006) but how we can measure degree of sustainability of these ties? Rather than

analyzing of presence or absence of it, it would be more productive to emphasis on different degrees of "density" of transnational ties and contexts of their creation.

Governing the Ganges: A Late Modern Ecological Challenge for India's Democracy

While environmental concerns are not new, contemporary society seems to enter an 'ecological era', in which ecological disruptions arising from modernity – climate change, biodiversity loss, water scarcity, etc. – increasingly challenge the cultural tenets and institutional foundations of the modern social order, including liberal democracy (e.g. Luhmann, Beck, Mitchell, Blühdorn). The presentation will contribute an analysis of this phenomenon with a theory-driven empirical study of the governance of the Ganges in India. Considered a material 'lifeline' for more than 40% of India's population and a Hindu deity (Gaṅgā) revered by hundreds of millions, the Ganges is also one of the world's most degraded rivers. It confronts India's democracy with growing tensions between aspirations of modern 'development' and the *related* unfolding of a major water crisis. After Narendra Modi became Prime Minister in 2014, his Hindu-nationalist government declared the rejuvenation of the Ganges a national priority, and it launched ambitious policies under the 'Namami Gange' program and the National River Ganga bill to revive the holy river. These policies provide a prime opportunity to examine *i.)* how structural features of India's liberal democracy – in particular caste politics and Hindu-nationalism – condition the way this regime copes with the ecological challenge of the Ganges outlined above, and *ii.)* how this ecological challenge possibly induces socio-political changes akin to what Ulrich Beck theorized as a 'metamorphosis' of late modern society. The presentation will provide first results of this ongoing research project, including findings of an in-depth qualitative fieldwork scheduled on February 2020.

Les Jeux De L'amour Et Le Marché Aux Amant(e)s : Idéologie Du Jeu Et Idéologie Du Libre Marché Dans Les Applications De Rencontres.

Nous partons de l'argument de Trépanier-Jobin (2018), selon lequel le jeu peut être perçu comme une idéologie centrale dans notre époque, pour discuter la présence de cette idéologie dans les applications de rencontres. Seront analysés les modes de fonctionnement et les aspects esthétiques des deux applications de rencontres, ainsi que les récits médiatiques qui prennent forme dans les publicités de ces applications, et les discours des utilisateurs/utilisatrices. Notre réflexion s'inscrit dans un intérêt de recherche plus large en termes de ludification et marchandisation de la sexualité dans l'imaginaire contemporain. Notre argument est que les applications de dating se rapprochent du jeu en son fonctionnement et dans les discours construits autour d'eux: compris comme des sphères relativement distinctes de la vie quotidienne sérieuse, plutôt liées au plaisir, la liberté, le divertissement, et consistant en un but en eux-mêmes. D'autre part, nous percevons que la dimension du marché est plus masquée dans ces applications, mais présente à travers, par exemple, de la marchandisation de soi dans la construction de profils, l'importance que l'acquisition de certains biens ou services au sein de l'application aura en termes de visibilité et d'accès aux autres utilisateurs/utilisatrices, ou à la présence forte d'une logique capitaliste dans les pratiques d'utilisation, fondée sur des calculs de rentabilité et sur l'idée de chercher une bonne affaire. L'idée est donc de montrer comment l'idéologie du jeu peut masquer une idéologie de libre marché dans les applications de rencontre et dans le dating.

Patients Advocacy within Rare Genetic Disorders in Poland

Project focuses on sociocultural aspects of rare genetic disorders in Poland. Rare diseases make up a large group of diseases (7,000-8,000) that are characterised by a low prevalence in populations (≤5: 10,000 in Europe). However, they affect 6%-8% of the population during their lifetime. They cause often severe, chronic, disabling, and possibly lethal conditions; they not only decrease patients' (and their families') quality of life, but also pose a challenge for public healthcare.

Drawing on ethnographic research in Poland, paper analyses patient activism and novel patient organisations that emerged with the "new genetics" (Rabinow 1996: 99). According to Carlos Novas (e.g. 2015), rare disease patients that he calls "novel populations" (2015: 189) have significantly contributed to "the development of a niche global economic sector focused on meeting specific medical needs". The proposed paper examines the role of patient advocacy groups in the development of healthcare policies regarding rare disorders and orphan drugs (such as National Plans for Rare Disorders) and their ongoing implementation in

Poland (in 2009, the Council of the EU urged member states to prepare and adopt a plan or strategy for rare diseases by the end of 2013 at the latest. It is worth noting that EU recommendations regarding the establishment of National Plans for Rare Diseases have been yet implemented in Poland).

Additional questions arising concerns the issue of "representation" and the creation of biosocialities: since patient organisations tend to primarily represent people who have been afflicted with "more popular" rare disorders (e.g. PKU), while only secondarily looking after those afflicted with the "less popular" ones, e.g. LCHADD or GA-1. How are biosocialities built and how are their activities and priorities negotiated in such cases?

Mapping the Field of the European Social Sciences through EU Funding Schemes

The European Union has invested heavily in a European integration of all sciences in the last decades. Through their Framework programmes the EU has emphasized collaboration across disciplines, borders and sectors. The amounts of money involved has meant that the programmes could reshape national scientific field. Through an analysis of the social sciences and humanities this paper investigates whether the programmes have reinforced or reconfigured existing national and regional hierarchies between universities. Using geometric data analysis we combine data on EU funded research projects from the CORDIS database with indicators of university prestige to create the field of the social sciences in Europe. This analysis will show the "unevenness" of the europeanization of the social sciences and its relationship with the EU research topics.

Being White in Mexico: Status, Beauty and Wealth As Racialized Aspirations

This paper explores concepts of "whiteness" in Mexico based on focus groups and interviews conducted in Mexico City, Mérida, Monterrey, Oaxaca, and three smaller towns in the Yucatan peninsula, covering different socioeconomic sectors. We discuss aspirations to whiteness on two different levels: firstly, aspiring to appear white by improving one's economic position, and secondly, aspiring to have offspring that are whiter than oneself by marrying selectively. The associations between being white, belonging to a higher economic echelon, and being beautiful are analyzed in relation to these two processes of whitening. Similarly, we analyze whiteness as an identity category, as we look into which persons claim to be white in Mexico and which elements are related to a white identity by both self-identified whites and non-whites. Identification and whiteness by third parties is also looked into, as we draw from previous academic literature to discuss whiteness as a contingent, relational characteristic, one that switches according to one's surroundings. Regardless of its contingency, the position of whiteness as a status marker and an aspiration proved to be relatively fixed in most regional and socioeconomic contexts.

Mechanisms of Exclusion in the Transition from School to Vocational Training: Team Fit Is a Major Obstacle for Migrant Adolescents on the German Apprenticeship Market

Even if migrant adolescents possess comparable qualifications to their German counterparts, their risk of exclusion from vocational training is relatively high. Individual level analyses cannot explain this difference. Therefore, we focus on the role of employers as gatekeepers and the mechanisms of recruiting which lead to a systematic exclusion of these adolescents. Our unique dataset combines panel data of adolescents with interview data of employers, thus, allowing us to analyse which selection criteria structure the recruitment process and how they relate to the chances of migrant adolescents to apply successfully for an apprenticeship.

Theoretically, the analysis is based on the conventional approach of Imdorf who argues that companies consist of multiple worlds influencing the recruitment process. When hiring apprentices, employers might not only anticipate future performance but also predict reactions from customers and the team. Our findings support this theory: personnel managers rely on different selection criteria throughout the recruitment process. Besides performance-based indicators such as school certificates and grades, non-performance-related indicators such as team fit strongly affect the hiring decision. This becomes a major obstacle for candidates with a migrant background. Under the pretext of poor team fit, processes of statistical and institutional discrimination appear to influence the decision.

Integrating all adolescents into apprenticeship training is crucial to mitigate the problem of skill shortage on the German labour market as well as to support social integration processes of migrant adolescents. In order to improve chances of migrant adolescents on the apprenticeship market, focusing on their individual qualifications does not suffice. Our study shows that the focus must lie on recruitment practices within the firms. Our findings can serve as a model for other countries as the entry into apprenticeship training in Germany is comparable to other entry labour markets.

Mental Health Professionals' Views on Addressing Parenthood Issues Among Service Users

Families where a parent has a mental illness face a number of risks and challenges. While mothers (or fathers) might be additionally burdened by family and social stressors, the children are at increased risk for suffering from maladaptive parenting behaviors. Family focused practices (FFP) in adult mental health settings refer to the family as the focus of care, recognize family and parental strengths and vulnerabilities, and encourage family choice and collaboration in treatment. Mental health professionals (MHPs) are in a central position to provide support for vulnerable families in regard to parental needs, from preconception to caring for children. In order to strengthen initiatives to develop and implement FFP, it is important to explore MHPs' attitudes towards their roles and responsibilities as well as potential barriers and facilitators to FFP implementation. We conducted focus groups with 15 nurses and 15 psychiatrists in order to examine whether mental health professionals' assess the issue of having children and being a parent as relevant to be considered in a clinical setting, how they describe their roles and responsibilities in this regard, and to what extent they feel willing and able to fulfil these demands. The study results show that while MHPs generally acknowledge the importance of parenting issues for psychiatric treatment, they restrict the relevance of parenting in mental health setting to two areas: clarifying children's situations during inpatient treatment and considering medication issues among (potentially) pregnant service users. MHPs' focus on the adult service user, privacy, and historical issues are the main arguments against addressing parenthood issues.

Reimaging Intersectionality in Social Exclusion in South Africa

This paper focuses on youths' subjective experiences of intersectionality and social exclusion in terms of access to education and employment for marginalised youth in South Africa. The bringing together of two seminal concepts, that is intersectionality and social exclusion, has the potential to enrich understandings and contest dominant and parochial representations of and the social location of marginalised and subordinated social groups while foregrounding the variability within and between groups. This is to demonstrate how, amongst others, race, age, gender, social class, language and geography intersect, and are normalised as exclusionary rules or codes and in tandem with institutional and structural barriers produce unequal material realities and distinctive social experiences. Young peoples' lives are subjected to unequal axes of differentiation, domination, power, inclusion, agency, and authority, and this carries with it disparate rights, duties, opportunities, status and privileges regardless of competence and capabilities. The paper draws on extracted verbatim responses derived from qualitative interviews conducted with Black African and Coloured youth from disadvantaged settings and contexts in the Western Cape province of South Africa. The data demonstrates that the intersection of race, gender, class, age, language, geographic location, or other socio-cultural, educational or political contexts and markers influences youths' unequal, constrained and differential access to education and employment opportunities. This affects youths' transition to adulthood, pathway to economic independence, their upward social mobility, and future outcomes and contributes to their social exclusion. The intersectional and social exclusion lenses unearth the lived realities of youth and provide insight to how power and authority intersect to exclude, marginalise and disempower young people's future outcomes.

KUBOTA, HIROYUKI* (NIHON UNIVERSITY, Japan)

Shared Households and the Transition to Adulthood in Japan

In Japan, one of the changes concerning the transition to adulthood, emerging from the past two decades, is household sharing among young adults—a housing option for those seeking to leave their parents' homes. In 1976, when "one-room" was invented as a smallest apartment for students and young adults, it was said that Japanese young adults would never share flats with unrelated roommates, especially given the country's gendered, family-centered but isolative social norms. However, by the end of the 1990s, young adults began moving into novel types of shared households. These household types gradually increased in number and availability because of economic recession and prolonged young adulthood during the 2000s. Yet, shared households in Japan have drawn less attention in the field of sociology, especially the sociology of family and youth, than in architecture, in spite of their rich implications for the society.

This paper thus explores ways in which young adults' experiences of living in shared households can prompt, hinder, or affect their transition to adulthood, in relation to family, gender and autonomy. Hence, long-term shared householders were interviewed about work, love, marriage, and the possibility of parenthood. In all, 12 interviewees who had lived for more than 5 years in a shared household with non-relatives were snowball-sampled from the metropolitan area of Tokyo between 2016 and 2019. The sample included male and female participants, married and unmarried.

The results exhibited that long-term experience of living in a shared household, especially in the context of Japan's family-centered culture, could challenge the participants' concepts of autonomy and independence. For instance, a 32-year-old woman who had lived with 3 of her friends for 6 years explained ways in which she came to reprioritize her long-term relationship with her flatmates over her possible boyfriend under pressures to marry and have children.

KÜHNE, JANNIS* (, Germany)

On the Move in the Lisbon Metropolitan Area: An Ethnography of the "Caravana Pelo Direito à Habitação"

This paper examines perspectives of residents of auto-constructed neighbourhoods engaged in social movements, through an ethnography accompanying the *Caravana pelo Direito à Habitação* (2017). Initiated by housing activist groups in 2016, it was organized in the context of a residents assembly including four neighbourhoods of the Lisbon Metropolitan Area (LMA): Torre, Quinta da Fonte, Jamaika and 6 de Maio. Its members confronted various political and administrative institutions and sought to find solutions for the problems and unmet needs facing. The Caravana represents an expansion of this struggle beyond the LMA, and the very existence of this initiative draws from a processes of exclusion of large parts of the migrant, afrodescendant, Romany and Tzigane population. This work could shed light on common sociabilities created between residents with different migrant trajectories and experiences in social movements. Concerning here, how common claims and expectations are negotiated and produced in relation to contemporary racial segregation and social housing policies. Migration and advanced marginality (Wacquant, 2008) are at stake here, since one deals with neighbourhoods that exist since the 1980s and are predominantly inhabited by families from the former Portuguese colonies, of African descent and Romany and Tzigane people. It's crucial to understand these places as localities of creativity when it comes to resistance, infra-politics and collective struggle. It is stated that the zones of refuge serve as places of escape, where certain people are pushed to, but simultaneously, where people adapt so they can live in dignity, negotiating with the State. Notions of the right to housing and to "a house", as well as notions of citizenship emphasizing on new urban and insurgent forms, can be read as inceptive counter-politics found in these contexts. Mainly, we are dealing with individuals who reclaim something that has been neglected for a long time.

Engaging Professionals in the Strategic Renewal of Public Service Delivery

It has been widely acknowledged that professionals working in various policy sectors face severe challenges in the execution of their daily work. The realm of the New Public Management urged professionals to be more efficient and cost-effective from the 1980s onwards, and more recently a policy paradigm known as the New Public Governance urges them to collaborate with various stakeholders in horizontal networks. Professionals are expected to co-create public services

with other stakeholders like private organizations and clients. Hence, expectations regarding professionals are 'piling up'. It is clear that public management reforms affect the position and roles of professionals, but *how* exactly professional work becomes reconfigured remains empirically understudied.

We will conduct a comparative case study in the Netherlands to explore how New Public Governance reforms transform professional work. We selected two cases that differ in scope (public value strategy and health and welfare), level (national and local) and focal group of clients (companies and citizens), to ensure we capture a variety of professionals in our data, as well a variety of co-creation processes. Data collection will consist of individual interviews with a manager or professional who is in a lead-position of the professional staff to gain insight into the changing roles and the engagement of professionals, and focus group interviews with professionals as 'regular producers' of public services to map their motivations in implementing strategic renewal processes, and to identify mechanisms that encourage or impede their engagement.

Data collection is planned for autumn 2019 and will allow us to compare professionals' motivations and conditions for their engagement in strategic renewal of public organisations across different policy sectors. We will contribute to the literature on strategic renewal and the role of professionals therein. Besides, our research will lead to recommendations to engage professionals in processes of strategic renewal.

KUMAR, ABHISHEK* (Babasaheb Bhimrao Ambedkar University, Lucknow, Uttar Pradesh, India, India)

Assessment to Act for Environmental Inequality: A Techno-Social Interventionist Approach to Reduce the Ecological Risk

Technology is the forerunner of development, but both are not free from risk of eliminating the critical and crucial components of ecology. Therefore, an all inclusive measure is required to act in an intended direction for an intended purpose to get a healthy and peace ecology. Idea of sustainable development has been introduced for the purpose to include future dimensions into development prospects. However, it could not be achievable in absence of an all inclusive methodology for assessment of multitude of causes & its implication over the ecology & environment. The role of technology is particularly significant here to make the assessment procedures & interventions reflexive. Digital technology, as of great importance for a reflexive mode of development, has capability to transform and revolutionise the idea of safe and sustainable development especially, because of its nature and ability to work with internet networking systems and communication tools. However, lack of socio-cultural prospects can further reduce the digital technology to a level of mere a development oriented technology. A socio-cultural assessment of intersectionality of factors, risks to ecology and degradation to ecological environment, therefore, must be taken into account for combating strategies to environmental problems and risks. Digital technology can transform the market structure, space exploration, species and medical discoveries and most importantly the behavioural pattern towards ecology. Therefore, an approach to spread information about ecological risk among the public should be adopted in the many intervention projects. An informed & engaged public who is reflexive and critical to the application of technologies is the need for a safe and healthy future and thereafter, an inclusive assessment and intervention can only be possible.

Riverbank Erosion, Sustainability and Migration: A Sociological Overview

Water is an essential component for human existence, a lifeline for the survival of all living creatures. All the major civilizations flourished near the rivers only. The rivers in India has a crucial role to play not just for the survival of the people but has 'sacred' importance too in cohabitants lives. There is no doubt that rivers have been contributing abundantly for the survival of the human beings but they have also become troublesome/curse for some especially the people affected by riverbank erosion. Riverbank erosion is an integral part of the functioning of the river ecosystem. Though there is a long discussion on riverbank erosion that whether it is a purely 'natural' or human-driven phenomenon, the focus of this article is to decipher the overview of the impact of riverbank erosion on migrated communities.

Riverbank erosion is a catastrophic problem that displaces people from their land and disturbs their source of livelihood and basic subsistence. According to the recent report of Internal Displacement Monitoring Center, published in 2017, that in India, out of 1,346,000 people internally displaced, 806,000 were disaster-induced internally displaced persons. There are numerous problems arose because of environmental degradation such are homelessness, identity crisis under social impact; landlessness, loss of occupation, poverty under economic impact and health, marginalization, social stress, insecurity, psychological trauma under health impact.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In this backdrop, based on secondary literature, the article tries to investigate how environmental degradation in the form of riverbank erosion impacts migration and displacement. How social-cultural, economic and political sphere of migrated communities get affected the cause of riverbank erosion? How riverbank erosion disturbs the sustainability of migrated communities?

WG05-707.1

KUNENE, HLENGIWE* (University of South Africa, South Africa)

Flooding and Social Inequality: The Nexus of Two Societal Ills Impacting on Vulnerable Communities in South Africa and Malawi

The frequency and intensity of cyclones and flooding ravaging different communities in southern Africa has been a recurrent phenomenon in recent years. This year alone, southern Africa has witnessed the wake of tropical cyclones Idai and Kenneth which ravaged through the already poverty stricken rural and coastal communities of Zimbabwe, Mozambique, Malawi, Comoros, and Madagascar. South Africa was equally affected by severe flooding in April which led to over 85 deaths. Loss of lives and property and exposure of people to such hazards is usually due to prevailing social inequalities that exist within poor societies. Social divisions further render the ability of certain socio-economic groups to prepare, respond, and recover from the flooding event. Hence, any preparatory work that seeks to understand vulnerability, resilience, and coping strategies pre and post-flooding event should be guided by research that uncovers underlying social inequalities. It is against this background that, this study seeks to examine the extent to which flooding has been a factor of social inequality in South Africa and Malawi by answering the question; how is the process of inequality (including spatial isolation) exacerbating household's vulnerability to flooding?. The study will employ the mixed method approach. A combination of research instruments including a global positioning system (GPS), semi-structured questionnaire survey, and participatory rural appraisal (PRA) exercises will be used to gather data for this study. The results of this study intend to inform existing flood risk policies with ways to address social inequalities concerning flood risk management and post-flood recovery and to create inclusive responses in the context of the Sustainable Development Goals' (SDGs) mantra to leave no one behind.

KÜNZLER, DANIEL* (University of Fribourg, Switzerland)

Fragmented Party Systems and the Politics of Social Policies: Attributable Social Policy Declarations in Kenya

According to the literature, social policy reforms are unlikely in fragmented party systems. In the example of Kenya, the literature furthermore points to the importance of what is called "ethnic voting", suggesting electoral promises of club goods rather than nation-wide social policies. However, politicians not only promised free primary education (2002), free maternity (2013) and free secondary education (2017) ahead of elections, but also introduced these policies shortly after them. This paper addresses this paradox based on repeated fieldwork in Kenya since 2004 and the literature.

The three promises concern nation-wide social policies and are thus relevant for the swing voters not caught by ethnicised voting, a significant group of the electorate. However, there is not much evidence that the promises actually influenced voting behaviour. Furthermore, why should presidents actually bother keeping such promises once they are elected? The policies were introduced way ahead of the potential re-election of incumbents at the next elections and in one case by a president in his last constitutional term. They were introduced without adequate preparation and seriously affected the quality of social services.

Two observations are striking: First, since 2002 all Kenyan elections were contested and there were serious doubts about the legitimacy of the elections and official winners. Second, among the different nation-wide electoral promises they made the presidents chose to introduce one that is easy to declare top down and immediately attributable to the president. The only election without immediate top-down social policy declaration were in 2007 when the opposition had to be included in government. After the other elections, presidents made such declarations of nation-wide social policies, portraying themselves as action men and vying for post-electoral legitimacy. In conclusion, the literature on the politics of social policies focuses too much on elections and neglects questions of legitimacy *after* contested elections.

Roles of the Sick Body in Complementary and Alternative Medicine: A Case Study of Yoga Practice in Malaysia

The purpose of this study is to consider how people make use of their sick experiences for the others in complementary and alternative medicine (CAM) throughout yoga practice in Malaysia. Sickness is one of the opportunities to get a new perspective to the relationship between body and society. "Illness narrative is

the leading study on this area, and contributed to grasping reconstruction of biography of sick people (Kleinman 1988; Frank 1995). However, the number of those who work in the society with a chronic disease has gotten increasing recently, and some of them make use of their sick experiences in their work. Therefore, this study is going to think more active roles of the sick body in CAM, especially yoga practice, because CAM can be practiced with emphasizing Patients' subjectivity.

Yoga is one of the most popular methods of CAM nowadays. Also, it can be taught with their subjective experiences because of its characteristic as a physical practice. The field research has been conducted since 2017 intermittently in Kuala Lumpur and Selangor in Malaysia. Main methods were participation observations at yoga classes and interviews with about 20 yoga instructors. As a result, there were three roles in the sick body. First, the sick people can become a role model for current patients. Second, they can also offer their lay knowledge which they got through their physical and mental experiences. And the third role is related to the second one, that is yoga instructors as ex-patients can lead the process of re-making cognition of the body to students as the current patients through sympathizing and understanding their physical sensations. These results also suggested that those who have the sick body "empower" (Kleinman 1988) patients by playing these roles.

Young People's Responses and Choices Towards Risk Society: A Theoretical Perspective

The issue of risk and risk-taking amongst the young has always been a great concern to adults. Young people take a range of risks which can be measured and theoretically, reduced. A strong social constructionist approach to understanding risk position is advocated by working in cultural theory, and it recognizes that risk is always a social product. Mary Douglas (1992) has explored how risks operate culturally to shape people's responses and choices. In this background, the main objective of this paper is to examine how youth facing risks in varied forms and explore of their responses and choices by applying theoretical perspective in this risk society.

A Feminist Reading of Experiences of Palestinian Women Refugees from Syria in Turkey

Turkey has been the primary destination for migrants escaping from the conflict that broke out in Syria in 2011. As of November 2020, the number of Syrian migrants registered in the country was 3,630,702 according to data produced by Turkey. Due to Turkey's reservations concerning the Geneva Convention these migrants have been afforded temporary protection (TP) and the official figures represent them as a culturally homogenous category or static figures disaggregated only according to gender, age and place of registration in Turkey (*https://www.goc.gov.tr/gecici-koruma5638*). The present paper focuses on Palestinian migrants from Syria who constitute a special group within the larger category of Syrian migrants in that they have been doubly marginalized and rendered invisible due to their exclusion from the Geneva Convention of 1951. This paper aims to develop a feminist analysis of Palestinian migrants from Syria in general, and that of women Palestinian migrants in particular with a special focus on Palestinian women's experiences related to their biological and social reproduction within the context of the status of TP. At first, the paper examines the phenomenon of refugeehood in the Middle East and the Palestinian experience of 'permanency of temporality' (Sayigh, 2013) and 'the condition of general homelessness' (Foglita, 2017). The second part explicates the relevance of the concepts of biological reproduction and social reproduction. The third part unveils the experiences of Palestinian women to illustrate their experiences as refugees navigating the processes of biological reproduction under the condition of general homelessness. The fourth part is about understanding how the giving and receiving of care work (social reproduction) both empowers and disempowers Palestinian migrant women. The conclusion suggests a shift from methodological nationalism to the household and community scale; from security to care; and from the work of death (conflict) to the work of life (reproduction) for feminist scholarship.

Gender Bias and Sexism in a Holy Language (Hebrew/Lashon Hakodesh)

The paper aims to analyze the **phenomenon of sexism, concealment of, discrimination and disregard for women in the Hebrew language**. The Bible was primarily written by men, for men, and about men, and thus the biblical text isn't particularly forthcoming when it comes to the women's lives and experiences. Same can be noted regarding the language, that has been created, developed and revived in the footsteps of the Bible.

Despite the fact that Israel's Independence Declaration was one of the earliest constitutional documents in the world to include sex as a group classification within a guarantee of equal rights, official language maintained the characteristics tailored to the old Jewish patriarchal society, that excluded women from full participation in the public sphere and subordinated them to male authority.

We discuss Hebrew as a sexist language from the typical aspects:

Sexism in words – among many other ancient gender biased words, we will try to explain the noun husband and find out why modern Hebrew has picked politically and socially incorrect, connotation (related to the ownership) loaded word – לעב (ba'al) instead of שיא ('ish), which was more often used in the Old Testament.

Sexism in grammatical rules, that creates clear distinctions based on gender in most of the grammatical forms and obligatorily marks the gender of speaker. In Hebrew even 'you' (תא, מתא) has a female or male form and according to the grammatical rules, when addressing a group including only one man, the masculine gender is used.

Respectively, based on sociolinguistic research and comparative case-study methodology, the paper will compare the above-mentioned aspects of the Sexism to **other Semitic languages/Middle Eastern societies**, in order to **highlight the distinctions and similarities and analyze them in the light of women's emancipation, employment rate, participation in the public sphere and political processes, etc.**

South Korean Women's Social Identity Negotiation: The Case of South Korean Women Married to Pakistani Husbands

The paper focuses on South Korean women married to Pakistani husbands, aiming to elucidate how these women develop a social identity as wives of Pakistani migrants in the context of South Korea (hereafter Korea). Specifically, the paper examines to show how the patriarchal underpinning of some aspects of Korean society combines with racism and Islamophobia to create a unique pattern of social identity. As a qualitative study, it carried out semi-structured interviews with Korean women married to Pakistani husbands, and the women's religion in this study was either Christianity or Islam. When it comes to the findings, it is argued that their marriage as well as the migrant husbands' ethnic and religious identity plays a significant role in changing the way religious beliefs are practiced. In addition, the women and her extended families struggle to accommodate Islamic beliefs and culture even on Korean national holidays. Furthermore, the role of social networks in the development of Korean women's social identity as wives of Muslim immigrants results in alienation of them from their wider family networks and acquaintances.

LABASTILLA, SKILTY* (Ateneo de Manila University, Philippines)

Philippine Cinema in Duterte's Drug War: The Case of Erik Matti's Buybust (2018)

When Rodrigo Duterte was elected President of the Philippines in June 2016, his administration immediately pursued a bloody "war on drugs" that victimized poor small-time peddlers and users rather than big-time smugglers. Human Rights Watch reported that close to 28,000 individuals have been killed extra-judicially from July 2016 to September 2018, with about 5,000 of them killed by police officers. This violent backdrop, mostly happening within the capital metropolis, has prodded several local filmmakers to use themes of "drug war", extrajudicial killings, and the urban poor's testy relationship with police authorities (Brillante Mendoza's *Ma'Rosa* [2016] and *Alpha, the Right to Kill* [2019]; and Mikhail Red's *NeoManila* [2017], are just a few). This presentation discusses Erik Matti's *BuyBust* (2018), a commercial and critical success both locally and internationally, and contends that the film's apparent denouncement of the administration's drug war (through an ending that points to the entrenched corruption of the police system as a major culprit of the current mess) belies a troubling misrepresentation of the Filipino urban poor, who are depicted as blood-thirsty hounds who will do anything to protect their illegal drug trade. Using the concepts of middle-class gaze and male gaze, the presentation shows how the filmmakers frame the story from the perspective of a good-looking female police officer, who is shown throughout the film fighting off zombie-like hordes of urban poor (men, women, children) out to kill her and her colleagues, and illustrate that this plot device is fairly common among contemporary heterosexual male filmmakers in the Philippines.

Creating Interfaces: Local Knowledge Co-Creation at the Food-Water-Energy Nexus

Global environmental challenges demand transformations in local governance systems in urban and rural areas and complex, multi-level approaches introducing different social and political actors, tools and processes. This includes the creation of socio-technical interfaces such as new communication and participation platforms. Those interfaces can potentially improve processes of local knowledge co-creation, cooperation and citizen participation in local environmental governance.

The project "Creating Interfaces" (JPI Urban Europe and Belmont Forum 2018-2021, co-financed by the Horizon2020 programme under grant agreement No. 830254) aims at making Food-Water-Energy linkages better understandable to the stakeholders (city government, science, business and citizens), and to facilitate cooperation and knowledge exchange among them. It develops and tests innovative approaches for local knowledge co-creation and participation through Urban Living Labs and Citizen Science approaches in three mid-size cities on water: Tulcea (Romania), Wilmington (USA) and Slupsk (Poland).

The paper presents the Urban Living Labs as knowledge co-creation approach and shows results from three Urban Living Lab Workshops and knowledge co-creation by an online PPGIS (Public Participation Geographic Information System) tool in Tulcea, Wilmington and Slupsk.

Main questions of the paper are: how can knowledge co-creation be realized linked to a crucial but rather abstract concept as the FEW nexus and embedded into the local communities? How can knowledge co-creation contribute to scientific knowledge building regarding the urban FEW nexus as well as to local sustainability governance?

LACERDA, RENATA* (Federal University of Rio de Janeiro, Brazil)

The Making of Movements in the BR-163 Highway Region (Pará, Brazil)

This paper is part of my PhD. research in Social Anthropology (PPGAS/MN/UFRJ). The aim of the presentation is to analyse and describe ethnographically what is understood locally as "making movements to fight the government". These encompass cycles of protests performed at the BR-163 (Cuiabá-Santarém) highway, which connects a strong agribusiness production region to export ports in the state of Pará (Amazon, Brazil).

The roadblocks are repeated ritually almost every year since 2003, when the first blockade of the BR-163 highway in Novo Progresso was organized by farmers and lumber companies against the demarcation of the Indigenous Land Baú of the Kayapó people. Since then, the expertise acquired by various social agents in the making of movements is enabling the reduction and flexibilization of the National Forest of Jamanxim, a federal conservation unit, and of the rural settlement Sustainable Development Project Terra Nossa.

Over that period, conflicting state branches and agencies, as well as national and international NGOs, research institutes, national social movements and communication means (press, radio and social media) have had a key role producing the recognition (or not) of the sometimes contradictory demands of heteroneous social agentes: farmers (large and small), land reform settlers, gold prospectors, lumber companies, merchants and indigenous tribes. These various social categories have formed changing alliances called "movements" among themselves to "fight the government" – i.e. to contest different environmental and land management public policies implemented in the region – through collective actions, but also administrative, legal and judicial disputes that involve conversations, meetings and public hearings with state agents.

Childhood and Neighborhood Factors: Assessing Its Impact and Association on Intimate Partner Victimization Among US Black Women

Research has found a co-occurrence between exposure to violence and adult victimization. Few studies have been conducted to understand this relationship among women within the US Black population. This study examined intimate partner violence and the role of child abuse and exposure to violence using a nationally representative sample on US Blacks. Bivariate results indicate an association between child abuse and adult intimate partner victimization. The relationship between exposure to violence and intimate partner violence was also shown to differ between African American and Caribbean Black women. Multivariate findings revealed that substance, conduct, anti-social personality, and oppositional defiant disorders were associated with increased risk for intimate partner violence among US black women, independent of child abuse. Moderating effects of childhood conduct and mental disorders in relation to child abuse with adult intimate partner violence was not found. Implications and possible preventative measures are discussed while highlighting directions for future studies.

Caring for Older People in the Philippines: Insights from a Survey of Caregivers

In a familistic society such as the Philippines, the family is at the forefront of ensuring the welfare of its members, such as children and OPs. This is even inscribed in the 1987 Philippine Constitution. Despite the ubiquity of caregiving within the family, particularly caring for OPs, little is known about this phenomenon. Aging in the Philippine context is characterized as being cared for at home and mainly family-based and family-oriented assistance (Antonio, 2015). But in the context of the changing demographic and socioeconomic landscape of Philippine society, how is caring for OPs affected? What is the profile of the caregivers of OPs? Are they still mainly family members?

Using data from the caregivers' survey of the 2018 Longitudinal Cohort Study of Aging and Health in the Philippines, this paper describe the situation of caregiving for OPs in the Philippines, from the perspective of primary or actual and potential caregivers whom the OPs themselves have identified. LSAHP has a total of 5,985 older person respondents (60 years old and over) and of this number, 5,143 identified a caregiver for the caregiver survey.

Initial results show that among older persons aged 60 and over, only 7% have a primary caregiver. This implies that the majority are still independent and do not need any caregiving help. Females make up the majority of primary caregivers and are the preferred potential caregivers. This gender preference for caregiving tasks becomes more meaningful when situated within family relationships. The gendered notion of family caregiving is evident in the results of the study: spousal caregiving is more associated with the wives providing care for their husbands while intergenerational caregiving is characterized by daughters and daughters in law providing care to their parents.

Analyzing 'manifesta' As a European Nomadic Biennale in the Global Artistic Fields: On the Curatorial Experiments Facing the Crisis Era

The Manifesta Biennial, an alternative biennale nomadically held in different European cities initiated since 1990 Amsterdam, aims to challenge the fix thinking of national boundaries in the existing dominating biennales such as the historical Venice Biennale. This paper firstly analyzes this alternative biennial's nomadic strategies to challenge the global biennial *field*(Bourdieu, 1993) by examining the imagination of Europe created by the selected nomadic series of relatively marginal host cities in Europe. And the special *cosmopolitan visions situated*(Beck, 2006; Haraway, 1995) in these marginal European cities that intersect culturally and historical geographically with other continents. The second, it examines the alternative *curatorial practices as experiments*(Weibel and Latour, 2007; Bal, 2007) and *socially engaged art practices*as inventive methods (Lury and Wakeford, 2012; Back and Puwar, 2013) based on sites specific artistic performances engaging the host cities as topological social fabrics and new mixed genres in the artistic field interrogating the climate change and refugee issues in the recent two Manifesta biennials held in 2016 Zurich and 2018 Palermo, according to media representations and my field work. Finally, through examining the biennale reviews on major art media, it concludes that Manifesta as a newly emergent biennial serves as an example to explore cities' new creative strategies with art practices surviving in the artistic field reflexively detoured from the margins.

Promenades in the Cities with AI: On Rimini Protokoll Theatre's Remote X As Alternative Mobile Cities Guides and Art Engaging Future Methods

Rimini Protokoll theatre's Remote X was a mobile experimental theatre in the cities, constituted by temporary assembly of 50 people promenade in the city guided with headphones of AI synthetic voice GPS navigators with scripts of future city scenarios lasting approximately one hour. By so doing, this theatre questions artificial intelligence, big data, algorhythms, posthuman being, city cultures and future scenarios. This experimental theatre has already applied at 65 cities around the world with specifically adapted scripts since 2013 up to now, this paper especially examines the case of *Remote Taipei 2017-2018*in Aug and September during Taipei Art Festival.

This research draws upon and engages with two theoretical problematics: Firstly, the theories of global mobilities in mobile media researches, from mediated cities, digital sociology, to audio guides and GPS research (Urry, 2007; Germann-Molz, 2014; Lai, 2014), and examines their creatively use by alternative guided tours of experimental theatres. It interrogates multiple senses involved, temporal spatial rhythm of city guides and their being regulated by and actively participate with audio guides. Secondly, art engaging as future methods (Back, 2012; Urry, 2016) when deals with experimental theatres initiated future scenarios led by AI figures for the cities that echoes cultural memories, politics and materiality, and participants' reflexive thinking on their cities. This research will base on script analysis, media reports, my participatory fieldwork when joining the tour and interviews of participants' responses.

Medicalization and Abortion: Evaluating Three Types of Service Providers in China

The domain of sexual and reproductive health has long been a target of medicalization, but the process and its extent vary diversely across socio-political and economic contexts. This study aims to illustrate the roles of structural and institutional factors in shaping the process of medicalization of a common yet controversial reproductive practice ⎯ abortion. Focusing on China, where safe and legal abortion is widely available, this study examines the variations in the medicalization of abortion within different institutional settings. Based on a set of qualitative data collected through ethnographic observations and in-depth inter-

views conducted in two cities in China between 2013 and 2016, this study evaluates abortion services offered in public hospitals, for-profit private hospitals, and a community clinic operated by a non-governmental organization. The findings show that the extent of medicalization varied among different medical facilities in which their institutional dynamics were structured corresponding to the broader sociocultural and economic circumstances. It is observed that in public hospitals and the NGO clinic, abortion was medicalized mainly for the purposes of guaranteeing safety, reducing pain, and facilitating recovery, whilst in private hospitals, abortion was medicalized not only for the above purposes but also for generating profit, which was achieved by using advanced medical technologies alleged to be imported from the Global North, and delivering excessive or unnecessary medical treatments. Based on the empirical evidence, this paper argues that the process of medicalization is shaping and shaped by different institutional settings that are configured by structural factors such as the medical system and healthcare market. Economic incentives and competition in the health care market have bought about the convergence of medicalization and commodification of abortion services, which impose potential risks to the well-being of women, especially for those who are young, less educated, and having limited medical knowledge.

LAINE, SOFIA* (The Finnish Youth Research Network, Finland)

Theatre Clownery As a Performative Analysis Method to Study Art Testers Initiative

In Finnish history, the Art Testers is the largest cultural project directed at young people. The Finnish Cultural Foundation took three age groups of eighth-graders to art institutions. Including the teachers, the national campaign will reach almost 200,000 individuals. The aim is to provide young people with an opportunity to experience art, also art to which many would not otherwise have access. Each school class will visit two art events, such as theatre, art exhibition, concert or opera.

This methodological paper explores theatre clownery as a performative analysis method to study Art Testers initiative. Together with my research colleague Maaria Hartman, we produced a half-an-hour long theatre clownery play out of our ethnographic experiences, i.e. interviews with 116 youth and participatory observation situations at the schools and art locations with the young people. Methodologically, when the social setting is analysed as a performance, the focus is on corporality, presence and the pre-discursive.

We presented our theatre clownery play first time at the International Children's Culture Forum, Tampere, Finland in October 2019 where we had been invited as academic key-note speakers. With theatre clownery we also wanted to make some of our primary results more approachable for the young people themselves. As I explain, theatre clownery was a strategic choice for many reasons. By hiding our identity we recovered the power of our acts. Performance theory gives central place to motion and emotions, as both actor and audiences must be moved of a performance in order it to be successful (Eyerman 2005). In this paper I also analyse the reactions of audience and organisers of the Forum. Our method turned also to be a contestatory performative act (Laine 2012) opening new perspectives among both the observers and the participants, and it shed light to macropolitics of the Art Tester initiative.

The Multi-Scalar Strategies of the German Anti-Coal Struggle

In Europe, anti-extractive struggles have taken a new turn in recent years following the emergence and increasing media coverage of conflicts related to the extraction of fossil fuels (coal, gas, and, to a lesser extent, oil). Many initiatives (eg. associations, activist groups, student campaigns, scientific or citizen groups, etc.), which could be labeled under the slogan "Keep it in the ground", have emerged to fight fossil-fuel energy extraction and exploitation. In Germany, most of these initiatives have focused so far on coal mining, which enabled the country to develop industrially from the end of the 19th century and which continues to play an essential role in power generation and in the German economy in general.

Thus, one of the initial objectives of the German climate justice movement, which originated in 2008 and has gradually consolidated over the years, was to force the federal government to put the coal issue on the political agenda. If this movement has focused on the coal issue, it is first and foremost to denounce the outcome and contradictions of the *Energiewende*, the German energy transition.

Drawing on literature review and two years of participant observation within Ende Gelände, a german alliance of local groups against coal-mining, this presentation seeks to illuminate the complexity of building a multi-scalar climate justice movement. In particular, we acknowledge the tensions between the local, national and international features of energy transitions and offer some insights on the ways social movements can cope with these tensions.

RC18-220.2

LAJARTHE, FANNY* (Université Libre de Bruxelles, Belgium)

Towards a More Intersectional Belgian Climate Justice Movement ?

The climate justice movement gained momentum in Europe since the perceived failure of COP15 in 2009 through a merger between the global justice and anticapitalist movements and the "radical" stream of the climate movement. This submovement is characterized not only by a systemic framing of the climate issue, but also by the emergence of a more transgressive repertoire of climate change activism, including protests, infrastructure blockades and climate camps.

In Belgium, this movement developed more recently and especially since 2018, with the rise of student strikes, massive climate marches, direct-action oriented groups and a climate justice camp. All these initiatives were inspired by similar ones in neighbouring countries but also adapted to the belgian context according to a principle of "selective imitation", whereby only some parts of a tactic or a frame are kept when diffused.

Although this movement has been mainly framed as "successful", on the grounds that it has attracted both media attention and new people into the sphere of activism, it has also been recently subject to criticism, both internally and from other movements. Concerns were raised regarding its constant focus on actions, its lack of diversity but also its perceived supremacy linked to a sense of urgency that was already part of the mainstream climate narrative. In this context, debates on the ways to build a more interconnected and intersectional climate justice movement have recently emerged in Belgium.

Drawing on literature review, focus groups and participant observation, this presentation seeks to understand the specificity of the belgian climate justice movement, in comparison with similar movements in neighbouring countries, and especially Germany. In particular, we argue that the temporality of movement-building, transnationalization processes and the political opportunity structures are key to understand why some internal debates emerge in some countries and not in others.

LAKHINA, SHEFALI* (University of Wollongong, Australia, USA)

Care in Disaster Research

Drawing on my research experience with local institutions and people from diverse refugee backgrounds in New South Wales, Australia, I reflect on what it means to care in disaster research. I explore how current disaster research methods seek to fulfil institutional requirements for ethical research procedures and protocols. Yet, disaster researchers continue to grapple with a range of subjective and relational dilemmas. The concern is not just around how to deal with researchers' emotions, but also how researchers relate to people in disaster-affected communities, 'other' researchers across post-colonial 'locals', and institutions that are entrusted with a duty of care. What are the ethical and personal strategies employed by disaster researchers across such contexts? Based on my research experience in Australia, I contribute two strategies to this ongoing discussion. First, I encourage disaster researchers to approach research as care - an embodied and relational way of seeing, doing and being in the world. Around the world, disaster researchers increasingly belong to disaster-affected communities. Researcher's personal traumas and experiences are intertwined with their professional ways of seeing, doing and being in a disaster context. It is important for disaster researchers to acknowledge such entanglements. Second, I propose an ethical framework for researching with CARE (collaboration, accountability, responsiveness and empowerment). Beyond satisfying institutional ethical protocols, what are the concrete everyday practices through which disaster researchers develop networks of care, trust and reciprocity in traumatic contexts? In concluding, I encourage disaster researchers to also learn from people and communities on the frontline of disaster impacts. For example, what can disaster researchers learn from the surge in caring work performed by young climate activists, volunteers and journalists on the frontlines? How can disaster researchers learn from the strategies of faith, healing and resilience demonstrated by people who experience frequent devastation and displacement around the world?

LAL, JAYATI* (Wake Forest University, USA)

Banishing the Ghosts? Tracing Women's Domestic Labor in Postcolonial Capitalism

Resurgent academic interest in theorizing the subsistence and informal sectors and workers has come as a consequence of the recent global fiscal crisis and the decades-long austerity programs of neoliberal governance which intensified the casualization of work and disposability of labor, diminished state social welfare, and led to a general decline in workers' social wage. Although it is women who bear the brunt of this reproduction crisis, unwaged domestic labor and carework has by and large been ignored in recent decolonial Marxist rethinking of work in postcolonial capitalism by scholars from the Global South. Feminist scholars have noted that domestic, reproductive labor haunts capitalism with its spectral

presence—although necessary, it is hidden from view and made invisible through state and transnational accounting practices that reproduce the cultural practices and ideologies of gender. Deploying the method of 'sociology of the trace,' this paper examines alternative feminist practices of representation to address the question how we can push forward the feminist project of making reproductive labor visible and valued. I first review the work of scholars such as Maria Mies and Sylvia Fedderici, who focus on primitive accumulation as an ongoing process in capitalism in their analysis of women's unpaid reproductive labor, and provide a corrective to gender blind theorization of subsistence work in postcolonial capitalism. Turning to Delhi-based feminist artist Shukla Sawant's multimedia work 'Triumph of Labour' (2006), I show she demonstrates the power of 'foregrounding' as a mode of critical praxis and examine its potential for breaking the epistemological impasse entailed in revisioning gender and revaluing the work of social reproduction. Drawing on interdisciplinary feminist criticism that traverses the binaries of Northern and Southern Theory, this paper contributes to transnational feminist anti- and postcapitalist imaginaries and a decolonial theory and praxis of carework.

LAMPIS, ANDREA* (Universidade de São Paulo, Brazil)

Objectivating Risk: How Environmental Expertise Shapes Drr and CCA in Brazil and Colombia

Conceptually based on the chapter published in the 2017 Routledge Handbook on Disaster Risk Reduction including Climate Change Adaptation, this paper explores the operationalization of one of its strands into an applied research project: the analysis of the objectivation of risk through processes of expert knowledge production. Almost the totality if not all institutions working on Disaster Risk Reduction (DRR) and Climate Change Adaptation (CCA) in the international and national arenas tend to objectivate risk. Although the concept of DRR has evolved over the last six decades from an emergency-centred to a more integrated disasters-development dialogue risk remain objectivated. In spite of this transformation intimately bound to the evolution of both the prevailing policy frameworks of DDR and CCA brought about by the changing conceptualizations of disasters brought about by epistemological debates risk. This is not a conflict free arena insofar scholars from the technical and natural sciences work to consolidate a scientific body of knowledge regarding hazards, whilst social scientists link this with the idea of disasters as socially constructed processes. On the whole, both DRR and CCA as domains of knowledge and policy production at the level of multi-lateral agencies and international institutions tend to disregard key sociological trans- formations. In particular, the debate on the relationship between development and the project of modernity is not taken on board because it is considered not relevant for the advancement of scientific knowledge. With a focus on Latin-American institutions and scholarship, the paper takes the debate into the domain of applied discourses entailing the IPCC, UNISDR and the national institutions of Brazil and Colombia where the author has worked at length to explore how the conceptual framework is reflected in textual frames, meaning discourses, texts, speeches, etc.

Slow Onset Disasters, Climate Change Adaptation and the Politics of Place

This submission is based on an on-going research project aimed at generating a new research focus based on the triangulation of the three research areas mentioned in the title. Broadly speaking, the connection among the three sides of the triangles is justified on the following grounds: Slow onset urban disasters related to climate change are less visible than quick onset ones caused by extreme weather events, as they are entrenched in various processes of the production of space. Long-term carbon impacts and climate vulnerabilities are often produced by choices in infrastructure, materials, transportation and housing systems causing slow onset disasters to kill, make people ill and deteriorate quality of life across protracted time. Yet, in spite of being located at the critical intersection of places as physical and social spaces, they are less documented as climate-related risks. The relation between the social, political and economic logics that regulate their use and the urban struggles over these uses are constitutive of a politics of place crucial to study for a better understanding of the climate change adaptation vs slow-onset disasters relationship. In the concept paper we are aiming to present in Porto Alegre from an interdisciplinary perspective we articulate a selection of the relevant literature prominent within those three research strands, on the premise that they are seldom found in a cross-cutting dialogue to date: i) Housing and climate change policies and their meaning through a politics of place perspective; ii) the politics of infrastructure the which brings into view how peripheral zones of urban areas host a mix of hazardous infrastructure in places of inhabitance with little visibility and planning, producing ecological, health and

safety risks; and iii) the politics of urbanization across scales and loci exploring its links with mobility rights, the production of spatial marginalisation and socio-ecological cleavages.

Comment Susciter Les Conduites Éthiques Des Entreprises : Une Expérience

Dans un article théorique publié récemment, j'ai analysé le mécanisme en deux étapes d'un frein entravant la conduite éthique des entreprises. La première étape est un dilemme entre les incitations marchandes et la bonne volonté. Les incitations marchandes peuvent soutenir une conduite éthique, mais peuvent également s'y opposer. La bonne volonté s'aligne avec les conduites éthiques, mais est arbitraire. Une régulation peut aider à sortir de ce dilemme, mais apparaît alors le second élément du frein : plus la régulation est exogène, plus elle risque d'être rejetée (moins les acteurs concernés par ces régulations sont impliqués dans leur formulation, plus elles sont exogènes). Jusqu'à présent, les régulations sont souvent fortement exogènes.

Sur la base de cette analyse, j'ai proposé une solution endogène originale au problème de l'adoption d'une conduite éthique reposant sur la création d'un « commun artificiel ». Je défends l'idée que le partage de ce commun artificiel peut spontanément conduire à l'émergence de comportements éthiques collectifs.

Afin de tester la pertinence empirique de cette proposition théorique, j'ai organisé un jeu expérimental avec deux populations d'étudiants d'écoles de commerce, au Brésil et en France. Chaque joueur représente une entreprise avec un capital initial et un degré initial de conduite éthique (DCE) et forme une équipe avec deux autres joueurs. Chacun fait une proposition concernant le partage d'un fonds commun proportionnel au capital de chaque entreprise, puis vote pour décider quelle proposition sera retenue. Les fonds sont alors partagés en fonction de la proposition retenue et chacun décide d'investir pour augmenter son DCE ou au contraire d'augmenter son capital en diminuant son DCE. Une autre session commence alors avec les nouveaux capitaux et les nouveaux DCE. Je fais l'hypothèse d'une augmentation globale du DCE (sans que personne n'y soit contraint). Pour cette communication, je présenterai les résultats de cette expérience.

Coping with Displacement: Hope, Despair and (Im)Mobility in Translocal Lifeworlds

This contribution analyzes the translocal coping strategies of migrants from rural areas in Eastern Paraguay. Displaced by the loss of land and livelihoods due to the industrialization of agriculture and neoliberal policies, they seek their future in rapidly growing regional urban centers in Paraguay and neighboring states. Contrary to common depictions of rural exodus and urbanization, many of them return to the Paraguayan countryside, expelled by crisis ridden urban labor markets, discouraged by chauvinistic encounters abroad, or disappointed by city life. Back home, they face again the familiar uncertainty and deprivation they sought to flee.

The study asks how (return) migrants deal with the adverse conditions that they find in regions of origin and destination alike. Continuously torn between leaving and staying, they navigate between different mobile and apparently immobile alternatives, between migration, adaptation, resistance and resignation. A multi sited field research explored the transnational lifeworlds that stretch out between Paraguay and Argentina and shows how they negotiate hopes and aspirations, how they deal with doubts, disappointment and periods of prolonged waiting for a better future. Conceptualizing the drivers of both return and out migration as a gradual, continuous process of displacement allows to rethink the relation between structure and agency that defines the room for maneuver of translocal coping strategies.

Temporal Indeterminacy: Regulating the Lives of Precarious Legal Status Families in Toronto, Canada

This article examines the regulation, negotiation and effects of temporal indeterminacy in the lives of precarious legal status families. It situates these experiences within scholarship on assemblages and precarious noncitizenship, particularly the concept of conditionality and precarious legal status trajectories; and questions the linear clock-time conceptualization of migration, transit and settlement. It demonstrates how temporal indeterminacy is regulated and produced by variable combinations of state and non-state to produce uncertainties and mismatched experiences of family and state-generated timelines for authorized presence and rights in Canada. It examines how temporal indeterminacy affects

denotes a presenting author. Abstracts are organized by first presenting author's last name.

family and community relations, sense of belonging and capacity to identify and claim rights and entitlements. It draws on documentary evidence of policies and regulations and on thirty interviews conducted in the 2010s with adults and youth who entered Canada with precarious legal status and settled in Toronto.

LANE FILALI, RASHON* (University of California San Francisco, USA)

Survivors at the Center: Engaging Ebola Survivors in Post-Recovery Research

The 2014-16 Ebola epidemic in West Africa is the largest Ebola epidemic ever recorded. The outbreak had a case fatality of approximately 50% which left over 15,000 Ebola survivors primarily in Guinea, Liberia and Sierra Leone. While disciplines including public health and disasters science attend to understandings of Ebola survivors during the height of the Ebola response and recovery phase, limited studies attend to the social-structural aspects of survivor health long after the epidemic ceased. Engaging disaster sociology, neo-colonialism, and community trauma frameworks, I aim to understand the ways in which survivorship is socially constructed after an epidemic. Recognizing that there is a gap in structural analysis of the post-Ebola epidemic recovery process that centers Ebola survivors, I use grounded theory methods to understand the lived experiences of Ebola survivors and survivor health. Media discourse, survivor illness narratives, and survivors' interaction within health institutions are centered in this research to understand structural inequity takes shape the aftermath of an epidemic. Using the 2014-16 West Africa Ebola epidemic as a case study, I examine how survivors were impacted by the outbreak long after the public health interventions ceased. I call attention to how a community-engaged research agenda that centers survivors beyond their contribution to the biomedical enterprise is needed. I seek to move away from describing survivor health in solely pathogenic and epidemiological framings to attend to the structural, social, and economic forces that impact the livelihood of Ebola survivors.

A Critical Discourse Analysis of the Discursive Construction of Terror in Newspaper Reports on the Attack of Garissa University in Kenya

Terrorism remains a global threat. The architects of terror attacks aim for maxim media coverage in order to attain multiplied shock effect over the citizenry including those who might be far remove from the direct impact of a given attack. In covering terror attacks, the media should be aware of this desired goal of terrorists. News reports of attacks form mental models in readers. These become their reference point of understanding about who is a terrorist and an evaluation of success of terrorists vis-à-vis counter terrorism efforts. This paper draws data from newspaper headlines and articles reporting on the 2nd April 2015 terror attack at Garissa University in Kenya in which 148 souls were lost. The paper analyses the linguistic strategies used in the newspaper articles. Then, using van Djik's Cognitive Model of CDA, the paper highlights the emerging construction of terrorism, terrorists and counter-terror efforts by the Kenyan security forces. The analysis reveals passivization, nominalization, presuppositions, thematization, lexical-choice and quotation patterns as the dominant language strategies used in the headlines and bodies of the sampled articles. Additional questionnaire data helps to show that these strategies cumulatively construct a terrorist as 'the other', very sophisticated. The security agencies are constructed as impotent, poorly organized and always playing catch-up to the terrorists.

LANGE, BIANCA* (University of Magdeburg, Germany)

Career Biographical Counselling As an Opportunity for Equal Opportunities in Vocational Rehabilitation

Women in Germany make significantly less use of benefits for participation in working life (LTA) than men. In 2016, only 55,090 out of a total of 156,117 LTAs completed were claimed by women (DRV 2018: 54). Women are thus clearly under-represented, accounting for almost one third of the total, which raises the question of the possibilities of increased use of LTAs - particularly when the gender mainstreaming concept is taken into account. Models such as the vocational rehabilitation close to home address the special needs of women in rehabilitation, who are characterised by the fact that women continue to be responsible for bringing up children and caring for relatives (Niehaus 1997), but the range of gender-specific instruments and measures is currently insufficient and blocks women with chronic illnesses from gaining access to vocational reintegration and thus also to participation in gainful employment. This calls for offers that take into account the low graduate rate of LTA measures, gender-specific role requirements, gender-specific handling of chronic illnesses and gender-specific expectations of gainful employment within a work-life blending culture (Mikfeld 2016).

Based on the findings of the qualitative research project "Preventive Health Strategies - Learning from OIM" (duration: November 2016- May 2019) on occupational integration (Ohlbrecht et al. 2018), the lecture will present the instrument of occupational biographical counselling, which emerges from social science biographical and identity research, and demonstrate its potential benefit for the practical occupational biographical anamnesis and counselling of women in rehabilitation. With the help of vocational biographical counselling, individual resources for vocational reintegration can be identified and included in these, gender-specific career choices can be biographically processed and recognised, and the challenges of biographical status passages can be interpreted in a gender-sensitive way.

LANGE, THOMAS* (Forschungsstätte der evangelischen Studiengemeinschaft, Germany)

Organisational Hybridity: Different Development and Impact Patterns of Welfare Associations on Markets and Society

Welfare associations (Wohlfahrtsverbände) are organisations with specific characteristics and with several functions. On the one hand, they are service providers through their member institutions and, on the other hand, they are interest associations for social groups that are considered socially disadvantaged. They can thus be described as multifunctional organisations operating simultaneously in different environments.

The socio-political upheavals in Germany in the mid-1990s are intended to show that the multifunctionality of welfare associations leads to contrasting patterns of development, which in turn have different effects on the environment.

A hybridity approach shows that welfare associations are a polycentric acting network and are thus able to react to different environments. While individual organisations of the network react in some environments according to isomorphic patterns and copy organisational models, they develop at the same time individually and innovative in other environments, which is understood as polymorphic development. The extent to which welfare associations act isomorphically or polymorphically depends on the (un-)certainty of the environment in which they operate.

Two different directions of effect between welfare associations and their environment can be derived from this: While their development is determined within the framework of isomorphic patterns in uncertain environments (markets), they develop innovatively and are able to shape socio-political structures in certain environments. They have an effect on the structures surrounding them.

The shaping potential of welfare associations is reflected along their impact on society (e.g. poverty policy). In the sociopolitical system, welfare associations have created a new form of corporatism, that I define as "confrontational corporatism", which, unlike its predecessors, is no longer characterized by cooperative coexistence, but by opposition between politics and welfare associations. Central to this is that this confrontational attitude can avoid destabilizing the socio-political system through social forces. Welfare associations become (again) a quasi-non-governmental organization (QUANGO).

La Criminalisation De l'Opposition à l'Exploitation Minière Au Guatemala : Analyses Croisées

Depuis le début des années 2000, un mouvement de résistance multi-focal s'articule autour de projets extractifs à travers le pays. La réponse de l'État et d'acteurs privés pour faire taire l'opposition est proportionnelle à la capacité des groupes locaux de canaliser le mécontentement populaire et de perturber les activités extractives. Par conséquent, on assiste à une escalade des stratégies répressives de criminalisation – passant de fausses accusations et fabrication de délits à la suspension de droits par des états de siège – non seulement envers des individus ciblés, mais également des groupes, voire des communautés, ainsi que de leurs avocats. Le recours à des tactiques de criminalisation de la résistance à l'exploitation minière a cours à travers le pays. Quel est son mode opératoire? Comment se déploient ses tactiques? Y a-t-il des différences en fonction de la situation socioéconomique de la région; de la mobilisation ethnique; de l'étape dans laquelle se trouve le projet minier? En se basant sur 3 foyers d'opposition (mine Marlin, San Marcos; mine Escobal, Santa Rosa; mine Fénix, El Estor), on cherchera à comprendre les points qu'ils ont en commun et les particularités propres à chaque cas et à proposer des clefs d'analyse permettant de construire la trajectoire de la criminalisation de la dissension à l'exploitation minière au Guatemala.

LANGMAN, LAUREN* (Loyola University of Chicago, USA)
LUNDSKOW, GEORGE (Governors State Univeristy, USA)

First As Tragedy - and then Again As Tragedy: From Fascism to Authoritarian Populisms

After the fall of the Soviet Union, we have seen an explosion of social movements beginning of course with the various progressive movements such as Arab soon followed in number of extremist right wing mobilizations typically authoritarian populisms, ethno-religions nationalisms that often border on classical fascism. While most of these movements are authoritarian, racist, sexist ethnonationalist/xenophobic, and not truly fascist, yet the classical analysis laid down by Reich, Fromm and Adorno, in which capitalism, its alienation, powerlessness, dehumanization, denial of recognition, and fragmentation of the social are mediated by character and emotion, namely authoritarianism and anger to outgroups, disposed "escapes" via submission to authority, domination of subordinates and projection of aggression to scapegoats. But today's neo liberal, global capitalism requires building upon the classical FS traditions, by considering unconscious shame (Scheff) and *ressentiment* (Nietzsche) at times of rapid social change resulting in what Fromm called "necrophilia" the love of death and destruction. The various right populisms contend that and unworthy, corrupt, elites acted contrary to moral community of "the real people," typically lower middle class bearers of reaction who have been "left behind" by global/cosmopolitan/multicultural leaders who must be replaced by strong, powerful leaders who promise to restore a lost cultural moment of individual "solid, enduring" qualities of ethnic, national, traditional heteronormativity (toxic masculinity) and often religious homogeneity that assuage the impact of crises of the economy, the polity and/or the culture (Habermas). The same forces have dialectally fostered progressive counter mobilizations-especially among the better educated young. Moreover. most authoritarian populisms don't do a very good job of governing once in power, suggesting an emerging democratic, humanistic socialism.

LANGMAN, LAUREN* (Loyola University of Chicago, USA)

From Social Movements to Social Change: A Better World Better be Likley

From the "Golden Age" of the Zapatistas, Seattle 1999 and the WSF, till Arab Spring, it seemed as if a world historical progressive transformation was in process, til the dark forces of reaction emerged as authoritarian populisms in Europe, Asia, South America and above all the USA. How and why did this happen. We must start with the fact that most of these reactionary movements have a long, yet dormant history, typically going back the 19th C. Why have they returned and indeed been so successful. Today we must start with the crises and dysfunctions of global neo liberalism as an economy that fosters inequality and precarity, as governance my global elites and a rapidly changing culture that has challenge, indeed the identities of more typically older, rural, religious, lower middle classes (w/o a college education). These legitimation crises of the system (Habermas) have migrated to the realms of life world -namely identity and emotion-eliciting constellations of anxiety, anger, indignation shame, and regressive forms of hope disposing various authoritarian populisms, ethno-religious nationalisms that would "restore" the time before the true people, a self-defined "moral community were threatened by if not displaced by the economic charges of neo liberalism and the cultural changes of cosmopolitanism-namely multi- culturalism, toleration and inclusion of differences, gender fluidity and sexual variety. While these reactional mobilizations have gained power, it might be noted that most of these governments do not, nor cannot reverse history and address the factors that brought them to power. Moreover, the progressive movements earlier noted, while often initially submerged (Melucci), as reactions the reactionaries, have been growing in power-especially among the young, and social movements typically depend on generational mediation (Mannheim). This analysis suggests that an growing, internet savvy generation or two will become the bedrock of a democratic, humanistic, global socialism.

LAPA, THAÍS* (Universidade Federal de Santa Catarina, Brazil)

Gender at Industrial Work in Brazil

This paper discusses occupational segregation by gender on both automotive and electronics segments of Brazilian metallurgical industry and its implications for the reproduction of gender inequalities at work. The text is based on a doctoral research conducted from 2015 to 2019, which included semi-structured qualitative interviews with 48 union representatives and workers from 6 factories, mainly women, as well as research on the labor market in these segments and bibliographic study, especially on French and Brazilian references.

Based on the concepts of the sexual division of labor and "gender mix" (*mixité*), I discuss the process of slow feminization and the barriers to entry and perma-

nence of women in the automotive sector, which is eminently male (92%), as well as the specificities of segregation by gender in the electronics segment, which is mostly female (56%), especially in the assembly of equipment such as mobile phones and notebooks, although reserves certain technical posts almost exclusively for men.

The approach on both segregation and the hierarchy of the sexes at work allows us to discuss one of the key points for reproducing a system of gender inequalities that builds / strengthens from work relations and spreads in society: the reinforcement of stereotypes about skills and female limitations which naturalizes its subordinated position. Such stereotypes were challenged in the research through various situations that showed the full technical and even physical capacity of women to perform work in principle considered masculine in these two industrial sectors, which also helps envision un attribution of jobs not based on the gender of who works. I also discuss the gender conflicts and the situations of class solidarity that are established between men and women from the situations of gender mix at work. If conflicts reiterate segregation, signs of class solidarity can point the way to its overcoming.

Consent and Resentment of Surveillance in Digitalized Workplaces: An Exploratory Study

Present-day surveillance is characterized by communicative wealth in leisure and work, where visibility is relentless (Ganesh, 2006). Recent scandals concerning mass surveillance, have brought attention to Governmental, political and consumer surveillance, perhaps shadowing the public and academic interest on "workplace surveillance" or "employee monitoring" (Ball, 2010). It is assumed that "employee monitoring" is an expected and ordinary feature of work settings even though it might progress to enable even more means of surveillance (Rosenblat, Kneese, and boyd, 2014). Furthermore, the average citizen appears to continue relatively tolerant towards digital surveillance in leisure, and contribute to its naturalization, if it means greater usability of technology (Best, 2010). But it can be argued that the conceptualization and measurement of resentment and resistance remains underdeveloped within surveillance studies (Martin, van Brakel and Bernhard, 2009). Furthermore, are there contractions in consent or resent between the realms of work and leisure? Following Lyon (2001), the present study seeks to further understand whether and how workers consent to or resent digital surveillance in their workplaces and daily lives. Can we identify different types of consent or resentment, one for workers of digitalized workplaces and another for digitalized places of consumption and leisure?

To address these issues, we applied an online survey to Portuguese workers. We also address worker's attitudes towards what they consider uncomfortable, permissible or what is considered an employer violation. What are the privacy concerns that Portuguese workers express about the data that is collected on them? Do they consider future implications of data collection such as future job prospects? This study is exploratory in nature and aims to assess possible measuring procedures to understand what is happening in digitalized workplaces. It, therefore, intends to contribute conceptually, methodologically and empirically to fulfil gaps on the study of contemporary workplace surveillance that merit further consideration.

Linguistic Acculturation of Romanian and Moroccan Youth in Catalonia. Bilingualism As Assimilation Ideology

The linguistic component of Acculturation Theory establishes that the descendants of immigrants construct four profiles of linguistic acculturation: pluralism, assimilation, separation and marginalization, depending on the degree of adoption and maintenance of majority and heritage languages.

In a multilingual context like Catalonia, with two official languages and an additional 250 spoken ones, it could be expected that the heritage languages of the descendants of immigrants would be valued more positively than in monolingual environments.

The aim of this communication is to explore weather this is the case or, on the contrary, the promotion of bilingual profiles entails an ideology of assimilation, that prioritizes the two official languages (Catalan and Spanish) over the ones coming from immigration.

These are the initial data of an ongoing investigation, where 256 14 to 16-year-old descendants of Romanians and Moroccans living in Catalonia have answered a questionnaire.

The data analysis includes descriptive statistics, cluster analyses and Univariate Linear General Models.

The main results show different tendencies: first, the descendants of Romanians and Moroccans mainly construct pluralist profiles and assimilation profiles. Secondly, their peers from the majority group prefer them to assimilate; and third, the outputs related to socio-educational integration are more balanced among those who assimilate than the ones with pluralist profiles.

This leads to the conclusion that, contrary to what could be expected, bilingualism becomes an ideology of assimilation that discredits heritage languages

El Espacio de los Jóvenes Estudiantes Como Coproductores de Políticas Públicas: Las Ocupaciones Escolares de 2015 y los Consejos de Escuelas Secundarias en el Estado de São Paulo.

El objetivo de este estudio es reflexionar sobre la participación social de estudiantes secundarios, dentro y fuera de instituciones formales, como los Consejos Escolares. Se refiere al papel de la escuela desde el punto de vista sociológico y demuestra que la escuela, más allá de promover la formación tradicional del ciudadano, necesita repensar el modelo para cumplir su papel de transformación.

Gobiernos han buscado involucrar a los ciudadanos en la implementación o incluso en la formulación de políticas. Así se constituyeran los Consejos Escolares, desde la Constitución Federal (1988), que están en las directrices y normas de los sistemas educativos brasileño, para promover la construcción de ciudadanía, gestión democrática y mejora de la calidad en educación.

En teoría, esta política pública sería, además de un canal de escucha o asesoramiento, un mecanismo de coproducción en los servicios públicos o sea, el usuario participa en la formulación, gestión, implementación y/o evaluación de este servicio. Pero la literatura existente señala dificultades en su consolidación, incluyendo la participación de consejeros: el 25% de los asientos son para estudiantes. Sin embargo, la forma que se inserta el joven en el proceso de creación e implementación de políticas está lejos de cómo se llevan a cabo su acción política hoy, cuando salen a las calles en manifestaciones porque entienden que la ciudadanía se basa en la experiencia.

Hay una tensión percibida en manifestaciones y protestas celebradas en espacios públicos, con la participación mayoritaria de jóvenes. En 2015, inspirados por las experiencias de Argentina y Chile, los estudiantes ocuparon durante dos meses 200 escuelas secundarias, contra el plan de reorganizar las escuelas estatales de São Paulo. La ocupación llevó al gobierno cambiar la decisión y mostró debilidad en su articulación con la sociedad, a pesar de los modelos institucionalizados de participación democrática, incluidos los consejos escolares.

LARI, NOORA* (Qatar University, Qatar)

Ambivalent Sexism in the State of Qatar: Gender Roles and Patriarchal Attitudes

The State of Qatar has undertaken considerable initiatives that prioritize strategies for female empowerment and promote gender equality. This paper investigates whether the effects of these equality initiatives are reflected in national attitudes toward women through the Ambivalent Sexism Inventory (ASI). While prior research has focused almost exclusively on the role of social implications, less attention has been paid to the public sentiments underlying traditional gender roles and patriarchal attitudes in a rapidly modernizing society. How and to what extent do various individual differences contribute to ASI scores in Qatar? And how does public opinion respond to benevolent sexism, which promotes ideologies that are slightly more progressive than those espoused by hostile sexism?

This paper examines these questions by using national public opinion data from a 2019 survey conducted by the Social and Economic Survey Research Institute (SESRI) at Qatar University. Given the high levels of gender inequality in Qatar, the results suggest that measures of hostility and benevolence correlate with Qatari national social attitudes. They scored slightly high on benevolent sexism. We explore these findings in light of ASI theoretical expectations, moving the discussion beyond the case study of Qatar to explore the different implications of the ASI in other Gulf Cooperation Council (GCC) countries.

LAROCHELLE, LAURENCE* (Université Sorbonne Nouvelle - Paris 3, France)

Religion, Morality and Gender Representations through Turkish Soap-Operas

Since 2000, the production of Turkish soap operas is in constant development. These soap operas that have indisputably a great success at a local level are also exported abroad. More precisely, they were first diffused in countries that were in the sphere of cultural influence of the ancient Ottoman Empire (which means the Balkans and the Middle East). Today, they are exported in more than 140 countries.

The exportation of Turkish soap operas abroad seems to coincide with a change of paradigm concerning the exercise of foreign policy by the Turkish government. More precisely, Turkish soap operas are considered by the Turkish government as a tool in order to enhance a positive image for Turkey and thus, augment its "soft power" to an important number of countries that were in the influence of the ancient Ottoman Empire (especially Arab and Muslim countries). Therefore, Turkish soap operas, enhance the promotion of Turkey as a country representing the ideal of a contemporary Muslim country.

O sum up, morality is a central element as far as the regulation of the production as well as of the diffusion of these soap operas is concerned. Consequently, the production of Turkish soap operas is determined by the values of the morality as it is defined by the government. Religion, is part of this morality as AKP implies a rhetoric which is based on religious rules and principles in order to legitimate its actions.

Through this paper we aim to present the representation of women - and men (considering the fact that our identity is defined also by alterity it is important to see how the "other" is represented in the same narratives) - by analyzing the narratives very popular Turkish soap operas as well as of their production process.

¿De Los Partidos a Las Causas? Trayectorias De Militantes De Estudiantes Secundarios. Un Análisis Inter Generacional.

Si bien la juventud es una construcción sociohistórica y no puede pensarse como categoría a través de la mera referencia etaria, esta ponencia busca reponer las primeras experiencias políticas de aquellos que comenzaron a participar en lo que -a grandes rasgos- podríamos denominar la "primera juventud". En esta dirección, la militancia en la escuela secundaria suele aparecer como una primera experiencia política y se constituye como espacio privilegiado para el análisis y la comprensión de la construcción del compromiso en este subgrupo en particular. Recuperando trabajos anteriores donde se da cuenta de las transformaciones sociopolíticas en la Argentina democrática (1983-2019) y sus figuras de activismo, es el objetivo de esta ponencia analizar carreras de militancia en jóvenes estudiantes secundarios con el fin de mostrar sus características, continuidades y transformaciones. Para ello, se recortan cuatro subperíodos: el retorno a la democracia en 1982/1983, los años de la hegemonía neoliberal (1989-2003) caracterizados no sólo por la adopción de un modelo económico y social excluyente si no por profundos cambios en los actores, formas de militancia y participación política, el periodo de los gobiernos de corte "progresista" (2004-2015) y el momento de restauración neoliberal abierto en 2015, caracterizado por una incipiente reconfiguración de las militancias en general y la irrupción/masificación en la escena pública de los movimientos feminista y de la disidencia sexual. Particularmente, se busca comparar, en cada momento, de qué modos concretos estos jóvenes de distintas generaciones políticas construyeron un compromiso posible, mediante qué referencias identitarias, redes, experiencias relevantes, espacios políticos, causas y sentidos del activismo. Para ello se utiliza el método biográfico interpretativo a través de entrevistas en profundidad atendiendo al diálogo entre biografías e historia social.

BLOMBERG, HELENA (Malardalen University, Sweden)
ÖSTLUND, GUNNEL (Malardalen University, Sweden)

Discursive Strategies in Adolescent Girl's and Women's Constructions of Mental Health and Ill-Health

The number of people with mental ill-health has increased in Sweden, especially among 10-24 year olds, where those who seek psychological consultations and psychiatric care for mental ill-health has increased with 100 percent in the past decade. Whether this is due to an actual increase of mental ill-health or can be understood as a result of an increasing medicalization of mental states is debated. Societal changes in late-modern society affect social relationships and experiences of mental health and ill-health, not least for women. One such change that has been highlighted in the field of medical sociology is the medicalization

process, which describes how a wider range of human conditions are labelled and treated as psychiatric disorders. The aim of this paper is to investigate whether and in what ways mental states are interpreted as medical (psychiatric) problems or social and/or societal problem. The paper is based on empirical data from two Swedish interview studies, one with adolescent girls (N=27) and one with adult women (N=16). The paper explores constructions of mental health and ill-health in the context of a diagnostic and medicalizing culture, and in relation to gender and social relationships. The analysis of how adolescent girls and adult women talk about mental health and ill-health reveal different discursive strategies. Psychiatric diagnoses are used as a rhetorical resource in these narratives, but other discourses which emphasize the importance of social relationships and the social environment are employed as well, and a one-sided medicalization and individualization of mental health and ill-health is thereby contested. The paper also highlights how young women, by using the psychiatric discourse to increase their socio-relational influence in the classroom or at the internet, act as active agents in the mental health dramaturgy.

LATRECHE, ABDELKADER* (Governement, Algeria)

Arab Future between Utopia and Reality

The Arab countries are unified by language, history, religion, , and very strong sense of common belonging. This is why Arab countries seem more united than others. However, only divisions, discords, crises, and conflicts are retained to describe the region. But these doubts disappear when we see the permanence of the strong sense of belonging to the same nation or "*Ummah*" among different Arab populations. But the belonging to the *Ummah* is not only limited to the feelings of the Arab population "from below", it is also linked to the survival of the idea of the Arab world, inherited from contemporary Arab thought and efforts, building an Arab space "from above". This is why another future in particular common future can be re-invent.

Forecasting the future of Arabs at this very particular moment of Arab history poses certain questions, such as: Do Arabs still have common future? Or has the common future of the Arabs become dream and become limited only to a simple feeling of belonging to a common history and geography? And how we can forecast the future of Arabs in a time of crisis and in a transformed world?

Forecasting the desired future of Arab countries, in dark times, will not present prophecies or a detailed picture of what will be the future in 2050 and more, but will aim to design the possible and alternatives features of the future, which should contribute to the designing of a better future.

This work does not claim to design the future of the new generations of Arabs accurately. But it does try, by means of an approach which combines both the inside and the outside, to ennoble the foundations of another future for the Arabs of tomorrow, without resorting to slogans.

The Library Loan Data As a New Resource for Studying Literary Culture

Finland is a country with high PISA rankings and a publicly funded library system, used by 80% of the population. However, radical changes in time use and digitization are influencing our reading habits. The consortium *LibDat: Towards a More Advanced Loaning and Reading Culture and its Information Service* (Academy of Finland) sets out to explore the reading culture in contemporary Finland. The material of the project consists of the loan data collected daily by Vantaa City Library in Finland's Metropolitan area.

In the proposed paper, I ask what the current reading culture looks like when analysed using this loan data. There seems to be a clear change since the 1970's: the widely read "national classics" no longer attract library users, the reading culture is not so uniform as it used to be. It is middle-aged female readers who maintain the literary culture in Finland: 73 % of all fiction loans in our sample (1,5 million loans, July 2016 – Oct 2017) were made by women, whose favorite novel was an entertaining historical novel *Ruokarouva* (2016, "The Housekeeper"). Loaners also favor novels published in series. On the other hand, the young loaners favor new translated Anglo-American young adult fiction (e.g. John Green), published also in series and adapted for film. They also read authors who are active in the social media.

In earlier studies of Finnish reading culture, methods such as queries have been used. The library data used in *LibDat* -project is a different, significant resource for understanding literary culture from a wider perspective. Analysis based on the integration of the large "born-digital" material, new computational methods and methods from the sociology of literature open a possibility to ask new questions within the qualitative approach in humanities, and to search for answers with the help of the quantitative data analysis.

Referral, access and participation in cancer rehabilitation for patients of low socioeconomic position: A study protocol of an institutional ethnographic study

Background
During and after cancer treatment a person can experience a broad range of sequelae, such as a decreased quality of life, fatigue or decline in physical functioning, this can be reduced by rehabilitation. Previous studies suggests social inequity in referral, access and participation in cancer rehabilitation. Especially for patients living with head/neck- and lung cancer, who are often associated with low socioeconomic position. In Denmark, there is equal access to health services, but patients of high socioeconomic position participate more in rehabilitation, creating a gap in health equity.

The aim of the study is to explore patients living with head/neck- and lung cancer of low socioeconomic position perspective on enablers and barriers for referral, access and participation in rehabilitation.

Method
The study is designed as an institutional ethnographic field study. Data consist of participant observations of patients, followed up by individual interviews with selected patients. The study will be conducted in multiple settings from hospital to municipal rehabilitation services. Following the patient's process from diagnosis to rehabilitation.

Expected findings
The study will provide an in-depth perspective on enablers and barriers to cancer rehabilitation for patients of low socioeconomic position living with head/neck- or lung cancer. The findings are expected to produce knowledge to increase equity in referral, access and participation in rehabilitation through peer-reviewed international studies.

Resonance in the Anthropocene

The scientific message of the "Anthropocene" (Crutzen 2000) suggests that humanity has been the most important factor in planet earth's transformation since the Industrial Revolution. Extreme weather events are increasing, biodiversity is decreasing, sea levels are rising, woods are disappearing, glaciers are melting, and civilization is perpetuating itself with radioactive waste and plastics in the earth's sediments. From the public discussion and political adaption of the diagnosis, there are at least three challenges to Critical Theory. The talk will adress them by exploring Hartmut Rosa's (2016) theory of resonance.

First, the concept of the Anthropocene favors a problematic homogenization, because it implies that the entire species equally bears the responsibility for the ecology crisis. In contrast, Rosa allows us to analyze the social conditions, heterogeneous actors and structural mechanisms of the Anthropocene. Second, the geological age of humankind has generated the political imagination that a technical solution to the ecology crisis by climate engineering is possible. Instead, Rosa's theory stresses the unavailabilities in the interplay between human and nonhuman entities. Finally, social science approaches from the posthumanist camp tend towards rather dystopian solutions for the current crisis: Bruno Latour (2015) calls for a state of emergency, Anna Tsing (2015) describes a life in capitalist ruins, and Donna Haraway (2016) pleads for a manipulation of the human genome in order to become closely related to butterflies, pigeons and other species. Again, Hartmut Rosa offers a potential alternative with his sociology of world relations. His theory provides a utopian redefinition of good life in times of the Anthropocene, which can justify its standards of social criticism immanently.

Cuban References of the Study about Youth Informal Groups

The first purpose of this paper conceived an approaching to gangs in Cuba, but, the following problem defined new aims to the study: there are no gangs in Cuba, or at least, there is little or none socialization of investigations about gangs among social Cuban researchers. Hence, it was necessary to relate close topics to the issue of gangs in the island. In this way, an approaching to subcultural and post-subcultural fields was drawn on. The current context of Cuba is exposed in this background through intertwined topics of deviance, youth and the conformation of collective identities. Some gaps found in this systematization as well as the main concerning of Transgang´s Project enabled to select informal groups which could be analyzed in a future research involved in Transgang´s project.

Does Social Spending, Organizational Membership, and Distributive Justice Amplify Protest Potential? a Cross-National Test of Conflicting Theories

A crucial question in this era of rising income inequality is why protest potential is so low. According to classic elite theory, the elite redistribute just enough of their economic resources through social spending to dampen protest potential. Yet, this "social spending" aspect of elite theory produces two conflicting theories. One says that higher social spending in education and health mitigates structural inequalities and thus averts protest mobilization, especially in the low-income nations (Acemoglu and Robinson 2000; Azam 2001). An alternative perspective considers that higher social spending creates louder demands for redistribution, i.e. the more government spends on welfare, the more social benefits citizens want to get from the government, and thus the greater the protest potential (Bellinger and Arce 2011; Evans 2018).

Whereas previous multi-level tests of these theories tend to focus on how structural conditions influence protest, what is needed are (a) meso-level explanations, particularly the role of organizations, and (b) cognitive explanations, including attitudes toward distributive justice. As for organizations, organizational membership and especially labor unions significantly contribute to protest mobilization. At the cognitive level, perceiving inequalities as unjustified, and perceiving the need for greater economic redistribution, can mobilize people to protest. Organizations and cognitive factors intersect: even when individuals share redistributive preferences, their protest potential will be low without organizational mobilization.

This is a multi-level, cross-time and cross-national test of the interaction of organizations and cognitive factors with the WVS data for 1999 – 2017. Preliminary results show that although social spending and pro-distributive attitudes are strong predictors of the protest potential, they interact. Higher level of education and health expenditures combine with the effects of the individual pro-distributive attitudes to amplify protest potential. Union membership and union density, in their turn, contribute to increased protest potential regardless of the level of social spending.

The Roots of Self-Rated Health: An Exploration of Its Comparability across Gender, Age, and Country

Background: Self-rated health (SRH) is arguably the most widely used generic health measurement in survey research. Yet, its basis is basically unknown and its comparability across socio-demographic groups and countries is highly questionable. In our paper, we want to gain a better understanding of SRH by quantifying the contribution of different health domains to SRH and investigating the potentially moderating role of gender, age groups, and country of residence.

Method: Using data from 61,365 participants of the fifth wave of the Survey of Health, Ageing and Retirement in Europe (SHARE) living in fifteen European countries, we explain SRH via regression models. The independent variables are grouped into five health domains: functioning, diseases, pain, depression, and behavior. Via dominance analysis, we determine their individual contributions to SRH and compare these across gender, three age groups, and fifteen countries.

Results: Our model explained SRH rather well ($R^2 = 0.51$ for females/0.48 for males) with diseases contributing most to the appraisal (.20/.18). Functioning was the second most relevant factor (.14/.16) followed by pain (.08/.07) and depression (.07/.06). Behavior (.02/.01) was less relevant for health ratings. This ranking held true for almost all countries with only little variance overall. A comparison of age groups, however, indicated that the contribution of diseases and behavior to SRH decreased with age while the importance of functioning increased.

Conclusion: Our paper demonstrates that SRH is largely based on diverse health information with functioning and diseases being most important in every analyzed country. However, there is still room for idiosyncrasies or even bias. Research that complements or primes SRH with its most relevant health domains (i.e., functioning and diseases) might provide an even more stable generic health measure.

Refugee Childhood in Brazil: An Analysis of Children's Request for Refuge to Brazil between 1998 and 2016

The refugee childhood is one of the many facets that involves the social phenomenon of childhood contemporaneously. In Brazil, there is an increase in requests for refuge, like worldwide, but no data in country really details which part includes children. This research mapped out which childhood have been formed as refugee in Brazil, based on the quantitative analysis of the children who make it up. The analysis of the composition is guided by the understanding that those children who have received recognition of the refugee status by Brazil do not solely form such childhood; this childhood is constructed from the hole universe of children's requests that are segmented in diverse statuses (accepted, rejected, with the process not judged). This organization is in agreement with the theoretical foundation that conceives refuge as a social process emerged in the governmentality of people: either expelling some of them from their country, as is the moment of emigration, or administering the immigration flows that enter the territories — the displacements of children are intermediated by migration policies. The methodology used is statistical analysis of secondary data, the table provided by the Comitê Nacional para Refugiados (Conare), which lists the cases registered until April 2016. As results, we highlight that the infantile flows of refugees to Brazil do not follow the same pattern of adult flows and should not, therefore, be simply analyzed as a derivation. It is also identified that the refugee immigration of children in the country does not follow the same intensity that occurs at international level. Another point is that the management of these

requests, through process judgments, promotes a significant change in the situation of refugee children, by not keeping similar proportions of the universe of child demands within status.

Weekend Work and Work-Family Conflict - Evidence from Australian Panel Data

Around one in three Australians usually works weekends in their main job. While it is often believed that non-standard work schedules, such as weekend work, interfere with workers' family lives, convincing empirical evidence on this issue is still scarce.

This paper investigates the impact of weekend work on work-family conflict among parents, using longitudinal data from the Household, Income and Labour Dynamics in Australia (HILDA) Survey for the period 2004 to 2017. We measure work-family conflict by a four-item scale reflecting how much workers' job demands interfere with their parenting and family role. Example items are: "Because of the requirements of my job, I miss out on home or family activities that I would prefer to participate in" or "Working leaves me with too little time or energy to be the kind of parent I want to be".

The paper adds to the literature in at least two ways. First, we focus on weekend work specifically, while previous studies have usually investigated broader concepts such as "non-standard work schedules". Second, whereas previous studies were cross-sectional, we compare results from pooled cross-sectional and fixed-effects regressions to investigate the role of worker characteristics in linking weekend work and work-family conflict.

We also investigate whether the effect of weekend work differs between the genders, by the degree of schedule control, and by the working schedule of the partner.

Results show that among both genders, weekend workers have significantly higher work-family conflict than those who do not usually work weekends. However, the association is weaker in the fixed-effects than in the pooled OLS model. Work-family conflict is particularly high for those who work weekends and simultaneously have little control over their schedule. Within dual-earner couples, there is no difference in the level of work-family conflict if only one partner works weekends or both.

LE BEL, PIERRE-MATHIEU* (Irstea, France)

Farm Incubators : Third Space for Rural Development?

In the academic literature on innovation, a lot has been written on third places (Oldenberg, 1989). Distinct from home (first) and work (second place), third place are define by free access, co-presence and collaborative processes. Morisson (2017) even proposes a fourth place were all three interact. Yet, as is the case with third place literature, Morisson centers on urban spaces mostly in association with the use of digital technology. This communication aims at exploring what third and fourth place mean for food networks and for rural development.

It does so by considering a specific case of AFN established since 2012 in France. The National Network of Farm incubators (RENETA or Réseau National des Espaces-Test Agricoles) aims to promote farming tests. These farm incubators enable prospective farmers to develop a life-size farming activity, in an autonomous way, during a limited time period, and in an environment designed to reduce risk-exposure. At the end, the prospective farmers evaluate their project and decide whether to continue their project, modify, or abandon it. The main activities of RENETA consist in experience-sharing and capacity-building, companionship as well as expertise and research in social innovation. The members of RENETA cooperate and mutualise their work, based on a charter and common values: social and solidarity-based economy and people's education.

This research shows that farm incubators can be considered as third spaces. With more than 500 project carriers all over France, farm incubators constitute an innovative way to secure food transition. The research methodology is qualitative and based on semi-structured interviews, secondary data, and direct observation. The people interviewed were founders, employees, project carriers, volunteers, politicians and public servants acting in RENETA's incubators. The implications are not only significant for third and fourth place theory but also in terms of power relations regarding rural development.

LE GAGNEUR, MARIANNE* (EHESS, France)

Telework and Information and Communication Technologies : Is Equipment Used As a Work-Intensifier or As an Articulation-Easer ?

Telework is often presented as an articulation measure: working at home would help along daily stakes, being a parent or not. However, research has shown that teleworking often comes with an intensification of work. Is then telework a work-life balance-easer ? When starting telework, employees that did not necessarily had access to a mobile phone or a laptop are given the possibility to incorporate work in other moments and spaces than office time, and telework moments. Not analyzing strictly telework, this communication will try to see how the equipment that comes with telework increases and intensifies work. Indeed, equipment standards that were traditionally reserved for executive workers are now extended to less qualified employees. How does this equipment modifies the organization and boundaries of work ?

This communication will focus on office workers of bank & finance sector, and will be based on field work and interviews (n=19) directed in the context of my PhD study. Employees interviewed have different roles, some of them do a low qualified work, and others are managers in different teams, and telework at home 1 or 2 days/week. The population studied comes from mixed gender categories, and are parents or not. Those specificities will be studied as they have a strong impact on the organization of work, and balance. They are all employed by the same company, and their offices are situated near Paris (France).

Firstly, this communication will depict my ethnographic research and methodology. Secondly, I will study how these ways of working can also ease articulation, by allowing employees to be more flexible on their work organization. Lastly, I will focus on teleworking and ICT as a work-intensifier : the idea that tools increase the amount of work done, inside and outside of telework will be discussed.

LE GROS, LUDIVINE* (, France)

Framing Young Managerial Elites' Work Aspirations out of Standard Career Paths : An Ethnography in a Career Change Training Program

As Binder, Davis and Bloom depicted it with Harvard and Stanford, elite universities are framing career aspirations and meanings of work. Therefore observing former engineering and business schools students' careers in France, it is not surprising to find that despite these two types of elite institutions are credited to offer a wide variety of career options, 73% of their graduates are actually occupying executive positions in private or public companies, according to INSEE jobs survey.

In a research on young managerial elites' socialisation to complex career change (Neal, 1999), we got interest into those who conversely "decide" to exit these standard career paths in the first years of working. While standard long-term executive positions in big companies could be perceived as most young workers as a social model of success, these exits question the career aspirations and meanings of work for this "privileged" population. Do the aspirations and frames of reference of work and career shift within the context of career change?

Considering career change as a socially embedded process, we investigated agents and places with whom and where radical career change is thought, designed and shared. Conducting an 8 weeks ethnography in a career change training program dedicated to young managerial elites, followed by longitudinal interviews with participants, we question in this communication how career aspirations and work perception are framed and shifted during the training program.

We will show 1) how the centrality of self-help and positive psychology in the program 2) combined with he reactivation of entrepreneurial dispositions, permeate work perceptions and new aspirations framing new references for future careers out of the standards.

RC52-637.5

LE GROS, LUDIVINE* (, France)

The Strength of Weak Ties in the Context of Managerial Elites' Career Change

Former traders becoming bakers or marketing managers becoming career coaches or entrepreneurs often make newspapers' headlines in France since a few years. These radical career changes are mainly depicted from a psychological standpoint suggesting they would be the outcome of self-motivation and willingness. But isn't this atypical occupational mobility more embedded into social context than it is depicted there?

While many researches have depicted the influence of social capital and weak ties into occupations and even occupational mobility (Granovetter, Burt, Lin), analyses into a context of disrupting type of mobility like complex career change are scarce. In this research we define complex career change as a voluntary occu-

pational mobility implying a simultaneous change in function and domain of work (Hall, 1999). In the process of shifting to a totally new professional context can weak ties still be activated?

This communication relies on a study combining quantitative data, collected from an on-line questionnaire (n=310), and qualitative biographical interviews (n=30) led with former managerial elites. These former managerial elites have in common to have studied in top ranking universities in France (called "grandes écoles") depicted by Bourdieu as a strong socialization agent (1989), and have worked as top managers mainly in private companies, before they decided to make a turning point.

We will show that continuous use of weak ties as key resource within the process of career change but also within the new profession is both inherited from 1) former social capital and 2) relational qualities incorporated through family, scholarship and former occupation.

LEAL, JANA* (Institute of Social and Political Studies of the University of the State of Rio de Janeiro UERJ-IESP, Brazil)

Unsafe Middle Classes: Changes in Consumption Profile and Lifestyles, Analysis of the 2000s in Brazil.

Despite the current trend of declining income and living standards of middle classes in developed countries, the 2000s in Brazil were characterized by the opposite tendency. Nevertheless, since 2013, a great number of brazilian middle class people have been rejecting governments that improved their standard of living during the 2000s and gradually started supporting far-right trends that culminated in the election of the current government. What would have happened over the course of the 2000s with the middle classes that contributed to the increase of their dissatisfaction and their current political conservatism? This is the central question that encourages this work. According to Bourdieusian's assumptions, consumption is an indicator of the middle-class lifestyle and social distinction. Thus, in an effort to reach social rise or in a fight against downward mobility, many middle-class people use the consumption to achieve the dreamed middle-class lifestyle. It is therefore an element that can reveal classes expectations and frustrations. Based on this theory, this paper seeks to demonstrate the popularization by which the consumption standards of the middle classes have passed during the 2000s in Brazil that possibly contributed to the increase of dissatisfaction feelings and insecurity of these people during that time. This paper, using 2002 and 2008 Family Budget Surveys (POF), a document from the Brazilian Institute of Geography and Statistics (IBGE), will seek to make a comparative analysis of middle classes lifestyles in these two moments in order to demonstrate lifestyle changes and how they may have contributed to the increasing feeling of insecurity and political conservatism of brazilian middle classes.

Trajectories of Social Entrepreneurship Development in Russia: Case of Saint Petersburg

In modern Russia, a new class of entrepreneurs is being formed, developing their business in the social sphere - private kindergartens, clubs, schools, interaction spaces, rehabilitation centers, nursing homes are being opened. Today it is obvious that social entrepreneurship has a wide range of applications and prospects. In a global context, there are two models of social entrepreneurship: European and American. However, the drivers of social entrepreneurship development all the same: political and legal environment in which to create socially oriented organizations, socio-cultural conditions and institutions involved in the study, training, and supporting social entrepreneurship. In this sense, from the perspective of development, social entrepreneurship in Russian society is possible with the active support of the state, the development of the necessary institutional environment and the stimulation of civil initiatives.

In the report, it is intended to cover both theoretical and practical issues associated with such aspects as: whether there can be a profitable business social entrepreneur; whether to distinguish "social enterprise" and "socially-oriented enterprises", where is the place of charitable funds; in what areas of activity is developing social entrepreneurship in St. Petersburg; what is the "product" offered by the social entrepreneur; what forms of participation and/or support from the state involved, and other issues.

On the basis of the conducted qualitative interviews, a large pool of biographies of heads of enterprises in St. Petersburg developing their business in the social sphere was collected and analyzed. Generalized characteristics of development trajectories of specific companies in the social sphere will be presented.

Fighting Sexual Harassment in New York Theatre

Contrary to certain media contents reflecting the effervescence of the "#MeToo movement, possibly tending to extract or dissociate sexual violence from their art context of production, this proposal intends to analyze how much the day to day theatrical practices constitute the crucible of gender violence, and, consequently, reveal as many obstacles to the naming, claiming and blaming of sexual harassment.

Based on a field survey conducted in 2015 and 2017 with twenty New York theatre professionals, before and while the "Weinstein affair" happened, our proposal intends to explore the professional continuum of inequalities between men and women, sexual harassment being one of its manifestations. The occurrence of violence is primarily dependent on professional structures and hierarchies (eg directors / actresses, employers / employees). It will be necessary to explain how the double positioning in a career (beginning / end of career), often correlated with the statutory position, and in a professional sub-space (at the margin or within the mainstream theater) makes possible the introduction of claims or on the contrary weakens them. Secondly, the specificity of the functioning and content of artistic practices can hinder the naming of both psychological and bodily violence, i.e. physical proximity on stage; temporal and spatial concentration of rehearsals and shows; porosity between private and professional lives on stage and off stage; importance of conservative aesthetic canons, stereotyped conception of physical attractiveness, etc. How do the artists and professional organizations start from these specificities to thwart the breeding-ground of gender violence? How giving proof of its existence? The modes of action invested will be scrutinized: mobilization of the law, writing of "statements of harassment", use of technological tools (creation of an app to fight sexual harassment and assault), use of choreographic techniques to formalize consent, etc.

LEDENEVA, VIKTORIIA* (The Institute of Socio-Political Research under the Russian Academy of Sciences (ISPR RAS), Russia)

Ethnic Enclaves As a Form of Self-Organization and Integration of Labor Migrants in Russia

The state of interethnic relations in Russia is closely associated with migration processes. The demand for cheap foreign labor contributes to increased flows of migrants. In this regard, the problem arises of the adaptation of migrants in the host community, or their social exclusion, provided there are no adaptation strategies, which, ultimately, can lead to the formation of ethnic enclaves in a long-term context.

The formation of ethnic enclaves is largely due to the lack of the necessary infrastructure that allows migrants to adapt and integrate into the host society.

Mono-ethnic enclaves have their own informal jurisdiction, generally accepted rules are completely ignored, these territories fall out of a single cultural and legal field, which poses a threat to the national security of the state.

The target set of migrants of a certain ethnic group and their compact distribution can seriously increase the burden on the social sphere of the local territory, contribute to the formation of multi-ethnic schools, lead to a drop in prices for real estate, and therefore contribute to the growth of territorial differentiation. In the ethnic aspect, an enclave is understood to mean a small territory, locality, and area of compact residence of people of the same nationality, surrounded by residents of the titular ethnic group.

The problems of the enclave of migrants are associated with objective problems of the social, cultural integration of migrants in the host community. The inability to integrate migrants into the host community initiates the process of enclaveization as a form of self-organization of the residence of people of one ethnic identity according to the standards of their culture within another socio-cultural environment. At its core, the host community itself pushes migrants into enclaves if this society is negatively inclined towards visitors and is not ready to accept migrants.

Redefinition of Employment Relations for Platform-Mediated Service Work

Along with the advent of digital platform economy, new forms of digital service work have proliferated. The digital service work, which is mediated by online platform business, differs from the typical form of employer-employee relationship in industrial economies. Despite remarkable proliferation of its presence, institutional norms to govern the platform-mediated service work have not yet been clearly formulated in both a statutory framework to regulate various actors involved in this work relations and consensual definition to allocate their status in labor markets. In many countries, policy controversies and labor confrontations have been escalated by such lagged institutional formulation on how to classify employment relations of platform-mediated work and to protect platform service workers from traditional and non-traditional risks of digitalized labor markets. In this light, our study sheds light on the case of platform-mediated delivery service workers in South Korea, by examining three research inquires: (1) in what work relations those digital irregular workers are located; (2) what difficulties they suffer from for lack of institutional protection given to 'legally employed' workers; and (3) who gains monetary benefits from the platform-mediated service work and, therefore, would be accountable for managing risks posed to the platform service workers. This case study might contribute to looking into and grasping work status and employment relations of platform-mediated service labor in digital economies.

Hong Kong's Anti-Extradition Bill Movement and Neoliberalism: Why Is Class Formation Unlikely Despite Class Grievances and General Strikes?

Hong Kong is a city where neoliberal ideology and neoliberal practices dominate. It is difficult for the workers in Hong Kong to unite together to challenge the neoliberal regime because of the lack of working class consciousness and the weakness of the trade union movement. During the recent Anti-Extradition Bill Movement, a lot of people in Hong Kong, including many workers, have been politicized. Attempting to force the government to offer major concessions, tens of thousands of workers took part in two general strikes in August and September in 2019. While the Anti-Extradition Bill Movement was not triggered by class issues, based on surveys targeting protesters and in-depth interviews, we argue that class grievances, which is a result of neoliberal policies and practices in Hong Kong, should be understood as an important underlying factor of the movement. Nevertheless, we argue that even the existence of widespread class grievances and the experience of taking part in strikes may have little positive impact on future workplace organization and class formation because of the mobilization process and framing strategies associated with the Anti-Extradition Bill Movement and the political strikes.

Socialization of Care and Gendered Social Economy in South Korea

This paper sheds lights on the recent increase in the social economy, in particular, in care service provision in the context of socializing care from the family. There are two important policy contexts in South Korea from the 2000s. Korean government implemented a series of socializing care policies including the long term care insurance for elderly in 2008 in response to the ageing population on one hand. On the other hand, the policies to promote social economy such as Basic Law on Cooperatives in 2012 and Social Enterprise Promotion Act in 2007 was introduced by the government "as a response to the negative impact of neo-liberal economic restructuring". It is worth paying attention that the growing portion of the social economy take part in the provision of care. It is regarded as an attempt to take the care provision out of market and to ground within the community, hence it may be an alternative to the marketization of care which has been accompanied to the socialization of care. While social economy is regarded as an alternative for the quality care provision, would it be an alternative to gender inequality? While the social enterprises and social cooperatives provide better working conditions to their carers compared to the other organizations in the market, the carers remain at the bottom strata of the labor market. While that the social economy may be regarded as an alternative to the economic liberalization, they fail to transform gender inequalities in the market as well as non-market by integrating women to the labor market with low wage and poor working conditions. Based on the qualitative study on the care workers in the social enterprises and medical social cooperatives, I raise a question on the meaning of the social with gender perspective.

Certification: A Crucial Component in the International Discussion of Professionalism

As the market for professionals becomes increasingly international, attention has focused on the credentialing of individuals (Allsop et al. 2009). In many countries, certification is overseen by government entities, while in others, including the United States, certification of sociological practitioners, both clinical and applied, is carried out by the Association for Applied and Clinical Sociology. In this presentation it will be argued that professional control of the certification process benefits both the practitioner and the client. For the practitioner the credentialing process creates a community of workers with similar interests and commitments. For the client certification creates a sense of confidence in knowing that the practitioner is knowledgeable, skilled, and will adhere to ethical standards of practice.

Intolerance and Human Rights: Discussing Vulnerability for Syrian Refugees

Description of the research: This work investigates the influence of intolerance for the victims of refugee camps, considering the theme of victimology and pandemic. It addresses the refugee situation at Syria in 2020, and its relevance to the understanding of reality within the fields of humanities. The research problem addresses the understanding of the degree of influence of Intolerance to increase victimization. It seeks to understand the relevance of intolerance to the increase of damages to the civilian population, as well as the degree of vulnerability present in those societies. The research also seeks to understand the relevance of humanitarian issues and their diffusion in the contemporary world, starting from the discussions on cultural hegemony with Gramsci and considering authors such as Boaventura de Souza Santos, Franz Fannon, Edward Said, Karl Marx, Marilena Chauí, Gizlene Neder, Gisálio Cerqueira Filho, Eugênio Raúl Zaffaroni, Eric Hobsbawn and Martin Van Creveld. It presents the various elements of Humanitarian effectiveness and the interaction in protecting the victims of that armed conflict. The research observes the relevance of the different theoretical traditions present in international relations regarding humanitarianism, as well as studies on intolerance and vulnerability, and its relevance to the discussion of the process of legitimizing Humanitarian Law. The hypothesis of the work is that there is a high degree of influence of intolerance for the development of vulnerability for the civil population and concludes on the relevance that intolerance has in armed conflicts, amplified by the diverse dimensions of cultural hegemony present in Syria. The results will allow the understanding of methods and elements to be considered in an analysis of armed conflicts in pandemic times, as well as the complexity of the actors involved, considering the absence of support for victms and the dispersion of violence.

Mozambique and Brazil: Understanding Hegemony, Emancipatory Knowlodge and Humanitarian Issues

This paper seeks to present the main conformationelements of the difficulty of social insertion of peripheral communities and social groups in Mozambique and Brazil. To this end, a clipping will be discussed on the social vulnerability present in these two countries. It seeks a documentary and bibliographic research, considering authors who discuss social insertion and vulnerability in Mozambique and Brazil. Authors such as Gramsci, Loic Wacquant, AmartiaSen, Zigmund Baumann, Pierre Bourdieu and Boaventura de Souza Santos will be treated. For this investigation, the following topics are observed: history; conforming elements of the difficulty of social insertion, level of social vulnerability, and theory on social exclusion, cultural hegemony, ideological apparatus of state, and on the role of governmental, religious, social institutions and emancipatory knowledge.

This research presents elements about vulnerability and social insertion considering the understanding of two realities present in Mozambique and Brazil. It deals with independence in Mozambique (1975) and the difficulties present with the civil war, involving the whole of Mozambican society. It also discusses the War of Canudos (1897), where about 5,000 military and 25,000 civilians died, with a large number of victims among children, women and old people. The destruction of the village of Canudos created a discussion about the atrocities committed against the civilian population, which suffered a process of distancing itself from access to basic social services such as education, sanitation and health services. More than that, it is considered the possibility of understanding the phenomenon of social exclusion present, considering an approach on intolerance in the non-recognition of the other.

The Happiness Quantified Self: Apps, Algorithms and Contemporary Sociabilities

The goal of this paper is to investigate the emergence of digital apps centered on wellbeing and happiness, their engagement strategies and their impact, resulting in daily practices of self-tracking and Quantified Self. Thus, the paper seeks to present the first results of an investigation that finds theoretical inspiration on economic sociology and sociology of emotion, and, as for its methodology, conducts ethnographic research using the app Happify. The referred app projects charts and happiness level indicators through the weekly input of personal information regarding the frequency of feelings such as happiness/sadness, loneliness, anger, self-realization and satisfaction/dissatisfaction in the personal, affective and professional realms. Thereby, the logic of algorithms begins to direct users to specific activities and programs offered by the platform, relating to affection/relationships, finance and career, thus suggesting the change of certain habits in order to conquer high performance happiness indicators. It follows that happiness is the result of personal abilities that are materialized in numbers and statistics pertaining to factors such as enjoying, thanking, wanting, giving and empathizing. In this manner, the first evidence on the digital metrics of happiness lead us to discuss the quantification of emotional matters, the pricing of happiness and the impact of the self-management of personal information in everyday sociability.

Knowledge and Acceptance of Homo-Bisexuality By Parents : What Consequences on the Mental Health of Lesbian and Bisexual Women ?

Si jusque dans les années 1950, les études sur la santé mentale des homosexuel·le·s considéraient l'homosexualité comme une pathologie, les recherches qui se sont développées par la suite ont permis de dépasser ce préjugé. Depuis plusieurs dizaines d'années, les travaux en santé publique et en sciences sociales se sont penchés sur le bien-être mental des LGB (lesbiennes, gays, bisexuel·le·s) sans considérer leur sexualité comme une maladie. Ces études montrent que les LGB présentent plus que la moyenne une mauvaise santé mentale. En effet ces personnes sont soumises à des facteurs de stress, en tant que minorité visible mais aussi lorsque qu'elles tiennent cachée cette situation minoritaire. Autant la visibilité que l'invisibilité sont de potentiels facteurs de stress qui détériorent leur santé mentale. Pour comprendre ces mécanismes, je m'intéresse aux liens entre la santé mentale des lesbiennes et des bisexuelles et la connaissance et l'acceptation de ces identifications par leurs parents.

L'enquête Virage LGBT (Ined, 2015-2016), à laquelle 2 500 lesbiennes et 700 bisexuelles ont répondu, dispose des informations nécessaires pour observer les variations de bien-être psychologique à l'aide de régressions logistiques dichotomiques. Deux principaux résultats se dégagent. Si la connaissance de l'homo-bisexualité par les parents n'est pas nécessairement associée à une meilleure santé mentale, l'acceptation de cette identification l'est fortement. Des effets d'identification sexuelle apparaissent : pour les lesbiennes, la connaissance de l'homosexualité par les parents n'est pas associée à un meilleur état psychique, quand les résultats pour les bisexuelles sont moins nets. La visibilité d'ensemble des LGB est, à juste titre, un enjeu des luttes militantes contemporaines. Mais les bénéfices d'une visibilité individuelle apparaissent moins évidents, notamment pour les lesbiennes et les bisexuelles, dont l'identification est souvent niée ou considérée comme transitoire, et ce d'autant plus au sein de la famille où la sexualité féminine est particulièrement surveillée.

LEMANCZYK, MAGDALENA* (Institute of Political Studies, Polish Academy of Sciences, Poland)

Language Diversity within and between German-Polish Families in Germany and Poland.

The author will present partial results of qualitative research conducted in Poland and in Germany within the international project "National identity of children from mixed Polish-German marriages" (Research Grant of the *Polish-German Science Foundation*, No. 2018-24, 2019-2021). The project has an interdisciplinary character (sociological, historical and political), entering broadly into the area of current research trends in the humanities and social sciences.

The author will focus on presenting the trajectories of transfer and transmission of German and Polish, and thus cultural patterns, norms and values, both among the examined families/respondents, as well as government institutions, educational institutions and mass-media. The issue of bi- or multilingualism of the respondents and their social environment as well as impact on the position in social structure will be presented, among others situation of the respondents on the labor market, access to education, perception by the social environment (e.g. positive or negative discrimination), examples of asymmetry (issues of cultural, social and economic capital). An interesting example will be presentation of differences in language maintenance within and between families. Examples of practical and symbolic role of language in respondents' lives will also be presented.

Dynamic of Holocaust and Slavery Family Memories and Public Memory in Bordeaux

Based on a multidirectional approach, this paper intends to address the issue of family memories related to the Holocaust and to Slavery in Bordeaux, and their relationship to public memory. Indeed, 1585 Jews were deported from Bordeaux to Drancy, and almost all murdered in Auschwitz. Their regional deportation was organized by the French local authorities, not only by the Nazis. Between the 17th and 19th century, Bordeaux traders and ship-owners deported about 150,000 captives from Africa to Caribbean and Indian Ocean islands. All these historical facts were silenced for a long time in local public and collective memories, but not in the social memory at intersubjective levels. Starting from my ethnographic and micro-historical fieldwork carried out since the 90th in Holocaust and Slavery socio-memorial contexts in Bordeaux, I propose to consider changes starting at the end of the 20th century and their developments until 2019. How Holocaust survivors have transmitted their experiences within families and outside, and what was the dynamic between inside and outside, especially in schools and during the Papon's trial? What are the interlacing of their memorial practices and those of their descendants? What are the social levels involved, and the effects on public memory? What is the impact of the public wall of names (Bordeaux Holocaust victims) that I carried out? Concerning the enslavement of African captives, how descendants originated from French islands and Haïti evoke it. How they express elements of their oral family history in their memorial activities? Among them, what are the current effects of the recently inaugurated statue of Modeste Testas (African women bought and enslaved by two Bordeaux brothers) that I carried out (starting from my implicated fieldwork with her descendant) with the municipality and with an Haitian sculptor? Finally, what are the local interactions between Holocaust memories and Slavery memories?

Men in the Realism of Machado De Assis and Rio De Janeiro of Nineteenth Century

From the relationships between the characters in the romances by Machado de Assis (classical author of national literature), the present work seeks to indicate in an analytical way their masculinity aspects of rio de janeiro in 19th century. The choice of the literature works came about with the author's narrative construction, which is based on a rich description of representations of certain social groups brought to Rio de Janeiro in the mid-nineteenth century, in the midst of the emergence of Realism in the country, also lived by Assis. Thus, leading to a possibility of understanding the impact of gender relations and their configuration in that period starting from the look of masculinities in the actors and relations of this society in that historical context that was undergoing sociocultural transformations based on fresh political ideals newly arrived in a colonized Brazil.

LENZ, ILSE* (Ruhr-University Bochum, Germany)

Global Inequalities Among Feminisms and Processual Intersectionality

Intersectionality was proposed by Kimberlé Crenshaw thirty years ago in order to analyse the interchanging inequalities by class, gender, migration and sexuality. It has been taken up in social and cultural sciences, politics and global institutions (UN, some governments). So it may be appropriate to reflect on the development of the concept and the new challenges it is facing. One central challenge is how to apply it to the inequalities between feminisms divided by geopolitical location, class, migration and diverse understandings of feminism (liberal, radical, queer).

After shortly summing up the present variations of intersectionality, I want to propose the concept of *processual intersectionality* and substantiate it with an analysis of the changing relations between authochthonous and migrant women's movements in Germany and Japan. This means investigating how intersectionality has influenced the starting positions as well as the processual development of feminisms: For example in Germany, migrant women started their autonomous circles and movements often in reacting on the racist and sexist ignorance and exclusion they experienced in society but also in mainstream feminism. In Japanese feminism, Korean feminists gained a leading voice in their struggle for recognition and solution oft the postcolonial problem of the women forced into military prostitution by the Japanese imperial army in World War II.

Migrant and postcolonial feminists created their own space; they thus entered the semipublic space of feminism and appealed to the political and social public. In the following negotiations, they gained voices of their own as well as symbolic and political capital. I will argue that the intersectional relations in feminism in Germany and Japan have changed and that the analysis at the start oft he migrant women's movement must be reevaluated in considering these processes. This is especially relevant when looking at social coalitions against racism, sexism and right populism.

De Víctimas a Defensoras: Estrategias De Mujeres Víctimas En El Nuevo Contexto De Justicia De Transición En Colombia

El trabajo propuesto presenta resultados parciales de la investigación doctoral en curso, de corte empírico, que explora las estrategias y demandas construidas por las víctimas del conflicto armado interno colombiano en el nuevo escenario de implementación del Sistema Integral de Verdad, Justicia, Reparación y No Repetición (SIVJRNR), creado con ocasión del acuerdo de paz firmado entre el gobierno colombiano y la guerrilla "Fuerzas Armadas Revolucionarias de Colombia – Ejército del Pueblo" (FARC-EP) en 2016.

El estudio se basa en entrevistas realizadas a representantes de seis colectivos de mujeres que componen la Red Nacional de Defensoras y un estudio de caso (Corporación Mujer Sigue Mis Pasos, organización creada y conformada por mujeres víctimas de violencia sexual). Las reflexiones resultantes y objeto de la presente propuesta se orientan por la siguiente pregunta: ¿Cómo grupos de mujeres víctimas y defensoras de derechos humanos construyen sus estrategias y demandas por "verdad, justicia, reparación y no repetición" ante el nuevo sistema de justicia transicional en Colombia? Los hallazgos parciales alcanzados nos remitirán a tres ejes de problematización:

Trayectorias e implicaciones de la doble enunciación "mujeres víctimas" y "mujeres defensoras". Dialogaremos con debates recientes sobre los modos y

desafíos contemporáneos de la movilización de las víctimas en contextos de transición política (Lefranc, 2008, 2009 y 2015) y con preguntas localizadas sobre las tensiones emergentes entre el activismo legal feminista y las acciones colectivas de las mujeres víctimas (Vergel, 2015; Amaya & Alvim, 2017).

Apropiaciones y usos del derecho por las mujeres víctimas para construir sentidos propios sobre "verdad", "justicia", "reparación" y "no repetición" en la transición post-acuerdo de paz en Colombia: dilemas y desafíos ante la marcada "juridización" de la justicia de transición.

La profesionalización de las mujeres víctimas en el oficio de escuchar, documentar y demandar y los desafíos de la traducción al lenguaje jurídico.

Seeking Legitimacy through Violence? Policing the Socio-Geographic Borders of the Urban Brazilian City

This paper seeks to explore the everyday forms of policing in Brazil, notably through Veena Das's idea of ordinary violence. Indeed, a year-long ethnography of the military police of Rio de Janeiro (precisely a Pacifying Police Unit working in a favela) reveals the quotidian forms of policing that are weaved between state recognition and state punishment, or simply between compassion and repression (following Didier Fassin's idea of dialectic between the two). The military police are most often one of the only state institutions present in pacified communities. On one hand, they seek legitimization through social initiatives (such as parties, courses, and activities) looking to establish bonds and trust with favela residents. On the other, they become delegitimized as soldiers struggle to classify residents by distinguishing the "well-known" traffickers from others social categories (*trabalhador* or *pessoa do bem*, *traficante* or *bandido*, *consumidor* or *vagabundo*). This process of filtering is often troubling and chaotic and incites distrust, tension and fear. Policing with such closeness is carried out by stereotyping and discriminatory practices that function to either condemn or protect, often set by a priori mapping of individuals. While some deserve compassion and protection, others deserve repression and retaliation. Ultimately, the pacifying power offers social control through repression and social legitimation through compassion. The police create new forms of (dis)order by managing life inside the favela and ultimately reproducing the very socio-geographic borders they were supposed to erase.

LEON SPESNY, SARA* (The University of Sydney, Australia)

Writing an Ethnography of the Military Police in Brazil: Research at the Borderlands of the Novelistic Narrative

"On a certain afternoon, Sergeant Ivan assigned a patrol with Batista and Remi. They walked quickly downwards through the morro, hoping to arrive at the station where we could rest. "At least until this rain stops" affirmed Remi. After a quick call to Sergeant Ivan, the soldiers expressed relief that he gave them permission to stay there. Afterwards, I headed to the delegacia, a few kilometers away. After a while there, Sergeant Ivan entered. He was following up on some report. He takes a glance and notices me. His expression perplexed. I walk up to him sensing the need to explain. He asks "What happened? What did they do to you? Did they hurt you?"

Searching to draw connections between the narration of violence and social sciences, this paper aims to discuss the stitching together of language, ethnography and violence. Based on a year-long ethnographic study of the military police in Rio de Janeiro violence emerged within a microphysics of power (in relation of her interlocutors and in a broader sense). The language of violence emerges to the ethnographer as a challenge. One that has methodological implications, but also, one that comes to life through the narrative process. What are the connections between the scientific ethnographic project and *l'act littéraire*? Where does the ethnographer find her narrative voice? How do we establish a language of violence, that seeks to explain, interpret and analyze, but also cast an image and an emotional response of the readership? How does the ethnographer appeal to broader audiences, respecting her ethics and scientific perspective, but also balancing a narrative pace that often carried a dose of suspense, violence, complicity and risk? Can the police ethnographer become a new voice as the one in the roman noir? Ultimately, what are the boundaries between novel and ethnography?

LEONE, FLAVIA* (Université Paris Est, France)

Managing Your Building with the Law: An Analysis of Lower-Class Condominiums in a Process of Energy Improvement

In 2009, as part of the Grenelle Building Plan, French public authorities set the goal of energy improvement of condominiums. The transposition of this energy policy to the housing sector challenges the co-owners on all the new obligations that now stem from their status: they must cooperate to "bring the common areas of their building up to standard". This paper proposes to question the way in which the co-owners apprehend this legal status of property and to what extent

their perception is modified (or not) at the time of the adoption of new housing standards. Inspired by the Weberian approach of the sociology of law (Weber, 1986), it is question of how law guides the social practices of the co-owners, their relations of residence, the management of their patrimony. In that sense, we must reorient the empirical attention of positive law towards the interpretations, transpositions and uses which constitute the apprehension of the law by profanes (Elwick P. & Silbey S., 1998). To develop these issues, we will rely on a fieldwork that concerns two lower-class condominiums located in two French suburbs (Montreuil and Saint-Herblain). The data mobilized are based on a body of interviews conducted with co-owners, trustees and institutional actors as well as observations made during working meetings among co-owners and building sites as well as general meetings of condominiums.

Inequality and Adaptation to Climate Change in São Paulo Macrometropolis: An Environmental Justice Approach

This proposal seeks to contribute to the study of climate change and environmental justice with a particular Global South case study, the Macrometropolis of São Paulo, Brazil, with about thirty-three million inhabitants. For the cases studied, there is a well-established link between the negative consequences of global warming on marginal groups, exacerbating social inequities. In that sense, this proposal dialogues with contemporary Environmental Justice literature understanding the importance of the concept from a critical research perspective, and considering that part of the original argument would contribute to the study of climate change and environmental justice interfaces, in a dialogue with new approaches and notions such as climate justice, environmental governance or anticipatory governance - where climate risks are assumed unequally and unfairly by those who have contributed the least to the global climate change process.

This propose problematizes the necessary interface between the rights and justice agenda and the debate on climate change, more specifically in relation to the issue of adaptation in the Global South. Assuming that adaptation, rights and justice must be so intertwined in planning, policies and social mobilization, so that adaptation does not become an empty or reproductive concept of the production of inequalities, the São Paulo Macrometropolis Action Plan (SPMP-AP) and the Ecological-Economic Zoning of the Northern Coast (EEZ) of the State of São Paulo was used as a case of analysis. Preliminary findings noted that in Brazil, the climate justice discourse has not yet been systematically incorporated, from the point of view of government actors as well as social movements.

Human Capital in Digital Economy

The authors show the relevance of researching human capital and ICT-competences in digital economy. Possessing the competences, connected with the usage of digital technologies, becomes not only the requirement for specialists hired for jobs, but also the necessity of everyday life. The paper reveals the competences that are appropriate for workers to a greater or lesser extent in terms of digitization. The authors analyze not only the degree of possessing competences, but also the frequency of their usage. The researchers pay our attention to the population's attitude to technological innovation that is considered as one of the digital literacy's components, representing the readiness of society for digital economy.

Shifting Identities to Support Climate Transitions in Agriculture

The latest IPCC report highlighted the need for a major shift within agriculture away from greenhouse gas-intensive approaches towards more ecologically and socially sustainable practises. Often, much of the responsibility to change practises falls on the individual farmers. Farmers, however, represent a unique identity group, one that is not always amenable to change. Their relationship to the land that they manage is centered around caring, livelihood, and sustainability, yet the majority of farmers in western industrial agriculture are reluctant to shift their practises to mitigate climate and environmental impacts. This study sought to explore how farmers are navigating the current socio-political climate, particularly pressures to shift towards more sustainable practises and the increasing volatility

associated with agricultural lifestyles from rising input costs, reduced revenues, and increasing variability of weather events, and how these forces shape farmer identity as a result. We conducted 31 semi-structured interviews with farmers in Alberta, a modern industrial agricultural field, to explore how they understand their group identity, particularly as it relates to their decision making and the environment. One of our key findings was the emergence of two very distinct groups of farmers: one still largely engages in conventional agriculture but adopts technologically-driven environmental mitigation practises that have an economic benefit; and an emerging group that represents a substantial departure from conventional agriculture, prioritizing ecological factors in their decision-making processes in ways that have significant implications for their goals and practices, in alignment with a sustainability transition in agriculture. Our findings indicate that a shift towards more sustainable agricultural practises on a large scale will require network support for emerging identities compatible with new regimes.

Dealing with Test-Based Accountability: A Conjoint Analysis of School Leaders' Strategies to Improve Tests' Results

In the last decades, most countries in the world have introduced accountability mechanisms in their education systems. The predominant model is based on national standardized tests that measure students' learning achievement at the school level. The stakes attached to test-based accountability (hereafter TBA) vary from context to context. While in some cases test results are associated to material incentives and sanctions for schools and school actors, in other cases, test results are associated to both tighter forms of school supervision and reputational consequences. In TBA systems, obtaining good test results becomes a central goal. Because of this, TBA increasingly changes educational practices at the school level (Lingard et al., 2013) and eventually favor the emergence of undesired behaviors that could threaten educational quality and jeopardize the content of the curriculum, as academic literature has highlighted (Berliner, 2011, Booher-Jennings, 2005, Ohemeng and McCall-Thomas, 2013). Few studies have until now specifically focused on both formal and informal strategies adopted by school leaders to improve results when dealing with national standardized tests (Jennings, 2010). Based on survey data collected in Chile and Spain, this paper fills this gap by using a novel survey-based experimental conjoint design. This approach accounts for the multidimensionality of strategies adopted by school leaders, but it also helps addressing the potential desirability bias that could arise when talking about undesired behaviors. In this study, we specifically explore which types of pedagogical and organizational strategies are preferred by school leaders, and assess how personal and contextual factors are related with different strategical preferences. Such strategies range from those related to the use of data from assessments for instructional improvement and staff and curriculum management to cream-skimming strategies. The results are relevant from the policy perspective due to its potential to identify the pedagogic, organizational and social effects of TBA policies.

Migratory Processes and Capitalism: An Analysis of Venezuelan Migration to Boa Vista - RR

Migration is a global process. The reasons why thousands of people leave their origin countries very often refer to structural or even conjunctural causes that do not adjust so easily, and because of this, migratory processes must remain constant. Following this line of thought we propose to analyze the ongoing migratory processes to the city of Boa Vista, capital of the state of Roraima, where in the last four years there has been an intensification of the migratory flow of passage and permanence, especially of venezuelan migrants. In this perspective we want to understand how the intensification of the migratory flow is impacting the labor relations of these migrants in the city of Boa Vista.

LEVENSON, ZACHARY* (University of North Carolina, Greensboro, USA)

The Dark Side of Distributional Democracy: Eviction Regimes in South Africa Today

Following apartheid, South Africa's first democratically elected government promised to house residents by delivering more formal homes than any other democratic regime on the planet. Government officials explicitly articulated this as a project of realizing democracy, drawing on the liberation movement's equation of land and housing with freedom. But the pace and extent of urbanization in this period completely overwhelmed the government's capacity to deliver. As a consequence, thousands of South Africans have no choice but to occupy land as they wait for housing. Housing officials often read increased levels of squatting as a sign of democratic deficit and therefore attempt to expedite the relocation of squatters into formal housing. Even if such occupiers are not attempting to secure formal housing, the fact that they often do means that officials imagine them as willful "queue jumpers." They misrecognize squatters as a cause, rather than a consequence, of the state's failure to deliver and therefore police new land occupations with a draconian severity. This speaks volumes about the post-apartheid eviction regime: rather than evicting in the name of boosting real estate value, this paper argues that these occupations are viewed as threats to democracy's material realization.

Work and Neoliberalism through the Lens of Georg Simmel´s Sociology: Affectivity, Money and Social Differentiation

Following the transformations that, in recent decades, resulted from the implementation of neoliberal policies, the sociological literature has focused on the figure of the "entrepreneur" as a central element of the contemporary capitalist ideology. In these investigations, however, a Foucaltian approach to subjectivity has prevailed. In contrast, taking up empirical materials that are the product of a series of interviews conducted in Buenos Aires recently, this presentation aims to explore the theoretical tools offered by Georg Simmel's sociology to describe the current situation of workers. For that, I take into account, in the first place, the relationship established by the German author between work and affectivity in the "sociology of the senses" sketched in his "*große Soziologie*", as well as his reflections on suffering and work in *Philosophie des Geldes*. Second, I display the relationship between work and money, recovering Simmel's characterization of certain modern jobs that consist of earning money and nothing else, regardless of any vocation. Finally, I use the Simmelian perspective of social differentiation, specifically, the contrast between synchronic and diachronic differentiation proposed in *Über soziale Differenzierung*, to describe the labor trajectories of workers under neoliberalism.

Does Competition at College Campus Rely on Family Background? the Effect of Family Background on Human Capital Accumulation of College Students in China

The university enrollment expansion policy adopted by the Chinese government in 1999 has brought about a sharp increase in high education opportunity from about 10% of college gross enrolment rate in 1999 to 47% in 2016. About half of today's young people have opportunities accessing to high education so as to arouse increasing researches examining if family background has lasting effect on academic achievements and other human capital accumulation after accessing to high education. The cultural reproduction theory and the selective elimination hypothesis provide opposite answers. This paper examines effect of family background on the accumulation of human capital of college students based on the Panel Survey of Chinese University Students (PSCUS) in 2017. The result shows that there are differences in the influence of family background among different universities and colleges. In elite universities, family background hardly displays its effect, meritocracy dominates competition and selective attrition effect is prominent. In other universities, on the contrary, family background shows a strong effect, and cultural reproduction mechanism plays an important role. In vocational colleges, neither cultural reproduction mechanism nor meritocracy reveals significant effect on the accumulation of human capital of students. These findings reflect that the fast expansion of high education has led to the differentiation of universities in competitive rules. Cultural reproduction theory or selective elimination hypothesis could not provide a full explanation for the changes in today's Chinese universities because of popularization of high education.

Income Inequality and Social Classes in an Era of Globalization and Deglobalization: A Comparison between China, Russia and Brazil

As the major emerging economies, China, Russia and Brazil had a fast economic growth during the first decade of 21th century but have been suffering economic slowdown or problems since the 2008 financial crisis. The three countries had all benefited greatly from globalization in the former period and impacted deeply by deglobalization in the latter period. Based on national survey data of three countries of 2001, 2008 and 2015, this paper is trying to examine the changes of income inequality and social class position in income hierarchy during two periods in three countries. The results show a similar trend in three countries: the middle income group expands significantly in both periods but more low-income people upgrade into middle-income in the former period and more high-income people downgrade into middle-income in the latter period. However, three countries show different changes of social class position in income hierarchy during two periods. It concludes that the fast economic growth following globalization as well as the economic slowdown following deglobalization have brought about same impact on income inequality of three countries but winners and losers as social classes are different between periods and countries because of differences in economic structure, social policies and state's role.

The Relationship between Understanding of Democracy and Political Participation in Russia Under Putin's Non-Democratic Regime

Understanding of democracy has two dimensions: citizens' normative ideals of democracy -- beliefs and expectations about what a democracy should be -- and citizens' evaluation of the quality of democracy in their country. In theory, an understanding of democracy can lead someone to participate, or not, in that democracy. In established democracies, it is easy to envision a citizen that holds high the normative ideals of democracy and evaluates the quality of democracy highly (or, perhaps, only in slightly less favorably), and decide to participate in the political process to change what they view as wrong. But what happens to the relationship between understanding and participation in regimes where the normative ideals were never put into practice? In this presentation, I explore the 'understanding - participation' relationship in Russia under Putin, which for the last two decades has repressed citizen actions to change the regime from autocracy to democracy. I ask two questions: How do Russian citizens understand democracy? and How does their understanding of democracy associate with political participation? I expect that, in Russia, (a) there would be polarization in normative ideals of democracy, (b) that strong anti-democratic ideals would correlate with a positive evaluation of Russia's democratic performance and (c) in contrast, pro-democratic normative ideals would correlate with a negative evaluation of Russia's democratic performance. I also expect that (d) only those with this strong negative correlation would have a higher probability of political participation. I test the 'understanding - participation' relationship in Russia using the European Social Survey round six (2012), fielded at the height of pro-democratic protest, which contains the module, 'Europeans' understanding and evaluation of democracy.'

*Semantic Analysis of a Political Term-Xieshang Minzhu (*协商 民主*)* in Chinese Context after 18th National People's Congress*

Chinese politics, characteristic with notoriously complex issue as to deal with the matter of large population and inherit with the centralized political traditions. Last two decades witnessed the sharp collision between Chinese and Western politics, in response, domestic authors increasingly focus on the indigenization (*bentuhua* 本土化) of the Chinese political science, therefore, defense with the idea of politics with *Chinese characteristics*. This paper, the authors focus on the Chinese discourse of '*deliberative democracy*'. Yet, there has been almost no scholarly literature on the specific issue of the semantic analysis of *Xieshang Minzhu* within the Chinese politics. thus, the authors try to adopt the methodology by better understanding the propaganda of the Chinese Communist Party (CCP) officially. By establishing a corpus that including three axes that of the Chinese official propaganda (newspaper), leaders speeches (since the 18th National People's Congress (NPC)) and the official documents[1] *via* Word Vec by calculating the word vector, thus combing the affiliation that of the *Xieshang* or *Xieshang minzhu* with

other key words. The purpose of this contribution, therefore, is to differentiate *Xieshang minzhu* adopted by CCP as part of political reform that embedded on the Chinese politics. The semantic analysis here also role also as a methodology that developed to build a conceptual model of the *xieshang* in a systematic way. Further, the author provide an outline of the polysemic of deliberative democracy that not only exist within an authoritarian regime, but also expound that, it can be presented in other forms and embedded in the Chinese politics, further to maintain the legitimacy of the CCP, simultaneously, develop the socialist democracy.

Profesión en lo ISCO y en la Sociología

Es propuesto hacer una reflexión acerca del uso de profesión en lo ISCO (International Standart Classification of Occupations), que es parte dela OIT, como una clasificación de un grupo, utilizando-se de la teoría de la sociología de las profesiones. Esto es levantado pues hay una multitud de conceptos de profesión y lo que es utilizado por la organización esta preocupado principalmente con la buena interpretación de dados estadísticos, así en lo primer hay mucha complexidad y lo segundo una simplicidad visible. Cree-se como premisa que la sociología de las profesiones tiene mucho lo que contribuir con la formación de constructos utilizados en pesquisas e políticas públicas. Inicia-se con la construcción de una visión panorámica del uso del concepto en la sociología anglosajones y francesa, así pues la abordaje tradicional y una que hace importantes críticas. Después, la presentación de la clasificación de lo ISCO, una interpretación visando demostrar los limites y virtudes del modelo. Al fin, busca se levantar propuestas para la construcción del concepto de profesión de forma que se presente bien adaptado a pesquisas estadísticas y se utilice de las reflexiones de la sociología de las profesiones.

¿Cuáles son las Variables de la Profesión?

Este trabajo pretende organizar variables capaces de comprender el amplio alcance de lo que es una profesión para futuros estudios cuantitativos. Por lo tanto, propone una breve, pero pertinente, digresión teórica, donde es posible destacar los puntos principales de lo que forma una profesión. Posteriormente, pretende hacer una reflexión acerca de la clasificación utilizada por la OIT (Organización Internacional del Trabajo), ISCO (Clasificación Internacional Uniforme de Ocupaciones), mas específicamente. Finalmente, pretende hacer una lista de las variables que son fundamentales para comprender las profesiones, incluido pensar en ellas en términos comparativos, como una clasificación en grados de profesión, o lo que autores como Julia Evetts llamarán profesionalismo.

Commodification of Immigrants: The Immigration Industrial Complex and the Politics of Inclusion and Exclusion

Immigration scholars have adopted the term "immigration industrial complex" (IIC) to refer to "a confluence of interests in criminalizing undocumented workers and in immigration law enforcement". As such, the theorization and empirical exploration around IIC have mainly focused on legal apparatuses that explicitly criminalize or exclude immigrants. Using longitudinal data on state immigration bills and laws between 1998 and 2010, we find that the same corporate interests in immigration detention contributes to the increase in both pro- and anti-immigrant lawmaking. Following a long tradition of critical immigration scholarship, we argue that instead of laws and policies that solely aim at criminalizing immigrants, the immigration industrial complex relies on a legal regime that simultaneously includes and excludes them. This is because 1) the "illegality" of undocumented immigrants presupposes "legality" as an unmarked status, and 2) the perpetuation of the immigration industrial complex relies on a stable and sizable immigrant population. We further reveal how this relationship between corporate interest and immigration legislation is conditioned by local political context. We build on previous scholarship on IIC by illuminating how economic and political interests intertwine in neoliberal border management. We expand this scholarship by highlighting the interconnectedness of seemingly contradictory legal tools utilized to control, manage, and commodify migrant bodies.

Gender, Race, and Home Foreclosure in the American Deep South

In this paper, we use Leonard Pearlin's theory of social stress to analyze housing loss among Black women homeowners in a Deep South County of the United States. From our longitudinal database on home foreclosure, we chart the frequency of housing loss over a 12-year period from the Great Recession to the present day. This period has seen a growing gap in Black-White homeownership despite a decade's worth of recovery in the national housing market. We identify chronic strains such as medical debt, divorce, death, job loss, mortgage delinquency, business failure, and bankruptcy for each foreclosee over time, and patterns of foreclosure that relate to unfair lending practices and racial steering to segregated neighborhoods. The results of the study provide a gender-race history of the structural factors that exacerbate housing inequalities through gender stratification and foreclosure.

The Impact of the Solidarity Economy on Youth Development

Young people are no longer waiting to be the future of societies; they are already taking control of the present and transforming it. Sadly, they are facing a big challenge: worldwide they are the group most affected by unemployment. Youth are responding to this difficulty by creating their jobs in organizations that answer to their socio-economic needs, and at the same time, to their demands for social and environmental justice: they are founding collective enterprises in the solidarity economy.

However, not much is known about collective entrepreneurial processes when carried out by young people and the impact that it could have on their human development. Youth studies have usually been framed within a single discipline. For example, entrepreneurship covers some elements in the current economic system ignoring youth human development phase. Meanwhile, youth development literature does not consider their monetary needs. Moreover, the social solidarity economy's research focuses on explaining how it is an alternative economic system capable of answering to problems such poverty and exclusion but does not provide details of how these alternative economies are built. Hence, there is a need to analyze such a complex phenomenon from a multidisciplinary approach that could provide new elements that are somehow neglected by separate disciplines.

By taking a multidisciplinary and de-colonial approach, I present a study of the processes that unfold during the creation of four youth co-operatives in Mexico. In particular, I analyze the impact that the social solidarity economy has on youth human development.

LIDDY, MAGS* (School of Education, Ireland)

Everyday Learning from Overseas Volunteering:Exploring the Translation Dynamic

Everyday we encounter information and experiences from which we can learn something, where these encounters can reinforce existing beliefs, or we can reject the experience as irrelevant to our worldview. I argue that there is a translation dynamic between everyday experience, where we engage in a reflective process and onto an integration or rejection of the experience into our worldview. These learning moments are negotiated by a variety of objective and subjective factors, and negotiation of between individuals' agency and dispositions within social structures and their own lifeworld.

To explain, I draw on my PhD research which examines social learning of overseas volunteers. It centres on the translation dynamic as the participants integrate this immersive experience into their everyday professional work practices and worldviews (Bourdieu 1977; 2000). My presentation will explore the learning arising from the experience of Irish teachers working in India, examining the potential of this socially and culturally different experience to interrupt taken-for-granted practices. The teacher-volunteers' learning process plays out through this translation dynamic is analysed through practice theory where changes in dispositions are mediated within the constraints and enabling factors of habitus (Bourdieu 1977, 1980).

This dynamic is demonstrated in two ways: how volunteer-teachers integrate relevant knowledge into their everyday professional practices, and how some volunteer-teachers struggle with learning on global development. There are clear professional gains in capacity for the volunteers from their work overseas, their learning fits within existing beliefs, it is purposeful and applicable to their everyday world (Wenger 1998;2010). However they also witness global development challenges and their translation dynamic is not as successful due to several hindering factors. I termed this liminality or third space (Bhabha 1994), as a place for the negotiation of everyday experience and where new meanings can emerge.

Shaping Environmental Expertise for Social Transformations: The Role of Social Sciences

Numerous international expert bodies and assessment centers have evolved around environmental issues with the aim to assess scientific knowledge and make it policy relevant. Even if social sciences are increasingly welcomed to these bodies, evaluations have found that they still play a limited role. A reason for this is that they often are restricted either to give advice on procedural aspects or to handle down-stream issues and end-pipe solutions. This presentation take this situation as point of departure and elaborates on the character of a social scientific expertise for environmental matters, i.e. for social science to become a more distinct change agent. Drawing on findings from Science and Technology Studies (STS), environmental sociology and critical social theory, it stresses that in order to give robust and relevant expert advice, expertise needs to include at least three aspects. An understanding of how society works (analysis of social dynamics); an identification of the character of a particular environmental problem (diagnosis of pathologies); and a proposal for how to solve the problem at stake (therapy, i.e. means for initiating and supporting social transformations). It is therefore crucial that social science expertise opens up for critical deliberations on social causes behind environmental destruction and political opportunities to transform society to become more sustainable. The paper ends by discussing the benefits and risks of including all three aspects – analysis, diagnosis and therapy – in the making of social science environmental expertise for social transformations.

La Cartographie Des Philosophies De Talent Chez Les Managers Des Talents : L'Approche Par Les Conventions Une Étude Comparative Entre Le Cameroun Et La Belgique

Les travaux de Meyers et Van Woerkom (2014) fournissent les différentes conceptualisations du talent et du management des talents portées par les managers au sein des organisations. Ainsi, à travers les philosophies de talents, il est possible de prédire la manière la manière dont ces derniers définissent le talent, les personnes qu'ils considèrent comme talentueuses, la valeur qu'ils accordent aux employés talentueux, et comment ils pensent que les employés talentueux devraient être déployés pour maximiser les performances (Meyers, Van Woerkom, Paauwe et Dries, 2019). Cependant, ces travaux ne fournissent pas des explications relatives aux repères qui orientent ces perceptions chez les managers. Partant de cette limite de la littérature, le recours à la théorie des conventions apparaît pertinent pour comprendre et expliquer les fondements des discours des managers des talents sur le talent et sa gestion au sein des organisations.

Dans ce travail, nous nous intéressons aux conventions à l'œuvre dans la construction des philosophies de talent au sein des organisations. Précisément, nous cherchons à identifier les philosophies de talent qui sous-tendent le discours des managers des talents et les conventions auxquelles ils se rattachent. Notre recherche permettra ainsi de comprendre pourquoi au sein d'une même organisation, d'un même groupe, voire d'un même secteur d'activité, des managers de talents peuvent avoir des conceptualisations « *différentes* » ou « *pas* » du talent et du management du talent. Nous entendons ainsi mener une comparaison entre le Cameroun et Belgique, des pays aux multiples cultures linguistiques et dont certaines entreprises sont des filiales d'une même maison-mère.

Pour réaliser notre recherche, nous allons mener des entretiens semi-directifs auprès d'une trentaine de managers des talents en Belgique et au Cameroun, appartenant à des secteurs variés. Les données collectées seront analysées par catégories conceptualisantes à travers le logiciel Nvivo.

Fighting the Opioid Crisis: Reducing Stigma and Healing Communities through Implementation of Evidence-Based Curriculum in Utah's Tribal and Rural Communities.

The United States is experiencing an opioid crisis. In 2017, the national rate of drug overdose was 14.9 per 100,000, with opioids contributing the highest portion of these overdoses. Additionally, rural areas are being hit particularly hard by this crisis. The state of Utah is in line with both national and rural trends regarding the opioid crisis. In 2017, the age-adjusted mortality rate from drug overdoses in Utah was above the national average (15.5 per 100,000), ranking Utah the seventh highest rate of drug overdoses in the nation. In particular, Utah's tribal and rural communities experience the greatest burden of opioid overdose. In addition to high rates of overdose, these communities experience a disproportionately high prevalence of stigma related to opioid use disorders. To combat these alarming trends, our team turned to community-based participatory research in order to develop and implement culturally and environmentally tailored Substance Use Disorder Counselor Curriculum and Naloxone Training Curriculum. With an emphasis on targeting rural and tribal communities, these curricula are delivered to both community members and professional substance use disorder counselors with the aim of reducing stigma and improving harm reduction practices related to opioid use disorders in Utah's most at risk populations (i.e. tribal and rural communities). For decades, research concretely shows that harm reduction practices, like medical assisted treatment (MAT), significantly reduce the prevalence of opioid use disorders and thereby decreases the rate of overdoses due to opioids. Yet, stigma stands as a serious barrier to individuals utilizing harm reduction practices and receiving MAT. Therefore, through the implementation of these curricula, coupled with pre/post evaluation of each training, our team utilizes community-based participatory research methods to intervene in an effective and sustainable manner, thereby reducing stigma related to harm reduction practices and opioid use disorders in Utah's tribal and rural communities.

¿Jóvenes Militantes, Trabajadores y/o Funcionarios De Juventud? Recorridos y Perfiles Militantes En Torno a Las Áreas Nacionales De Juventud Durante La Recuperación Democrática En Argentina (1983-1989)

En el siguiente trabajo se propone realizar un abordaje de la gestión de las primeras áreas nacionales de juventud creadas en Argentina durante el gobierno constitucional de Raúl Alfonsín (1983-1989), desde la exploración de sus articulaciones entabladas con el ciclo de movilización política juvenil que acompaña la apertura democrática en el país. Mas puntualmente, colocamos la mirada en aquellos dirigentes y jóvenes militantes de diferentes organizaciones socio-territoriales y políticas, que participan de esta primera experiencia de trabajo estatal de la juventud. Siguiendo la perspectiva de la sociología del militantismo (Fillieule, 2001; Agrikoliansky, 2017), nos interesa reconstruir las carreras y recorridos personales de dichas juventudes movilizadas en la época orientando la indagación en dos grandes sentidos: por un lado, explorando las experiencias de participación política de estos actores a partir de identificar las causas, proyectos militantes y repertorios de acción que caracterizan a sus espacios de pertenencia y en torno a los cuales se configuran sus compromisos políticos. Por otro lado, nos abocamos a desentrañar los modos de vinculación de los jóvenes dirigentes y militantes con las áreas nacionales de juventud, los roles y funciones ocupados en la gestión, así como los saberes, capitales y experticias movilizados por los mismos en torno a la construcción de una nueva agenda de trabajo con las juventudes en la década del ochenta. Finalmente, proponemos la definición de figuras (Pudal, 2011) que permiten retratar los diferentes perfiles militantes recorridos y también, los sentidos construidos por parte de los propios actores acerca de sus múltiples inscripciones y pertenencias a la actividad militante y al trabajo en el estado.

LIM, HYUN-CHIN* (Seoul National University, South Korea)

Populism Grown in Globalization: Civic Empowerment for Democratic Resileince

Today we are witnessing the decline of democracy as well as the resurgence of authoritarianism worldwide. Undoubtedly, democracy is in retreat, threatening to undermine political rights and civil liberties. With regard to this, two things of importance must be pointed out. First, while citizens throw doubt on electoral votes, they tend to rely on increasing activism on the streets and to show growing resentment online. This politics of distrust endangers democracy characterized by participation and competition. Second, populism makes a comeback to threaten party politics while at the same time widening political and ideological cleavages. From Italy through Sweden to Brazil, anti-liberal populist parties have gained increasing power by resorting to an exclusionary national identity. This paper argues that neo-liberal economic globalization has brought in sovereignty crisis in terms of making national policies on migration, refugees, inequality, polarization, job losses, and so on. I claim that populism is dictated by rhetoric and mobilization to remain in power. Agitation and mobilization often outweigh debates and participation. Populist parties try to mobilize mass support to link directly to the people. It would undermine the possibility of democratic contestation and compromise. In the present literature, there are three ways to deal with populist challenges: (1) the accommodation of non-democratic actors, (2) repressive democracy, and (3) the containment of political extremism. In this paper, however, I strongly argue that civic empowerment would be the best possible solution to

334

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

save democratic ideals and values in the face of populist challenges. Enlightened citizens could join together to form civic organizations based on mutual trust. An examination of an Asian case of Indonesia and a European case of Sweden will prove my hypothesis of civic empowerment.

Mujeres En Movimiento En La Comunidad Quilombola Buriti Do Meio: Trayectorias Femeninas y Estrategias Productivas

    La Comunidad Rural de Buriti do Meio, ubicada en el municipio de São Francisco, en el Sertão de la región Norte del estado de Minas Gerais en Brasil, recibió su reconocimiento como quilombola por la Fundación Cultural Palmares en 2004. La población de Buriti desde entonces viene ampliando su acceso a servicios estatales y asegurando sus derechos. La historia de Buriti do Meio es hecha por un conjunto de vivencias y experiencias de las mujeres, con sus vidas marcadas por los procesos migratorios y por las estrategias productivas y reproductivas como alternativas a la escasez de las oportunidades de trabajo en la región. Propongo, a través de narrativas biográficas de cuatro mujeres de la comunidad, analizar la relación entre trabajo y familia. Es posible que analizar las trayectorias de vida de las mujeres quilombolas permita comprender el panorama de las alternativas de trabajo desarrolladas por ellas en la comunidad y sus relaciones sociales en el ámbito familiar y comunitario. El concepto amplio de trabajo – que envuelve producción y cuidados – da sustento teórico metodológico para exponer las multitareas desarrolladas por las mujeres del quilombo Buriti do Meio. Voy a dar enfoque especial a los trabajos en cerámica, por sus características de ser mayoritariamente desarrollados por las mujeres y por ser considerado por la población local la principal actividad productiva de la comunidad.

Labore: Participatory Technology Assessment of Automation Technologies

    Throughout the history of work, the industrial revolutions were periods of time work was rapidly transformed and one of the main drivers of this transformation was technology. Nowadays, as the 4th Industrial Revolution is becoming a reality around the world, society faces another such moment of rapid transformations of work.
    In the long run, technologies positively impacted work and, in general, brought benefits to society. However, it is also known that the first generations coexisting with new technologies had their jobs profoundly impacted both in terms of quantity and quality.
    If society desires to avoid the negative aspects of the implementation of new technologies, Technology Assessment must assume a fundamental role given that the impact of emerging technologies on work should be understood. Furthermore, considering the power imbalance usually intrinsically built in the new technologies, any assessment that does not involve the stakeholders, risks being a legitimation tool for the interests of the powerful.
    Given this context, this paper presents the development of LABORe, a methodology and a computer system for the assessment of technologies that will impact work. The proposed artifact allows workers to have a central role in the assessment of technologies that will impact their work in the future. As such, LABORe seeks to be a tool for the participation of workers in the decision process of technology adoption; where they would usually be left out only to later fight the negative results.

RC16-206.2

LIMA NETO, FERNANDO* (Pontifical Catholic University of Rio de Janeiro, Brazil)

Democracy and Participation in Contemporary Brazil: Reframing Political Culture

    The fact of having historical phenomena as its objects of analysis implies that sociological theory should permanently be adjusted to empirical processes that are ever changing. In this sense, concepts such as democracy and participation are associated with a wide and diverse range of theoretical traditions and historical phenomena. The idea of participation was often associated with direct democracy or totalitarian regimes of the twentieth century. It is only recently that theorists have begun trying to reconcile the notions of participation and representative democracy. The events that succeeded the redemocratization of Brazil in the late 1980s to the present constitute an opportunity to analyze the relations between participation and democracy. The field of participation has been consolidated in Brazilian political theory during the last decades and presents different perspectives to understand the recent course of democracy. The aim of this research is to identify and analyze the new practices and meanings that activists from *coletivos* have attached to the notion of democracy in Brazil. *Coletivos* are recent forms of social and political mobilization in the Brazilian public sphere that concerns the mobilization of people in activisms linked to various themes and domains of life. The rise, recurrence and empowerment of the *coletivos* constitute a promising laboratory to further contemporary theoretical debates, in particular the approaches of quality of democracy and participation, in the light of recent challenges of democracy in Brazil. I analyze the meanings that activists from *coletivos* attach to the notion of participation and identify ongoing important changes in the formation of political culture in Brazil that points out to the emergence of news frames of State-society relations.

Fighting Warriors: Militant Women for the Rights of the Elderly

    This work, which is part of my ongoing PhD thesis research, aims to understand the trajectories of elderly women who become militants of the cause of the old-aeged. The Permanent Forum of the National and State Policy for the Elderly of the State of Rio de Janeiro (Forum PNEIRJ) emerges as a central space to understand the participation and representativeness of civil society in the dispute of legitimacy about who knows and who can say what the demands are for the elderly population. From this instituition, stands out women leaders of civil society for the cause of the elderly, with singular histories and trajectories, working in spaces such as the Forum, the State Council for the Defense of the Rights of the Elderly in Rio de Janeiro and the National Association of Gerontology - Rio de Janeiro (ANG-RJ). Using as a research methodology the actor-network theory (LATOUR 1998), investigating the paths covered, as well as the performance, participation and networks of relations established by these women, this research seeks to understand who these women are, how they build their militancy being at the same time public target of their actions, where and how they act by militating for the rights of the elderly, with which other spaces and agents they dispute, what discourses they produce about old age and its needs and how they relate to the elderly population in general.

Educational Upward Mobility. Practices of Social Changes--Research on Social Mobility and Educational Inequality.

    Social class is defined by the possession of all forms of economic capital, cultural capital and social capital which shape the kinds of experience and lifestyles. This process Bourdieu dubbed symbolic violence. Education is crucially linked to assets such as income, occupational position and social prestige. Educational upward mobility requires more than individual effort and intelligence, and sometimes different ingredients, such as specific social conditions. Inequality is a major issue today in public debates. The different dimensions of inequality—income, poverty, social exclusion, education and social mobility—are interconnected. The paper has been inspired by Bourdieu's work on symbolic domination and capitals, and lifestyles. Our objectives are to note the various kinds of capital the students of different classes brought into their university experience, and to explore the various types of capital they acquired over the four years. The author identifies a persistence of inequalities among the students due to social reproduction mechanisms: family background and precisely parents' social situation have a strong influence on the life chances of people. My focus on working-class people captures the historically, politically, economically, and culturally decisive structures that supported the educational upward mobility. Part 1 begins by outlining the research field and analyzing the literature. It allows us to analyze social contexts and outline how social change in a way that contributes to social upward mobility. To draw objective conclusions from these factors, a theoretical framework is needed. Part 3 discusses methods. These experience and practice tended to correspond to evident differences in possession of capital, would appear to reveal differences of class habitus produced by distinct conditions of existence. In order to explore these, qualitative and quantitative researches are undertaken in 2019. The empirical data of this study come from a survey. The paper ends with a summary of findings and conclusions.

Evaluation of Tsunami Hazard Education in Coastal Communities of the Cascadia Subduction Zone

Government agencies often provide residents of hazard-prone areas with brochures containing essential information about local hazards and appropriate protective actions, but few agencies evaluate those brochures to see if local residents can understand the information they contain. To evaluate tsunami evacuation brochures for residents of Washington, Oregon, and California, this project developed an evaluation rubric comprising eight criteria—1) general criteria, 2) tsunami hazard content, 3) environmental cues content, 4) tsunami warnings (sources/channels/messages) content, 5) preparedness actions content, 6) response actions content, 7) numeric information, and 8) maps. These criteria showed that six currently available tsunami brochures had some notable weaknesses. However, they provided a basis for constructing a composite brochure that was presented in *DynaSearch*, an Internet-based computer system that allowed a sample of coastal residents to search individual text boxes and maps. *DynaSearch* recorded the number of times each text box or map was clicked and the length of time that it was viewed. The information search data revealed that respondents spent the most time reading a) what to do when a major earthquake strikes, b) interpretation of natural warnings, c) sources of official warnings, and d) the difference between distant and local tsunamis. The information search phase was followed by questionnaire pages assessing variables from the *Protective Action Decision Model* and the *Risk Information Seeking and Processing* model. The questionnaire data indicated that respondents had only a few inappropriate beliefs about tsunami hazard and response actions, the most important of which were expectations of engaging in so many milling activities that they would be unable to evacuate before a local tsunami arrives. Overall, this project's findings provide emergency managers with guidance on methods of improving their tsunami hazard education programs. In addition, these findings can guide transportation engineers' evacuation analyses and evacuation plans for coastal communities.

LINDGREN, LENA* (, Sweden)

Populism: Old and New - a Conceptual Itinerary 1968-2020

ISA now mirrors the rapidly increasing attention directed at 'populism' in the social and political sciences. At the world congress in 2010 the term appeared in two papers (3+7 mentions of it), whereas there were 170 mentions of 'populism' at the 2018 congress. The aim of this paper is to discuss the general impact of 'populism', following use of the concept in public discourse and political rhetoric over the last five decades. Already in the mid-sixties the London School of Economics held a conference entitled "To define populism", although there was general agreement then that the subject was much too vast "to be contained in one definition" (Berlin et al. 1968). The opening lines of an edited report of that LSE conference "A spectre is haunting Europe – the spectre of populism" (Ionesco & Gellner 1969) seems even more relevant today. 'Populism' is often considered to be the greatest threat to democracy, although a generally accepted definition of it seems still to be missing. Democracy in this context is seen as being more often 'liberal' than 'constitutional' or 'representative'. I will discuss the terminology of 'liberal democracy' and its opposite 'illiberal democracy' and argue that this dichotomy is more obscuring than clarifying in analysing the impact of 'populism' on democracy. Definitions of democracy seem to have lost some of their significance when co-opted by 'populism'. An example of this could be the classification of the Hungarian, Russian and Turkish regimes as being "essentially democratic, but at odds with liberal democracy" (Mudde & Kaltwasser 2017). 'Populism' is often described as a "thin" ideology, as compared with classical political ideologies such as liberalism and socialism. 'Liberal democracy' has become an accepted political category in most theoretical and empirical studies of the political impact of populism, whereas economic or social democracy is not.

LINDHULT, ERIK* (, Sweden)

Action Research, Philosophy of Science and Democratization of Research

One common feature of different variants of action research is a rejection of technocratic, undemocratic streaks in science and inquiry, particularly emanating from different aspects of the still quite strong positivist and contemplative academic heritage (Toulmin 2001). Action research was from the Lewinian start already seen as a form of research to further the democratic process. A basic impetus in participatory action research is bringing practitioners into the scientific research process (Fals-Borda & Rahman 1991; Aagaard Nielsen & Svensson 2006). Democratizing science raises the questions whether science will become more or less scientific. How can the academic researcher be engaged, useful and democratic - as well scientific - at the same time? The purpose of this paper is to clarify to what extent and how different philosophies of social science can collaborate in the development of arguments for democratizing scientific activity and action research approaches. The focus will be on the way pragmatism, critical theory and critical realism can further a democratic and action turn in social science. I.e. in pragmatism there are resources in its conception of inquiry as situational transformation and the overlapping of democratic and scientific practices, in critical theory conceptions of power, communicative rationality and emancipation, in critical realism in identifying contextual constraints to freedom and strategic uses of our freedoms for social transformation. At the same time there are controversial issues in different ways in these three philosophical-theoretical positions in arguing for scientific inquiry as inherently democratic, e.g. the the role of objectivity and mechanisms in critical realism and the reflective distancing from action and practice in critical theory. We land in a guarded argument for a democratic turn and action research orientation based on the three positions.

Dialogue As a Social Research Orientation and Method within the Framework of Participatory Action-Research

Dialogue as an approach to social science research transforms the relation between researcher and researched and is a core feature in the orientation to research in participatory action-research. The purpose of the paper is to show how a dialogic relation in social research improves scientific knowledge generation, the transformative learning of participants as well as the capacity for contributing to social change. We draw on and compare contributions to dialogic approaches from southern (i.e. Freire, Fals Borda) and northern (i.e. Lewin, Reason, Gustavsen) traditions, and the way these approaches can support PAR and be combined in a paradigmatic clarification of an emerging dialogic social science. It takes a point of departure in openness to the other, democratizing the research relation striving for equal participation in knowledge creation where knowledge is co-created and made transformative in the interaction between participants. Ontologically it is a paradigmatic shift from depicting a given reality, to a participatory worldview where reality is co-constructed through generating transformative learning and cooperative action among concerned parties. We draw on project experience of PAR that shows that there are hugh challenges involved both in the struggle of transforming established paradigms of social research in a dialogic direction and in the cultural struggles in relation to structural inequality in society. At the same time PAR experience in enabling dialogic relations shows the potentials for empowerment of actors and more workable and efficient research methods and practices that can enhance scientific quality by mobilizing the learning and reflective capacity of all, in a way that can produce transformative social change. We contribute by offering a model of dialogic research in PAR which nospan southern and northern approaches and practices.

Neoliberalism, Extractivism and Corporate Mining in the Philippines: The Politics of Dispossession, and Indigenous People's Resistance Towards Sustainable Development

This research paper argues that neoliberalism's constant search for new spheres for global capitalist expansion and extractivism apparently are going hand in hand. This is for example seen in the global expansion of corporate mining that result in the expulsions of indigenous communities from their land and dispossession of their basic social, economic, political, environmental, and cultural rights. In such process, we see the alliance of transnational capital and neoliberal states, especially in the periphery. This is, for example, illustrated in the case of the Philippines. The Philippine Mining Act of 1995 that liberalized corporate mining for transnational corporations embody neoliberal policies that serve the extractivism of transnational capital for profit while it plunders the environment, usurped the Filipino people's self-determination, and wreck the lives of indigenous people. This context has become a site of resistance of indigenous people and other allied organizations and human rights defenders, where transnational corporate power, state violence in defense of capital, and state bureaucrat capitalist elites are challenged. This dialectic of oppression and resistance provokes alternative visions of a post-extractivist regime anchored on an integrated framing of human rights and sustainability. In gathering data for this research I was guided by some principles of grassroots-oriented research and used methods that included fieldwork in the Philippines in Fall 2017 where visits to a mining site and interviews of indigenous people affected by corporate mining and participant

observation of some of their forms of resistance were conducted. The fieldwork was made possible by the US Fulbright Scholar Award of which I was a recipient in 2017.

From the Creative Class to the Spectacular City: Comparative Urban Development and the Multiple Logics of Displacement

This paper offers a comparative analysis of contemporary urban redevelopment through the lens of displacement(s). Using the cases of the "spectacular city" of Rio de Janeiro and "creative class" development in the Washington, DC metro area, we demonstrate how, despite their different logics and political promises, contemporary urban development strategies achieve "improvement" of the city through the displacement (both discursive and physical) of marginal populations manifested as either suppression or replacement.

In the case of Rio de Janeiro, we focus on competition for global city status through the construction of the spectacular city. This included the promotion of the city as an international venue through the hosting of the 2014 World Cup Final and the 2016 Olympic Games. Global city status is seen as a way to attract both global capital and international tourism. Here displacement takes the form of discursive *de-location* (or narrative erasure) and physical *suppression* of marginalized communities (in particular the informal settlements or favelas).

With the arrival of Richard Florida's "creative class thesis", inter-city competition has taken on a new form: cities are to compete, not for corporate investment, but instead for the highly-educated knowledge workers prized by the most profitable sectors of capital. Interrogating the arrival of Amazon's new headquarters in the DC metro area, we argue that this creative class development involves a new relationship between government and population; Floridian city governance, it would seem, is no longer about supporting and cultivating the health of the city's existing population, a la Foucault, but instead the reconstitution of its population by attracting new, more privileged subjects (the well-educated subjects of the creative class) to replace sectors of the population that are less attractive to capital. Urban redevelopment here followed a different logic of displacement, one that took the form of demographic *replacement*.

LINDWALL, JOHAN* (University of Gothenburg, Sweden)

Housing First or Last? on the Dilemmatic Representations of Homeless Drug Users in Swedish Social Work Discourse

Homelessness is a global, yet very local, concern. An increasingly popular method for targeting homelessness across the world is 'housing first'. In social work with homeless users of illicit drugs, the method offers clients an independent accommodation as a primary and unconditional intervention, as opposed to a 'staircase model' where clients earn their way towards an increasingly independent living by accepting treatment or abstaining from drug use. New methods introduced in a field can however clash with other social ambitions. In the context of Sweden's restrictive drug policy, where all non-medically prescribed drug use is criminalized, the dilemma arises that social workers, in order to embrace 'housing first' or similar strategies, must accept drug use among clients – something they simultaneously are expected to prevent. In the context of this dilemma, the focus of this paper is on the rhetorical strategies at work within social workers contemporary homeless discourse to deal with this seeming contradiction. The material, collected as a part of my ongoing PhD-research conducted at three social service units in Sweden, is qualitative: field notes from observations and transcribed audio recordings of professional team meetings as well as of meetings between social workers and clients. Using DA-tools the paper discusses how clients' housing dilemmas are handled rhetorically in Swedish social workers situated talk, how homeless drug users are represented and how different categorizations have implications for social action, raising both ideological and practical concerns. Findings show that social workers, when promoting or countering arguments for or against 'housing first', make use of situationally shaped, but still socially shared, discursive resources containing different client positions and suggesting different paths of action. In terms of rights and social justice, the implications for clients are often double–sided; in order to be entitled certain benefits, they often have to renounce other rights.

Revisiting the Notion of Precariousness: Theoretical and Practical Approaches

The unrest that motivates this debate stems from the current association between territories and self-built dwellings to precariousness. This attribute, con-ferred to almost all of these territories and dwellings, in general, based on their materiality and poverty condition, is based on fixed and watertight parameters regarding housing that disregard the diversity and heterogeneity of the city's modes of production. As it is often immediately associated with poor quality, poor performance, informality, illegality, among other dimensions that permeate normative and ethnocentric dimensions, such association deserves to be critically explored. Its indiscriminate use defines typologies and patterns that feed the capitalist market of social housing production (or the so-called "social market housing") and is used as a political instrument to justify state violence and private interest actions.

This article thus proposes to problematize the notion of precariousness that reaffirms the materiality of housing as a pattern / type, defined historically and socially, and which has been incorporated into political and market discourses. The argument is presented that there are no territories and self-built dwellings without the daily practices that produce them: the processes of living happen since the insertion of housing in the urban territory, the choice of materials, the application of labor, the possibilities and destination of the financial resources and construction techniques employed, until - and above all - the effective uses of space in daily life and over time. So, what dimensions constitute or dismiss the notion of precariousness in these processes, beyond the material, technical or typological dimensions? In this sense, we intend to approximate the historical and theoretical reflections on the notion of precariousness to the realities experienced by self-builders through the empirical crossing of analysis in self-built territories, with special attention to the case of Salvador, located in Bahia, Northeast Brazil.

Risky Behavior and HIV and Non-Hivstds Among Youth in Southern Africa

Over the past two decades there have been major advances in HIV prevention and treatment. Despite these advances,HIV remains a major public health threat in many parts of the world. Currently,there are over 36 million estimated cases of HIV worldwide.

Most of these infected individuals live in Africa south of the Sahara. Within Africa,the countries with the highest rates of HIV infection are in the southern cone of the continent. Accompanying the high rates of HIV are high rates of non-HIV STDS. The highest prevalence of HIV and non-HIV STDS in Southern Africa are found among young men and women(ages 15-24). This analysis examines the prevalence of HIV and non-HIV STDS among youth in samples of young males and females in several countries in southern Africa.

Borders between the Global and the Local: Central Recife Public Markets As Agents of Re-Production and Re-Affirmation of Aspects of Local Cultural Identity.

Based on the concepts of Place and Non-Place in globalized cities, this paper develops theoretical approaches to social elements encompassed by what would now be the place of Public Markets within globalized cities, their material and symbolic uses, their power to empower social relations and emphasize the local culture, as well as its monument aspect - element of culture and identity - resignified through time and constituent of social memory. Based on the anthropological concept of Border as a space between places, dialogic and explicit of differences, the objective is to identify the notion of belonging that the architectural image and the experience in this place (now Place) give to the inhabitants of the urban space in which they live. inserted, as well as symbolically provide social cohesion through relationships and collective dynamics. The methodology consists in the comparison between uses in supermarkets and public markets, in order to establish which cultivated relationships between users who experience these spaces and how to establish relationships with the city from these distinct and distinctive experiences, having as a place of study. of case the city of Recife. Preliminarily, one can observe the existence of an affective relationship, of memory and distinction, as well as of cultural consumption, with the Public Markets, which is transferred to the urban social space, interfering both in the material and concrete experiences, as well as in the experiences. immaterial, symbolic, of a place, composing the local shared consciousness.

Build By Understand: City Perception through Cinema and Its Influence on Material Production of Urban SPACE

In a postwar context of revisions around the practice of urbanism, experiences by non-architects/non-planners pointed to a new path - that of citizen activism and the struggle for popular participation. Thus, this research examines how the audiovisual production of Recife in recent years, which has always been artistically expressive, gradually and gradually absorbed urban themes, especially those related to the right to the city (LINO, 2016), with a particular characteristic of being a cinema of spontaneous production, but permeated by the exchange of knowledge between audiovisual filmmakers, city professionals, the common public and academia, an unprecedented collaboration raised by connections created by activism around José Estelita Pier. From this, it is possible to affirm that the urbanistic agenda of the city left the circle of discussion among specialists and spread by the citizens. In this sense, this research investigates how the phenomenological experience of cinema acts as an essential tool for the production of the material field of the city of Recife, with special attention to the perception of the city through cinema and the production of material urban space. To this end, we use two subsequent procedures: 1) the literature review, within the scope of visual sociology, social psychology and anthropology, especially in the theory of perception education, which the body as a learning and memory apparatus (INGOLD, 2013), interrelating such areas for the purpose of the proposed analysis, thus constructing a theoretical model of investigation regarding the citizen engagement process related to the specified cinematographic experience; 2) performs a spatial mapping (MAGNANI, 2000) of the cinema circuit through field research, seeking to understand from the perception to the viewers's filmic memory, in order to understand how the cinema circuit it spatializes and contributes to the strengthening of sociability among such groups who share the phenomenological experience of cinema.

Is Negative the New Positive? Secondary Transfer Effect of Exposure to LGBT Portrayals in TV Entertainment Programs

In multicultural societies direct intergroup contact is not always possible, and even if it is, people may not easily develop friendships or intimate relationships with outgroup members. The aim of our study is to investigate the primary effect of exposure to LBGT (the primary outgroup) TV portrayals in entertainment programs on attitudes toward them, as well as the effect of such exposure on attitudes toward people with Asperger's Disorder (the secondary outgroup), controlling for face-to-face and online contact with both outgroups. The research was conducted using a mixed methods approach, a combined analysis of simultaneously collected quantitative and qualitative data. Study 1 was conducted through an online survey of 716 Israeli Jews. Study 2 was based on in-depth interviews with 80 Jews. The study found positive significant relationships between TV exposure to portrayals of LGBT and attitudes toward them either when respondents defined the viewed portrayals of LGBT people as positive, or when they defined them as negative. We also found a significant relationship between TV exposure to portrayals of LGBT and social distance from people with Asperger's Disorder when viewed portrayals were defined by respondents as negative. The more frequently respondents were exposed to such portrayals, the lower social distance they reported. Such effect was not found when viewed portrayals were defined as positive. Our qualitative findings provided several alternative explanations for this phenomenon. One possible explanation is the different interpretations of LGBT portrayals on TV given by different people depending on their social background and life experience. Most TV programs present LGBT images as positive characters and worthy subjects of identification and therefore a slightly less positive LGBT portrayal may be interpreted and reported as negative. Respondents also clarified that stereotypical and exaggerated LGBT portrayals in TV are annoying, perceived as extremely negative and produce an opposite reaction.

The effect of non-standard maternal work hours on children's development

Past research has shown that nonstandard parental work schedule is associated with adverse child developmental outcome, particularly for disadvantaged families. However, further research is required to establish a causal link between the two. This study aims to advance our knowledge on how children fare in today's 24/7 economy where parents are increasingly working non-standard schedules. Using the Millennium Cohort Study (MCS), a study that follows the lives of over 18,000 children in the United Kingdom born around 2000, we test whether non-standard maternal work schedule is associated with internalizing or externalizing behavioral problems in three year old children, operationalized by the Strengths and Difficulties Questionnaire (SDQ). We account for family size and structure, family income, childcare arrangement, parental characteristics and work hours. First, we model the outcome of children's SDQ scores with maternal NS schedule during early infancy (around one year of age) and then toddlerhood (around three years of age). Next, we test whether the quality of time spent with children, such as sharing meals and reading stories, moderates the effects. This study uses longitudinal data with repeated measurements of the same individuals in pinning down the mechanisms behind the relationship between maternal work schedule and children's socio-emotional development.

LIU, JIE* (University of Milano-Bicocca, Italy)

Mobile Youth

Youth studies is a discipline with extensive research purposes and various research approaches. It tries to make sense of how young people live out their lives and contributes to theoretical development, and its 'outputs can impact directly and indirectly on the lives of those researched and others in similar situations' (Fraser et al., 2004: 1), and it offers a lens through which social changes can be detected acutely since contemporary young people have been dealing with a time of uncertainties and instability.

Youth (sub)culture and youth transitions have long been the two research traditions within youth studies until recently 'mobility turn' has been called for in exploring young lives. However, most scholars like to insert 'mobility' into 'you transition' approach and discuss how young people shape and reshape their identities and negotiate a way out against social structural constraints while they are on the move. When mobility has become a salient feature of youth transitions, it should be noted that youth culture perspective has been overlooked here. In this ever increasingly mobile age, young people are more than ever creating a 'mobile youth culture' characterized by their traveling around the world, pursuit of education abroad and entering a foreign employment commensurate to their skills and qualifications. This article first reviews the widely acknowledged two theoretical traditions of youth studies, i.e. culture approach and transitions approach, then looks into the critiques against such division and the efforts have made to dissolve such binary. Finally it sheds light on the role mobility plays in both youth transition and youth culture and argues that while mobility impacts on how young people try to make successful transitions, it also forms a mobile youth culture in the meantime.

Seasonal Parents/Grandparents: The Shifting Transnational Family Strategy of Care Circulation in New Chinese Migrant Families in New Zealand

Since the freeze of Parent Category permanent residence visa application in 2016, the family reunion of many migrant families in New Zealand (NZ) could only be achieved through a short-term family visitor visa scheme. This visa scheme grants the parents of adult migrants with multiple entries to NZ but only allows them to stay up to six months at a time with a maximum total stay of 18 months for every three years. To some migrant groups who prefer living in multigenerational family units, this drastic policy change poses significant challenges towards their family care and intergenerational relation. By taking the case of Mainland Chinese migrant families in NZ, this paper explores how migrant families cope with the increasingly restrictive immigration regime to consolidate their family welfare and solidarity. Drawing on 30 multi-sited ethnographic interviews with multigeneration from those Chinese migrant families, this research discovered a shifting transnational family strategy for coping with the above challenges. More specifically, it is an increasingly routinised transnational movement adopted by the parents of adult migrants traveling seasonally between the homeland and migration destination. This transnational movement pattern is firstly in strong contrast with the traditional focus of transnational migration studies that depicts the younger generations (i.e. first-generation adult migrants and their children) as the generations who pose greater transnational migratory mobility. It is also significantly different from the elderly's occasional transnational movements triggered by some critical family events, such as birth-giving and its associated childcare. Via the lens of "care circulation", this increasingly routinised transnational movements of the elderly demonstrates a growing active role that they play in negotiating their power relation and care circulation in the transnational family context.

To unpack the rationales behind this phenomenon, multifaceted sociocultural, political and even geographical factors in both sending and receiving societies are also analysed.

20 Meters Apart: How Migrant and Local Workers Negotiate and Integrate Distinct Work Ethics in Guangdong-Hong Kong-Macau Greater Bay Area

Last decades have witnessed continuous regional integration of emerging economies, among which, China seeks to generate profound influence of connecting Global South countries in multiple dimensions. In this blueprint, the development of Guangdong-Hong Kong-Macau Greater Bay Area (GBA) is accorded the status of key strategic planning. This cooperative region comprises nine cities of Mainland China, Hong Kong SAR and Macau SAR, and is now facing the interconnection of two social systems and two legal systems. Recent studies suggest a top-down approach on enforcement of factor mobility in GBA, e.g. the labor mobility, as a priority of developmental plan. Indeed, policies regarding connectivity and facilitation for labor flow across the region have been implemented. Previous evidence shows noticeable differences regarding codes of conduct and ethical attitudes of workers between Mainland China and Hong Kong/Macau, due to vast and long-standing divergences in economic, social and legal institutions. However, further insights into the adjustment and interaction of actors in this new translocal and transcultural setting are lacking, challenging the "in-depth integration" of GBA plan. In this regard, empirical evidence of bottom-up processes and mechanisms is needed. This study takes a probing step to ascertain the above issues from experiences of migrant and local workers. More specifically, I interviewed mainlander and Hong Konger Chinese working in an intra-ethnic working environment of Shenzhen and Hong Kong, which are geographically 20-meter away from each other. These migrants' stories are punctuated with difficulties of accommodating different labor practices, and, more importantly, the dynamics of adjusting and negotiating two distinct work ethics. The findings offer a detailed and experience-based observation to stakeholders of labor-flow. Finally, I discuss the literature on cooperative strategies for working environment integration of culturally/institutionally diverse economic zones.

Covid-19 Vulnerability and Perceived Lockdown-Norm Violations Predict Loss of Social Trust

Natural disasters (e.g. earthquakes) are generally thought to promote trust in unknown fellow citizens (i.e. social trust) by boosting community cohesion. However, pandemics may be different, as lockdowns and prolonged social distancing measures hinder social support and invite norm violation, potentially eroding social trust. e conducted a pre-registered panel study on a representative sample of the Dutch population (n=2,377), measuring social trust reported by the same individuals before and after the first wave of the COVID-19 pandemic. Results show that, overall, social trust declined significantly in the Netherlands, reaching one of its lowest points on record. This is particularly true among residents belonging to official high-risk categories, and especially if they perceived themselves as likely to become infected. Also, individuals who more strongly agreed with self-isolation norms or did not perceive a widespread compliance or agreement with such norms reported a loss of trust.

Assessing Student Power over Time. History, Transformations and Future Perspectives of Three Italian Student Organisations: A Case Study

A global wave of student protests opposing the neoliberalisation of education, of labour and of youths' life conditions, has been emerging worldwide over the last decade. In this context, student power and student activism have been re-activated, manifesting the prominent role of student movements among young people in contemporary societies. In particular, three Italian student organisations, namely the Students' Union (founded in 1994), Link and the Knowledge Network (emerged during the Anomalous Wave protests' cycle in 2010-2011), have been embodying the student power in a changing social landscape. They have been constantly asserting knowledge to be a common good, opposing the neolib-

eral marketisation of education. Asserting school and university to be the primary site of democratic participation, they have expressed a critical voice within society and manifested their collective subjectivity both as students and as different generational units. By creating new forms of protest and political activism, combining 'modernist' organised forms of political participation with movement-like forms of engagement, also mediated by social networks, and mobilising on multiple issues (immigrants' rights, feminism, anti-racism, environmentalism), they have been contesting the neoliberal capitalistic worldview, deemed a competitive, exclusionary if not violent power system, asserting the leading role of students in society. Continuing to mobilise over time, they embodied protest in the past at the onset of the neoliberalisation process of education in Italy, keeping mobilisation for students rights alive right up to the present, currently reframing their protest in the future perspective: the "future is unwritten', "education for future", "let's take our future back", they are claiming. Based on these considerations, a critical and historical analysis of this case-study on these student organisations (consisting of 70 interviews, direct observation, analysis of their documents) will be addressed, aimed at assessing both the potential and weakness of student activism in contemporary politics and society.

Paternal Involvement Beyond Residence:the Role of Non-Resident Fathers in Raising Their Children

Many studies, particularly in western countries, have made assumptions that fatherhood can only be exercised in the context of a nuclear family. However, in a South African context the understanding of a family from a homogeneous, dual-income and co-resident lens disregards the emergence and prominence of the so-called non-traditional families. Rather co-residence is not always plausible or realistic and as such it should not be presented as something to aspire for. This ignorance tend to present other family forms (extended, same-sex and single families) in a negative light. This article is a presents preliminary findings of ten in-depth interviews conducted with non-resident fathers in Pretoria. The preliminary results reveal that father define paternal involvement as "one's ability to provide financial for his children". Maternal gate-keeping has been he acclaimed as one of the biggest challenge to paternal involvement. Some participants have been denied access to their children out of spite, while others have been denied access because of their inability to pay maintenance. The preliminary results also shows that fathers are not aware of their paternal rights provided for by the Children's Act. Only 1 out of the 10 participants followed the court processes to gain access to his child. The results also reveal that father's who are still romantically involved with their partners stand a better chance of being allowed access when compared to their counterparts.

LOEZA REYES, LAURA* (UNAM, Mexico)
RICHARD, ANALIESE (Universidad Autónoma Metropolitana Cuajimalpa, Mexico)

Las Organizaciones de la Sociedad Civil y las Políticas de Identidad en Democracia. Un Análisis del Caso Mexicano

En la década de los años 90 del siglo pasado hubo una producción abundante de literatura sobre las políticas de identidad, que se explica por la erosión del proyecto nacional-popular. Esta se evidenció cuando múltiples sujetos en el bloque reclamaron sus propios derechos, historias e identidades y se hizo patente la crisis de los intelectuales como mediadores de tal visión (Hale, 1997: 573). Como resultado de estos procesos hubo un cambio en las formas de relación sociedad-Estado en las que la sociedad organizada comenzó a asumir la ciudadanía en términos de derechos. A partir de dichas transformaciones diferentes grupos de población se auto-reconocen como plurales, con una historicidad, necesidades y aspiraciones diversas. Sobre esta base construyen identidades, proyectos y reivindican reconocimiento e inclusión; buscan incidir en política públicas y en ocasiones en el diseño institucional para su implementación.

A través de las políticas de identidad, los grupos identitarios desafían directamente las categorías universales que tienden a subsumir, borrar o suprimir sus particularidades (Hale, 1997: 568). Así, reivindican el reconocimiento social e institucional de sus identidades y la redistribución más justa de los recursos. Históricamente, organizados en, o acompañados por ONGs (organizaciones de la sociedad civil) han logrado la ampliación de derechos a través del activismo en el ámbito doméstico y gradualmente lo fueron extendiendo al ámbito internacional. Actualmente muchos de estos derechos forman parte de los derechos humanos. Nuestra ponencia daría cuenta de cómo en México algunos de estos derechos están siendo violados por el gobierno federal con base en un discurso que remite al pasado modelo nacional-popular y a través de intervenciones dirigidas a diferentes grupos de población (algunos de ellos grupos identitarios). Con ellas está desmantelando instituciones y cancelando políticas públicas a través de las cuáles se atendía a dichos grupos, muchos de ellos vulnerables, vulnerándolos aún más.

LOGUNOVA, OLGA* (National Research University Higher School of Economics, Russia)
LEBEDEV, PAVEL (Superjob, Russia)

Bodypositive in Russian Social Media Discourse

As part of the rapidly developing interdisciplinary field of bodystudies, scholars have sought to critique stigmatizing representations of a human body such as fat-shaming and identify their negative effects for the ways in which people think about their bodies and identities. In fact, public health campaigns using weight stigmatisation in an attempt to 'motivate' individuals to adopt healthy practices alienate people of larger bodies from engaging in health behaviors and leads to further weight gain (Puhl and Suh, 2015; Puhl and Heuer, 2010).

Digital media have allowed people of all types of body sizes not only to consume media content, but to create, comment on, share, and curate it (Holland and Tiggemann, 2016). Photo-based platforms are particularly salient given their widespread use, the idealised nature of the images presented, such as thinspiration and fitspiration, and the infinite opportunities for appearance-comparisons they foster (Cohen et al., 2017; Fardouly and Vartanian, 2016). This content typically portrays thin and toned bodies in sexually objectifying poses with guilt-inducing messages about diet, weight, and exercise (Boepple and Thompson, 2016; Simpson and Mazzeo, 2017; Tiggemann and Zaccardo, 2018; Wick and Harriger, 2018).

Viewing body-positive imagery is associated with improved mood and positive body image, which runs counter to criticism that it makes women feel worse about themselves (Oltuski, 2017). On the other hand, it is still associated with a focus on appearance over other attributes (Webb et al.'s 2017).

The purpose of this report is to show the social media discussion about bodypositive in Russia. The sample of images for coding was collected from social networks during one year. The total number was 45.283 posts. The sites were searched for any image marked with the 'bodypositive' mentions. The results demonstrates the main themes, persons, dynamics of mentions and features of bodypositive content's representation.

What's Wrong with "God"? Indications from the Intersection of Humanities and Theology

Across a spectrum of academic disciplines, the concept of *godhood* is being put to question. Somewhere between earlier attempts more firmly to define what a shared understanding of this concept would be and, more generally, a common implicit "feel" for the denotative and connotative dimensions of this concept, the sense has been developing that something is amiss. *Something is wrong with "god"*: the traditional understandings of this concept does not resonate well with current sensibilities and sensitivities. In this contribution, reasons for that sense of unease are proposed, including:
- the openness in the intellectual atmosphere in much of the Humanities enterprise internationally towards post-secularism;
- the concomitant rise to popular prominence of concepts such as spirituality, wellbeing, mindfulness, flourishing and other meaningfulness-seeking developments;
- the discussion around shades of realism – non-realism within Theology, drawing on i.a. Philosophy.

These different trends are not always conversant with one another, yet parallel each other in some respects, such as relating notions of god / God / the divine / the metaphysical / meaningfulness to living a "real" life (i.e. with integrity, in touch with something significant-yet-concrete). In this contribution, these matters are elaborated, and indications are given towards understanding godhood differently.

An Exploratory Study of Demographic and Structural Determinants of Mental Health during the COVID-19 Pandemic.

The COVID-19 pandemic has become the most severe global health challenge of the new millennium. Studies of previous pandemics have mapped the substantial effects of infection, fear of infection and the measures designed to reduce the likelihood of infection on psychosocial health and wellbeing. Mental health depends on individual factors (such as age, gender, educational qualification, working conditions, family status), structural factors (including the measures taken in a specific country to cope with the pandemic) and a mixture of the two (for instance how one's employment is affected by public health measures).

This study attempted to assess the influence of individual and structural variables on the experience of anxiety and self-rated mental health of a sample of European citizens during the COVID-19 pandemic first wave. The aim is to identify which subgroups have been most vulnerable to poor mental health during the initial stages of the pandemic so as to inform specific interventions to reduce the psychological burden during any possible future lockdown.

An online survey was conducted using a non-probability snowball sampling technique. A total of 9,541respondents, living in six European countries took part in the study. Mental health impact was assessed by the 8-item version of PHQ-8 scale. We apply a fixed effects model and a set of individual control variables to obtain parameter estimates. To control for country-level heterogeneity, some macro-level variables are considered, including welfare regime, health care expenditure, acute care hospital bed ratio and physician density.

First results show that the higher the perception of risk, the greater the likelihood of depression, although the direction of this effect is unclear. This effect appears valid in all countries considered, although the effect intensity varies significantly. Moreover, the analysis shows that microlevel dimensions, i.e. individual characteristics, and macro level factors interact in shaping people's mental wellbeing.

Language and Migration: Georgian Communities and Language Outside of Georgia

Georgian language belongs to the family of Caucasian languages. It is a Kartvelian language spoken by about 5 million people, primarily in Georgia but also by indigenous communities in northern Turkey and Azerbaijan; it was also spoken by the diaspora, such as in North Caucasus and Iran; Today, in the age of globalization, when political-economic crisis and decline in living standards in Georgia led to the intensification of the migration from the country, the number of Georgian communities has increased drastically worldwide and Georgian is also spoken in Russia, Israel, Europe, and North America (primarily in the U.S.A) in varying linguistic and cultural environments without any legal status. The present contribution focuses on the speech of Georgian communities in European countries, U.S.A, Russia and Israel. Its aim is to draw attention to the linguistic situations within Georgian communities abroad. We will try to demonstrate the ways in which a peripheral community (peripheral because of its socio-economic and political subalternity), to a large extent defined by speaking a minority language, adapted itself dynamically to a metropolitan environment, maintaining – at least partially – traces of ethnic identity. On the other hand, emigration has had certain 'rebound effects' on the ethnolinguistic, cultural and glottopolitical dynamics of the Georgian communities abroad; to put it more precisely, we will try to outline the ways in which sociolinguistic, ethnocultural and glottopolitical dynamics of the migrant communities interacts with indigenous communities. The case of Georgian language seems to be particularly interesting in this regard, as we hope to show. In all cases mentioned above, except for Israel, Georgian is spoken by ethnic Georgians exclusively. As for Israel, Georgian, or to be more exact, a kind of Judeo-Georgian language is spoken by Georgian Jewry who had lived in Georgia for 26 centuries.

Police Criminality in Buffalo City Metropolitan Municipality

Policing as a global concept, involves an exchange of trust between the public and a given police service. The underlying basis of this exchange is the premise that police services exist to protect citizens and their property, and to ensure that order is maintained in societies. The police services by virtue of the nature of their role in society can therefore be regarded as 'protectors'. Recently in South Africa, there has been an increase in reports accusing police officers of becoming involved in criminal activities themselves. With a focus on the Buffalo City Metropolitan Area of South Africa, this paper presents the incidences of undocumented police crimes as occurring in the Buffalo City Metropolitan Municipality policing district. Findings from this study reveal that police officers are involved in undocumented incidences of white collar, and violent crimes. Most white collar crimes include bribery and corruption; whilst most violent crimes include assault, assault GBH (Grievous Bodily Harm), torture and interrogation techniques with a violent element. This study found that through the enactment of these various forms of economic and violent crimes, the policing services mete out a form of vigilantism which is unique in the modus operandi, underlying rationalisations, and victimological profile of those against whom such acts are administered. Where police men and women have not committed such acts themselves, they were found to be secondary victims (as witnesses) to oftentimes brutal violence enacted by their colleagues. The result of incidences of violent and economic crimes, are reduced police legitimacy and efficacy in terms of the police's ability to deliver on its mandate to protect and serve.

LONGA, FRANCISCO* (CONICET / IDIHCS / UNLP, Argentina)

Making the Decisions. the Construction of the Decision-Making Process, in a Social Movement of Argentina.

In Latin America, the 1990s was marked as the moment in which a series of new social movements emerged, and differed from traditional forms of collective action, such as political parties or guerrillas. One of the main characteristics of these movements would be that, unlike the other formats, they presented more horizontal schemes in their decision-making processes (Zibechi, 2003; Sitrin, 2010).

In this paper I analyze the decision-making process in a social organization of Argentina, the Popular Front Darío Santillán, between 2004 and 2015. Based on in-depth interviews, field visits in their grassroots organizations and analysis of its official publications, I analyze the complex and different ways that the movement has to channel its decision-making process.

The main working hypothesis that guides my research indicates that the decision-making processes that occur within a social movement are so complex, that categorizing them from the 'horizontality-verticality' pair is insufficient. On the contrary, an analytical approach in a sociological perspective would show that the practice of making decisions in a social movements is varied, complex and diverse, articulating unevenly centralizing, consensual and democratic dynamics.

LOOCK, JOHANNA* (University of Leeds, United Kingdom)

(Re-)Construction of Identities and Subtle Nationalism in German Politics

In contemporary Germany – as in other European and US contexts – resurgent right-wing populist nationalisms and racist demands to confirm an exclusive national identity are to be observed. While such nationalisms are sometimes considered extremist exceptions, I show that they are underpinned by subtle forms of nationalism which can be detected in unexpected places of politics.

It is particularly unsettling how in a contemporary situation where Germany is recognized to be a 'country of immigration' the very politics explicitly opposing exclusionary and racist movements seems to be concerned to reconstruct the national identity, promoting ideas of 'Germanness' as white, liberal, Christian, and German speaking, instead of adjusting it to a post-Western reality. Nationalist reconstruction can be traced for instance in official campaigns advertising German identity and German integration politics promoted as a major tool for the inclusion of immigrants (primarily assumed to be Muslims). Especially integration politics allows to expose ways in which the figure of the Muslim is marked, shaped, and framed through processes of comprehensive racialization and how a national identity or 'Germanness' is reconstructed in distinction from 'Muslimness'.

If official politics allows to defend and transmit the concept of the nation and exclusionary ideas of 'Germanness', they are to be seen as propagating subtle and inconspicuous forms of nationalism. A remaining question concerns the relation between soft versions of nationalism and right-wing movements – are they in opposition, parallel, or complicity to one another?

The Challenges of Retirement: A Case Study at Petrobras.

The increasing life expectancy in Brazil and consequently aging are calling attention to the subject of Retirement. The transition to this period of life can be a complex process embeded with doubts because the work is a relevant component in the individual identity that, besides represents a way to subsistence, organize the routine and promote interpersonal exchanges.

Many factors can influence the decision about retirement, such as personal, familiar and organizational issues. Identifying and understanding these reasons are important for individuals, but also to organizations and the whole society. This present research aimed to identify the factors that contributed to the decision of joining or not the Voluntary Dismissal Program (VDP) held by Petrobras in 2014.

The study follows a qualitative methodology based in sixteen individuals and presential interviews realized in May and June 2015. Using two structured roadmaps, eight former employees who joined the VDP and eight employees who have chosen to stay at the company were selected by convenience.

The results showed that the decision between remaining or leaving depends on several factors, including health, financial status, family aspects and the individual's relationship with the company and the job. The way of joining Petrobras, the expectation of holding a VDP, the freedom of time and the lack of career opportunities are some examples.

Based on the degree of difficulty in the decision-making process, the existence or not of a retirement plan and the experiences and feelings after decision, we identified seven different groups of respondents. Those decided to stay at the company were classified in "Attached", "Repentant" and "Indecisives". On the other hand, those decided to join the VDP were considered "Planned", "Disappointed", "Repentant" and "Forced".

The Intersection of Race, Gender and Class in the Heroic Age of American Art:

The Articulation of Hyper-Masculinity in the Iconic Art Rebels Miles Davis and Martin Scorsese

The last half of the twentieth century experienced what I call, borrowing from Pierre Bourdieu, the Heroic Age of American Art. This period witnessed a rebellion across the arts that refashioned the American art field, where "avant-garde" and "independent" art became permanent positions in this field. Two iconic rebels during this age were Miles Davis and Martin Scorsese. Davis as a race man provocateur stood as the ultimate innovator in the modern jazz rebellion, while Scorsese as an unmeltable Italian American became one of the most innovative filmmakers of the New Hollywood rebellion in film. Both artists in their pubic stories – the discourse about these artists and their art in the written word and recorded sound and image – inextricably linked their racial and ethnic identities as fundamental to their artistic rebellions. Such heroic stances against the racial and ethnic formations also engendered a problematic articulation of hyper-masculinity as either a symptom or reaction to their marginal positions in American society and culture. This paper looks at how these artists articulated a toxic hyper-masculinity in their art and public stories that was inseparably linked to their racial and ethnic rebellions. I also argue that we must look at Davis and Scorsese's public stories as the product of the collective cultural practices of artists, critics, journalists, producers, and audiences. This allows us to see how hegemonic masculinity as a *norm* in America led to such expressions of toxic masculinity remaining mostly unproblematic, especially within the male imaginations of those contributing in their own fashion to the public stories told about music and film during the Heroic Age of American Art.

LOPES JR, ORIVALDO* (UFRN, Brazil)

The Biopolitical Feature of the Anti-Prohibition Devices and the Church Role in the Drug "Recovery"

We defend in this paper that tactics of cursing and demeaning drug users is part of a bigger strategy of closing access of these persons to public order as citizens. This movement of exclusion matches to a correlate movement of inclusion of this people in the category of *Homini Saceri*, namely non-sacrificial being, subject of all sorts of justifiable extermination. At same time, a barrier to profanation works to establish to a public and juridical order that includes all human beings. The arguments of this article ground on Giorgio Agamben concepts, as *Homo Sacer* and *profanation*, and others like band and device. To these, we add the concept of secularization, trying to call the attention on the role of the religious agents in keeping or breaking those tactics of war, typical of Exception States. The intense programs of drug addiction recovery of evangelical churches in Latin America fulfill an unexpected role of sacralization and later profanation of Homini Saceri.

On Economic Relevances

Economic institutions have a major presence in our everyday life. However, as Alfred Schutz clearly saw long time ago, they have lost their reference to human generating activities, becoming somehow anonymous. The reference to the generating activities is what has been lost in our institutions and what has led to the disaffection of the citizens towards them. Schutz was aware of the development of this type of anonymity, together with the restriction of our autonomy to decide our own relevances. However, he was convinced it was essential to get to know and distinguish them from the imposed relevances. Motivated by understanding the process through which certain actors question their relative-natural concept of economic life and institute alternative economic relevances, our paper aims at exploring an empirical case study of social economy in the City of Buenos Aires. In order to approach the phenomenon we will enhanced the ideal type of the "well-informed citizen" by exploring economic concrete experiences, which will lead us to talk about an "economic citizen" ideal type. We will maintain that these well-informed economic citizens are able to choose the frame of reference by choosing

their own economic interests, they are capable of gather information about the origin of the imposed economic relevances, and to dig where the anonymous economic powers which may overtake them lies.

LÓPEZ, EMILIO DEL CARMEN* (FLACSO - México, Mexico)

Ayotzinapa Frente a La Construcción De Una Cultura Del Trauma Social.

La presente investigación propone un modelo teórico de alcance medio para realizar análisis empírico con el objetivo de comprender los factores por los que algunos crímenes de lesa humanidad se construyen como eventos traumáticos al afectar a diversas colectividades sobre su estabilidad futura, formas de vida y capacidades productoras de sentido.

Para ello, se presenta un estudio de caso concerniente a la desaparición forzada de 43 estudiantes normalistas de la Escuela Normal Rural "Raúl Isidro Burgos" de Ayotzinapa en el estado de Guerrero, México, los días 26 y 27 de septiembre de 2014. Dicho suceso, ha propiciado que diversos grupos sociales construyan una cultura del trauma entorno a estos hechos con la intención de sedimentarla en la memoria como un suceso que ha obligado a (re)configurar la identidad colectiva de los grupos afectados y, a su vez, de la sociedad nacional.

El modelo teórico presenta la asociación de una serie de factores inmersos en relaciones mediadas como la intervención de organizaciones de la sociedad civil y grupos afectados, los cuales interponen una serie de repertorios para visibilizar los actos padecidos mediante el desarrollo de una narrativa que enmarca los sucesos como actos de injustica. Con ello, se significa el dolor de las víctimas sobre dicha afrenta contra su dignidad y propia existencia. De esta manera, la intervención de organizaciones y grupos afectados, a través de un enmarque favorable a las víctimas y que cuente alta visibilidad, incide en edificar un sentimiento de solidaridad social para la construcción de una representación simbólica, la cual permita que los acontecimientos sean alojados en la memoria colectiva como un evento traumático.

Inserción Laboral, Legislación y Formas Organizativas De Las Mujeres Trabajadoras Del Hogar En Paraguay

Nos proponemos estudiar la situación laboral y las formas de organización de las trabajadoras domésticas en Paraguay para comprender la realidad de un margen importante de la población de mujeres que trabaja en este país, en una tarea históricamente invisibilizada. Un abordaje a contracorriente que ha sido contemplado mucho más por trabajos de investigación de diversas ONG's y organismos internacionales que por trabajos provenientes del ámbito académico. En el caso más preciso de las trabajadoras domésticas paraguayas, el mayor caudal de estudios estuvo dado en su inserción como trabajadoras migrantes en Argentina, superponiendo, al mismo tiempo, diferentes vulnerabilidades y construyendo subalternidades étnicas, económicas, laborales. Algo que tomó el nombre de "triple discriminación", "discriminación múltiple" o "triple victimización" por combinar la situación de desplazamiento del país de origen, la condición de mujer en un sistema de dominación patriarcal y la relación laboral con un oficio invisibilizado y subvalorado. Nos proponemos analizar la situación de las trabajadoras del hogar remuneradas de Paraguay y su contexto político. Para 2017, más del 17% de las mujeres ocupadas del país, realizaban sus tareas dentro de esta rama. Indagaremos en el marco legal en el que las mujeres trabajadoras y las trabajadoras domésticas encuadran su trabajo, desde la dictadura (1954-1989) hasta nuestros días, para poder comprender en qué consiste y cómo se articularon las demandas específicas que tuvieron en el inicio de la transición a la democracia hasta la actualidad. Las trabajadoras paraguayas se enfrentan a una legislación que restringe sus derechos laborales, desde una estructura organizativa que tiene décadas de trayectoria de lucha. Daremos especial atención a la construcción de organizaciones que agrupan sus reclamos y disputan significados en torno a esta actividad, y nos detendremos en la experiencia regional de consolidación de reclamos por mejoras en las condiciones de trabajo dentro del hogar.

LOPEZ FLORES, PABEL* (CIDES-UMSA, Italy)

Repensando Los Movimientos Societales En Bolivia y América Del Sur: Continuidades, Rupturas y Desafíos De La Acción Colectiva y En La Relación/Tensión Con El Estado

Este siglo se abrió en América del Sur, particularmente en la región Andina-Amazónica, con una innegable reemergencia de movimientos sociales, principalmente de matriz comunitaria e indígena históricamente subalternizados pro-

venientes del 'subsuelo de la política', pero también desde sujetos sociales que desbordaron y/o resignificaron los marcos de los movimientos sociales clásicos y que al interpelar y contestar las lógicas y estructuras de colonialidad vigentes y supuestos del Estado-nación configuraron verdaderos 'movimientos societales' (Tapia, 2008). Esta impronta de nuevos repertorios de acción colectiva, revelaron un nuevo ciclo de 'sociedades en movimiento' y una época de disposición para articulación de horizonte potencialmente contra-hegemónico en la región, con procesos paradigmáticos como en Bolivia, que se expresó a partir de ciclos de movilización colectiva desde movimientos sociales principalmente de matriz comunitaria que también fue reconfigurando, en escalas distintas, las relaciones con el Estado y abriendo horizontes de transformación, descolonización y emancipación. Sin embargo, en la última década se asiste a un proceso complejo de retroceso democrático, de recomposición geopolítica y de confusión sociopolítica en la región marcado; por un lado, por el llamado "fin de ciclo progresista"; por otro lado, por el avance de gobiernos con narrativas y políticas neoconservadoras y neo-fascistas, pero también con la expansión o intensificación generalizada de modelos extractivistas y de despojos múltiples de la mano con procesos de represión y criminalización de la protesta social. Me propongo reflexionar, problematizar y discutir sobre los procesos de reorganización de la acción colectiva que darían cuenta de diversas continuidades, rupturas y cambios en los lenguajes políticos y en los repertorios de acción colectiva, así como de cambios en las relaciones entre el Estado y los movimientos sociales en América del Sur, a partir particularmente del contexto boliviano, dando cuenta, a su vez de los horizontes de posibilidad y potencialidad de alternativas societales.

Enfoque De Capacidades y Ética Profesional En La Formación Universitaria Para La Democracia: El Caso De Las Carreras De Negocios y Humanidades De Una Universidad Privada En México.

Esta contribución se sustenta en el análisis de la aportación teórica del Enfoque de Capacidades de la filósofa estadounidense Martha Nussbaum para la definición de elementos éticos del quehacer docente en el nivel universitario que orienten la formación profesional hacia la construcción de sociedades auténticamente democráticas.

Se plantean en el marco teórico las definiciones del enfoque de capacidades concebido como una teoría de la justicia orientada hacia la construcción de libertad efectiva (Nussbaum,2012; Sen,1999; Lonergan,1988) de los individuos y las comunidades humanas partiendo de la visión de la dignidad humana y los rasgos que Nussbaum (2010) plantea en su libro Sin fines de lucro, para distinguir entre lo que llama Educación para la renta –una educación centrada en la visión de crecimiento económico- y la Educación para la democracia –una educación integral para la formación de ciudadanos que requiere toda sociedad democrática-.

A partir de estos rasgos se construyó una guía de entrevista que fue aplicada a una muestra de profesores universitarios de una institución privada, que tienen a su cargo la administración de programas de licenciatura en las áreas de Negocios y de Humanidades para conocer la manera en que conciben y están llevando a la práctica la formación de futuros profesionistas en la tensión entre educar para la renta o educar para la democracia.

Se encontraron algunas diferencias en la comparación entre ambas áreas pero los resultados muestran en general una orientación hacia la Educación para la democracia en las carreras de ambos campos disciplinares a partir de la comprensión y adhesión al ideario y la misión de la universidad en la que se realizó el estudio que define como meta la formación de líderes transformadores para el bien común de la sociedad, lo que supone una visión democrática en su orientación pedagógica institucional.

PISA As Big Science

Big Science presupposes the mobilization of technology and significant financial and human resources - in a matrix of interdisciplinary work developed with large teams and eventually made up of geographically disseminated researchers. The Program for International Student Assessment (PISA), promoted by the Organization for Economic Co-operation and Development (OECD), can be included in this descriptor for its specificities in terms of the volume of statistical data collected (Big Data), participating countries, and the number of public and private organizations involved in the production, exchange and consumption of educational services through transnational interactions.

PISA assesses the extent to which 15-year-old students, near the end of their compulsory education, have acquired key knowledge and skills that are essential

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

for full participation in modern societies. The triennial assessment focuses in the areas of reading, mathematical and scientific literacy. Policy makers around the world use PISA findings to gauge the knowledge and skills of students in their own country in comparison with those in other participating countries. In this sense, the activity of its promoter, the OECD, in its educational policy-making and knowledge mediator role has been linked to the exercise of a particular type of power, commonly referred to as soft power, or soft mode of regulation, that would have been leveraged precisely by the sophistication of its statistical work, in particular, since the creation in 1968 of the Centre for Educational Research and Innovation (CERI).

Within this framework, we propose to analyse in this paper, on the one hand, the organization, formalization and adoption of research and knowledge production practices within the Big Science paradigm and the use of Big Data, with relevance to the PISA Program and, on the other, to examine its impact on the conditions for carrying out scientific work on education in Portugal.

The Transnational Spread and Local Reproduction of Charitable Inequality

Food banks collect excess food from manufacturers and retailers and distribute it to people in need, in an effort to address social security. Starting as a local initiative in the USA in the late 1960s, food banks have expanded to a global phenomenon. They are affiliated regionally, nationally and transnationally as three networks that include members in about 90 countries worldwide: the Global FoodBanking Network (GFN), the Food Banking Regional Network (FBRN or 'Arab Network') and the European Food Banks Federation (FEBA). This presentation introduces a new international collaboration investigating the dynamic development of these networks, and their national and regional adaptions and articulations with local social security institutions. The food bank approach originated in high-income welfare countries, where current international food bank case studies are mostly situated. This research includes the exploration of low and middle-income countries within each of the networks. It draws on qualitative social science methodology for exploring food banking in a wide variety of social, economic, cultural and religious contexts. Food banks operate on a social dividing line: affluence and excess food availability, in contrast to people on low incomes in need of social assistance. While food banks relieve immediate pressure by transferring the excess, they do not change entrenched social inequality. The claim of fighting food waste is also controversial from an inequality perspective. Poor people do not partake in the affluence of wealthier consumers, but are expected to be grateful for getting – and thus removing – the leftovers. In the context of an increasingly globally-articulated food system, the spread of food banks indicate the global establishment of charitable inequality relations as an element of an inequitable global food regime, rather than a socially transformative solution for poverty and exclusion.

Fake News and Elections in Courts: A Sociological Study about Brazilian Superior Electoral Court' Decisions during the 2018 Presidential Election

This research presents a quantitative and qualitative study of the case law of the Brazilian Superior Electoral Court, during the 2018 presidential elections in Brazil, regarding the judicial discussion about fake news in electoral campaigns. The study contributes to the sociological literature on the judicialization of electoral processes, with an emphasis on the theoretical framework of systems theory. Electoral courts are increasingly engaged in the electoral process in Brazil, structuring it and operating as a vector of control and direct change in the electoral dispute. This role is not only perceived in the final result, but can also be seen when the Judiciary defines and interprets the rules of the dispute. In the 2018 presidential election in Brazil, the new digital electoral campaign manifested more intensely via social media and messaging apps, following patterns observed in the 2016 electoral processes in the USA, and also in European and other Latin America countries. The use of social media for political militancy lead to the destabilization of previously crystallized structures of the electoral system in Brazil, specifically regarding the electoral campaign, but also contributed for a new role of the judicialization of politics. The hypothesis developed in the research refers to the political openness that the topic of fake news echoes in courts, mainly as

an electoral strategy during the election dispute. Regarding the exam of the case law, the research identifies, codifies and interpret the legal arguments applied by the Justices. Moreover, the research explores the relevance that technology companies assume in the litigation nowadays. Finally, the study highlights the importance of understanding the new political environment in light of the complex articulation and repercussions among the Judiciary, political parties and digital platforms.

Systemic Sociology of Electoral Fake News: The New Means of Disseminating Communication, Uncertainty and Its Repercussions on Politics and Law

How does the growing use of fake news in the electoral process, mainly via social media and messaging apps (with its repercussions on the privacy of personal data) have been addressed in the political, legal and media systems? This research exam this question, applying Niklas Luhmann's social systems theory and with the analysis of regulatory attempts implemented since the 2018 majority elections in Brazil. These initiatives cover both the Legislative (where they are seen in the context of earlier statutes on digital communication and data protection) and the Judiciary (especially the Superior Electoral Court) as well as experiences of self-regulation implemented by the digital networks and platforms themselves. Systemic sociology allows us to correlate the evolution of the means of disseminating communication (technologies) with the processing of communications by the various functional and organizational systems (politics and the State; law and courts; the media and the communication companies). Fake news performs a crucial role in the network information society. Through different subjects and repercussions, this news circulates quickly on a daily basis through social media and messaging apps, and this dissemination is potentiated by the decentralization and anonymity of digital networks. Anyone can be a protagonist and produce fake news through a few clicks on the networks. Underlying the issue of circulation, the interest regarding the operation of fake news reveals as a new structure to control the chances of success in impacting public decisions. For this study, even accepting the overcoming of the monopoly of true/falsehood criteria from the philosophy of knowledge – after all, those who operate with this kind of news are not in the scientific system –, there is an important trade-off between uncertainty of information and increase of certainty of the role of political and economic power in elections that is important to observe.

DIAS, THAIS (Universidade Federal Fluminense, Brazil)
CAMARGO, ANA VALÉRIA (Universidade Federal do Espírito Santo, Brazil)

The Rio Doce Mining Disaster Framing in the Brazilian Justice System

The objective of this article is to analyze the repercussions in the Brazilian justice system of the mining disaster that devastated the Rio Doce Valley in Brazil. The disaster was caused by the rupture of the Fundão dam under the responsibility of Samarco Mineração SA and its controlling companies Vale SA and Anglo-Australian BHP Billiton Brasil LTDA in 2015. We seek to characterize the addressing of collective claims to the justice system by identifying which issues, claims and arguments are present in the actions. From the results, we observe that the environmental laws are mobilized to address a very wide range of effects of the disaster, as well as a re-discussion of the legal definition of damage as the reality imposes a definition not provided by law. Finally, the article presents important problems with the use of mediation and conciliation tools. This is evidenced by the fact that the lawsuits present several aspects that elaborated the effects of measures resulting from agreements that had as objective the repair and identification of damages. In this sense, the instruments fail because they do not present themselves as an effective way to replace litigation with a mediated resolution.

LOURUZ DE MELLO, NATHALIA* (Pontifícia Universidade Católica do Rio Grande do Sul,)

Biography and Educational Trajectory of a Young Angolan Woman in Brazil.

Considering the breadth of studies that relativize the figure of the typical migrant as a man who decides to leave his country for financial reasons, this article proposes to address the migration of women, as they are a fundamental part of migratory mobility. In this sense, the relationship between migration and women´s social mobility is a phenomenon that still needs to be observed more closely, in order to remove sociological research from processes of repetition of representations of socially legitimized discourses about immigrants. To this end, we analyze the educational trajectory of an Angolan woman who experienced a migration process to the southern region of Brazil, motivated by the need for educational qualification and the desire to improve socioeconomic conditions, as well as the projected return migration. From this case, it is questioned how families established in Angola rely on their educational background and the knowledge of the Portuguese language - a result of the colonial heritage - to maintain or access positions established in the country while migrating to Brazil and how this relates with the inequalities of power between the different groupings in Angola. Also, it is questioned how these women can be empowered through their educational trajectories to rise socially, both in Angola and Brazil and how this educational trajectories relate to gender-based power inequalities. The discussion presented is bases on the reconstruction of the biographical case of an Angolan immigrant, pointing to some preliminary results of my study on African women in Brazil and can be considered as a type of migratory mobility related to educational trajectory.

Occupational Positions and the Exclusiveness of Higher Education Degrees

The present contribution aims at examining how the occupational outcomes of German higher education graduates change with the expanding number of higher education degrees. The treatment of education as a positional good accounts for the declining exclusiveness of higher education degrees in the course of educational expansion.

According to the job competition model, individuals are ranked in a `labour queue´ based on their background characteristics such as educational degrees. Each occupation has its own labour queue which is shaped by the applicants' characteristics. This stresses the importance of individuals' relative positions. If degrees become less informative as a consequence of educational expansion, it is assumed that having some higher education degree is not sufficient to reach the highest labour market positions. Before higher education expansion, a smaller group of graduates was prepared for occupationally closed professions with typically high prestige. With the expanding number of higher education degrees, graduates potentially apply for a broader range of occupations where they compete with degree holders from other educational levels. Therefore, it is expected that the less exclusive higher education degrees, the lower the occupational prestige of higher education graduates. Moreover, it is assumed that higher education graduates' occupational prestige approaches to the occupational prestige of lower degree holders.

The empirical analysis is conducted with the data from the adult cohort of the National Educational Panel Study. On the basis of level-log regression models, the influence of the exclusiveness of higher education degrees on the occupational prestige as well as on the occupational status will be examined. The exclusiveness of higher education degrees is specified by the Positional Status Index and the Educational Competitive Advantage Score. Both measures show the individuals' relative position in the educational system at a specific point in time.

Géneros y Sexos En Las Naciones Latinoamericanas. Ciudadanía y Diversidad Desde Los Movimientos Sociales Latinoamericanos Contemporáneos

El desarrollo teórico en torno a la idea de nación atravesó discusiones sobre los fundamentos de la misma y sobre su ficcionalidad, para dar espacio luego a debates acerca de quiénes construyen a la nación y quiénes son considerados (y quiénes no) parte de ella. El debate clásico acerca del proceso de construcción de las comunidades nacionales fue enriquecido por la mirada poscolonial, con la pregunta acerca de las relaciones de poder vigentes en esa idea en constante disputa. Fueron los Estudios Subalternos lo que llamaron la atención sobre las voces invisibilizadas en los grandes relatos nacionales. Durante el siglo XX los Estados latinoamericanos implementaron programas políticos que evidenciaban distintas formas de concebir a la Nación y de afrontar la diversidad contenida en sus territorios. Estas propuestas han mostrado habilitar la discusión respecto de la heterogeneidad y han dado lugar a reclamos por la ciudadanía, pero no han logrado derribar paradigmas hegemónicos heteronormativos y patriarcales. Aun son escasos los aportes teóricos para pensar la multiplicidad de la nación en términos de identidades sexuales.

Entendiendo a los cuerpos como territorios de disputa donde se imprimen los sentidos de la pertenencia, este trabajo se propone reflexionar sobre las ideas hegemónicas respecto de géneros y sexualidades y su impacto en las ideas de nación. Revisaremos las formas de ciudadanía que las naciones contemporáneas habilitan a partir de esos marcos de sentido. Visitaremos en estas páginas las intersecciones entre raza y género, colonialidad y nación, a partir de un análisis empírico de experiencias de acción colectiva latinoamericanas. El análisis de experiencias de acción colectiva transnacional en torno a derechos de identidad sexual nos permitirá reflexionar sobre el lugar que ocupa la heterogeneidad en las naciones latinoamericanas y en las políticas de la multiculturalidad.

Babies and Material Culture

This paper aims to discuss the material culture and its relations to childcare practices through a child-centered approach research. It sheds light on the social, educational and generational inequalities which are deeply intertwined at the practices experienced by babies and toddlers at a public nursery school located on the edge of the city of Curitiba, Brazil. This discussion emerged from a cross-disciplinary study based on ethnographic guidelines, sustained by participatory observation and visual methods, with a group of nineteen babies and toddlers. The research also relies on an inventory of toys and materials present at their classroom, which possibilities the study of their daily lives through the analysis of cultural artifacts. In Brazil, children from 0 to 18 years of age have the constitutional right to education; younger (0-5 years old) and older (6-18 years old) children are entitled to different federal educational politics that impact on the material culture to which they have access on their everyday lives. Throughout this research, it has been noticed that educational politics are embedded to generational ones, resulting on and deepening inequalities. Infant and toddlerhood experiences are constrained by the material culture to which they have access and are affected by the global culture of consumption. At the observed context, donated toys, like McDonald's promotional gifts and broken second-handed toys from Fisher-Price and similar ones, are offered to children on a daily basis. The research has opened up a discussion about the material organization of childcare centers considering the porous relations between global and local contexts. The social construction of nursery schools, which is historically related to social assistance, seems to imply on the acceptance of donations, and, from a broader view, to the adherence to normative standards related to childhood and, in this case, to babies and toddlers.

LUCKING, STEFAN* (Hans-Böckler-Stiftung, Germany)

Algorithmic Decision-Making and Workplace Democracy

The use of "artificial intelligence" in human resource management poses a particular challenge to workplace democracy because decisions are no longer taken by interest-driven human beings but by apparently rational "self-learning" algorithms unaffected by emotions or prejudices. Algorithmic decision-making is seen as a black-box, in particular since algorithms "learn" to perform their tasks on the basis of abstract statistical models instead of predefined instructions. How can labour unions and works councils challenge automatic decisions made by "self-learning" algorithms?

The paper will analyse the impact of algorithmic decision making with regard to two use cases: algorithmic management and "talent analytics".

Algorithmic or "app-based" management refers to the assignment of tasks by algorithms. The case of food delivery riders shows that algorithms are not used to calculate the most efficient distribution of tasks but rather to control work processes in a way that creates the illusion of autonomy by using gamification, nudging and information asymmetry.

Systems for "talent analytics" promise to improve human resource management decisions on the basis of "artificial intelligence". Using machine learning they analyse all available data in order to identify the best career path or the most efficient composition of teams. However, as they are "trained" on existing data they tend to reproduce the discriminations of the past.

On the basis of empirical evidence from several research projects funded by the Hans Böckler Foundation the paper will finally discuss ways to make algorithmic decision making susceptible to workplace democracy. Although the precise way machine learning algorithms perform their tasks is not even understood by their programmers, they are programmed for a certain objective and have to be

tested for "bugs". Practical examples show how labour unions and works councils can challenge the way algorithms work without a deeper knowledge of programming languages or statistical models.

LUCKING, STEFAN* (Hans-Böckler-Stiftung, Germany)

Impacts and Limits of the Platform Economy

The new forms of employment discussed under such terms as "crowd work", "click work", "gig economy", "platform work", or "sharing economy" are related to more global developments which are rather fostered by institutional changes than technological developments: new forms of "outsourcing" (e.g. contract work and temporary work), self-employment, zero-hour contracts, multiple employment as well as "marketisation" in the sense of indicator-driven competition.

What makes platform work in the "gig economy" different form these more general forms of precarious work? The paper identifies the impact of digital technologies in three particular aspects of platform work: Digital platforms reduce transaction costs via a drastic standardisation of tasks, processes and contracts. Their power is based on the accumulation of "big data" and their analysis by so called "artificial intelligence". They use algorithmic or "app-based" management as new means to control the labour process.

The paper will use three different empirical examples in order to discuss the impact and the limits of these aspects of platform work. The example of online platforms for live music shows the difficulties to reduce transaction costs in a sector where the necessary standardisation of processes and contracts is hard to achieve. Crowdsourced production of training data for self-driving cars is used as a model for the complex relation between human work and "artificial intelligence". Finally, the example of food delivery riders shows how "app-based" management based on gamification, nudging and information asymmetry undermines the potential of big data analysis and leads to similar contradictions as classical managerial control.

The empirical examples are used to analyse the internal contractions of platform work in order to identify opportunities for new forms of organizing and workplace democracy.

Housing Tenure Security and Domestic Violence Against Women in Recife, Brazil

The intersections of domestic violence against women and housing tenure insecurity are still under explored by research and policies. This qualitative study discusses how housing tenure security may interfere (positively or negatively) on the incidence of gender-based domestic violence and on women's critical path to escape and, on the other hand, how the incidence of domestic violence may interfere on their tenure security during and after an abusive relationship. Empirically based on the experiences of 56 black, low-income women living in consolidated informal settlements in Recife, Brazil (including 31 domestic violence survivors), supplemented by the perspectives of 25 experts from various sectors, the study illustrates how domestic violence and multidimensional gender asymmetries are shaping women's perceived and *"de facto"* housing tenure security, regardless of equal legal property rights, contributing to a gender gap in asset distribution. Women in the sample are facing disproportionate challenges to access housing resources and to hold on to property upon separation due to misconceptions around property rights or to avoid family conflicts. When women are aware and try to exercise their property rights, domestic violence is often a tool to ensure men's predominant relationship to property. When domestic violence is unrelated to property, women's perceived and actual tenure security may be constantly violated by the perpetrator, while many survivors continue in the relationship due to the lack of housing alternative or lack of means to exercise property rights. This dual crisis has serious implications to urban development. This study contributes to the debate on tenure security from a gender and intra-household perspective, and to the debate on domestic violence against women from a tenure security perspective. Ultimately, it seeks to shed light on how these intersections contribute to broader gender and housing inequalities in an urban context in the Global South.

Norwegian Kindergarten Teachers: Professionalism between Market and the Welfare State

This paper scrutinize the professional roles of Norwegian Early Childhood Education and Care (ECEC) teachers, in an organizational setting with high political

attention, and with ambitions related to the fulfilment of broad welfare state and educational goals. Since 2006, ECECs is an integrated part of the Norwegian educational system. Access to services is defined a right for all children, and marketization has been a tool for expanding the ECEC-system. Norwegian ECEC teachers have legal monopoly to leader positions in public and privately owned ECECs. Some studies has indicated a decline in ECEC teacher autonomy along with the political attention and increased funding and development of the services. The government aims at increasing the density of educated teachers with a bachelor degree, but still ECEC services depend on a large group of unskilled and vocationally trained workers. A national framework plan give large commercial owners as well as municipalities a crucial role in implementing qualitatively good services, based on a mix of principles from the Nordic ECEC model and ideas related to learning skills.

In this context, teacher professionalism is regarded an important tool, and policies aims at enhancing professionalism of teachers in both primary education and ECEC as an integrated part of securing educational quality. How do the ECEC teacher professional roles and relations develop under such conditions? Through an actor - based analytical framework we analyse the changing relations between different ECEC professional groups and other stakeholders like the clientele, higher educational institutions, and the public and private owners in diverse organizational contexts of public and private ownership and varying market situations. What kind of professionalism is developing though the changing relations in ECEC organization? The paper is based on interviews and written material gathered through several projects on leadership and organization in Norwegian kindergartens.

Mothers in Domestic Violence Context and Her Point of View about Children: Biographical Research of Battered Woman

This work is a result of my thesis. I propose a discussion about maternity and marital violence. To help us to understand this phenomenon and find the structures of action of women in front of their children who witness domestic violence, we resorted to Interpretive Social Research. Interested in the experience of subjects who suffer domestic violence and what interpretation mothers make of their children in these relationships, I resort to the approach of biographical research as one of the main tools for my results. We combine participant observation and open interview. With these instruments, after going through the steps of the analysis, it was possible to reach two distinct types of interpretation about the child in cases of domestic violence. The research universe have 24 mothers, of which 15 were submitted to open interviews in Brazil and five to the United Kingdom, in addition to the 4 narrative interviews conducted in Brazil. The first Type demonstrates that the mother blames the child for entering and staying in a violent relationship and acts to penalize him, and the second Type finds in the child salvation to break up with the cycle of violence.

Nowhere Now Here: Comparing Multipurpose Sites in West Africa.

This paper is an attempt to productively compare two particular sites in West Africa. The first site is "Ficgayo", a space the size of two soccer fields located at the center of Yopougon, the most densely populated district of Abidjan, Côte d'Ivoire. Though the local government imagined this space to have the form and function of a town hall, Ficgayo has always been kept empty, but it is used by urbanites in meaningful ways. The second site is a former telecommunications antenna in Kuntunse, Ghana, which has now been transformed into a radio telescope designed to contribute to „the biggest science project in Africa". Both sites were constructed based on a past vision of multiple future purposes; they are made productive and maintained in the present as well as transformed for various kinds of new purposes.

Based on ethnographic data generated in Abidjan and Kuntunse, this paper explores concepts of space and place focusing on their common „matter of concern" (Stengers 2011), i.e. their multiple purposes. It examines the practices of space-making and place-making that allow for multipurpose sites to emerge. Multipurpose sites are spaces of becoming. Their primary purpose is „the multiple"; thus, they provide ground for possibilities to be realized.

Brazilian Top Executives: Identity and Class Action

In research on social stratification, sociology has been mainly concerned with studies on subordinate groups. The "bottom" segments in the social pyramid are

constantly scanned, while the same treatment is not given to the upper strata. The 1970s marked a period in which the rich stratum gained a greater focus, coming to be seen as having peculiar characteristics (MEDEIROS, 2003). Over the past two decades, Thomas Piketty's studies are expressive of what Andrew Leigh (2009) has termed "*new top incomes literature*." Within the sociology of professions, studies on high-status professional groups are increasingly prominent. However, there are a number of caveats that these segments are inscribed in a broader social class, composing common socioeconomic identity and collective performance. This research seeks to revisit the literature on top executives and their role in the current context of capitalism. At this stage of the investigation, prosopography serves as a method to construct the mapping of the universe that involves Brazilian top executives and their social profiles. It is based on experiences previously conducted for the study of economic elites in Germany, East Asia and Brasil itself. The use of standardized exploratory instruments allows the gathering and organization of a large amount of information about the chosen segment and, if applicable, the establishment of variables (POHLMANN & VALARINI, 2013, p. 41). For the analysis, the dialogue with the classical and contemporary sociological tradition about the concept of social class will serve as a reference, reflecting on the constituent elements of the so-called dominant classes and their relevance to analyze this professional segment. In particular, it is of interest to verify symbolic elements of distinction of the Brazilian top executives within the dominant classes and in their relationship with other classes.

Workplace Facilitators and Constraints to Men `s Working Time Reduction for Family Reasons

This study investigates how workplace- and occupation-specific working time norms and work-life support in the direct exchange relationship between workers and supervisors are relevant for men's possibilities in realizing a preferred reduction in their working hours due to family reasons. Relying on arguments from Amartya Sen's (1992; 1999) *capability approach* and the *relational inequality theory* (RIT; Tomaskovid-Devey & Avent-Holt, 2019), this paper argues that the existing norms of long working times in workplaces and occupations are cultural barriers to a preferred reduction in work times, whereas a work-life-supportive supervisor is a facilitator. Based on unique linked employer employee data (LEEP-B3), this paper shows that men are less likely than women to realize a preferred reduction in their working hours due to family reasons. Furthermore, strong pronounced long working time norms in the workplace rather than occupational working time norms hinder this reduction for men. At the interactional level between workers and supervisors, work-life-supportive supervisors are not facilitators of but barriers to the realization of the preferred reduction in working hours for family reasons.

Implementation of a Psychosocial Outpatient Clinic for People Exposed to Violence in a University Hospital.

The process of implementation of an outpatient clinic offering psychoanalytic group psychotherapy to children, adolescents and adults exposed to violence, assigned to the northern region of Campinas-SP, is discussed. The implementation takes place at the University Hospital - Unicamp, in partnership with the Laboratory of Collective Health and Mental Health - Interfaces, the Social and Health Care of the Campinas City Hall. The objective is to qualify the assistance and articulation of the public services network (Primary Health Care and Social Assistance), offering matrix support and joint follow-up of cases; and to build evidence on the effectiveness of group psychoanalysis in the therapy of disorders associated with exposure to violence. Using psychoanalysis is justified in the context of the approach and prevention of violence, enabling a place of elaboration of traumatic experience; otherwise there are risks of invalidating, denying, silencing and perpetuating violence. Psychoanalysis understands the individual and collective causes and consequences of violence, as well as provides resources to intervene and prevent transgenerational transmission through therapeutic devices that consider the collective, intersubjective and intrapsychic. Discuss the importance of the clinical practice of psychoanalytic groups and the potential for application in the context of public policies. Working with groups is a solution that extends its technical utility to serving many people and reducing waiting times in lines. Investing in a therapeutic setting from the groups has a clinical function: to reactivate subjective and symbolic ties in a territory marked by fragmentation of the senses

and denial of rights. What can a group? Able to restructure and strengthen family relationships and the bonds of users of public health, care and education services with the territory where they live, group therapy is an affirmative tool of the collective potential in the construction of meaning and elaboration of suffering.

Across Boundaries: Knowledge on Families Created By "World Cafés"

Living together as a family brings laughter and happiness – but also a variety of questions, anxieties and challenges. These are addressed by family support and parenting programmes: with counselling and information, classes and informal get-togethers, they aim at fostering familial resources and enhancing parenting competence. As such, these educational offers can facilitate family life and the challenge of "doing family" – and preventing problems before they become serious.

But what ideas of "good parenting" do family practitioners have in mind? How do they address the question of familial and cultural diversity? What do they themselves perceive as "good practice" and "professional"?

As family sociologists tasked with the scientific support of these programmes, we aim at connecting family research and practice, and encouraging the co-creation of knowledge, i.a. regarding the above-mentioned aspects.

Our current research question is: can we use the conference method "world café" in order to, first, stimulate the transfer of experience and development of new ideas among and with family practitioners, and, second, use it as a creative and innovative research method generating new knowledge on family work?

In 2018 and 2019 we conducted four "world cafés" on family matters; in total, 140 family workers participated in 100 discussion rounds.

In our presentation, we will (a) specify the conflicting requirements applied research is confronted with, (b) introduce the method "world café" and its potential for practitioners, (c) present our empirical basis including preliminary results, and (d) discuss its opportunities, challenges and limits as a research method within the field of family research.

Does the Digital Transformation of the Labor Market Foster Atypical Forms of Employment? Firm-Level Evidence from Germany

The digital transformation of the economy leads to fundamental changes in the dynamic and structures of the labor market. The skill-biased technological change approach and the polarization/upgrading thesis are subject to intense discussions (Arntz et al. 2016; Goos et al. 2009; Oesch/Rodriguez Menes 2011). Automation and artificial intelligence rapidly change the working Environment, affecting the task composition of workers and skill demands (Acemoglu/Restrepo 2018; Autor 2015; Autor et al. 2003). Moreover, modern communication and production technologies allow for more flexibility regarding time and place of work. In addition, forms of employment as well as the employer-employee relationship are subject to major changes. New models such as employee sharing and crowd working challenge traditional forms of employment (Degryse 2016) and – from a legal perspective – the question arises, at what point a firm should be considered as an employer with responsibilities and obligations towards employees (Prassl/Risak 2015). Also, the willingness to freelance largely depends on individual worker characteristics such as skill, tenure or family status (Bidwell/Briscoe 2009) suggesting a distinction between workers who self-select into flexible working contracts and workers who are induced to do so. This paper tries to shed light on the relationship between technological progress and atypical employment contracts. Technological advancement allows more flexible work arrangements. This leads to a decrease in standard employment contracts and less planning and financial security for employees. In addition, workers have less bargaining power in times of vanishing local boundaries of the workplace. Therefore, within the course of this study, the hypothesis is tested, whether the introduction of digital technolo-

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

gies fosters atypical forms of employment. For this purpose, this study examines firm-level data from Germany. The introduction of new technologies is expected to lead to an increase in atypical employment contracts.

La Sociología Del Voto Obligatorio En La Democracia De Brasil.

El tema de la democracia electoral en Brasil plantea al sociólogo dedicado a enseñar sobre la relación entre los derechos humanos, la democracia y el Estado De Derecho, un hecho extravagante, a saber: la singular recurrencia del régimen obligatorio de votación "forzada", con severos castigos impuestos por la ley para punir los incumplidores.

De hecho, debido a la obediencia social como un valor normativo, el voto obligatorio "forzado" sería menos insólito cuando se adoptara en tiempo de regímenes monárquicos, en lugar de ser en un país con más de cien años de historia republicana, cuyas instituciones parlamentarias, más allá de eso, cuentan dos siglos de existencia, como es el caso de Brasil.

Estas situaciones inadecuadas en las instituciones democráticas, aunque no directamente en el nivel de corrupción, como factores endógenos de la creciente desconfianza en la autoridad del estado, deben superarse para evitar la angustia psicológica y la perturbación moral, y para promover la confianza, especialmente en las instituciones propiamente democráticas, como la votación en las elecciones. Sin mencionar que el voto obligatorio forzado segrega un daño institucional perjudicial que está arraigado estructuralmente.

En la presente exposición, relataré mis observaciones en dos argumentos. En primer lugar, destacaré el aspecto comparativo del modelo de votación, entre un régimen monárquico y otros regímenes republicanos ejemplares. En el argumento 02, enumeraré mis comentarios específicamente sociológicos, para resaltar en sus niveles diferenciales el embrollo institucional del voto obligatorio.

The Social Organization of Feminists Talking about Each Other

How do academic feminists talk about the commitments of other feminists and how is this talk socially organized? What does the talk reveal about the relations of ruling organizing everyday life in academia? What are the political and social implications of this talk? These are some of the questions motivating the explorations in this paper. Drawing on the resources of Institutional Ethnography (Smith 2005), and engaging from the standpoint of feminist scholars in Finnish academia, I will explore the social organization of feminist academics' talk. More specifically I will focus on explicating what Clare Hemmings (2011) names the "political grammar" of the stories we tell, and its effects on the possibility of "affective solidarity" (Hemmings 2012) and ultimately, the consequences of this talk for feminist transformation. I draw on life story interviews carried out with feminist academics at different universities and departments across Finland.

Climate Change and Tribal Livelihood: A Study from the North-East India

In the present scenario, climate change is an ongoing issue across the world which is an alarming factor due to its massive impact on environmental sustainability and human welfare. India has the world's largest population of schedule tribes consisting about 8.6 percent of the total population; out of which 89.97 percent are living in rural areas and 10.03 percent in urban areas. North Eastern states of India, are home to tribal people who belong to different ethnic groups. Majority of the tribal people are dependent on forest and agriculture for their livelihood, and they rely highly on natural resources to meet their basic needs. However, with the impact of climate change, their dependency on nature put the tribal peoples' lives at stake and thus make them vulnerable.

The effects of climate change are irreversible which will take thousands of years and its impact is beyond retrieve. At present, the tribal peoples' main occupations are affected significantly due to climate change. This paper will be focusing in understanding the recent trends in climate change and its impact on tribal livelihood. The study relies on the available reliable data that emphasizes the impacts of climate change on tribal livelihood. The above-mentioned points indicate the topical issue of climate change and aims at creating awareness to lead a well-balanced and secured life with the available resources for better future.

Methodological Figurations: Why Media Multistability Matters in the Study of Digitally Mediated Social Movements

The growing ubiquity of ready-to-hand digital media platforms as means of social interaction raises some epistemological implications which scholars should consider when studying the relationship between digital media and social movements. In particular, the supposed deterritorialization of the field, and the increase in digitally mediated interactions, require us to rethink our research practices in face of the increasingly complex digital mediascape. Building on, and extending, the session's goal, i.e. "to revisit the contemporary relationship between digital media and social movements", in this paper we problematize the relationship that we, as researchers, establish with digital media technologies in the study of social movements. We advance the concept of methodological figurations to problematize how digital platforms open possibilities for different kind of interactions between researchers, digital media and research subjects. Countering the supposed transparency and neutrality of digital platforms, we propose to conceive digital media as multistable objects that are capable of redefining, in multiple ways, the relations between us, them and the research subjects, e.g. participants to social movements. We claim that digital media, as in a Gestalt shift, can be framed according to different methodological figurations that generate multiple conceptions of the same social phenomenon. Conceiving digital media as inherently multistable quasi-objects means becoming attuned to, aware of, and responsive to, the ways in which they colour the interrelationships between researcher, research subjects and the research field. On the contrary, ignoring digital media multistability might lead us to either overlook the substantive role they play as part of social movements or, far worse, extend and legitimize their datafication logic. To demonstrate how methodological figurations are well placed to account for digital media multistability, we examine a test case involving the event-planning platform Meetup as part of an ethnographic investigation into the organization of labour in the Vancouver creative industry.

Occupational Communities and the Democratization of Startup Culture

This research investigates to which extent informal meetings of tech workers and creative practitioners can promote collective actions, lead to political mobilization and overcome the limits of flexible capitalism, such as lack of social security, individualization of risk and the normalization precarious forms of employment. We therefore study the potential of "occupational communities", i.e. grassroots organizations connecting workers with similar competences and professional interests, as sites of tactical resistance, in opposition to the strategic organization of labour informed by the 'Startup Culture', which constitutes the ontological and epistemological reality of many creative practitioners, hi-tech workers and startup employees. The research was conducted in on of the highest rated startup ecosystems/creative hubs in North America. For the exploration of the field we relied on "platform ethnography", a combination of online data analysis and classic ethnographic practices. Through the analysis of publicly available data about tech-related events, we identified and mapped formal and informal communities of tech-professionals operating in the city. The outcomes informed the subsequent ethnographic investigation of startup/tech workers' community. The results collected through interviews with software engineers, freelancers and creative practitioners emphasize the ambivalent nature of occupational communities. If on the one hand they counteract the losses that workers experienced in the passage from industrial to flexible capitalism, on the other hand they promote individualistic approaches to social problem thus reinforcing current hegemonic forms of managerial power and control.

The Road to Freedom: Worker Autonomy in the Platform Economy

Platforms are a source of livelihood for millions around the world and have dramatically restructured the world of work. By classifying workers as "independent contractors", "micro-entrepreneurs" or "partners", platforms evade contractual obligations to protect workers. With the onset of neoliberalism, ideas of freedom, autonomy and flexibility – key to the cultural appeal and business model of platforms – gained ideological force that has since increased in vigor. Platforms actively champion these ideas as desirable, liberating and emancipatory for workers. Examining ride-hailing platforms in India (a country with a massive informal economy and high joblessness), this paper problematizes the discourse of freedom, autonomy, entrepreneurship and partnership as constructed by platforms.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

The analysis places three key actors viz. Companies, Customers and Drivers in a three-way reciprocal relationship. Drawing on insights gained from in-depth interviews with Uber and Ola drivers in Delhi-NCR, this paper seeks to answer the following questions: 1) Do the simultaneous, digitally-mediated interactions create or inhibit conditions for freedom/autonomy for drivers? 2) To what extent do these ideas/discourses affect and shape the perception of drivers towards their work? 3) Is freedom/autonomy an applicable framework through which to understand platform-work in India? While most scholarship approaches the subject of work in platforms from an objectivist viewpoint, this paper explores the narratives of work as articulated by drivers themselves, thus illuminating the subjectivities that get engendered as a result of changing work conditions. By analyzing data gathered through ethnographic fieldwork, this paper argues that freedom and autonomy are structurally and systematically denied to drivers, thereby producing a stark contrast between the drivers' own perception of these ideas and the ways in which they are strategically deployed by platforms. Some of the insights provided in this study have general applicability across a host of platforms that employ low-skilled service workers around the world.

Pratiques Sociales Contemporaines Et Objets Matériels : De La Domination Politique Envers Les Pouvoirs Techniques

Les NTIC changent les modes habituels du pouvoir et d'influence. D'où la nécessité d'explorer de nouvelles dimensions sociologiques pour appréhender l'environnement global de la technique et de la technologie accompagnant la vie personnelle dans la société postmoderne. Au début des années 2000 on glosait sur « les médias omniprésents », qui s'introduisaient dans notre vie en changeant les structures du pouvoir, mais aussi la configuration de la perception, les interactions avec des gens et des institutions (M.Featherstone), la réflexion scientifique s'est déplacée depuis pour envisager que le monde social et culturel des « intermédiaires », «des délégués et des chérubins» (B.Latour) est constitué par des outils non silencieux et obéissants. Il convient d'interagir avec eux, car cet environnement objectif est animé, il réagit et interagit avec nos mouvements hasardeux par les sons ou des éclats de lumière, il nous donne des signaux et nous observe, en sorte qu'il actualise un nouveau pouvoir technique et technologique qui se substitue partiellement à la domination politique. Deuxièmement, il s'agit de la mutation du pouvoir comme l'ensemble des dynamiques du quotidien de nos actes associés à nos pratiques de la langue, des corps, des objets, en ce qu'ils engendrent en permanence de nouveaux agencements de réseaux et non plus seulement en tant qu'ils répliquent des schèmes de domination symbolique. Ainsi, si l'on fait le bilan, on peut affirmer que l'apparition de l'intérêt scientifique pour la matérialité et la facticité de la réalité moderne permet non seulement de comprendre d'une nouvelle manière la polyrythmie des textes de la culture et la polyrythmie des régimes modernes du pouvoir et de la domination, mais qu'il ouvre également un nouvel objet pour des études anthropologiques et sociologiques sorties de l'anthropocentrisme et dirigées vers l'analyse du rapport ambigu du transcendant et de l'empirique, de l'humain et du non-humain.

"Short Communicative Acts" As a New Type of Participative Practices in Social Media: Social Functions and Dysfunctions (Ukrainian case)

The purpose of this study is examine the phenomenon of "short communicative acts" in social media as one of new participative practices emerged in 21st century. We define "short communicative acts": liking, sharing, and commenting as a participative practice of a little personal engagement and as a crucial element of weak social ties. It deals with background social practices, non-reflexive everyday routines of social media consumption & participation as well as with constructors of private identity and public manifestation. This also emphasizes the analysis of differences between participation and interaction, engagement, interpretation, production. Such conceptual framework enables to disclosure ambivalent communicative & social shifts in contemporary society.

The analysis of "short communicative acts" manifests the emergence of "fuzzy objects" which are defined as "your world": your thoughts, photos, videos, your events, when sharing doesn't mean transmission of any information, but only maintaining social contact or providing access to joining significant individuals and groups. Thus, we talk about a positive connotation of equality and selflessness which is associated with positive social relationships. At the same time we dwell on the mystification component of such "positive exchange". Critical analysis of social networks practices suggests, in particular, the use of free labor of people to carry out tasks for which the Internet platforms would have to pay the money.

In Ukrainian context new participative practices can be considered as creators of new communicative environment, new sociality that favoured to express one's

identity, to create community, to structure one's past and to present experiences. Meanwhile "short communicative acts", on the other hand, have been transformed into the social field of information wars, political conflicts and personal or social isolation. To reveal social functions and dysfunctions of new participative practices we have observed different information technologies used in Ukrainian internet platforms during 2014-2019.

The Promises and Fears of Welfare Technologies in Elderly Care

This presentation focus on elderly care personnel in Sweden and the introduction of welfare technology at their workplaces. We will present some preliminary results from an ethnographic case study in which we study how personnel respond to, and interact with, welfare technology, and what values on welfare and care that guides these responses.

Welfare technologies are digital technologies aiming to contribute positively to the welfare of the population by increasing safety, activity, participation and independence for people who have, or risk developing, a disability. Door sensors, video-communication technologies and robot pets are examples of welfare technologies. Used in care and social sector they are - as indicated by the term - supposed to contribute positively to the welfare of the population.

While there are a lot of hopes projected on welfare technologies, including a promise of more efficient care and a more sustainable work life, some worry that these technologies will replace human contact, involve a surveilled work practice or that it will lead to job losses. Thus, there are a lot of conflicting values and expectations about welfare technologies.

Combining insights from science and technology studies (STS), and Boltanski and Thévenot's (2006) work on institutional values, we argue that technology and human practices are mutually produced in the user-technology interaction. This interaction is influenced by different values that are upheld and reproduced by representatives for the care organization, and which can also be traced to various societal discourses and conditions.

Bienestar y Fragilidad En La Gran Vejez: Un Ejemplo De Ventajas y Desventajas Acumuladas En El Curso De La Vida

El objetivo de esta comunicación es relacionar la percepción del bienestar que poseen mujeres y varones que se encuentran transitando la gran vejez (80 años y más), etapa de la vida en la que se hace visible un proceso de fragilización, con las ventajas/ desventajas acumuladas a lo largo de la vida.

Nuestro trabajo encuentra sus fundamentos teóricos en el enfoque del curso de la vida, los estudios sobre la acumulación de ventajas y desventajas sociales y las teorías de la fragilidad y el bienestar.

Se trata de un estudio descriptivo y comparativo para el que utilizamos una estrategia de abordaje cualitativa.

La información se obtuvo mediante la realización de entrevistas semi-estructuradas a 20 individuos, distribuidos de manera equitativa según género, que contaban entre 80-84 años.

El análisis de los datos se realizó mediante la convergencia del análisis de contenido y el método comparativo constante.

De esa manera fue posible reconstruir diferentes trayectorias de vida teniendo en cuenta: el origen familiar (conjunto de ventajas y desventajas sociales heredadas), el itinerario biográfico y el contexto en el que esas trayectorias se desenvolvieron.

Sabemos que la fragilidad (que se caracteriza por el deterioro manifiesto de las capacidades físicas o cognitivas de las personas) posee un efecto potencialmente dañino en el bienestar, tanto sobre su dimensión cognitiva como emocional. En nuestra investigación encontramos que ambas dimensiones del bienestar, además, son sensibles tanto a las variaciones en las trayectorias de vida como al género. Estos resultados deberán ser profundizados en futuras indagaciones.

Entendemos que la posibilidad de establecer modelos analíticos al respecto redundaría en una mayor comprensión de las prácticas de autocuidado y cuidado familiar de los adultos mayores y, por supuesto, en el reconocimiento de la existencia de necesidades de apoyos institucionales diferenciados en la vejez frágil.

Trayectorias Familiares Y Laborales EN EL Curso De La Vida: UN Estudio Comparativo De Mujeres Y Varones EN La Argentina Contemporánea

En esta comunicación expondremos resultados de una investigación más amplia referida a la construcción y transformación de los modelos de curso de la vida en la Argentina contemporánea.

Específicamente, nuestro objetivo será describir, con una perspectiva retrospectiva, los cambios en las trayectorias familiares y laborales de varones y mujeres de distintos grupos de edad.

La fundamentación teórica del estudio fue el enfoque del Curso de la Vida; perspectiva que permite articular conceptualmente las biografías individuales con los contextos sociohistóricos y culturales en los que se desenvuelven y los impactos de las mediaciones institucionales, sobre todo, familiares y laborales.

En consecuencia, y a los efectos de captar las múltiples dimensiones del objeto de estudio, recurrimos a un abordaje metodológico mixto, cuantitativo y cualitativo que, en el marco de los estudios biográficos, combinó múltiples técnicas de obtención de información y de análisis e interpretación de datos.

Los resultados indican que, hasta mediados del siglo XX, se institucionalizó un modelo se curso de la vida ternario -dividido en tres edades articuladas en función de la inserción en el mercado laboral: niñez/juventud (formación), adultez (actividad) y vejez (retiro)- fuertemente estandarizado según género (entre los varones, alrededor del mundo del trabajo; entre las mujeres, de la familia y el ámbito doméstico).

A partir de 1960 se produjo una flexibilización "de hecho" del modelo normativo a raíz de una desestandarización de las trayectorias generizada y según perfiles de inserción.

En los comienzos del siglo XXI, asistimos a un nuevo proceso de "institucionalización ampliada" de aquellas trayectorias desestandarizadas.

Developing a COVID-19 Sociology Course: Structuring Student Learning about a Pandemic during a Pandemic

This presentation details the development of a new sociology course, *COVID-19 & Society*, delivered remotely in summer and fall 2020 at the University of British Columbia in Vancouver, Canada. This course focused on the impacts of the pandemic in relation to social inequality, social interaction and social institutions. It attracted 350 undergraduate students from across Arts, Science, Applied Science and Business faculties. Course design considerations to be discussed include the strengths and challenges of teaching about an ongoing crisis, the facilitation of digital course learning communities, the rapid and collaborative development of thematic course content, and the utility of such a course for non-sociology students.

Gender Blindness or Gender Awareness: Two Strategies for Achieving Equality Facing the New Professionalism in Armed Forces

During the 20th century, women gained a lot of equality with men in various aspects of social life. However, women can't claim equal rights in all areas, without at the same time raising the question of their right to defend their country.

Our investigations, carried out between 2014 and 2019, show that the question of gender equality in the army depends not only on the decision of politicians, but also on the norms prevalent in the society. Moreover, women's gender construction in the Military could explain the transformation processes of this institution.

What is the most effective strategy of female opposition to the norms of the military organization? Is it believing in men's and women's similarities ("gender blindness") or relying in women's distinctive qualities ("gender awareness")?

The purpose of this paper is to question the socio-professional phenomenon of Women in the Military in order to understand to what extent they contribute to gender equality work in armed forces. It aims at understanding in what measure women can contribute to the feminization of the military profession in the contemporary army.

Instrumental Solidarity As a Strategy for Profit Accretion

Conflict produces group solidarity and facilitates collective action. We argue that it can be a manifestation of a collective need derived from a rational choice to attain capital. A study done on collectively oriented task groups consisting of women disclosed a behavior pattern of functional integration guided by reason and calculation to rationally arrive at a desired end which is profit accretion. Thus we propose to define this rationally motivated collective consciousness as instrumental solidarity. This analytical work was situated within the context of "micro-mobilization and participation" primarily focusing on the interrelation between collective identity, solidarity and commitment to make profit. The analysis is built upon a rigorous five year field trip to illustrate the construction of women enterprises in the context of Kerala, the southernmost state in India. The interpretive methods of inquiry aimed at constructing an understanding of the context. The findings of the study were corroborated using mixed method. Quantitative and qualitative data was gathered using 280interviews, 38 in-depth interviews and 16 focus group discussions of women beneficiaries. Through this work we are constructing and assessing the concept of instrumental solidarity in terms of two general questions: What role does solidarity and commitment has to determine the multifaceted nature of collective identity? How does the instrumentality of solidarity maintain the collective identity?

El Auto-Cuido, La Auto-Generación y La Auto-Organización Comunitaria, De Los Adultos Mayores: Un Desafío Del Siglo XXI Para Mejorar La Calidad De Vida

Las personas adultas mayores forman parte de una población con alto grado de vulnerabilidad. Cada vez son más urgentes y pertinentes los estudios interdisciplinarios relacionados con dicha población, no solamente para conocer ese nivel de vulnerabilidad, sino para comprender la complejidad de la problemática y proponer programas integrales de apoyo encaminados a prevenir situaciones difíciles y/o solucionar sus necesidades y problemas. Ciertamente, el proceso de envejecimiento y la etapa de la vejez son ahora una realidad preocupante, sobre todo cuando la calidad de vida se ve mermada por falta de cuidados. Este trabajo presenta una propuesta interdisciplinaria para resolver el auto-cuidado, la auto-generación y la auto-organización comunitaria para el mejoramiento de la calidad de vida de los adultos mayores, asunto que es un desafío del siglo XXI. El trabajo responde a las preguntas: ¿Cómo podemos vivir juntos en un planeta limitado? ¿Cómo resolver los problemas de espacio de vivienda, de recursos económicos, de salud integral y de suministro de alimentos? Todos éstos son asuntos urgentes de resolver en esta población adulta mayor. El auto-cuidado, la auto-organización y la auto-gestión, son parte de la clave para transitar por el proceso de envejecimiento y la etapa de la vejez con salud y calidad de vida. El trabajo está basado en los resultados de un proyecto de investigación realizado en una casa de Retiro en el que conviven personas adultas mayores y donde se han logrado grados de auto-organización.

Loneliness, Disease and Poverty? Care and Self-Care Methodology in Order to Improve the Quality of Life in Older Adults

Older adults are considered a vulnerable population group. Every day many of them are poorer, alone and sick. That is why we must rethink care and self-care as a strategy to promote their health. Likewise, interdisciplinary studies related to this population are increasingly urgent and relevant, not only to know that level of vulnerability, but also because we must understand the complexity of the problem and propose comprehensive support programs aimed at preventing difficult situations. and / or solve your needs and problems. Certainly, the aging process and the stage of old age are now a worrying reality, especially when lack of attention decreases the quality of life of older adults. This work presents some characteristics of health self-care practices in older adults and methodologies to solve the improvement of their quality of life and some techniques to reduce discomfort or pain, for example. The work answers the questions: What do we talk about when we talk about care and self-care? Who needs care? How much attention is needed? How much should we take care of ourselves? Where are the limits? Who cares about care and caregivers in the aging process? How do we want to live in old age? Who will take care of us? Who are the caregivers? Who will take care of those women who took care of their partners, their children, their parents? What economic, physical and social cost does attention imply? Is it a careful and / or work job? A reflection on socially constructed knowledge regarding each of these questions is presented. The work is based on the results of a research project carried out in a retirement home where older adults live together and where degrees of self-care and shared care have been achieved.

Encontrar La Posición De Uno Mismo En La Sociedad: Una Encuesta Basada En Viñetas

Los indicadores para medir clase social o estratificación según estatus pueden ser examinados cuantitativamente desde el punto de vista de la autoidentificación de las personas en el contexto de su propia realidad. Con este enfoque, a partir de una clasificación de las personas en la sociedad elaborada por los propios individuos, analizamos de qué modo ellos se identifican con una posición social. Nuestro análisis se basa en una encuesta en que se solicitó a los participantes realizar un juego de clasificación de viñetas representativas de personas en la sociedad chilena. La encuesta fue aplicada en Chile en el año 2016 a una muestra de 2.000 individuos estadísticamente representativos de la población. Los resultados muestran los criterios que predominan al clasificar a las personas en la sociedad y qué influye en la definición de su posición social por parte de los individuos, quienes se autoidentifican mayoritariamente con una categoría baja en la sociedad. Finalmente, los datos obtenidos nos permiten establecer si las clasificaciones subjetivas incluyen desigualdades de género o étnicas. Discutiremos este trabajo empírico desde la perspectiva de un diálogo con los principales indicadores de clase social –como EGP-, examinando en qué medida la ocupación u otros factores son significativos en el autoposicionamiento. Del mismo modo, debatiremos si existe una correspondencia con investigaciones basadas en escalas de estatus subjetivo, que tienden a mostrar el predominio de una identificación con una clase media. El proyecto de investigación contó con el apoyo de la agencia chilena de apoyo a la ciencia y tecnología (CONICYT Chile: proyectos Fondecyt 1150808 y 1190436).

Narratives and Counter-Narratives about Radicalization: Experiences of Moderation of an Online Communication Campaign

This paper presents the results of a cyber-ethnographic study. The research analyzes the dynamics that make, calm and increase the radicalization narratives. This study is part of the Oltre project (ISF - DG Migration and Home Affairs, EU) which directly involved 42 Italian and second generation youths in the dissemination and moderation of an online communication campaign in order to prevent radicalized behaviors. This paper illustrates how the young "moderators" interacted each other, highlighting how counter-narratives can represent useful tools for deconstructing "complex" issues such as radicalization. Furthermore, the paper shows (using social network analysis) how on the social media the communicative dynamics are influenced by the characteristics of virtual networks that convey media messages. Finally, this study elucidates the content analysis results, in order to compare narratives and counter narratives, identifying different meanings, specific vocabularies and relevant thematic clusters.

The Co-Design of a Counter-Narrative Social Campaign: Second Generation Youths Against Radicalization

This paper deals with the OLTRE project (ISF - DG Migration and Home Affairs, EU) funded for preventing the radicalization of the second-generation of migrants in Italy. This essay aims to study the production of an online communication campaign co-designed by second-generation youths. The four Universities engaged in the project, in order to collect the issues for the campaign made an in-depth

sociological research and an interdisciplinary social network analysis. We will present the results of the non-standard field research. Starting from the different dimensions of the risk of radicalization proposed by the kaleidoscopic overview of risk factors (Sieckelinck and Gielen 2018: 5; Ranstorp 2016), we created a topic guide for the in-depth qualitative interviews, then we collected 42 interviews of second generation youths (18-30 years) in 7 Italian towns. Furthermore, we studied the theater performances taped during the laboratories made by second generation youths collecting narratives, representations, stories and emotions about their representation of the radicalization risk and protection factors. This corpus was used for the social communication campaign to prevent radicalization, engaging the research participants as key players, co-designing the counter-narrative contents (Institute for Strategic Dialogue, 2015). The paper study also the viral dissemination of the social communication campaign on the social network and the role of the moderators.

Positive Reputation Bias in Cryptomarkets. Validating Quantitative Ratings with Automatic Analyses of Feedback Texts.

Reputation systems establish trust in large anonymous online markets by allowing market participants to signal their qualities (e.g. trustworthiness, reliability). However, these systems face an important shortcoming – the overwhelming majority of the reviews that constitute market participants' reputations are positive (Hu et al., 2009). Furthermore, positive reputations seem to "inflate" more and more as the market grows. Previous research identifies concerns about damaging others' reputations and the fear of retaliation as likely drivers of increasing bias of market feedback. This suggests that peer-to-peer markets with more personal transactions and high potential of reputational damage are particularly susceptible to positive reputation inflation (Filippas et al, 2018).

We explore this possibility in cryptomarkets for illegal goods, where inflated seller reputations can present a threat to the health and safety of buyers. In the two markets we study, only buyers evaluate sellers – anonymously – minimizing the cost of negative evaluations stemming from retaliation. We perform analyses of digital trace data obtained from SilkRoad 1.0, an early market with a strong community spirit, and AlphaBay, a more mature professionalized market. We explore the development of the share of positive reviews over time, seeking differences in trends stemming from different market participant structures. We use automatic text analyses to evaluate trends in textual feedbacks compared to quantitative ratings. We ask whether buyers become increasingly biased towards leaving positive feedback or no feedback, rather than negative feedback, as markets mature. We explore possible causes of the bias by leveraging the information contained in textual ratings.

MAAM: Maternity as a Master. Corporate family responsibility and Innovative work-life balance measures

The aim of this paper is to analyse the social mechanisms trough which a digital platform, offered by companies to women employees, allow them to balance their roles between work context and family life. The study carried out with qualitative methodology, through a semi-structured interview and a software analysis. The research involved 30 Italian female working mothers who used the tool. MAAM is a digital tool based on the lifelong learning approach. This tool through self-training sessions wants to develop mother's meta-reflexivity.

This process empowers women to transfer soft-skills developed in their maternity experience into soft-skills useful for the workplace organizations. We use the work-to-family/family-to work interface approach to analyse the effects of the role accumulation and the soft skills process transposition to verify the efficacy of the tools as a real social innovation in the work-life balance field. We observed that this social innovation process it triggers in a global mutation of cultural codes that characterized the maternity experience in the modern societies. That demonstrates a new codification of female role and maternity experience in the workplace organization, but already present in the civil society.

Data reveal that mothers that used MAAM they've become aware of the positive spillover between care maternity experience and job commitments. The acquisition of this capability allows working mothers to codifying the conflicting semantic between maternity and job inside a discursive universe founded upon the fundamental human skill of taking care of others. We suggest that this (innovative) process could contain a new gender paradox: the risk is to use the semantic of taking care to stigmatize specific social actors (women; mothers; female) through the burden of care.

Debunking Discourses in Mental Health Services: Interactional Analysis of Psychotherapeutic Contexts

In spite of recent advances in academic research, there still are few studies that qualify psychotherapy in terms of its sociology. These studies develop scientific interventions that conceive the notion of 'language-in-use' and 'everyday discourses' to the construction and implementation of analytical categories useful to Mental Health clinic, specially those concerning social idiosyncrasies of vulnerable populations, such as LGBT (lesbian, gay, bisexual and trans) people. Such discussion concerns both methodological and technical improvement of psychotherapy itself, and the qualification of 'psy' sciences (Psychiatry, Psychology and Psychoanalysis) as major areas for Mental Health care in public or private health services, as well as its interface with public policies and institutionalized clinical protocols (e.g., DSM V and ICD 11). We aim to describe and analyze interactional practices that emerge in the context of psychotherapeutic interactions in a private clinic specialized in mental health care directed to LGBT people in southern Brazil. We focus on (a) how the concepts of 'agenda setting' and 'epistemic domains' interfere with the supposed 'therapeutic course' of clinical interventions and (b) how the categorization process of the therapist's/clinician's self becomes a phenomenon relevant to the client's/patient's own self categorization. Due to its interpretative and microethnographic analytic procedures, we use Conversation Analysis (CA) as theoretical and methodological framework. The research corpus is composed of five hours of video-recorded interactions, which were transcribed and analyzed following CA principles. Results point to the frequent use of several linguistics/interactional practices to support social actions in the clinical setting. Linguistic and interactional analysis of participants' social roles, oriented by the categorization of their own self in clinical environments through talk-in-interaction, proved to be a potent theoretical-methodological approach to the qualification of Health Services in their multiple laminations (social, political, technological, and epistemological). Data are in Brazilian Portuguese.

Comprensión Epistemológica Del Sistema Social De La Vejez En Tres Subsistemas Casa Del Adulto Mayor "La Armonía", Residencia "San Juan" En Colima y "Centro De Convivencia De La Tercera Edad Del DIF Estatal Colima".

Introducción: Explorar el sistema y subsistema complejo se parte como un "proceso y no como un "acto" de coordinación de resultados (García, Rolando, 2006, p. 99). Por lo que se presenta el trabajo exploratorio que se realizó dentro de tres subsistemas donde ofrecen atención para adultos mayores "Casa del Adulto Mayor La Armonía", "Residencia San Juan" y "Centro de Convivencia de la Tercera Edad del DIF Estatal Colima". **Objetivo:** Explorar el sistema social complejo vejez y envejecimiento para la comprensión del objeto de estudio a través de la autopercepción, percepción y representación social del adulto mayor y su contexto en diversos escenarios socioculturales, nivel educativo y socioeconómico. **Método:** Se empleó la observación participante, donde se usó la estrategia del juego, la conversación, el involucramiento en sus actividades con el fin de conocer y tener acercamiento al sistema social complejo vejez y envejecimiento. Asimismo se aplicó una entrevista no estructurada y una encuesta con el propósito de saber sobre la situación de los subsistemas, cómo obtener datos que enriquezcan la investigación. **Resultados:** La distinción entre los residentes de las casas hogar para adultos mayores y los que asisten al centro de convivencia, los segundos lleven una vida plena y la condición económica, familiar, etc. no ha sido obstáculo para sentirse con bienestar. En cambio en la casa hogar "la armonía" y Residencia "San Juan" tengas una posición solvente, precaria, familia o no familia solo esperan la muerte.

MACZKA, KRZYSZTOF* (Adam Mickiewicz University, Poland)

Public Participation in the Eyes of Local Elites – a Comparative Case Study of 12 Municipalities in Poland.

Introduction

The main aim of this paper is to answer the question: What is the participants – local elites' reception of participation, taking into account: 1) quality of decision making, 2) level of trust to the local government, 3) sense of agency?

The existing analyses of public participation focus on the reception of participation (public consultations) from the initiators' perspective (local authorities). An only a limited body of knowledge exists concerning the reception of participation from the citizens' perspective. Moreover, a relatively small percentage of the general population participates (or is interested in participation) in public consultations and this group might be treated as local elites (Edling et al. 2014).

Methods

The qualitative, comparative, multiple-case study approach is applied in the research. The purposeful case study area selection is based on a typology of historical regions of Poland and the administrative division of municipalities in Poland. The analysis is based mostly on individual in-depth interviews in 12 municipalities with representatives of local elites (councillors, village heads, ngo, local media, etc.) - approx. 6-10 interviews per municipality. The pilot study in one municipality was conducted in May 2018.

Results and conclusion

The preliminary results have shown that the relationship between public participation and trust, quality of decision making or sense of agency is much more complicated than it is described in recent research where participation is treated like a dogma or a panacea. Moreover, public participation might be counterproductive even if they are well planned and there are good intentions behind the process because of 1) responsibility shift (authorities do not want to decide), 2) negative attitudes towards participation among citizens and 3) lack of participatory processes promotion by authorities.

„Energy Justice"- a Boundary Object or a New Fixation? – Critical Systematic Literature Review

The main aim of this paper is to answer the question: What is the significance and role of energy justice (EJ) for research and management of energy issues, e.g. related to extraction of raw materials, technology development and stakeholder involvement in decision-making processes?

EJ is one of the main normative approaches shaping the energy discourse and is increasingly being used in analyses of resource extraction and infrastructure projects. It is a concept that refers to the idea of environmental justice, but also introduces other dimensions specific to the energy sector, such as the distribution of costs and profits of the investment itself to various social groups.

EJ has so far been described in scientific literature in at least four different contexts: 1) as a practical tool; 2) as a conceptual framework for interdisciplinary research of energy production and consumption; 3) as research programme in the field of social sciences, which aims to apply the principles of justice in e.g. energy policy; 4) as a normative effect of this policy.

Basing on systematic literature review of 159 publications in Scopus we show the complexity, multifunctionality and interdisciplinarity, which may lead to misunderstandings and untapped potential in the work of interdisciplinary teams of geologists, energy specialists, social scientists, public authorities and business. It can also have some positive outcomes. We present energy justice as a so-called boundary object, i.e. a mechanism allowing for the integration of knowledge from different social and professional environments, which provides a common language for introducing theory into practical actions. Similar attempts have been made so far with some success in the context of other scientific concepts such as ecosystem services or resilience, but not in the context of energy justice.

Discipline and Indiscipline of Latin American Political Science: A Bibliometric Analysis

In this research, we distinguish and compare two Political Sciences (PS): the PS native of Latin America (from Latin America), published in journals from five countries in the region (Brazil, Chile, Colombia, Mexico and Venezuela), and the foreign PS (about Latin America), published in journals of five countries from outside the region (United States, United Kingdom, Germany, Canada and Spain). Our goal is to answer two questions: 1) what is the thematic and methodological structure of Latin American Political Science? and 2) who are the leading authors of the discipline? To answer these questions, we mobilized three types of bibliometric analyzes: 1) analysis of the reciprocal citation network among the 23 selected journals indexed in the Scopus database; 2) co-occurrence of terms in titles and abstracts of 5,880 articles published between 2006 and 2018; and 3) co-authoring authors in bibliographic references. The data grouping method was clustering and the data visualization method, networks. The study points out that both Political Sciences are structured internally and are divided around two main axes: Political Science and Political Sociology. Themes, authors and methods are significantly different. The main feature of this disciplinary field is certain indiscipline.

MADENIAN, HELENE* (, Canada)

Urban Climate Imaginaries and Policy Narratives

My thesis project aims to shed new light on urban climate governance by documenting how actors imagine the process of transformation between the present and the desired future of a carbon neutral city adapted to climate change. My Phd aims at identifying: 1) the different imaginaries that exist in Montreal, Canada, and 2) the imaginaries that are privileged in the planning and implementation of urban climate policies. In this session, I will present a theoretical framework enabling to understand these phenomenons as well as my first findings of the Montreal case. The session would offer me an opportunity to nourish my project with inputs from other participants.

As "super wicked problems" (Levin et al. 2012), climate change cannot be treated with traditional analytical techniques, however actions must be taken quickly to avoid catastrophic consequences for the future. In such situations of uncertainty, policy narratives can provide a relevant theoretical framework (Rhodes 2018). They enable to stabilize hypotheses necessary for decision-making (Roe 1994) and "thus make social problems comprehensible and accessible to human action. Typically, they suggest a series of actions over others, linking the present and the future" (Radaelli 2010) through a "storytelling" reflecting the dominant values and belief system (Beck 2017). Public policy narratives "certify" and "stabilize" the assumptions needed to make decisions about what is uncertain and complex (Roe 1994). They are expected to facilitate and bring together actors around an interpretation of reality and thus bridge the gap between present and future (de Maillard and Kübler 2015, 175).

The study of public policy narratives put into perspective with the four "climate imaginaries" identified by Levy and Spicer (Levy et Spicer 2013) - "fossil fuels forever", "climate apocalypse", "technomarket", "sustainable lifestyles" - could help understanding this visualization of the link between present and future in urban climate decisions.

How Lifelong Employment and Residential Trajectories Affect the Extension of Working Lives Among Men and Women?

While life-course studies have emphasized that social status expressed in old age stem from longer generative processes reflecting the accumulation of individual exposure to advantages/disadvantages across different life stages and multiple domains, little research has specifically examined the life-course determinants of remaining active in the labor force during later life. Based on the cumulative advantages/disadvantages approach and employing longitudinal quantitative tools (multichannel sequence and regression analyses) this study examines particularly how the simultaneous exposure to different employment and

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

residential trajectories across individuals' life courses lead to confront, or not to confront, the extension of working life beyond the statutory retirement age. The study also analyzes whether gender plays any moderating effect in this association. The research is focused in Chile, a Latin-American country that pioneered private-oriented pension reforms worldwide in the 1980s, that has experienced an unprecedented demographic transition due to increased life expectancy and decreased childbirth, and that has a strong male-breadwinner culture. To perform this study, we used data from the survey '*Life course and vulnerability among older people in Santiago, Chile*', which provides both current and retrospective information of the life course of 802 individuals aged 65 to 75 years old. Preliminary results indicate that individuals more likely to extend their working lives in old age are, first, women who during long periods of adulthood resided with children, parents, and other relatives, and who simultaneously experienced a weak labor market attachment (i.e. career interruptions, informal and part-time jobs); and second, men with a similar residential trajectory but who after obtaining a professional degree work most of their lives in full-time jobs with open-ended contracts. The results of this study will have policy salience not only for Chile, but also for numerous countries debating responses to population aging through varying welfare state orientations.

Tri-Generational Residential Trajectories across Time and Their Early Life Determinants

In national contexts of meagre welfare benefits, extended-family residential arrangements, notably tri-generational ones, has been largely seen as a strategy of poor individuals to deal with situations of vulnerability and economic scarcity. This assumption, nevertheless, is mostly supported by research based on cross-sectional data, which only allows to analyze both residential arrangements and socioeconomic conditions in one point of adulthood, thus neglecting possible modifications across time in residential configurations as well as the influence of early life conditions on these configurations. Based on a life-course perspective and employing longitudinal statistical tools (sequence analysis) this study challenges previous research and examine types of lifelong residential trajectories and their association with life conditions during childhood and youth. The research is focused in Chile, an unequal Latin-American country (Gini coefficient=0.55) with a strong familial regime. We used data from the survey '*Life course and vulnerability among older people in Santiago, Chile*', which provides retrospective information on different life-course dimensions of 802 people aged from 65 to 75. Results show the existence of seven representative types of lifelong residential trajectories, which have different frequency, duration, and occurrence timing of tri-generational arrangements across different stages of the life course. Regarding the influence of early life conditions, we observe that women growing up with lower-educated fathers employed in manual positions, but also women with healthier parents, are more associated with residential trajectories indicating high frequency, long duration, and early start (and late end) of tri-generational arrangements. Findings support the relevance of analyzing residential configuration as a longitudinal and dynamic process rather than a cross-sectional event, and of understanding how early life experiences moderate the residential trajectory each individual follow. This study will have policy salience not only for Chile but also for multiple countries debating responses to residential issues.

MADHAVAN SARASAMMA, JAYAKUMAR* (University of Kerala, India)

Ageing, Return and Adaptation:

The Situation of Return Emigrants in Kerala, India

The state of Kerala is well known for international migration, especially labour migration to the Gulf Cooperation Council (GCC) countries in the Persian Gulf, started in the early 1970s with oil boom. The majority of these 2.4 million expatriate workers are lesser educated and involved in construction and other manual jobs at the destinations. Return of these emigrants started in the 1980s and still continues. Their number was 1.25 million in 2014 against 1.15 million in 2011. The present study, based on empirical data, looks into the situation of the aged return emigrants who are mostly males, and their adaptation in the state. As most of their earnings is spent on building house, educating children, marrying off girl children, meeting everyday needs etc., they could not save much for their elderly life. Investment of their earnings and savings for purposes other than sustainable income generation caused loss of income. They also could not utilise the skill and expertise they gained abroad back at home after return as they are aged and unhealthy. The social security system in the destination does not cover their life

after return. Thou there are welfare schemes in place, they do not substantially benefit from them. The loss of income has brought about undesirable outcomes in their familial and social relations.

MADHAVAN SARASAMMA, JAYAKUMAR* (University of Kerala, India)

Technology and Transnational Ties: Experience of Left behind Wives in Kerala, India

The state of Kerala, India, is known for migration, especially male migration to the Gulf Cooperation Council (GCC) countries in the Persian Gulf, which started in the early 1970s with the oil boom. In migrant dense areas, 60-90 percent of households have participated in emigration. Since most of their spouses are prevented, through income and visa restrictions, from joining the emigrants, the couples rejoin only once a year or even in lesser frequency. The emergence of Information and Communication Technology (ICT) is a boon enabling them to have virtual social relations with their families left behind. The present study, using both quantitative and qualitative data, captures the instrumentality of ICT in maintaining transnational relations between the wives left behind and their emigrant husbands in the state. Mobile phone and internet based communications substantially increased the frequency of communication between the transnational couples. While the aged women did experience an acute deficit of communication before the ICT era, the millennials never faced such a situation. The innovative communication media created a virtual world in which they interact freely and in privacy, thereby maintain family bonds intact between long distances, across borders. Communication technologies facilitate the couples to have real time interactions especially through instant messaging even about daily routines like cooking, recipe etc. They also help the long distance couples overcome geographical separation and compensate their physical distance. The couples could extend emotional support to each other through the ICT enabled communication. Thus, ICTs play a key role for preserving the bonds and ensuring the well being of transnational coupes.

Qualitative analysis of interviews in comparative studies using f4analyse software

This article explores the methods involved in the use of f4analyse software in a comparative study of the strategies for reducing school dropout within the context of vocational education in Brazil and Argentina. The study, developed between 2014 and 2018, performed a total of 36 semi-structured interviews with professors and school managers as well as specialists in education. The researcher was assisted in the classification and systematic analysis of qualitative data by f4analyse through selection, coding, commenting, and retrieval of the most relevant content of the interviews. The software keeps the transcribed text synchronized with the interview audio, so that at any time it is possible to reproduce the audio which corresponds to a selection of the text. For writing the research results, f4analyse makes it possible to export the performed analyses directly into the text processor. These features and their methods of execution were explored regarding the specific context of the research, as well as within the general discussion on the use of computing software for supporting qualitative investigations in the field of education and social sciences.

Profession within, between and Beyond. an Analytical Frame for Studying Contemporary Professionalism

Professional work in relation to the concept of professionalism is facing new challenges. The post-industrial transformation has given new centrality to the expert labor, while changing profoundly the composition of the labor force and the content of work. Societal changes, impacting on, and impacted by the labor market itself, can be described as in a change; precarization, polarization and digitalization are describing these processes that are changing our notion of professionalism. These processes of change, both driven by and impacting on the labor market, calls for a deeper understanding of the professions, as they are situated in new circumstances. The outcome of the trends described above is the increasing differentiation and heterogeneity within and between the professional groups.

We propose a novel analytical frame able to innovate the debate, and to give new and powerful tools to understand the social change occurring in professionalism. The first dimension we take in account is the "within" dimension. "Within" helps us in reading the increasing heterogeneity and differentiation occurring inside each professional group. The second dimension is the "between" dimension. "Between" help us reading the multiple geographies of professional groups, with a specific focus on the institutional factors that affects professions and professionals. The third dimension is the "beyond" dimension . "Beyond" helps identifying the way professional groups are governing the current societal change, contributing to the establishment of the above-mentioned trends: globalization, precarisation, digitalization, marketisation, etc.

The separation under the three dimension is an analytical strategy to make order in the complexity of the transformation that occurred in labor in the last decades. They have to be considered irreducible, meaning that the separation between the three is an analytical strategy to make sense of the trends involved, but each trend is interrelated and has consequences on the other dimensions.

Making Connections and Disconnections for African Sociology: Building a Woman-Centered Vernacular Sociology, South Africa

This paper seeks to discuss the call by Manuel Castells (2002) for a much needed and practical form of Sociology of the 21st century; a Sociology, which is aware of the society it exists in, and the context within which it is created. Focusing on the challenges facing African Sociology in the 21st Century, I build on Jimi Adesina's (2006) argument on sociological 'epistemic interventions' by concentrating on indigenous (African) languages and knowledge institutions. I make use of one of the most enduring African knowledge institutions – *UMakhulu* (the elder mother), to argue for the potential reconnections and disconnections of the African Sociology to its society and the context this institution is embedded in. In centering the elder mother in African Sociology, we then introduce a 'matrifocal framework' sociological understanding of the discipline, which moves away from the 'Fathers of the discipline'. In decentering the hegemonic body of the discipline (the father), we then destabilize the bio-logic of the sociological discipline in Africa and thus start building a sociological language that can move beyond the binaries and integrate language and values carried by our grandmothers in dealing with socio-political and economic challenges of our societies.

MAHADEO, RAHSAAN* (Georgetown University, USA)

Prescience within Present-Orientations: De-Arresting Youth from the "Ethnographic Present."

Within urban sociology, the unpredictability of poor, urbanized space explains why racialized youth are "present oriented" and why they treat orientations to the future as futile. But where urban sociology suspends racialized persons in time and space, this research aims to de-arrest them from the "ethnographic present." Drawing on data from in-depth interviews with thirty youth, I make the case that within "present orientations" there is prescience. This paper is based on over one year of fieldwork at Run-a-Way – a multi-service center for youth in the Twin Cities. With limited life chances and limited chances at life, youth at Run-a-Way saw the future as fugitive. Having cogitated so deeply over their futures, many racialized youth reject that which is constantly on the run - "equal opportunity" within a highly unequal world. Instead of being a paralyzing force keeping youth suspended in time, present orientations were marked by the production of nowness, in light of a prescient vision of what is to come. Because poor and racialized youth choose not to entertain liberal futurities directed towards "freedoms" associated with a "post-racial era" did not make them present oriented. It made them prepared.

MAHALI, ALUDE* (Human Sciences Research Council, South Africa)

The Glass/Grass Ceiling: Young Women Graduates, Leadership and the Covid Crisis

This paper reports on a recently initiated longitudinal cohort study that focuses on a scholarship programme for young Africans, describing the theoretical and analytical frameworks of the research, as well as aspects of the methodology and inviting comments on our approach. The scholarship programme has a special focus on girls and young women, a recognition that empowering women makes developmental, political and economic sense given their central role (and simultaneous vulnerability) in Africa's rural and urban economies, as well as in human development. Addressing the barriers graduates face, especially in the context of the global Covid pandemic, requires sensitivity to the extent to which social identi-ties, such as gender, can be an individual, structural, and place-based barrier. The study will focus on six countries (Ethiopia, Ghana, Kenya, Rwanda, South Africa, Uganda), exploring the roles of gender and poverty on young people's ability to leave an imprint on their worlds. A core component is therefore the ways in which participation and gender intersect through educational opportunities and the role of these in young people realising their aspirations. Applying an intersectional framing around scholar outcomes (education, skills, career, leadership, economic and social mobility, geographic mobility) inspires critical research questions that have place based implications. For example "what factors, such as family expectations and social norms, influence female scholars' decision-making around exercising leadership?" "In what ways does gender intersect with place and other identities to influence the ways in which people experience and resist unequal power relations in their communities?" These kinds of questions, underpinned by intersectional theory, will help us understand how young women craft identities as transformative leaders and experience both privilege and discrimination at the intersections of race, gender, age, ethnicity, class and now - pandemic.

MAHMOUDIAN, HOSSEIN* (University of Tehran, Iran)

Internal Migration in Iran: Status, Determinants and Consequences

With fertility and mortality slowing down in most countries including Iran, migration has been getting an important role in population changes. During 1976-2016, on average about one million people have migrated annually within the country. With an upward and downward trend, the size of internal migration has decreased, but the share of long distance and urban-urban migration has been rising. By contrast, rural-urban migration has declined. The migration is dominated by young male migrants. However, the percentage of female migrants aged 20-29 in 2016 was more than that for males. Females had a bigger share in urban-urban, rural-rural and intra-province migrations. In contrast, males were significantly more in rural-urban and inter-province migrations.

Early rural-urban migration (during 1960s) was mainly due to rural push factors. Later, with the decline in population growth and the general increase in rural education, urban pull factors played a bigger role in the continuation of this migration. In addition, environmental degradation has also led to discharge of rural areas. There has also been a direct correlation between the number of migrants and the country's economic growth rate. In consecutive decades, regional inequalities have been the main stimuli for internal movements.

Migration from less-developed into more developed areas have increased the concentration of population in the central and northern regions of the country. The relatively large rural-urban migration has increased inequality between rural and urban areas. Many rural areas are subject to destruction. Rural population has become aged due to young people migration. The remaining population, mostly elderly and women, do not possess sufficient welfare facilities. Also, as a result of the migration of rural men, the rural women are facing marriage squeeze. High urbanization growth rate, increasing the number of people living in urban fringe areas, and environmental pollution are other consequences of internal migration.

MAHMUD, BASEM* (University of Granada, Germany)

Forced Migrants' Hope, Gratitude, and Reciprocity

The main objective of this contribution is to study the role that hope, gratitude, and reciprocity plays in the lives of forced migrants. This is based on qualitative research, using semi-structured in-depth interviews (approximately two hours each, conducted between 2015-201) with 33 Syrian refugees and asylum seekers in Berlin. The findings show that the "hope of starting a new life in a place" is the central category for understanding not only what happened after departure, but also why people decided to remain and face the tyranny and why many of them "decided" later to migrate to Europe. This hope cannot stand unless its four elements are fulfilled: material satisfaction, legal status, empathic emotions, and dignity-recognition. The forced migrant's sense of place – i.e. the kind of relationship developed with it (temporal, rational-conditional, run away, and potential belonging) – is informed by these elements. Gratitude and reciprocity are connected, and both are influential for *constructing home practices* and the perception of discrimination. I distinguish, however, between gratitude toward individuals and gratitude toward collectivities; the latter may become a kind of blindfold which keeps the forced migrants from seeing – or at least reduces their sensitivity to – situations of racism or discrimination.

TG04-749.2

MAHMUD, BASEM* (University of Granada, Germany)

Refugee Workers: Living Conditions and Expectations

Global displacement exceeds, according to UN figures, 70 million people. The ONU and UCLG also warn of the situations of helplessness of this displaced popu-

lation and warns of the need for solidarity. About 60% of the refugees in the world live in urban areas, and among those internally displaced, the number reaches 80% (UNHCR, 2015). Refugees are usually studied as a subcategory of migrants, which does not allow the researcher to see their specific situation. When there is a differentiation between refugees and economic migrants, the first is approached as traumatized people and therefore as people in need of help. This approach enhances the negative perception of them, which sees them as exploiting the social security system and negatively affecting the economy of the host country. Many studies have tried to show another side; that refugee impact in the economy is very limited or even positive. To do this, they show how the formal economy is not affected or sometimes positively affected. Another route is to analyze the contribution of refugee entrepreneurs or those who have high skills or are educated. The result is that the situation of the refugee-worker in the global economy remains neglected. This contribution aims to shed light, understand, and promote the debate on the actual situation of refugees who work in the global textile industry based on a case study; Istanbul. How does the situation of refugee-workers in the global economy influence their everyday lives, expectations and plans? Understanding these issues will help local and regional leaders, councilors, local governments to make more effective plans to "create spaces where everyone can live in safety, become self-reliant, and contribute to and participate in their local community" (Cities are standing #WithRefugees).

MAHROUSE, GADA* (Concordia University, Canada)

Effective Affect for Asylum Seekers: A Case Study of the Emotional Social Media Narrative of Hassan Al Kontar

This paper contributes to critical humanitarian scholarship on affective regimes of communication (Chouliaraki, 2013) by examining how certain emotional appeals and depictions produce the conditions for compassion in Western societies. Specifically, it zooms in on the case of Syrian refugee Hassan Al Kontar. In 2018, Al Kontar made global news headlines when he was stranded at Kuala Lumpur International Airport for more than seven months. Using social media, he described the banality and powerlessness of living in an airport terminal. His posts garnered a lot of attention and sympathy and eventually led to him being granted asylum in Canada. Al Kontar's case raises many compelling questions about emotions vis-à-vis the politicization of humanizing narratives and their impact on public responses. Through an analysis of the emotional content of his narrative (Kleres, 2010), and drawing from an interdisciplinary analytic that brings together the fields of critical refugee studies, mobility justice studies, and critical race theories, this paper shows how he became an emblematic subject of western compassion. Moreover, using the concept of "migrant citizenships" (Nyers 2015), which emphasizes performative forms of citizenship the paper asks: (1) what types of emotion did he mobilize; (2) how did emotions impact how he was treated; (3) how did his public display of emotions help him to exercise his agency; and (4) what can be learned from the particular emotive ways that his story was circulated?

RC05-68.2

MAHROUSE, GADA* (Concordia University, Canada)

Influential and Inspiring Black, Indigenous and Women of Colour in Canada

For decades, critical race scholarship has documented the exclusionary effects of hegemonic patriarchal whiteness and described its inequitable and unjust effects. A large proportion of these studies have focused on institutional barriers that exclude or discount the contributions of people of colour, especially women. Indeed, in the Canadian context, although Black, Indigenous and other Women of Colour (BIWOC) have been at the forefront of promoting justice and equity, their contributions have been largely under recognized and overlooked. While some publications have sought to highlight women's contributions, they tend to focus on women in the past or are entrenched in neo-liberal feminism insofar as they mainly celebrate women who have overcome gender discrimination in job markets to attain positions in the professions, government, and cultural institutions normally held by men. No research in Canada to date has focussed exclusively on the contributions of BIWOC.

This paper describes a two-year community-engaged research project that combines narrative research, oral history, and portraiture methods to recognize a "critical mass" of influential and inspiring BIWOC for the production of a digital collection. Its primary objective is to intervene in public memory and to "repair the historical record" (Reinharz, 1992). It will be presented in three parts. First, it will offer an overview of the anti-racist feminist, intersectional, and anti-colonial theoretical framework to representation and recognition that it uses. Second, it will hone in the challenges of doing community-engaged research (for example, setting up an advisory committee to do community consultations). Third, the paper will discuss the significance and implications of the research, showing how in acknowledging their resilience, knowledge and contributions, the project takes up the call to recognize BIWOC in ways that can be meaningful and disruptive by focussing on their "historical strength as agents of change in their own world" (Carty, 1991, 17).

MAIA, FELIPE* (UFJF - Universidade Federal de Juiz de Fora, Brazil)

Crisis, Reflexivity and Agency: Conceptual Challenges to Understand the Present

There is a diffuse sensation of crisis in contemporary societies, and a huge number of books published about crises. Nonetheless, the concept is far from stabilised in social theory what may be an obstacle to an adequate understanding of social processess conceived as crisis.

Part of the problem is that many of central problems in social theory are directly related to definitions of crisis, involving questions of structure and agency, micro or macro analysis, realism and constructivism, culture and reflexivity or social dinamics versus stabilisation. In fact, crises should be a priviledged laboratory to social theory.

Some would argue it is imposible to stabilise the concept, since it is intrinsically linked to the subjective perspective of critics, to a negative self description of society or becomes just a weapon in political conflict. On the other hand, there are significant efforts to make the concept at least more understandable.

I want to argue that crisis should be better conceptualised in conexion to a more broad conception of reflexivity and agency, in that critics is a possibility, but not the only one.

Crisis does not necessary entails critics or vice versa. It is possible that other modes of reflexivity and agency are related to crisis in different contexts or situations, like self interested strategies, collective learning, and the critical (and relevant) social criticism and protests. We can find in a selected bibliography (specially Habermas, Koselleck, Dobry, Luhmann, Dewey, Honneth and E. P. Thompson), empirical and theoretical studies of crisis with different descriptions and analysis of these modes of reflexivity and agency, leading us to different models of crisis – reflexivity relations. In the paper I will work upon these models, trying to show how a more compreensive understanding of crisis could help us to deal with the crises of the present.

RC35-447.1

MAIA, FELIPE* (UFJF - Universidade Federal de Juiz de Fora, Brazil)

Sociology of Crisis and the Crisis of Sociology

How the study of crises could help us to understand the propalled crisis of sociology? Sociology has not been indifferent to the many crisis in the world. In fact, crisis of democracy, capitalism and the Anthropocene are main topics on recent debates in the field. We could even feel a new mood in sociology concerning the production of big narratives, diagnosis of times or ontologies of the present.

But we probably cannot acknowledge yet how the present crises are reshapping sociological knowledge and intellectual activities, or even if it is effectively happening. In this paper I will draw on recent studies of crises to offer some insights into these questions and to evaluate the possibilities of new diagnosis of times. I want to explore theoretical, conceptual and methodological challenges present in this kind of sociological work, i.e.: How are these works related to more classical diagnosis of crisis? How far have we gone in a more stabilised concept of crisis? How do descriptive and normative questions are adressed? Is it possible to offer a more totalising view of the crisis?

In this effort I want also to argue that the study of crises can be a good way to renew the relevance of the discipline both inside the sciences and the public sphere.

KONZEN, LUCAS* (Federal University of Rio Grande do Sul (UFRGS), Brazil)

Founded Suspicion for Investigatory Stops and Drug Trafficking: A Legal Geography of Police Practices in the City of Porto Alegre

This sociolegal study aims at investigating the existence of a geographical component in determining "founded suspicion" for investigatory stops related to drug trafficking in the city of Porto Alegre, Brazil. Investigatory stop is a procedure that consists of police officers stopping, questioning, and even searching a person who is suspected of carrying illegal objects such as weapons and drugs. Scholars have long been discussing disparities in terms of policing strategies and highlight that behavioral, organizational and contextual factors may explain these variations and lead to more frequent violence against certain social groups. In the context of Latin America, the literature suggests that criminalization of individuals with certain characteristics may be reinforced by the criminalization of territorially-based communities. For instance, it is claimed that individuals who encounter the police in informal urban settlement are more likely to be suspected of crimes such as drug trafficking compared to similarly behaving individuals who interact with police forces in affluent neighborhoods. By means of theoretical categories

developed in the field of legal geography, this paper seeks to understand whether the spatial dimension is a factor that influences police practices in urban settings. Empirical evidence is provided to test this hypothesis, by means of a quantitative analysis of a dataset on investigatory stops related to judicial decisions in drug trafficking cases. Information for the State of Rio Grande do Sul Court of Appeal cases during the period 2015-2017, referring to the city of Porto Alegre, was compiled in a single georeferenced database. The data analysis shows that representations of space in the police narratives influence the construction of police suspicion.

MAIDO, MARJORIE* (Iloilo Science And Technology University, Philippines)

Gossip As a Language of Bonds and Chains in Global Seafaring

Gossip as Language of Bonds and Chains in Global Seafaring Practice
Gossip is a sociological phenomenon and functions as a mechanism of social control where it contributes to the social integration of the group to which it belongs. In global seafaring career, social cohesion is vital to maintaining a safe working environment, and avoiding maritime accidents. Building on Elias' and Scotson's theory on established-outsider relations which is a thesis on power, status relations, and emotional tensions, this paper examines the role of gossip in explaining the differences in power and rank between global seafarers, and how certain groups tend to dominate and monopolize sources of power and use these advantages in excluding and stigmatizing other members of the same profession. Drawing upon the rich experience of global Filipino seafarers who have been working for more than fifteen years onboard international vessels, this study further analyzes the key themes of gossip onboard international ships, inclusive of the contexts where it is used, the various outcomes (positive and negative), as well as the controversies and challenges faced by the social actors, and its polarizing effect on social integration of Filipino seafarers in a multi-ethnic environment. This paper also scrutinizes the history of the Filipino people's seafaring culture vis-à-vis their global positions in the global maritime career. As the global maritime field is substantially male-dominated, this paper also elucidates on the role of masculinity and ethnicity in the process of idealization and denigration enclosed in gossip.

MAITI, ARUNDHATI* (SCHOOL OF PLANNING AND ARCHITECTURE, India)

Policy and Planning Instruments Available to Address the Challenges of Urban Poverty in India in the Context of Rapid Urbanization

Urban poverty resulted from unprecedented urbanisation is a multidimensional phenomena. Various aspects of urban poverty such as residential, occupational, social vulnerabilities etc. need to be addressed simultaneously in a comprehensive and integrated manner.

Urban poverty has been included under the purview of Sustainable Development Goal 11 which seeks to promote inclusive and sustainable urbanisation by providing access to safe and affordable housing, public transport, basic services and green public spaces through improved urban planning and management. Government of India, since the launch of its first five year plan has adopted many pro-poor schemes in general for the Country at large, but the impetus on urban poverty was given in the form of inclusive planning and sustainable growth from the Ninth Five Year Plan (1997-2002) onwards. A separate Ministry was formed in 2004 to implement policies and programmes to tackle the challenges of urban poverty in India. Currently a number of Central Government schemes have been rolled out to address the urban poverty and related aspects in a holistic manner. Effective implementation of these schemes can have sustainable impacts in the lives of the urban poor.

In this context, the proposed paper will analyse the potential of the current policies and ongoing urban poverty alleviation programmes in addressing the challenges emerging from urban poverty. The first part of the paper will briefly discuss the different dimensions of urban poverty in the context of rapid urbanisation in India. In the second part, an overview of the policies, programmes and planning instruments available (national and international) to address the challenges faced by the urban poor in India will be discussed in details. In the third part the implementation gaps and deadlocks between the options available and the interventions taken at different levels will be identified with example of a few case studies.

MAJCHRZAK, IRMINA* (Pablo de Olavide University,)

El Pensamiento Crítico, Creativo y Cuidadoso en Educación: Filosofía para Niños y Teatro del Oprimido.

El objetivo de esta comunicación es comparar dos prácticas socioeducativas: Filosofía para Niños (FpN) y Teatro del Oprimido (TO) respecto a sus propios objetivos y metodología en el ámbito educativo. Filosofía para Niños y Teatro del Oprimido desarrolladas en el aula surgen como una propuesta para enfrentarse al problema en la educación que han percibido tanto Freire, Lipman, como y profesionales dedicados al teatro: principalmente la falta de potenciar el pensamiento crítico en la escuela, conocimiento fragmentario no enraizado en el contexto, método repetitivo de aprendizaje. El programa de Lipman (Filosofía para Niños) desarrolla el pensamiento complejo que consiste en potenciar el pensamiento crítico, creativo y cuidadoso, en las "comunidades de indagación", en las que los/as niños/as y jóvenes se consideran agentes activos de su propio aprendizaje: se dialoga sobre la problemática de interés para el alumnado y es un proceso horizontal, una práctica de la libertad. Teatro del Oprimido pretende problematizar, concienciar, transformar a nivel individual y social, a través del teatro, a través del ensayo, preparando a los/as espectactores/as para una revolución. Los dos enfoques responden a la misma carencia del sistema educativo, y aunque su metodología es diferente, comparten algunos objetivos y fines relacionados con el pensamiento crítico, creativo y cuidadoso en Educación.

Physical Ecology and Policing: An Impact Assessment of Police Commissionerate of Two Cities of Eastern India

Policing is the way in which the police maintains formal social control. Police in India is under the State List (Entry No. 2) of the Constitution of India hence the State Governments have entire control over police and policing. India sprawls across a diverse topography, culture, social dimensions and political ideology. This paper is an attempt to reconnoitre the variance in the relationship midst physical ecology and policing in the police commissionerates of two cities of eastern India. These two cities are the economic, educational and cultural hub of their respective states. Topographically speaking, the two states are antagonistic in nature. One is in the hills and the other is located in the plains. The objective of the study is to explore the impact of the physical ecology on policing. Physical ecological factors refer to the climatic conditions and the topography of the two cities. This is an exploratory study on police personnel under the Police Commissionerate of Bhubaneswar and Guwahati. The sample consists of fifty police personnel in charge of police stations of the two cities. To undertake the said empirical research non-probability sampling technique has been employed. The privileges and challenges faced by the police personnel of the two cities are unique in their own way. Performing patrolling in hilly areas which are frequently inundated due to torrential rain is a challenge for the police in Guwahati. Whereas scotching heat resists effective policing for the police personnel of Bhubaneswar. There is a disparity in the rate of crime in the Bhubaneswar and Guwahati also. Thus it signifies that physical ecology has an influence in the maintenance of law and order, and prevention and detection of crime.

Hidden Narratives of Sexual Harassment in South Africa's Academy: Exploring Students' Experiences at the University of Johannesburg

Sexual harassment and assault have recently become issues of concern due to prevalence and have been a topic of interest in university spaces across South Africa. Activists who advocate against sexual harassment, assault and gender based violence across the country and particularly on university campuses state that there has been little institutional reform in helping to address these issues. In addition, institutional and policy interventions put forward are argued to be have "very narrow definitions of rape and sexual harassment and marginalise survivors whilst creating a safe haven for perpetrators", and not putting emphasis and priority towards helping victims of sexual harassment, assault and gender-based violence. Since 2013-2019 complaints against male university staff have been put forward by female students and have made headlines as part of putting sexual harassment and assault in the spotlight, however there are many cases in these universities that remain unreported by female students. This promotes a culture of silence around sexual harassment and reinforces power dynamics that exist in patrichal societies such as South Africa, which then justify violence against young women in universities by their male lecturers. Thus, there has to be a deeper analysis of what perpetuates the culture of violence in universities, and what power

denotes a presenting author. Abstracts are organized by first presenting author's last name.

dynamics exist and also what places women students in compromising situations to be targets of sexual harassment. As such, this study focuses on the unheard views and voices of students on the issue of sexual harassment, what their experiences of a partriachally constructed university space are and also their views on what perpetuates the culture of silence and hidden nature surrounding sexual harassment, gender inequalities, and gender-based violence in universities.

L'Education Relative à l'Environnement Dans Le Milieu Scolaire Algérien à l'Ère Des Tic: Analyse Sociologique

Sur la scène internationale, depuis les années 70, l'éducation relative à l'environnement est considérée comme un moyen crucial afin d'aboutir au DD. Suivant les préconisations internationales, de nombreux pays ont mis en place des politiques nationales en termes d'éducation au développement durable (EDD). Ainsi, cette éducation a été progressivement intégrée dans les systèmes scolaires dans de nombreux pays du monde[1].

L'Algérie à l'instar des autre pays, s'est inscrit dans cette dynamique, qui vise l'intégration de l'éducation relative à l'environnement au développement durable dans le système scolaire algérien et ce suite à la création du Ministère de l'Aménagement du Territoire et de l'Environnement en collaboration avec le Ministère de l'Education Nationale qu'un protocole d'accord a été signé en avril 2002[2].

Nous souhaitons à travers cette modeste recherche apporter un éclairage sur la question de l'éducation relative à l'environnement dans le milieu scolaire algérien à l'ère des TIC autrement dit, quelles seraient l'apport des TIC dans la question de l'éducation relative à l'environnement dans le milieu scolaire algérien et quelle est la place de la sociologie en tant que discipline dans cette dernière ?

Social Innovation in Vocational Education and Training

Institutional change in education is crucial for a systemic change. Institutions represent the result of an innovation process in education. This work provides a theoretical framework of institutional change in education by analyzing to what extend innovation in vocational education leads to an institutionalization process. We observed the institutionalization processes and innovation in two countries. One, a country with long experience with vocational education and training such as Switzerland. Two, a country with less experience but with a recent implementation model of vocational education and training such as Serbia.

We argue that innovation is the result of a need for change in an educational system, whereas innovation in vocational education can take form in institutions, methods and models. Institutionalization process in vocational education in Switzerland is analyzed in a framework of cycles of change. We focus on institutional theory and social innovation theory to study the social innovation, especially after educational reforms take place. This work contributes to the literature on social innovation and institutional change, especially in vocational education and training. Additionally, we provide preliminary results of innovation and change in vocational education in Serbia during the implementation of the new Dual Education Law of Serbia in 2019.

Understanding Innovation Differently: A Literature Review on Innovation, Social Innovation and Innovation in Education

The innovation paradigm in the last eighty years shows that innovation is mainly understand as technological transformations. This understanding of innovation has slowly evolved, but the permanence of this understanding as a technological transformation is still present in most of the current scientific and political dis-

courses. This research is an historical analysis and literature review of the innovation paradigm including the concepts of innovation, social innovation, and innovation in education by drawing in the most relevant literature during the period 1939-2019. These work present different perspectives of innovation over time, in order to recognize the evolution of this concept and to identify the relevance of innovation in the field of education.

MALDOVAN BONELLI, JOHANNA* (Centro de Innovación de los Trabajadores (CITRA-CONICET/UMET), Argentina)

The Unionization of the "Popular Economy" Workers: Reflections and Challenges from the Argentinean Case

Non-salaried workers in Argentina - as in other countries of the region - have traditionally been conceived as "poor", "informal", "unemployable", "marginal" or "excluded". In recent years, various social and trade union organizations have sought to resignify these senses by orienting their demands towards the recognition of the status of workers of those who belong to the "popular economy" as well as the union status of their representative organizations. Their main horizons of struggle are guided towards access to rights and protections for these workers (seeking to equal those perceived by formal salaried workers) as well as the implementation of specific policies in order to improve their working and living conditions. In the last decade, through social mobilization and diverse forms of collective actions, these organizations managed to gain visibility, be included in the public agenda, begin a process of institutionalization of their demands and get access to a set of resources that allowed strengthening their organizational processes.

Some of the main questions that arise from this experience are: what characteristics does the union representation acquire in the popular economy? Which are their main representation strategies? What differentiates these organizations from traditional unions? What intersection points can be built between them? What lessons does Argentina's experience leave us to build possible action frameworks in the organization of non-salaried workers?

This paper aims to bring answers to these questions from the analysis of two emblematic cases: the Confederation of Workers of the Popular Economy (CTEP) -emerged in 2011 from the confluence of different popular and social movements - and the Brick Workers Union of the Argentine Republic (UOLRA) -union confederated in the CGT that since 2013 has incorporated the popular economy into its representation strategies-.

Alienation, Authoritarianism and the Political Economy of Affect in the Work of Marcuse and Democratic Theory Today

This paper engages Herbert Marcuse's *Counterrevolution and Revolt* and the 'Historical Fate of Bourgeois Democracy' (both 1972), putting them into dialogue with current critical democratic political theorists who have reflected on how systemic forms of alienation under neoliberalism have enabled the rise of populist authoritarianism within existing liberal-democracies. Specifically, I want to look at how what I call the *political-economy of affect* in Marcuse's work, or his mapping of forms of alienation (both from above and below), can shed light on the 'proto-fascist syndrome' Marcuse saw as a potentiality within western liberal-democracies. Revisiting how Marcuse saw the relationship between forms of alienation, authoritarianism and democracy can illuminate recent discussions, by political theorists Sheldon Wolin, Wendy Brown and John Keane, of how liberal-democracies have become more openly authoritarian under neoliberalism. These theorists have implicitly or explicitly taken up, in a kind of debate with Marcuse's 'ghost', aspects of Marcuse's analysis in their own critiques of neoliberalism today.

Infrastructural Development and Environmental Risk Perceptions: Understanding the Conflict in Major Road Development Project in the Wild Coast Region of South Africa

The Wild Coast of South Africa is arguably the least developed region of the country – owing mainly to its historical marginalisation by the Apartheid era government. With infrastructural provisioning on top of its sustainable development agenda, the post-Apartheid government of South Africa plans to construct the N2 coastal toll road linking East London in Eastern Cape Province with Durban in KwaZulu-Natal Province. This 550 km road project, the government envisages,

will provide access to the Wild Coast, open the region to economic development through tourism, and other economic activities that are expected to benefit local people and the nation in general. While this plan has been lauded for its 'developmental agenda', it has equally been criticised by several local communities and environmental advocacy groups who fear that beneath the 'developmental agenda' of the state lay the plan to mine the titanium-rich sand dunes of the Wild Coast. Such project, many suspect, will permanently damage the pristine Wild Coast region, described as a biodiversity haven because of its plant endemism, and also home to several indigenous Pondo communities with rich cultural landmarks. This study seeks to: a. understand the risk perceptions of the various stakeholders in the Wild Coast road development project, and how their views intersect; b. explore the tensions between different stakeholders with varying notions of development in the Wild Coast road project, and c. analyse the consequences of their policy positions on the environment and infrastructural development in the Wild Coast.

Transnational Migration, Gender, and Care Work: Examining the Work of Social Reproduction within Chinese Immigrant Families

This paper is based on an empirical research study which explores the experiences of recent Chinese immigrant women from mainland China to Canada. In particular, it investigates how the social reproductive work of women exacerbates inequalities experienced by a particular group of minoritized women in the context of globalization and neoliberal restructuring. Many of these women were skilled workers or professionals in their home country. However, as a result of migration, they were deskilled or de-professionalized due to discriminatory employment practices, transforming their everyday lives. Using a feminist perspective and an intersectional analysis, the paper examines how these Chinese immigrant women manage their productive and reproductive work locally and transnationally - in the caring of children and adult members of the family, as well as the caring of aging parents and in-laws who reside either in Canada or transnationally in China. The myriad strategies recent Chinese immigrant women employed to simultaneously provide care work for members of their family, as well as juggling their paid work will be examined. As well, the various kinds of reciprocating care work elderly parents offer to their adult children's families will also be investigated.

MANCA, TERRA* (Dalhousie University, Canada)

Pregnancy, Patriarchy, and the Prioritisation of Risks during the COVID-19 Global Pandemic

During pregnancy, many women receive (and provide) care through expanded care networks. The COVID-19 global pandemic followed four decades of neoliberal hollowing of these collective care networks and social assistance programs. Although outcomes for most pregnant women with COVID-19 initially appeared optimistic, they faced uncertainties from various pandemic response measures that restricted their access to all forms care. Some countries restricted transportation and hospital closures limited access to obstetrical care. In some regions (e.g., China and parts of the United States), healthcare providers recommended against women with COVID-19 holding their newborns. Moreover, public health recommendations to socially distance disregarded pregnant women's access to financial resources and their various roles as essential workers, parents, and caretakers. For instance, the Prime Minister of the United Kingdom recommended pregnant women socially isolate for 12 weeks during pregnancy, ignoring women's social commitments, general wellbeing, and intersecting factors that may limit their ability to follow public health advice about COVID-19.

In this talk, I explore how risk discourses from COVID-19 affect pregnant women's wellbeing. My approach combines intersectional feminist, cultural, and governmentality approaches to risk. I focus on three overlapping themes from the literature that appeared in early news articles, clinical practice guidelines, and public health recommendations about COVID-19. These themes include the deprioritisation of pregnant women's health, the prioritisation of risks to the foetal body over the maternal body, and the responsibilisation of women to minimise health risks for foetal development. I argue that responses to COVID-19 through governance directed at institutions, professions, and individual actions prioritize universal interventions that organize responses around the needs of men. That is, many responses to the COVID-19 pandemic reinforce patriarchal power relations that disadvantage pregnant women and families.

MANCA, TERRA* (Dalhousie University, Canada)

"Protect Your Baby:" Narratives of Risk and Maternal Responsibility in Information about Vaccination in Pregnancy

Pregnant women in the media often appear to be in a state of domestic bliss, with thin limbs, perfect hair, stylish clothing, and prominent baby bumps. In contrast, ultrasound images depict a fetus floating as if it exists independent of the surrounding space that is a woman's body. Both types of images conceal the risk work that women and other pregnant persons undertake. One aspect of their work involves following public health recommendations about how to best protect the health of the fetal body. In many high-income countries, public health agencies recommend the inactivated-influenza and tetanus-diphtheria-acellular-pertussis vaccines during every pregnancy.

In this paper, I discuss findings from a content analysis of over 300 texts that describe vaccine use during pregnancy in Canada (e.g., webpages, printouts, posters, videos). Texts included in this study were developed by institutions that provide information about vaccination in pregnancy (e.g., public health services, professional organizations, vaccine manufacturers). Feminist literature informs my analysis of how information about vaccination in pregnancy incorporates content about family, gender, and fetal bodies. I argue that texts about vaccination in pregnancy are organized around narratives of vaccine success and motherhood in ways that recreate women's responsibility to protect their fetuses. That is, the narratives in texts present the disease as a threat to a healthy infant/pregnancy, vaccines as a means to protect that pregnancy, and pregnant women as responsible to accept that protection. Thereby, I argue that texts about vaccination incorporate culturally dominant narratives about domestic bliss and intensive mothering that exert moral pressure on eligible pregnant women to receive each recommended vaccine during pregnancy.

MANCILLA, ROBERTO* (, USA)

Sociocybernetics and Political Theory in a Complex World: Recasting Constitutionalism

In *Beyond Camelot*, Edward Rubin argues that many of the basic concepts of political science and Law were conceived during the Middle Ages and states that they do not adapt to the current times and with the reality that surrounds the administrative state. I wish to expand on this point to state that not only the institutions that we use but the way in which social organization is thought of is outdated.

Currently, we are faced with a reality that goes beyond the State: a globalized world, in the midst of a climate crisis and with a rapid technological development that is not always followed by efforts to regulate or is done so in an inconsistent manner across different countries. What all these phenomena have in common is that they are complex.

Rubin attempts to make his reconstruction by means of the usage of engineering terms and ideas and I think that he falls short in this effort because of this, as he is not using the right tool for the job. Sociocybernetics can be useful for the reconstruction of concepts of social organization in the context of phenomenon that are complex in nature and taking into account the biological aspects of sociability.

I will first try to address the issue of the inadequacy of the current framework of constitutional theory and then I will outline the ways in which constitutional theory can be remade, For this to work, I will state an example: the inadequacy of the public/private distinction and then I will offer an alternative idea, based on the mobility of social systems.

MANCINI, FIORELLA* (Universidad Nacional Autonoma de Mexico, Mexico)

Movilidad Social Intrageneracional y Desigualdades De Género En México.

Investigaciones sobre el constreñimiento que ejerce el mercado laboral sobre el curso de vida de trabajadores han mostrado que las condiciones de entrada a una determinada clase social tienen efectos de largo plazo en la carrera ocupacional de los individuos, donde la movilidad a una clase diferente a la de entrada no necesariamente sucede.

Bajo estas premisas, el objetivo del estudio es analizar la movilidad social intrageneracional en México, a partir del análisis de las probabilidades de movilidad que tienen las y los trabajadores entre su primer empleo y el actual, a partir del esquema clásico de clases sociales (EGP), adaptado para América Latina.

La principal hipótesis es que el primer empleo actúa como una especie de herencia social de las personas que condiciona y cristaliza tanto posibilidades futuras de trabajo como oportunidades de bienestar social y acumulación de (des)ventajas sociales a lo largo del curso de vida.

Para someter a prueba esta hipótesis, las principales preguntas de investigación son: 1. ¿Qué posibilidades tienen los individuos de mejorar sus posiciones sociales a lo largo de su trayectoria laboral?; 2. ¿Hasta qué punto se observa un patrón de movilidad "clásico" en términos del peso del primer empleo para actuar como un factor social de herencia o, en cambio, asistimos a la emergencia de un nuevo patrón asociado con procesos de individualización y pluralización de las trayectorias laborales? y; 3) ¿Qué características adquieren estos patrones desde una perspectiva de género?

Para el estudio se utilizarán datos provenientes de la Encuesta ESRU de Movilidad Social en México en 2017 (ESRU-EMOVI 2017), a partir del análisis de tablas de movilidad, medidas resumen de la movilidad absoluta y modelos estadísticos para el estudio, por separado, de varones y mujeres que participan en el mercado de trabajo mexicano.

MANCINI, FIORELLA* (Universidad Nacional Autonoma de Mexico, Mexico)

Perceptions of Uncertainty and Social Inequality in Mexico: Empirical Responses to the Sociology of Risk from Latin America.

Recent debates around social change indicate that, at present, a strong sense of uncertainty covers contemporary societies. A kind of cloud of doubts, fears and risks would fall - indiscriminately - on the individuals who, daily and with little efficiency, must deal with the vicissitudes of their existence. All this would have resulted in changes in lifestyles, family relationships, labor markets and, in general, an opening of possibilities and enabling options for a more critical, reflective and self-responsible agency.

These arguments about social change also suggest that risk perceptions are generalized, that they would not be linked to concrete contingencies, but rather to a kind of globalized transformation of social life, beyond institutional or cultural differences.

While the discussion about social changes and risk is prominent in recent sociology, certain observable concatenations have been suspended. This paper aims to contribute to this sociological debate, submitting to the empirical evidence hypotheses that are scarcely "corroborated" by the sociological theorists of risk.

The objective of the study is to analyze, through a quantitative analysis, the link between social risks, reflexivity and social inequality, in order to answer these three nodal questions of contemporary sociology of risk: 1. To what extent does this widespread perception of uncertainty exist? 2. How far the perceptions of social risks are related to certain degrees of reflexivity? 3. How the perception of these risks is linked to classical or traditional social inequalities.

The main hypothesis to consider indicates that neither social change nor globalization have a homogeneous effect on risk perceptions. Not only is risk perception permeated by the characteristics of social contexts, but its intensity is modulated, at least, by three structural axes of social inequality: the one that prints gender, the stage of life course, and the social origin of individuals.

RC16-201.1

MANDARA, LUCA* (University of Naples "Federico II", Italy)

Reason and Sensibility in the Time of Labour and Environmental Crisis

The intention of this paper is to revaluate Herbert Marcuse's Critical Theory in the light of two of the main contradictions of our time: work vs. capitalism and environment vs. capitalism.

I would begin retracing some features of the development of the productive forces in our society and how they are affecting capitalism. Using some insight of the Marxian theory, I would indicate that, within the limits of capitalism, the main consequence of the so-called "second age of machines" can be nothing but the destruction of the living productive forces: humans and nature.

In this light, I would recall how this analysis meets with the complete Herbert Marcuse's Critical Theory, reading, for some aspects, *Eros and civilization, One dimensional Men, Counter-revolution and revolt* among the others. In brief, Marcuse thought that the main challenge for a Critical Theory to the height of advanced capitalism, was to rethink the traditional goals and forms of socialism. Marcuse's Critical theory itself, indeed, found its definite ground in the development of the productive forces which dialectically make possible, according to the author, to enhance life toward Eros, the subjective power for a Great Refusal of the obscene destruction of man and nature made by capitalism. The negative *reason*, that is the understanding of the objective contradiction of capitalism, is to complete with a negative and positive *sensibility*, that is Eros, the maturation of a new Subject for revolution.

Finally, I would connect this view with the environmental, gender, racial movements whose ground seems to be what Marcuse called a new sensibility, the deep need of a new way of experiencing life and freedom. In the end, I would question whether work can still play a fundamental role for their emancipation as the current dramatic labour condition.

MANHÃES, ALEXANDRE* (Brazilian Air Force, Brazil)
LOURENÇÃO, HUMBERTO (Air Force Academy (AFA) and Air Force University (UNIFA), Brazil)

Brazilian Military Professionalization Process and Higher Education Levels: Universidade Da Força Aérea (Air Force University) Case

The release of the Strategic Project Air Force 100 triggered structural and processual modernization in Brazilian Air Force. Among all involved areas, great focus has been given to human resources, considered critical to achieve the Air Force's vision of future and sustain its capabilities to face new tasks and challenges. Additionally, it is said that military professionals with greater educational levels will access greater opportunities. That said, this paper explores how the military professionalism has developed in the last five years, since 2015, when several actions already have been taken to achieve a professionalization process that supports a higher credential of university education. The study will focus on the measures taken within Universidade da Força Aérea (UNIFA, Air Force University) because of its relevance in postgraduate studies of Air Force Officers. This research will be a combined exploratory and descriptive study of documents issued by Brazilian Air Force about higher education, seeking to demonstrate its importance for the development of military professionalism. It will be theoretically based on Huntington (2016) and Janowitz (1971) from the military sociology, Freidson (1996) and his thesis about professionalization, Castro (2004; 2016) and his studies within the brazilian military society and Barbosa (2012), in the sociology of professionalism in Brazil. Finally, this study aims ultimately to contribute to the development of the military sociology theories that consider the brazilian society and reality.

RC52-JS-54.2

MANIGLIO, FRANCESCO* (UTM ECUADOR, Ecuador)

Cognitive Dependence. Knowledge-Based Economy and Inequalities in Latin America

Comparative studies based on research and development (R&D) expenditure, patenting rates, and international higher education systems state that the current international division of knowledge stresses the forms of dependence that arise from the international traditional division of labor.The world wealth distribution thus becomes all the more visible because it now includes the movement of human capital and an increasing differentiation of human activities. When considering human capital as a variable in the international division of wealth, the reproduction of knowledge elites becomes a key factor in the political governance of cognitive capitalism. Rethinking the dependence approachin the context of knowledge-based economies, I posit that the reproduction processes of knowledge elites would account for the consolidation of a specific core-periphery geography, as a form of political and economic dominance. The hypothesis stating that the reproductionof knowledge elites and qualified workers generates new forms of dependence emphasizes the political contradiction between dependence and development, particularly in the case of Latin America.Therefore, this article analyzes the differentiation of qualified workers and the reproduction of knowledge elites in relation to the global development of knowledge-based economies. For this purpose, I consider (1) the San Matthew hypothesis and the reproduction of core-periphery knowledge divisions (2) the dominion of knowledge elites on political and social mobility (3) the differentiation of human capital by class, gender, and race divisions that reinforcethe production of political-economic dominance and reproduction of social inequalities.

Indigenous Food As a Means of Communication: The Case of Mankon, Cameroon

Food is an indispensable item for all human beings, being used as a means of survival. But it is also more than this: food is also indispensable as a cultural fact. People create various identities through food, and are able to qualify how they view themselves *vis à vis* other people. In most African societies, food functions go beyond its consumptive use. Food has many other meanings attached to it, depending on the occasion. Food is also a tool to foster communication among people, as it provides access to coded messages and forms of interaction that are not obvious to the external observer. However there is a paucity of studies on the matter, and thus the rationale of this research is to show that the symbolic and communicative use of food is critical to understanding African cultures.The aim of this paper is to examine the coded messages embedded in certain foods in relation to specific social or cultural events. A qualitative research approach is adopted, with the use of in-depth interviews that was used to collect data from 30 participants from the Mankon ethnic group in Cameroon. The findings reveal that the consumption of food is attached to particular cultural meanings and is

symbolic to different cultural and social events. Particular food choices are symbolic, being represented at different social or cultural events such as weddings, funerals, naming ceremonies and other such social rituals.

Keywords: Indigenous food, African rituals, ceremonies, communication, consumption.

RC40-508.2

MANN, ALANA* (Sydney Environment Institute, University of Sydney, Australia)

Utopian Thought and Action for Inclusive Foodscapes in Sydney

Utopian visions motivate us to challenge the status quo and can create the political will for radical, structural change that reduces oppression. *Real* utopias are based on ideals of the "potentials of humanity" and, as such, provide "pragmatically accessible waystations...that can inform our practical tasks of muddling through in a world of imperfect conditions for social change." (Fung and Wright, 2003, vii). Food utopias are necessarily "hope-filled" (Stock et al, 2015, p.3) as they offer a better way of living. More than just a mix of alternative food initiatives on a local level that offer innovative while limited strategies for change, they can *re-politicise* our thinking about how food systems are created. Rather than representing "a better world like it is a given, unchanging location" any food utopia becomes "the necessary act of imagining a better world, which involves processes for learning, adapting, and changing in response to growing knowledge and shifting circumstances" (Chappell, p.26). It calls for "visionary organising", a time of convergence together "as inventors and discoverers committed to creating ideas and practice, vision and projects to help heal civilisation" (Boggs, 2012, p. xxiii).

This paper presents three small-scale models of participatory social enterprise that draw on energy, influence, and knowledge of citizens to co-create vibrant and inclusive foodscapes in the city of Sydney, Australia. These examples reflect a "politics of the possible" (Swyngedouw & Kaika, 2003 cited in Williams, 2017, p.2219) that sits alongside utopian thinking as a way to contend with potentially totalising discourses such as neoliberalism. They unite diverse cultures and communities concerned about the deeper aspects of justice in the city, including social exclusion, food insecurity, and violence against women.

MANSKI, BEN* (University of California Santa Barbara, USA)

Climate Democracy Against Climate Leviathan

The Earth is in peril today. The climate has been destabilized. The global order seems fragile. Authoritarian and democratic movements are in struggle everywhere. This paper compares the implications of climate democracy and climate leviathan, two opposing visions for the constitution of global governance, in defining personhood, property, citizenship, sovereignty, and nature. Since 2013, climate democracy has begun to emerge as a "master" or intersectional frame aligning the global climate justice movement and various democracy movements in pursuing a common set of policy initiatives as well as a program for global constitutionalism. The Green New Deal and the Global Climate Strikes are two examples of movement projects instigated by the author and other green activists operating explicitly within a climate democracy framework. In contrast, climate leviathan, as conceptualized in the influential book of the same title by Geoff Mann and Joel Wainwright (2018), refers to the prediction that, if unchecked, an authoritarian "capitalist planetary sovereignty" will emerge to manage the climate crisis. This paper considers the prospects for climate democracy and climate leviathan in light of historical constitutionalist projects from below (particularly labor internationalism, global cooperativism, world federalism, and nuclear disarmament), versus constitutionalist projects from above (in particular the Bretton Woods process), as well as intermediate projects such as the United Nations. I make theoretical comparisons between the conditions that animated and shaped those

historical projects and the conditions emerging out of the climate crisis today and identify implications for the future mobility, management, and bordering of people, nature, and capital.

MANSKI, BEN* (University of California Santa Barbara, USA)

Constituting Democracy, Democratizing Constitutions: Lessons from a Global Comparative Analysis of Democracy Movements, Social Movement Strategy, Constitutional Change, and Democratization (1974-2001)

In times such as these that try the souls of democrats, is it more dangerous to pursue constitutional change, or is there a greater danger in avoiding it? Toward the end of the 20th century, many countries entered formal constitution-making processes. This wave of constitutionalization came about as part of a tumultuous reordering of the world system. Popular movements for democratization vied with authoritarian countermovements over the formation of new national, regional, and global institutions. Much of today's world is similarly defined by constitutional crises and demands for structural reform. There is great uncertainty and worry in this new period, and many are searching for new forms of order. What can we learn from the last period that might prove useful today? In facing the major constitutional crises of our day, what can and should democrats do? This study relies on a comparative analysis of the 11 major countries that engaged in formal constitutionalization between 1974 and 2001. These include Australia, Brazil, Canada, China, Iran, Poland, Russia, Saudi Arabia, South Africa, Spain, and Turkey, each at the time a top-30 GDP country of population greater than 15 million. The main finding of this study is that agenda-setting matters: Democracy movements that prioritized demands for constitutional change came away with much more democratic outcomes than movements that were less prepared for constitutional tumult. Taking lessons from both social movement studies and constitutional studies, I argue that when a democracy movement involves large numbers of people in the construction and articulation of a clear constitutional agenda, it deploys a constitutional master frame that redefines the political situation, the constitutional process, and the society's historical trajectory, as well as the movement's own collective identity.

Equality in Information Age: A Study of Indian Digital Landscape

A technology driven digital age in its own way manifests a new type of inequality which has both economic and social ramifications. This inequality is clearly visible among those who have access to information through ICTs and those who don't. The growth of developmental process requires that this digital divide be minimal. Access to Information through digital platforms will play a more critical role in coming years. Information and Communication Technologies offers huge potential to growing societies.

ICTs initiated the concept of a global village and technological innovations triggered the birth of information society. Information is the peg around which the ICTs revolve and developmental progress is closely linked to emerging communication technologies. Faster dissemination of information through ICTs has created a web wherein connectivity is the key element.

High rural tele-density over the years has given a boost to the digital penetration in India and the Government's focus is now squarely on rural broadband. Technology has become more affordable and internet access increasingly ubiquitous but the digital divide between urban and rural India still continues. Illiteracy, incapability to access technology, non-availability of content in local language, lop sided infrastructure further widen this divide.

The paper unveils the technological transformation underway in the emerging Indian digital landscape by looking at ICT user patterns both in terms of usage and information flow especially in the rural areas of the country. Keeping in view the vastness of its landscape, inherent cultural social diversity and disparities which makes the functionality of ICTs challenging. On the one hand ICTs are involved in bringing the world closer through technology but on the other hand technological transformation is creating a digital divide in the urban – rural landscape of this vast country.

MANZANO, MARTÍ* (Universitat Autònoma de Barcelona,)

Fotografiando Presentes y Futuros: Fortalezas y Límites De Metodologías Visuales En El Estudio De Las Transiciones Educativas Postobligatorias

La incorporación de los métodos visuales en los diseños de investigación basados en entrevistas se plantea como una herramienta capaz de ofrecer una mayor

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

emergencia de factores no contemplados en el diseño, acceso a aspectos de la realidad social de los entrevistados que de otro modo quedarían ocultos y un potencial de empoderamiento en el acto mismo de generación de datos.

Partiendo de estas consideraciones, la comunicación pretende presentar una evaluación de las fortalezas y los límites del *photovoice* y la entrevista fotoestimulada como herramientas de generación de datos mediante la reflexión sobre una experiencia de investigación. El análisis se genera a partir de la incorporación de la entrevista fotoestimulada en una investigación sobre las transiciones educativas hacia la educación postobligatoria por parte de descendientes de migrantes pakistanís y marroquís en la ciudad de Barcelona. En una de las tres rondas de encuentros se les pidió a los jóvenes que realizasen una serie de fotografías con su teléfono móvil sobre temas propuestos por el investigador para estimular una entrevista cualitativa sobre su realidad cuotidiana (¿quién soy?) y sus horizontes de futuro (¿quién quiero ser?).

Los resultados apuntan algunas consideraciones metodológicas como los factores que explican el éxito o el fracaso de las entrevistas fotoestimuladas tanto en su objetivo de generación de datos como en el de provocar autoconocimiento y empoderamiento. Se plantea también un debate sobre los límites de lo fotografiable en investigaciones que incorporan lo visual en los imaginarios de futuro ante las dificultades que han tenido los jóvenes para fotografiar aspiraciones ajenas a sus realidades sociales actuales y las estrategias que han seguido para superarlas. Finalmente, se cuestiona el lugar común de la supuesta familiaridad de los jóvenes con el lenguaje visual y se ofrecen herramientas para identificar distintas relaciones de los jóvenes con este lenguaje.

Stressors and Subjective Well-Being Among Chinese Older Adults: Uncovering the Buffering Role of Social Support Patterns

Using data from two waves of the China Health and Retirement Longitudinal Study (N ≈ 5,500), this study used latent class analysis to identify social support patterns among Chinese older adults based on the types and sources of social support, and multivariate regression to examine the buffering roles of social support patterns in the relationships between stressors (i.e., poor health and functional dependence) and older adults' subjective well-being (i.e., depressive symptoms and life satisfaction). We found five distinct social support patterns (i.e., financially independent/family-focused, financially independent/spouse-focused, financially dependent/spouse-focused, Chinese traditional support pattern, financial dependent/diverse) among Chinese older adults. Poor health and functional dependence were significantly associated with lower subjective well-being. The buffering role played by social support differed significantly by its patterns. Chinese traditional social support pattern and financial dependent/diverse pattern mitigated the negative relationship between two stressors and older adults' subjective well-being. In addition, financially independent/family-focused and financially independent/spouse-focused somewhat buffered the relationship between functional dependence and low subjective well-being. Implications for the well-being of the Chinese elderly population are discussed.

"to Go or Not to Go, It Is a Question": Perceived Accessibility Among Disabled Individuals in Shanghai

The purpose of this study is to explore how individuals with disabilities perceive their environment accessibility during the process of accessing public space. Community-dwelling disabled individuals participated in semi-structured, in-depth interviews in Shanghai (*N*= 16). The findings suggest that despite some improvement, participants encountered physical and social barriers during the process of accessing public space. These barriers posed tremendous challenges for participants to access routine destinations, such as workplaces. As a result, most participants voluntarily chose to confine their living spaces to avoid prejudice or burdening family caregivers. The combined implications of physical and social barriers en route exacerbates participants' limited environmental accessibility. This study sheds light in policy and practice to understand social inclusion from perspectives of the disabled.

Researchers and the Universal Human Right to Enjoy the Benefits of Science

Access to scientific knowledge and to its benefits is a human right, as stated by Article 27 of the 1948 Universal Declaration of Human Rights and by Article 15(1)(b) of the 1966 International Covenant on Economic, Social, and Cultural Rights. The right to knowledge must ensure that everyone in the world can access the best scientific contributions that are being made internationally. This, on the one hand, ensures the fulfillment of human rights while contributing to the democratization and openness of science, following the premises that founders of the Sociology of Science, as Merton, had already theorized. In this context, IMPACT-EV project funded under the 7th Framework Programme for Research and Technological Development of the European Union delivered the first social impact of research repository, namely the Social Impact Open Repository (SIOR). The purpose of this communication is to present this repository, which is a new tool and a great opportunity for researchers to promote the social impact of their research but also for the users, who will have free access to high-quality scientific evidence to improve their lives in aspects that are important for everyone. IMPACT-EV developed a system to monitor social impact of research that will be used by the European Commission to evaluate all research projects in the next framework programme for research, entitled HORIZON EUROPE. Social impact of research understood as social improvements achieved after implementing the results of a particular research project or study. The social impact must be supported by social challenges or goals, such as the EU 2020 targets or the 2030 Sustainable Development Goal Agenda. In this way, research from all scientific disciplines can be displayed and shared through SIOR and advance in this way to guaranteeing the universal human right to enjoy the benefits of science.

Worplace Discrimination Against LGBT People

Although globalization has brought many advances in gender equality in terms of employment in several countries, this has not been the case of the LGBTI people. In places like US, private companies have taken the lead in this matter because at the federal there is not a political will to offer employment protection against dicrimination based on gender identity or expression as well as sexual orientation. In Europe, the situation is not any better. And this situation accounts for most of the Western countries, where states do not offer protection against employment discrimination to LGBT people, albeit they have championed other issues such as same-sex marriage. According to the International Lesbian, Gay, Bisexual, Trans and Intersex Association discrimination against LGBT people may take several forms: during recruitment procedures, promotions, harassment in the form of 'jokes' or LGBTI-phobic comments or threats to 'out' them, or denial of benefits. The purpose of this communication is to make visible this discrimination against the LGBT people and analyse elements that we found in the scientific literature that can transform workplaces in more inclusive, non-discriminating and violence free places for LGBT people.

MARCELINO, GIOVANNA* (Universidade de São Paulo, Brazil)

Heleieth Saffioti: Sociology, Marxism and Feminism in the Peripheral Context

The 1960s marked a period of renewal of sociology in Brazil, something embodied in the effort to elaborate new theses dedicated to the interpretation of Brazilian society, many of them fed and based on a "new reading" of Marx, such as that undertaken by the initiative developed in São Paulo which became known as "*The Capital* Seminar". Under the same social and political atmosphere, feminist thought and practice entered a "new wave" in which gender discussions were complexified with the categories of race, class, sexuality and nationality, and in which the protagonism and voice of black, lesbian and "third world" women gained a greater centrality, in contrast to the hegemony of a "universal and western" feminism.

At this time, sociology, Marxism, and feminism, therefore, were converging on a mutual and concomitant effort: the challenge of deepening and consolidating themselves as national traditions, linked to culture and the contradictions of a country of dependent capitalism, having seen the necessity to readjust general perspectives that were originally formulated in the European context to the particular and concrete Brazilian reality. Heleieth Saffioti's *The Woman in Class Society* (1976) is undoubtedly a good example of this synthesis and process of incorporation and readjustment of classical references from the center to the Brazilian context (in particular, the canonical work of Marx and socialist feminism), which

produced unique contributions to the analysis of the feminine condition from the point of view of the reality of peripheral capitalism, as well as to the understanding of the sociohistorical formation of the capitalist system, in particular its structural relationship with patriarchy. This work aims to perform an analysis of Saffioti's work as part of the intellectual constellation of that time that inaugurated a new line of research in the social sciences in Brazil, bringing together sociology, Marxism and feminism.

MARCON, FRANK NILTON* (Universidade Federal de Sergipe, Brazil)

Youth, Precarities, Mobility, Work and Lifestyles

Based on research that I have been conducting in recent years, involving youths, creativity and aestheticization, I present some reflections on the relationship between the contemporary experiences lived by young people with work. More specifically, I am interested in the meaning of their agencies through music, dance, graffiti and street art in general, usually in hostile contexts and conditions of social vulnerability and informality. What hostilities do they face in such situations? What is the social profile of these young people? What features do they use? How do they express themselves, resist and compete for spaces of social interaction and political participation, work and leisure? What do they say about the transition to adulthood and work as a possibility of autonomy? What do they have to say about their lifestyles, especially regarding the use of time, space, technology, aesthetic resources and what they do for a living? I try to answer these questions by analyzing the main and different contradictions between the aesthetic experiences of youths and the relationship of their agencies with the precarious conditions and social moratorium imposed in contemporary times, in particular, medium and large cities in Europe (Lisbon and Barcelona) and Brazil (Aracaju and Salvador).

MARCUELLO SERVOS, CHAIME* (Universidad de Zaragoza, Spain)

Beyond the Algorithms: From Netnographic DATA Collection to DATA Hermeneutics

When Kozinets (1998) disseminated the term netnography, skillfully combining two words ethnography and Internet, we were far from imagining the current developments. That initial commitment to transfer the know-how of ethnography to the world of the Internet opened up a universe of possibilities that have now multiplied.

This article proposes a theoretical framework to discuss the role played by the use of algorithms and the work with specific software from the Sociocybernetics perspective. That is, it is proposed to go beyond the automation and processing of data from a second order observation process. For this reason, it begins by discussing data collection procedures in different digital social spaces. In addition to social media (Facebook, Twitter, Instragram, Tinder...), there are different places of digitalized interaction that require specific approaches. In any case, once the data has been accumulated, in different formats and quantities, the most complicated step is interpretation. The hermeneutics of data has here is posed from the Sociocybernetic perspective as a paradigm that defines a space for observation and analysis.

The article is divided into five sections, including the introduction and conclusions. The first dicusses the construction of observables in digital contexts mediated by software and hardware. The second raises the issues of boundaries in data collection in digital and social media contexts. The third proposes a Sociocybernetic analysis strategy that allows going beyond algorithms to formulate dense explanations of observables and understand their effects in off-line contexts.

Rediscovering Human-Machine Interaction. the Effects of the Introduction of Robotics in Amazon Plants in Italy.

This paper compares Amazon Castel San Giovanni with Amazon Passo Corese, the plant where for the first time in Italy, inbound and outbound work processes were partly transformed by the introduction of robots, affecting two central aspects in the logistics sector, such as the high turnover and the management of peaks production.

The comparative analysis aims at examining the effects of the introduction of these robots on organizational and production processes, and to understand main changes of activities carried out by workers and the impacts of automation on the amount of manpower employed, on the different skills required and on the quality and pace of work performed.

The analysis is based on non-participating observation experiences during guided tours organized by Amazon, supplemented with interviews to the main trade unions at national and local level and to Italian employee, but not to Managers (being expressly forbidden by the company).

The theoretical approach focuses on human-machine interaction. The analysis is not limited to observe how technologies change the organization of work (Butera, 2009), affecting human work (Friedmann 1971), but it highlights how workers had been able to use technological tools available at their own discretion. Results are more complex and articulated. Robots influence both the number of employee, thus reducing workers -especially temporary one employed during peak production- and also the quality of work and working conditions, by reducing workload and physical fatigue, but not the performing of a task, which continue to be routinal and repetitive. More controversial is the impact on pace and time of work, strongly conditioned by machines- which raise workers' stress- and by the objectives set (and controlled) by the team-leaders. However workers had been able to adapt technologies available to their own needs and rhythms, by adopting some "tricks" in order to reduce the pace work.

RC19-229.8

MARINS, MANI* (Universidade Federal Rural do Rio de Janeiro, Brazil)

Social, Political and Moral Effects on Poor Women

The relationship between state and society has been mediated by public policies that sometimes produce more opportunities (and equality) and sometimes create problems in the area of   local implementation (as well as corruption, paternalism, access barriers, discrimination, stigma and moral judgments about the beneficiary population). Often such consequences have perverse effects on democracy and citizenship. In this paper, from an empirical study on the Bolsa Família Program, we intend to: 1) systematize the rhetorical and practical mechanisms of implementation and 2) analyze the political, social, moral and gender consequences from the interaction between public agents and beneficiaries. To this end, we used as a methodological tool interviews with different actors: beneficiaries, non-beneficiaries (families who had a similar socioeconomic status as beneficiaries) and institutional actors (social workers, Bolsa Familia registrants, health agents, traders and coordinator of Bolsa Família). In total, 70 interviews were conducted in an urban periphery of Rio de Janeiro. From the empirical material, we show the existence of a broad system of political, social, gender and moral vigilance over beneficiaries (Marins, 2017; 2018). First, surveillance is political, because there is specific oversight and sanctions related to conditionalities. Secondly, the surveillance system is also social because it is based on behavioral controls of these poor (often black women). Surveillance is also based on gender norms, through demands in relation to the traditional role of mothering. And, lastly, the surveillance system is moral in that others use moral judgment as a means of classifying over beneficiaries in relation to their daily practices.

WG05-706.4

MARINS, MANI* (Universidade Federal Rural do Rio de Janeiro, Brazil)

The Ambiguity between Public Policies and Inequalities

Public policies have been implemented as the central motto of democratic societies in order to combat multiple inequalities: economic, social, cultural, racial and gender. Such inequalities may occur between families and between distinct units of the territory. Part of the literature in sociology points out that the relationship between public policy and forms of inequality is ambiguous and conflicting (Lipsky, 1980; Dubois, 2010; Duvoux, 2009; Maynard-Moody, & Musheno, 2003; Porras, 2012; Marins (2018 & 2019).

Such works show - in the local scope of the implementation of social policies and, in particular, those of fighting poverty - the existence of inattention, exclusion and discrimination in the treatment of socially vulnerable segments of the population. Thus, beyond a matter of relative insufficiency, we see that policies formally designed to reduce inequalities can contribute to their reproduction. The advancement of debates on the multidimensionality of poverty has drawn attention to the fact that better equity conditions are unlikely to be attained only by improving income distribution. Multiple inequalities impose barriers that hinder social advancement and the improvement of the quality of life of socially vulnerable segments. It is a complex intertwining of the axis of economic inequality with the axes of gender, ethnic-racial, territorial and age-based inequalities as structuring a process of (re) producing unequal social relations.

To what extent would the daily operation of public agents contribute to an unequal distribution of opportunities and to the continuity of existing forms of exclusion? The idea here is to discuss, from the theoretical framework of sociology, the unintended effects (stigma, high discretion, patronage, moral judgments and discrimination) of income transfer policies in Latin America.

MARONTATE, JAN* (Simon Fraser University, Canada)

Preserving Memories of Art and Artists: Multiple Meanings, Competing Values

Values associated with artists and artworks (often related to variations in socio-economic class, gender, race, and age) have been important for artistic recognition processes. This paper examines strategies for considering diverse (and sometimes competing) values for arts professionals developing contemporary strategies for preserving memories of recent art. *How* do the multiple meanings of artistic practice enter into decisions about what memories of art to conserve?

Decisions about the 'meaning' of art works are central when planning conservation interventions, particularly for recent work in impermanent or time-based media (such as electronic technologies or performances). Records of the creator's intent, interviews with artists and other art world authorities, analysis of the historical contexts of the work and of subsequent transformations provide insights about ways to preserve the integrity of art work that respect its symbolic and cultural significance. Tensions may arise too in disagreements among caretakers of art (curators, conservators, technicians and directors) who hold different levels of authority in professional, institutional and national contexts.

The paper presents findings from studies of three art international conservation projects (including fieldwork at their meetings and documentary research). If the meanings for creators, collectors and publics differ, whose opinion prevails in decisions about what to preserve? If creators or experts change their views over time which viewpoint is considered legitimate? What happens when curators, hands-on conservators, conservation scientists and other categories of experts fail to reach consensus? *What logics inform decisions about the fundamental 'meaning(s)' of artistic works to preserve? What criteria are used in the assessment of successful or unsuccessful preservation initiatives for establishing continuing records about meaningful art?*

The paper considers strategies used in conservation for confronting multiple meanings and in multi-disciplinary, international projects with participants who subscribe to different (and sometimes incommensurable) value systems.

El Rol De Las Tecnologías Digitales En La Acción Colectiva De Las Organizaciones Sociales De La Ciudad De Rafaela - Argentina

La ponencia analiza las prácticas y estrategias comunicacionales, basadas en el uso de las tecnologías digitales e Internet, en dos tipos de organizaciones sociales de la ciudad de Rafaela: las tradicionales y las nuevas, surgidas en los últimos quince años y cuyas temáticas están relacionadas con lo que se ha denominado nuevos movimientos sociales.

Se hace foco en la manera en que estas organizaciones combinan las prácticas cara a cara y las mediadas por las tecnologías digitales, analizando a partir de allí la construcción de las subjetividades e identidades colectivas y su inserción en la cultura digital.

Se realiza una comparación entre ambos tipos de organizaciones tomando como indicadores los modos de utilización de estas tecnologías y el rol que cumplen para alcanzar los objetivos de cada organización. Se estudian las producciones intelectuales -materiales escritos, programas de radio, imágenes, audiovisuales- de estas organizaciones sociales, centradas en la acción colectiva, tanto en espacios de encuentro en línea como presenciales.

Se usa una metodología cualitativa de diseño transversal, la delimitación temporal comprende los últimos 15 años (2004-2019), el recorte geográfico refiere a diez organizaciones sociales que intervienen políticamente en la ciudad de Rafaela, incluyendo tanto las tradicionales como las denominadas nuevas, no sólo por ser de reciente creación, sino por las temáticas de las que se ocupan. Se relevaron los sitios web y las redes sociales de estas organizaciones, analizando la utilización de estas tecnologías tanto para la comunicación interna como externa. También se realizaron entrevistas semiestrucutradas, grabadas en audio y video.

El análisis tiene como marco la transformación de las sociedades industriales tradicionales en postindustriales y el surgimiento de una cultura digital atravesada por prácticas comunicacionales con base en las tecnologías digitales e Internet que, además, permiten la realización de producciones intelectuales muchas veces relacionadas con la libre distribución del conocimiento.

Modificaciones en las prácticas de enseñanza y aprendizaje a partir de la Educación a Distancia Digital en el nivel universitario

El objetivo de esta ponencia es analizar de qué manera los docentes universitarios se valen de las tecnologías digitales y, específicamente, de un Entorno Virtual de Enseñanza y Aprendizaje (EVEA), para desplegar estrategias didácticas que acompañen el recorrido de los estudiantes universitarios de primera generación, en una universidad nacional de reciente creación (2015), en una ciudad mediana del interior de la Argentina.

Se toman como objeto de estudio las prácticas de enseñanza y aprendizaje de docentes y estudiantes de la Licenciatura en Medios Audiovisuales y Digitales de la Universidad Nacional de Rafaela (UNRaf), especialmente aquellas referidas a la combinación de textos académicos y materiales educativos multimediales. Se centra en las materias que se dictan presencialmente pero que cuentan con un aula virtual de apoyo. En este contexto se observa y analiza cómo los docentes readecúan sus prácticas de enseñanza en función de los rasgos coyunturales de las prácticas de estudio, teniendo en cuenta el rol que cumple el EVEA en este proceso.

En las prácticas de estudio se identifica la dificultad para comprender ideas abstractas, para expresarse por medio de la escritura académica, para verificar la validez de las fuentes utilizadas cuando se recurre a información disponible en Internet. Estas dificultades están relacionadas con la lecto-comprensión, entendida como práctica cognitiva y social. Así, las estrategias didácticas de los docentes deben readecuarse a las necesidades de los estudiantes para desempeñarse en el ámbito universitario, contribuyendo, de esa manera, a la inclusión social y educativa.

Se utiliza una metodología cualitativa que incluye la observación no participante de las aulas virtuales, entrevistas con el director de la carrera, con los docentes y con los estudiantes y participación en las reuniones del equipo docente de la Licenciatura.

MAROULI, CHRISTINA* (DEREE - The American College og Greece,)

Critical Pedagogy for Environmental and Social Change: How? What Helps? What Obstructs? Learning from Experience

Environmental Education (EE) was conceived as an important method for raising awareness and bringing about the needed changes in social practices that can lead to environmental protection, and more recently sustainable development (transforming EE to Education for Sustainability (EfS)). Thus, EE/EfS – especially when aiming to change behaviors – has been akin to critical pedagogy which aims to prepare independent and critical thinkers and empowered citizens that can effectively address social problems.

Despite the 50-year long life of EE/EfS, environmental problems persist and some have become accentuated although learners' environmental knowledge base has increased.

What pedagogical approaches and educational methods are more effective in bringing about attitudinal and behavioral change? What is the key(s) in instructional design and practice that facilitate(s) this transformation? What are the challenges? These are questions that trouble educators working in EE / EfS and transformative learning. This chapter aims to contribute to the ongoing discussions around these issues, with theoretical reflections and insights from the author's more than 30-years teaching experience in higher education and other settings in Greece. After a discussion of the author's key pedagogical influences (e.g. Paolo Freire, EE/EfS), the evolution of her (my) instructional practices (primarily in Greece) will be presented, with the aim to identify classroom practices that have a transformative potential, within the context of challenges and facilitating parameters that have been experienced. The instructor's (my) self-reflections and students' qualitative comments are used in a variety of research methods: a self-study research approach drawing on the author's self-reflections as instructor; an analysis of students' qualitative comments on the course, as well as reflections on a recent pre- and post-instruction survey applied to an introductory Environmental Studies course with the aim to evaluate the transformative potential of different teaching methods.

MARQUES, ADRIANA* (Universidade Federal do Rio de Janeiro, Brazil)

La Conexión Puerto Príncipe-Brasília: Participación En Misiones De Mantenimiento De La Paz y Sus Reflejos Para La Política Nacional

El debate sobre las consecuencias imprevistas de la participación de las Fuerzas Armadas de Brasil en la Misión de Estabilización de las Naciones Unidas en Haití (MINUSTAH) ha crecido en los últimos años. La "reimportación" de la experiencia de los militares en Haití, especialmente con respecto al uso cada vez más frecuente del ejército de las operaciones de carácter policial, es la consecuencia imprevista más visible de la participación del país en las misiones de mantenimiento de la paz y también lo mas discutido por la literatura internacional y nacional. Sin embargo, después de las elecciones presidenciales de 2018, otro aspecto ha llamado la atención de la academia: la gran participación de generales brasileños que regresaron de las misiones de paz bajo el mandato de la Organización de las Naciones Unidas en el gobierno de Jair Bolsonaro. En esta ponencia presentaré una discusión preliminar sobre este tema enmarcando al grupo de generales que la prensa brasileña llama "ala militar" del gobierno en la tipología creada por Charles Moskos para calificar el tipo de profesional militar que surgió en el post Guerra Fría debido a la participación, cada vez más frecuente en misiones de pacificación/estabilización bajo el mandato de organizaciones internacionales. El autor describe a este nuevo profesional como un *soldado estadista* que se relaciona bien con la prensa y conoce el intrincado juego de la diplomacia internacional. Además de la bien estudiada conexión Puerto Príncipe, discutiré aquí la conexión Puerto Príncipe-Brasília basada en la tipología de Moskos. La fuente principal de la ponencia son las entrevistas dadas por los generales brasileños que estaban a cargo de las Fuerzas de Paz de las Naciones Unidas en Haití al Centro de Pesquisa e Documentação de História Contemporânea do Brasil en el año 2018.

Precarious Organizing and Beyond: The Case of Arts and Construction Industry

Ongoing reconfigurations of work under contemporary global capitalism increasingly defy the centrality of the workplace for workers' organizing. Some sectors, though, have always been challenged by the lack of a stable workplace and by the temporary nature of work relations. That is the case of the arts and construction industry which provide longstanding examples of precarious and mobile work and have been related to precarious organizing. Despite representing two distinct sectors of the workforce, they present a set of similarities that challenge the possibilities of workers' organisation and mobilisation: the temporary, project-based nature of work; the precarious employment arrangements, often informal; the mobile nature of work activities, not linked to a fixed workplace. Based on the Portuguese context, this paper provides a comparative analysis of both sectors, arguing on their analytical significance to explore new forms of workers' solidarity and broader terrains of struggle.

Margins Reload. the Mutual Information Index As a New Approach to Educational Regularities.

In a complete bibliographic review carried out by Mellizo-Soto in Spain in 2014 on the inequality of educational opportunities, that is, the inequality of reaching a specific educational level according to social origin (IOE, hereinafter), indicates the lack of agreement between researchers who are dedicated to this type of studies. Then, we do not have strong conclusions that indicate the direction and intensity that these inequalities have taken. When the published works are inspected, it is verified that the improvements in the reduction of educational inequalities are few and of little intensity. In a paper for the American Journal of Sociology, Breen et al. (2009) refuted the conclusions of Shavit and Blossfeld (1994). Unlike the latter, who only found an improvement in inequality in Sweden and the Netherlands (from thirteen countries), Breen and his colleagues found a decrease in educational inequalities. The mechanisms hypothetically consist of a decrease in both primary and secondary effects. The primary ones consisted of the improvements of nutrition and health experienced due to the economic improvements after the Second World War, the increasing involvement of the parents and the greater protection of the state. The secondary effects consisted in a reduction in opportunity costs. A recent work in Spain (Bernardi, Gil and Luijkx, 2019) emphasizes that has been an increase in social fluidity, but this has been due more to the compositional effect via educational expansion. In this communication we propose to look for the reasons that explain the changes in the IOE and we propose a different analysis that accounts for the changes in the IOE composition. To date, most of the measures employed have been invariant to marginal distribution. Finally, we will give an interpretation that explains what are the social mechanisms that have hypothetically contributed to shaping the changes that have occurred.

Avances y Desafíos En La Integración De Género En Las Políticas De Respuesta Al Cambio Climático

El Panel Intergubernamental de Cambio Climático reconoció que la vulnerabilidad social al cambio climático es de carácter multidimensional y producto de factores no climáticos. Significa que hay poblaciones más vulnerables, con riesgos

diferenciados creados por la intersección de desigualdades económicas, sociales, culturales, étnicas, transversalizadas por desigualdades de género que afectan fundamentalmente a las mujeres. (IPCC, 2014).

Las mujeres se encuentran en situación de mayor vulnerabilidad social, con menos capacidades para la adaptación y mayor riesgo a sufrir impactos negativos por menor autonomía económica, acceso y control de los recursos naturales como la propiedad de la tierra, menos información y capacitación técnica. Asimismo, se observan desigualdades en los ámbitos de participación y gobernanza, debido, entre otros factores, a que ellas aún asumen la mayor parte del trabajo doméstico y de cuidados y cuentan con menor tiempo para actividades vinculadas al desarrollo.

En relación a la respuesta al cambio climático es preciso atender que mujeres y hombres cuentan con habilidades, capacidades y conocimientos diferentes que deben integrarse en las estrategias de adaptación y mitigación. La Convención Marco de Naciones Unidas ha adoptado un Plan de Acción en Género (PAG 2017-2019) para reforzar la respuesta de la política climática a las cuestiones de género en todas las actividades de los países miembros relativas a la adaptación, la mitigación y los medios de aplicación conexos (la financiación, el desarrollo y la transferencia de tecnología y el fomento de la capacidad). (Decisión 21/CP.22, CMNUCC)

En esta comunicación se sistematizan experiencias de integración de la perspectiva de género en las políticas climáticas de la región latinoamericana y del mundo que permiten determinar la viabilidad de este enfoque, y comprender los desafíos para lograr políticas climáticas que sean efectivamente género responsivas.

Cultural Mobility Among Immigrants' Descendants: Comparing and Contrasting Italy and France

Cultural reproduction and cultural capital accumulation are particularly relevant in shaping the trajectories of immigrants' descendants. Since cultural mobility is closely intertwined with social mobility, achieving a high level of cultural capital appears to be one of the best ways in which second generations migrants can experience social mobility. Investigating the strategies that migrant families carry out to improve their children's cultural capital can offer a fruitful point of view. If we think of groups that have in general less capitals, frequently lost or lowered in the migration process, we understand why their reproduction strategies are of particular relevance for the general analysis. The case of migrant families can clearly show the bare impact of parental educational action, as well as the social positioning effect, but it can also highlight the agency shown by the children themselves, and the school system influence in conditioning the educational paths.

This contribution aims to present the result of two empirical studies, carried out employing a qualitative methodology with around 50 in-depth interviews conducted to both immigrants' descendants and key informants. These investigations compare Italy (Turin) and France (Lyon), and focus on the factors that influence school choices when it comes to higher education and attending (or not) university. How parents' cultural capital affects the school paths of their children? What are the effects of parental advice on children's choices? And which are the bases upon this advice rest? How children build their own aspirations? The comparison between two countries with different migration histories, albeit in both immigrant groups play a relevant role in shaping society and political intervention, allows to broaden the results extent, especially in a perspective of policy learning and policy transferability. Lastly, our contribution aims to connect these empirical results to the wider literature on cultural mobility and cultural reproduction.

Parental Investment in Schooling and Child's Well Being

What is the relation between investment of the parents and well-being in school? Do parent/child discussions about school enhance a better well-being of their child? Is there a difference if the mother, the father or both parents invest in talking with their child about school? Are there differences of practices between socio-economic categories? To answer these questions we analyse two surveys: "The Childhood of Leisure" and PISA France. The first one is a national representative survey undertaken in 2008 by the French Ministry of Culture with a representative sample of 15 years-old students (N=9600) drawn from a representative sample of schools (N=1570) stratified by size and sorted according to region and to 'urban unit' of different sizes. The second survey is the French part of the international survey PISA, carried out in 2015 among 15 years-old students (N=6108), selected randomly from a representative sample of schools. We argue that the more the children talk about school with their parents, the more they declare a feeling of well-being at school and in general. More precisely, boys and girls are more likely to feel good (at school) when they can talk (about school) with their mother and their father. Second, we emphasize that discussing (school) with the children varies according to the parents' and children's gender. Finally, we show that the role of parent-child discussions on the well-being of children evolve according to the social background of children. This communication will present the association between the investment of the two parents and the child's academic well-being. Policies should encourage the involvement of both parents in their child's school issues and focus on fathers who are less invested than mothers in discussions with their children.

Ageing, Materiality and Everyday Life

Studies of ageing, as part of the wider cultural turn, have increasingly engaged with questions of materiality. Through the exploration of the role of stuff, things, dress, possessions, senses, technologies, spaces, design and environments in the experience and perception of ageing, materiality offers new perspectives through which to explore the embodied lives of older people, highlighting the interconnections between the corporeality of ageing bodies and the socio-cultural context in the everyday lives of people as they grow older. The aim of this paper is to highlight and explore how a focus on materiality in ageing studies has opened up new theoretical and methodological possibilities that elicit rich and illuminating accounts of people in mid to later life. This will include how a materialist perspective provides novel perspectives on a range of topics in ageing studies as well as the ways materialist approaches can be used to research ageing. Through an exploration of a range of research projects and data this paper will conclude by showing the significance of the development and enhancement of creative and material methods as a means to elicit data on the sensate, atmospheres, material aspects of ageing and everyday life.

Understanding Critically Women's Care-Work : Vulnerabilities, Supports and Interdependencies

This paper presents some results of the Research-Project "New forms of social and existential vulnerability, support and care in Spain", funded by the Spanish R&D&I National Plan CSO2016-76179-R of the Ministry of Science and Innovation. The project is based on the qualitative investigation conducted in Spain by means of three discussion groups composed of particularly vulnerable social groups: family caregivers, young individuals in a situation of precariousness and long-term unemployed individuals over 45 years. This paper focuses on the analysis of discourse of female family caregivers and it delves into the relationship existing between the experience of care and those of vulnerability and interdependency. In a broad sense, care, as defined by Joan Tronto and Berenice Fisher (1990:40), allows explaining the complexity of the discourses regarding the experiences of care, as well as enabling a better understanding of the different dimensions which shape care: emotional, moral and physical (corporal, material and temporal) (Martín Palomo, 2008; Martín Palomo and Krabel, 2016). The processes of interaction between those who give support and those who receive it are pierced by affection, bodies, suffering, satisfaction, physical effort and, ultimately, a di-

verse range of dispositions, many times in conflict with each other –especially concerning the tension between self-care and the care of others. This work intends to analyse how the body and emotions operate in the processes of interaction between caregivers and care-receivers in order to elaborate further on the subjective and material dimensions which promote vulnerability within care and on the impact these processes have on caregivers.

Investigating within-Education Inequality Using Job and Task Descriptions, U.S. 1972-2018

In addition to rising inequality between educational attainment categories, inequality within educational groups has also increased over the past five decades. Skill-biased technological change and the erosion of labor market institutions, principally labor unions, both contributed, but their relative contributions are uncertain. We examine how changes in the occupational structure and the task content of jobs has contributed to the rise in within-group inequality in the United States between 1972 and 2018, with data collected as part of the General Social Survey (GSS), but not previously released for analysis. We use respondents' verbatim replies to open-ended questions about current occupation and job tasks to examine within-education variation in socioeconomic status by gender and decade. Verbatims are linked to the full set of variables in the GSS, including union membership, size of firm, and a detailed industry classification. In combination, these data allow for a more in-depth analysis of jobs and tasks than is typically possible with traditional survey data. Specifically, we group respondents by education, gender, and decade and measure the variation in socio-economic status in each group. We then use computational text analysis to calculate the dissimilarity of job and task descriptions and to identify the key words and phrases that differentiate workers in the lowest and highest quartiles of each education-gender-decade bin. Skill-biased technical change will reveal itself in the appearance of new terms over the decades; deinstitutionalization will reveal itself in the disappearance of other terms.

On Acquisition of the International Management Language for Identity Construction and Professional Performance of Indian Industrial Engineers

We examine the consequences of acquisition of specialized International Management Language (IML), as assimilated and inculcated via an MBA-like training program, for Indian managers from the large industrial sector. Focus is on modifications in professional identity construction and alterations in managerial practice; established by study of a panel of 50 engineer-managers, back on the job after a year-long advanced management training, delivered in English by highly reputed Indian School.

With no material product, exercise of the managerial role is entirely dependent on the tactical use of language. As conceived here, the IML is a professional argot constituted by a frame of linguistic codes developed principally by USA B-School professors. It is intended to provide in a standardized fashion, a set of notions for information sharing, reporting and other managerial responsibilities. The principal linguistic vector for this training is a limited matrix of American-English intended to assure that the role-conduct of trainees fits rather seamless into the field of world-wide business activity.

While reasonably skilled in use of work-place English before their MBA-like training, the participants in this study were embedded in a decidedly Indian, national and industrial culture. Given that the IML-formatting deploys a foreign Western perspective, we focused on its performative dimension. We attempted to establish how—if at all, this MBA-like training affected their professional identity construction and social- relational dimensions of managerial practices, as Indian Managers in a Globalized economy.

Guided by a grounded-theory perspective, the research in India involving five cycles of iterative fieldwork, capped by a set of Delphi validation meetings with small groups of respondents. Using an institutional-conceptual frame drawn in part from Bourdieu, we establish the potency of IML training for increasing the symbolic-power of former trainees, as they selectively use the IML-argot in the dynamic relations with colleagues, superiors and external consultants.

El Cuerpo Resignificado: Miradas a Través Del Tiempo

La ponencia es el resultado de un proyecto de investigación en el que, a través de una metodología de museología social, se realizó un trabajo de memoria y resignificación de imágenes fotográficas en el año 2018 con comunidades indígenas del Putumayo (Colombia). Las fotografías fueron tomadas por los misioneros capuchinos a las comunidades indígenas Inga y Kamëntsá del Valle del Sibundoy (Putumayo), durante su misión evangelizadora a comienzos del siglo XX. Las fotografías se obtuvieron principalmente del archivo de la diócesis Mocoa-Sibundoy en el marco de un proyecto más amplio sobre imágenes e impresos de distinta índole que se desarrolló en 9 ciudades del país. Buena parte del trabajo fotográfico de los misioneros era mostrar el éxito de la misión y, en consecuencia, estas fueron incluidas en los informes e impresas como postales que enviaban a las prefecturas y luego circulaban ampliamente. Metodológicamente se parte del análisis iconológico e iconográfico para identificar los aspectos semióticos de la imagen y, de la muldimensionalidad experiencial, que vincula la imagen con sus observadores y la resignifica. Desde esta doble perspectiva metodológica se presentan dos reflexiones a la luz la perspectiva de la sociología del cuerpo y las emociones: una sobre el papel de las misiones capuchinas en el disciplinamiento de los cuerpos y la transformación de las emociones a través del ritual religioso, la escuela, la casa y los oficios manuales a comienzos del siglo XX y, otra, sobre la mirada que actualmente tienen los grupos étnicos fotografiados, de dichas imágenes en un ejercicio de memoria y resignificación de las mismas, haciendo un especial énfasis en la lectura crítica de la modernidad y un énfasis en lo cotidiano, como lo explica Dube, en tanto constituye un escenario significativo diferente.

Lessons to Improve Governance and Quality to Reduce Social Inequality in Colombian Public Universities

The public universities of the Colombian Caribbean are paralyzed by the internal and external strife of conflicting stakeholder demands within the post-conflict era. Institutions face the challenge of navigating and defining future demands, expectations, and directions to achieve excellence, in alignment with the concept of the "high quality university" within the Colombian Institutional Accreditation model set forth by the Colombian Ministry of Education. These mounting tensions create a perceived showing of "weakness" and "lack of competence" to mobilize different partners and enact a shared vision of public higher education – a focus in global media at the conclusion of the 60-year civil. As a result, public Colombian universities seem to be unable to fully exercise their institutional autonomy and effectively contribute to this mission of high-quality academic opportunities leading to social mobility and economic independence for their local communities. These poor results can be observed in terms of weaker academic quality, restricted access for low-income populations, and low effectiveness and efficiency on persistence and graduation rates. Considering Burton Clark's (2000) concept of the steering core and its necessary influence on the institutional governance, a comparative case study of four public Colombian Caribbean universities (*Universidad de Cartagena, Universidad de Córdoba, Universidad de La Guajira* and *Universidad del Atlántico)* was led during the years 2015 to 2017 in order to identify how their governance, motivations and beliefs influence the institutional outcomes. This paper presents the initial results of this comparative case studies of the four universities as they strive to achieve a culture of "high quality" and fulfill their mission. Yin's (2003) socio-critical qualitative research method was used for the purpose stated, using data from semi-structured in-depth interviews with 40 participants members of Governing Boards, participant observations, document analysis including media records, institutional documents, and institutional statistics .

Syrian Newcomers in Brazil: The Challenges for Finding a Job and Setting up a Business

In 2013, Brazil was one of the few countries that accepted the legal entry of Syrian newcomers. Until 2017, around 2,900 Syrians came to Brazil with a humanitarian visa. Once they claimed refugee status in Brazil, they received a work permit and were able to open a bank account and access the education and healthcare system. However, the government did not provide them with language classes or technical/training courses. Consequently, these services were provided by NGOs and faith-based organizations. This paper addresses the centrality of work for Syrian newcomers in Brazil. Thus, I analyze the challenges they face to find a job or set up a business. Qualitative methods are adopted, consisting of interviews with Syrian newcomers, resettlement professionals and the Syrian-Lebanese community members. The analysis is based on an extensive literature review: the history of the Syrian-Lebanese community in Brazil, "transnationalism", "resettlement", and "ethnic entrepreneurship". The results show that learning Portuguese, recog-

nizing their diplomas, finding a job and setting up a business are the biggest challenges they face. Few Syrians are working in jobs related to their former jobs in Syria. Moreover, the majority of them are self-employed, which frequently equals precarious work. On the one hand, the results show that Syrians are willing to work hard in order to make their living, because they do not like to live on charity. On the other hand, few Syrians are thriving in the job market. As a result, most of our interviewees are uncertain about their future in Brazil. In summary, I suggest that finding a job is very important for their dignity and to make future plans in Brazil.

MARTÍNEZ-ARIÑO, JULIA* (University of Groningen, Netherlands)

"No One Asked Me If I Wanted to be Baptized!": Young Adult Apostates in Spain and Argentina

Most young adults in Argentina and Spain don't have the same experience with the Catholic Church as the generation of their parents. The younger generations were born in a period of democracy and at a moment when the Church's public role was not as strongly dominant as in the case of previous generations. Many of these young adults did not even have an actual religious upbringing beyond receiving sacraments at a young age. However, despite this social distance from the institution, some of them feel the urge to leave the church formally. Apostasy ¾as the formal process of leaving the Catholic Church is called¾ has gained some resonance in the two countries in the last ten to years, despite it being a rather minority phenomenon. Like in other contexts in Europe, the approach of large proportions of the youth towards historical churches is one of indifference rather than opposition. Understanding what drives these young adult apostates to formalize this rupture enables a better understanding of the configuration of non-religious subjectivities in majority-Catholic countries. Who are these militant "nones" and why do they care so much about their "imposed" membership to the Catholic Church despite already being so distant from it? Which motivations do they refer to when narrating their apostasy? And how do they configure their identity as apostates within their most immediate social milieu? Drawing on narrative interviews conducted with apostates in Argentina and Spain, this presentation will address these and other questions.

MARTÍNEZ-DOMÍNGUEZ, NÉSTOR DANIEL* (Universidad Autónoma del Estado de México, Mexico)

Inscription and Circulation of Medical Knowledge in Mexico: Analysis of Technoepystemic Practices of Mexican Journals.

The objective of this doctoral research is to identify the technical and epistemic practices of the actors that participate in the communication process in medical journals published in Mexico.

Based on the theoretical premises of the sociology of scientific knowledge and the sociology of technology, and a sample of 29 medical journals, the methodological route of this research is two phases: 1) analysis of editorial and content policies, and ; 2) interviews with actors immersed in the communication process (editors, authors, designers, technicians,) that allow identifying the relevant social groups that interact with the journals, their interpretive flexibility, and the translation mechanisms that they allow to build the network of medical publications in the field.

As preliminary results of this research, dependency relationships have been found between the editorial teams / scientific committees and external agents that are not part of the academic communities (workers unions, editorial offices, financing agencies, technical teams) who make decisions about publications and they influence -in a multidimensional way- the mechanisms of publication and the thematic lines of diffusion of the journals. Similarly, it is observed that the technological trends of the scientific publishing processes (editorial managers), for the mexican case, have been absorbed in an uncritical and problematic way, generating new forms of social division of labor and cognitive interdependence among multiple actors. Situation that leads us to argue that the edition of medical knowledge is a heterogeneous process located in trans-epistemic arenas, which are articulated through networks of human and non-human actors, which are connected through different translation mechanisms for the dissemination of medical knowledge in Mexico.

Manufacturing Charisma in the Digital Age: Pope Francis' Leadership on Instagram

In recent years, global religious leadership has been intensified through institutional and media efforts. From the Dalai Lama to Ali Khamenei, social media has become a pivotal platform, enabling various religious groups and leaders a social sphere to compete for religious primacy. This study aims to unveil the strategic media action that religious institutions deploy to fortify charismatic appeal of a leader and expand outreach. Focusing on Pope Francis' Instagram account, the study inquires, how is online religious authority constructed, re-affirmed and implemented by religious organizations? To uncover the nature of online religious charisma we developed an unobtrusive research design that analyzed the full Instagram production of Pope Francis' official account (429 images). Through the prism of construal theory, our findings identified the Catholic church's strategic management of social, spatial, affective and hypothetical distance. Hence, we suggest introducing the term of image-mediated-charisma, and its theoretical framing through digital distance. Concepts that are acutely observed in the religious media realm, and may be useful as an addition to the theoretical toolkit of the sociology of religion as well as meaningful additions to political sociology and the study of cultural leaders.

MARTINI, MICHELE* (, Brazil)

Topological and Networked Visibility: Politics of Seeing in the Digital Age

Today, the convergence of video-based Internet Communication Technologies (ICTs) is challenging centralized control over cultural topologies. Accordingly, this paper proposes a theoretical prism for the analysis of the sociopolitical impact of online audio-visual communication. More precisely, this study discusses how topological visibility (i.e. culture-based, highly centralized and spatially organized visibility structures) and networked visibility (i.e. occurrence-based, decentralized and network organized visibility structures) interact in today's digital landscape. To this aim, four examples divided into two clusters will be discussed. The first cluster (i.e. Occupy Movement and BlackBerry Riots) will describe the functioning of topological visibility, while the second cluster (i.e. NO DAPL drone activism and Aleppo residents' live-streaming) will illustrate how technology-enhanced mediability may create networked spaces of appearance. The paper concludes by arguing that networked visibility does not neutralize the relational nature of the human gaze but rather forces and expands the culturally-defined boundaries of its legitimate social existence.

MARTINS, ARMANDO* (IE, Brazil)

An Institutional History of the Fall and Rise of in(egalitarian) Democracy: The Case of Argentina (1913-1999)

In general, the literature on democratization and inequality emphasizes the idea that the adoption of a democratic regime brings voters who are below the national income average the incentive to voting for redistribution of income in their favor. However, it is worth mentioning that such an approach is usually based on events in developed countries, such as the United Kingdom, Sweden, France, and Germany. On average, these countries present particular models for moving through regimes of absolutist states and constitutional monarchies until, through popular pressure, they undergo a long and almost continuous process of democratization and an increase in the scope of the right to vote (Linz, 1990). This work analyzes the egalitarian aspect of democracy in the context of Latin American history (especially Argentina), given the political and institutional peculiarities of the region (clientelism, caudillo, slavery, and others). Argentina has undergone alternation between typically Latin American autocratic and democratic regimes (caudillismo, military regimes, populist and liberal democracies) and enjoys long-run database. The methodology to be adopted by the study follows a multi-method approach through quantitative (ARDL and Granger-causality) and qualitative (process tracing) methods, as described by Mahoney and Goertz (2006). The results of the estimates indicate a long-term relationship between the democratization process in Argentina and the increase in income inequality. However, there is also an increase in the share of income distributed to workers. Qualitative historical work suggests that this relationship is due to the dispersion of wages caused by economic shocks and redistribution of income to the middle class for electoral purposes.

MARTINS, CRISTIANA* (Universidade Federal de São Paulo, Brazil)

Images of Contemporary Society: The Narratives of Instagram's Interface.

As part of the social relations in the cyberspace, the imagens produced and shared by individuals on their social media are an important part of the narratives about everyday life built nowadays. However, once the users post them on their social media, such imagens – fotos, vídeos, figures and others - are no longer just unitary representations which contains a totality in themselves, they become fragments of another image: the platform's interface. The platform's interface, by constituting itself as a post image, in the senses that Philippe Dubois attributes to the term, constructs representations that arise from the arrangement of other images in its layout – the dispositions, movements, storage and exposure time of those images on the platform's interface are all aspects that constitues not only this new image but also new narratives that emerge from it. This work aims, therefore, to explore this new image that is formed in the platform's interface to find, in this surperficial manifestation, an access to fundamentals contents of contemporary society (Siegfried Kracauer). Thus, the interface of Instagram, a social media directed to the sharing of images and that has become one of the largest social networks of today, will be the analyse to investigate the narratives and represantations it builds. Standing from a sociological perspective, in which imagens are understood as representations of social reality, the work will conduct an analyse of the image generated by Instagram's interface considering it in its intern aspects.

MARTINS ALBUQUERQUE, PAULO HENRIQUE* (Federal University of Pernambuco, Brazil)

Critical Theory of Coloniality and Internal Colonialism

The importance of refounding and unifying the theoretical debate on coloniality in the current world context is justified by the urgency of clarifying the new types of colonization that neoliberal capitalism is promoting by expanding the culture of consumerism and controlling the available material and symbolic resources. The development of the postcolonial debate in Latin America suggests that a Critical Theory of Coloniality is being formulated worldwide, articulating critical theory in the North and the various emerging sociologies in the South. The debate on internal colonialism is a way of analysis of this approximation of the geopolitics of knowledge by highlighting the complexity of interethnic, national and class conflicts in the dynamics of colonial power. The debate on internal colonialism may be the necessary connection to unite the many existing approaches to postcolonialism, including those on imperialism, dependence, and decoloniality.

MARTINS ALBUQUERQUE, PAULO HENRIQUE* (Federal University of Pernambuco, Brazil)

Gift As a Feeling and Practice: The Challenges of Loving Action

Sociological studies on gift necessarily have to consider its relational character, valuing the complexity of emotional, moral, aesthetic and cognitive motifs present in various human rationalities. This implies always valuing the presence of two or more protagonists of a symbolic, emotional and sentimental plot in the origins of the social pact that generates the imaginary institution of society. The possibility that individuals experience an aesthetic emotion in daily life depends directly on their ability to address each other to exchange and share pain and joy. These are the roots of the loving gift. But getting out of your mind is not always free. Gifts in circulation are both free and compulsory. Every action however free generates mutual expectations and obligations (please! Thank you! You're welcome! It was a pleasure!). Even in the case of loving action based on spontaneous exchange, the parties involved do not necessarily have expectations regarding retribution. The giver has an obligation to himself, to self-care. It is at least an obligation of self-gratitude with regard to his own generosity in the uncertain expectation of founding a bond of closeness.

Conflictos Urbanos En América Latina a Partir De Montevideo (Uruguay) y Porto Alegre (Brasil)

Los conflictos son inherentes a cualquier sistema social, dadas las contradicciones que necesariamente conforman estos últimos; funcionan como imperativos estructurales y como motor de cambio y refieren a una forma de concebir la realidad, su funcionamiento y consecuentemente a una pauta de cómo abordarla para transformarla (Zemelman, 2004). A su vez, el territorio está constituido por varios componentes y comprenderlo implica abordar y analizar las relaciones entre estos y las múltiples situaciones de sus actores, considerando sus estrategias. El presente trabajo apunta a visualizar los conflictos urbanos, territoriales y por vivienda, para pensar nuestras ciudades latinoamericanas desde una perspectiva amplia de derecho a la ciudad, en el espacio abierto por el recorrido del concepto, que lleva desde su enunciación fundamental (Lefebvre, 1969) a su visualización privilegiada en los movimientos de protesta y los conflictos territoriales (Harvey 2013). Han surgido además varios debates en los últimos años acerca de cómo pensar una ciudadanía insurgente (Holston, 2013) o el planeamiento conflictual (Vainer, 2016). Por otro lado, es importante visualizar el contexto nacional e internacional y la influencia del Estado y de los agentes privados, situados, aterrizados, en la ciudad. Es que es en el espacio donde los conflictos sociales generan territorialidades de dominación y de resistencia, y sólo los estudios comparativos permitirán comprender la influencia del contexto y los agentes. En Uruguay se abordará centralmente el desarrollo de un "Observatorio de conflictos territoriales" interdisciplinario, que ya presenta evidencia de los últimos años, y se presentarán también varios estudios de caso (residuos, personas trans, el conflicto del Dique Mauá, varios conflictos ambientales y otros). En Porto Alegre se abordará el caso del 4 Districto, en especial del barrio Floresta, a partir de la mirada de los actores, entre ellos los movimientos sociales de lucha por la vivienda.

Social and Environmental Demands through the Art of Transarchitecture Project–Deterritorializing and Building Networks

Adriana Varella's way of thinking, making, and presenting art is situated in a position of resistance to hierarchical social structures, especially about the bipartite division of genders, women's oppression, and the marginality and violence to which the LGBTQIA+ community is subjected. It also encompasses other social problems such as class issues, racism, and the forest people's extinction, as is a great part of the Brazilian indigenous population. All those fronts of struggle, consequences of colonialism, and the neoliberal logic, its updated manifestation, are recognized by the artist and assembled in their intersectional way of producing art by building networks and connections between different social demands. Adriana Varella's production is located in the intersectional view of capitalist oppression and also in an optimistic perspective of establishing links between the multiple networks of social demands that pursue a place of horizontality. For Varella, architecture is an ideological, social space built in accordance with the status quo of conservative white-cis-hetero-patriarchal capitalism that must be confronted. This communication intends to discuss the project "Transarquitecture" (2019-2022), which breaks with the instituted architecture aiming at deterritorializing. Transarchitecture is a dispositif composed by the construction of three central interconnected elements: two prototypes of monitoring centers, one located in an Awaete village in the Amazon rainforest (Pará) and one in a Guarani-Kaiowá village in Dourados (Mato Grosso do Sul); a community healing and reforestation center in the Guarani-Kaiowá village, and a New York city extension that will act as a direct mode of communication from indigenous communities to people and communities beyond Brazil's borders throughout media and art.

MASLAUSKAITE, AUSRA* (Vytautas Magnus University, Lithuania)

Cohabitation and Transition to Marriage in Lithuania and Belarus: An Analysis of First-Partnership Formation Among the 1970-1984 Birth Cohorts

Demographic literature extensively scrutinized the family formation changes, which proliferated or accelerated after the 1990 in Central and Easter Europe. Research focused on different aspects of this change: timing, factors, impact of cultural and socio-legal discourses. Majority of the evidence comes from the *Gen-*

erations and Gender Survey conducted in the middle of 2000s. However, after the GGS there were no datasets collected, which would record the further developments of the family formation changes in majority of the countries of CEE.

In this paper, we examine the family formation trends of the birth cohorts 1970-1984 in two neighboring countries – Lithuania and Belarus. We focus on two family transitions: from being single to cohabitation or marriage and from cohabitation to marriage. We apply the event history modeling techniques in order to identify the demographic and socio-economic factors, which have impact on these transitions.

Our paper is on based pooled dataset, which integrates Families and Inequalities Survey (FIS), Lithuania, and Generations and Gender Survey, Belarus (2017). The FIS is representative survey conducted in 2019, with the sample size of 3000 respondents of 1970-1984 birth cohorts. The survey recorded wide range of issues linked with families and inequalities, but also include partnership and fertility histories.

The countries represent two extremely different contexts, which emerged after the 1990 after the dissolution of the USSSR. Lithuania stepped on the path of market capitalism and liberal democracy, joined the EU and Belarus represents the planned economy and authoritarian regime. Our analysis provides the opportunity to scrutinize the macro level contextual effects, such as growing inequalities, limited access to the housing, on the family formation in Central and Eastern Europe.

RC02-26.2

MASLAUSKAITE, AUSRA* (Vytautas Magnus University, Lithuania)

Stalled Gender Revolution: Re-Traditionalization of Child-Care in Central and Eastern European Families

Growing or high level of female employment raises an expectation that gender asymmetry in parenting should decrease over time. Some scholars suggest that the prevalence of dual earner family in the contemporary society will transform the gender relations in the public, but also in the private sphere. Consequently, societies will or are already moving towards a new "gender equilibrium" (Esping-Andersen 2009; Esping-Andersen, Billari, 2015) or are experiencing the "second half of the gender revolution" (Goldscheider, Bernhardt, Lappegård 2015). A substantial characteristic of this new gender regime is more active involvement of men in the childcare and housework activities.

Against this backdrop, the paper examines the child care practices in families in Central and Eastern Europe (CEE) and identifies the set of factors (individual, family and broader societal level) determining childcare divisions. We hypothesize that over the past three decades some CEE countries experienced growing inequalities in gender division of childcare in the families. Moreover, our results show that gendered childcare practices could be explained by economic dependency model and by the structural gender inequalities in the labor market.

The paper is based on the cross-sectional longitudinal dataset composed from Family and Fertility Survey (1994), Generations and Gender Survey (2006), and Families and Inequalities (2018) datasets, which record the self-reported child-care divisions and provide very detailed indicators of family processes. We focus on several CEE countries, i.e. Lithuania, Belarus, Poland and Hungary. The window of observation encompasses more than two decades and we try to reveal the period effects while observing different cohorts at the particular family life stage.

Contrary to the theoretical expectations, our initial empirical analysis proved an increase in the gender gap in childcare on all components of parenting with the exception of the narrowing of the gap in the child play activities.

Biographical Research in Times of Emergency: Possibilities, Challenges and Constraints of Field Research. a Discussion

This presentation is aimed at engaging in a dialogue and critical discussion with the speakers participating in the panel, on the basis of the biographical research experiences in times of pandemic presented. In particular, it is devoted to address the adaptations and constraints emerged during biographical research practices, the innovations adopted in order to maintain and/or reshape the constitutive frame of this type of research method - profoundly anchored to a co-presence between the researcher and the research participants - and the opportunities and challenges, also from an ethical perspective, which might arise from the need to reconsider alaready consolidated research practices and assumprions.

MASSARI, MONICA* (University of Milan, Italy)

The Violence of the Words and the Right to Opacity: Doing Biographical Research with Refugees

This contribution deals with the feelings of discomfort and disorientation that researchers doing biographical research with refugees often experience during the interview. These feelings are mostly related not only to the *topics* addressed during the interview, but also to the different *power position* of the people involved in the interview setting, the *conditions* in which the narration takes place and, most crucially, the unexpected *goals* that it may achieve in terms of fostering a new *politics of voice* within the current migration regime.

Narratives that refugees and asylum seekers sometimes hardly try to develop – with words but also with long silences – cannot be separated from the trauma that they experienced during their migration process as well as the need to survive and struggle against physical and psychological effects of the abuses and humiliation suffered. While in the public sphere refugees' accounts are usually entrapped within the logics of institutionalization and/or medicalization where people are encouraged to provide stereotyped narratives which more effectively fit the requirements for obtaining recognition for their status, biographical interviews may offer the opportunity to disclose subtler dimensions where room is provided for a politics of voice sensitive not only to the possibility to speak, but also to the choice to remain silent and/or not being fully transparent to the interlocutor. Reference is made, in this regard, to "the right to opacity", i.e. the right not to be fully understood, and, at the same time, the right not to completely understand the other. The adoption of this approach, however, if, at one side, enhances a more profound recognition of migrants' experiences and struggle for surviving - thus allowing a counter-narrative about contemporary migration – at the other, puts the researcher fully inside the picture, given the profound relational and emotional dimensions of these encounters.

MASSIDDA, LUCA* (Tuscia University, Italy)

Digital Media and New Political Leadership in Italy: Matteo Salvini, Phenomenology of a Super-Populist.

In the last two years, Italian political scene has been dominated – not only from a communicative point of view – by Matteo Salvini, young leader of the populist and sovereign party *League*. Two factors help to explain his extraordinary political success, certified by the last political elections (March 2018; May 2019): firstly, Salvini perfectly embodies the spirit of contemporary politics with his sovereign, ethnocentric, anti-elitist and xenophobic populism. Secondly, he dominates our hybrid media system, showing an extraordinary ability to empathize with social network's logic. The paper will focus specifically on this aspect. Salvini's ability to mimic the mainstream uses of the medium is the key to his success. In the adopted formats, in the preferred aesthetic solutions, in the language used, Salvini seeks maximum proximity with his audience. This lack of distance does not dissolve his "superhuman" aura. On the contrary, wearing this pop-mask Salvini can lead his heroic mission: to represent the genuine will of the people against the privileged interests of traditional political elites. This paper aims to reconstruct the profile of Salvini's political leadership and to deepen, observing the characteristics of his communication, the relationships that today link the rise of populism and the pervasive diffusion of social media.

The analysis is conducted by using original data collected by Tuscia University's political research group during the 2018 Italian Election and the 2019 European Election. Both surveys have been carried out within the framework of national research projects (PRIN) funded in Italy by the Minister of Education, University and Research: *Personalization, institutionalization and deinstitutionalization: the new dynamics of power in the post-democratic society* (2015-2018); *The Transformations of Democracy: Actors, Strategies and Outcomes in Opposing Populism in Political, Juridical and Social Arenas* (2017-2020). In both projects, the UNITUS research unit was directed by professor Flaminia Saccà.

MASSIMO, FRANCESCO* (Sciences Po Paris, CNRS, France)

A Struggle for Bodies and Souls. Amazon Management and Union Strategies in the Workplace. Considerations on the French and Italian Case.

Starting from ethnographic inquiry and participant observation within two Amazon warehouses in France and Italy, this chapters shows the strategies through which Amazon management secures the governance of these larges service-sector factories building an hegemonic corporate regime, namely: (1) ensuring workers commitment and acquiescence, (2) hindering workforce unionizing and (3) escape, or at least take advantage of loopholes in institutional constraints such as legally binding labor regulation on wage work. Ideally, this is sought through the combination of rigid technical division of labor, constant supervision and sympathetic management. Actually, this equilibrium is hardly found. Workers bodies and souls continuously escape from management control. However, if, along its development, the firm organization finds its limits in the mobilization of the workforce, the same is true for trade unions. On the one hand unions are able to express and translate into the field of collective bargaining some the antagonism within the labor process (and the scope of union action is linked to the institutional environment, that is national systems of employment relations); on the other hand, through their action, they end up isolated from the workers and entrenched in institutional arenas, in which the company is smart enough to neu-

369

Understanding Power Positions in a New Digital Landscape: Perceptions of Syrian Refugees and Border Experts on Relocation Algorithm

Several datafied solutions are in use for governing the forced migration in Europe. However, datafied solutions like migration governance algorithms are not just operating as computational artefacts, but also as devices, which could help us to rethink the premises about agency, transparency, power and normativity. Our study explores the differences and similarities between the perceptions of data experts and refugees as data subjects, in the context of a refugee relocation algorithm, which is used for assuring the economic integration of refugees. The study conducted in-depth interviews with data experts and Syrian refugees in Estonia and Turkey. The results indicate that both refugees and data experts acknowledge the algorithms' potential power for structuring the everyday life experiences of people. Whereas refugees mainly focused on cultural and social concerns, the data experts underlined the importance of refugees' agency and the potential drawbacks of algorithms in terms of transparency and accountability. While both groups of interviewees thought the relocation algorithm could be useful especially in terms of economic outcomes, the study demonstrates that algorithms create complex power relations and place extra pressure on both refugees and data experts. The new digital landscapes produced by algorithms entail a 'triple agency' – an agency of experts developing and using these datafied solutions, an agency of data subjects being targets of those calculations, and an agency of algorithms. It is necessary to consider this triple agency to find solutions to the selectivity principle prevailing in datafied solutions. For solving the issue of 'false authority', where the modelling of spatial choice cannot grasp the socio-cultural reality, it is necessary to consider the socio-cultural context of the calculative devices. A paradigm shift in machine learning is necessary from learning machines as autonomous subjects to machines learning from social contexts and individuals' experiences.

Attitudes Towards Indebtedness in Southern European Countries

The aim of this paper is to analyse the socio-demographic determinants of household indebtedness in Southern European countries in order to examine how these factors form different patterns of indebtedness. This analysis is conducted within the context of an increasing process of financialization in which housing finance is an integral part of macroeconomic policy (see Van der Zwan, 2014).

We will begin by identifying different models of household indebtedness in southern Europe and then determining the individual variables that best explain those differences and variations in household debt levels. These processes are examined by using the Household Finance and Consumption Survey (HFCS), a new dataset drawn up by the European Central Bank (ECB) and conducted in 15 euro area countries between 2009 and 2011. The methodological plan consists of a combination of a multiple correspondence analyses in order to identify the various household debt models and a logistic regression analysis in order to detect the explanatory variables that best explain the differences between the indebtedness models. The main contribution of this paper is the identification of institutional arrangements that explain the economic differences in household debt levels.

MAST, JASON* (Goethe-University Frankfurt, Germany)

Normative Orders in Crisis: The Populisms of Brexit, Trumpism, and the Afd

Recently, western democracies have been wracked by unanticipated swells of populism, ethno-nationalism, and isolationism, all of which greatly unsettled the neoliberal, globalist, and multicultural trajectories many assumed were durable and determined. The shock produced by events like Brexit in the UK, Trump's victory in the US, and AfD's rise in Germany, indicate that taken for granted cultural assumptions are being not only called into question but upended. I interpret these developments theoretically as representing severe challenges to the foundational cultural elements that *control, anchor, and organize* western democratic social orders. In this research project, I am examining the scope and intensity of these challenges. My research sites: 1). Two of the most prominent features of the pro-Brexit "Leave" campaign were its racial and xenophobic discourse, and

its nostalgia-fueled calls for the restoration of "the people's" sovereignty. Combined, these features indicate that the Brexit vote represented a robust reactionary movement aimed at dismantling the UK's multicultural model of citizenship and at re-inscribing a stricter form of national sovereignty. 2). In 2016, American voters elected a candidate who campaigned on the themes of putting "America First," on withdrawing the country from international commitments, on building legal and physical barriers to greatly restrict immigration, on surveilling minority religious communities, and on removing foreign nationals from American soil. Throughout his campaign (and presidency), Trump has radically destabilized culture structures that have functioned as the established boundaries of legitimate political and civil discourse in the US. 3). My third empirical site is Germany's federal elections of September 2017, which offers a strategic case for comparative analysis. Examining and explaining the scope and intensity of these challenges requires conceptual and methodological innovation; in my analysis, I use the interpretive method *structural hermeneutics*, and I am incorporating emerging techniques (*computational hermeneutics*) and new types of ("big") data.

MATA ZUNIGA, LUIS* (Universidad Nacional Autónoma de México, Mexico)

Aspiraciones y Estrategias De Incorporación Al Mercado De Trabajo En Jóvenes. Heterogeneidad y Desigualdades.

Una de las problemáticas que cruza la vida de muchos jóvenes en México y América Latina tiene que ver con la incertidumbre que se construye en torno a los procesos de transición a la vida adulta, particularmente con la incorporación al ámbito laboral. Desde hace décadas, México ha experimentado un deterioro sostenido en las condiciones de vida de un amplio sector de la población, coincidente con varios momentos de crisis económica, política y social que han marcado la vida de las generaciones más jóvenes. Realidad que, en buena medida, ha sido compartida por buena parte de los jóvenes en otras latitudes. Este escenario se ha traducido en una crisis del diseño institucional para los procesos de recambio y movilidad social, constituyendo en la práctica una experiencia generacional marcada por la precariedad y diversas desigualdades.

Dicha experiencia pudiera estar minando la capacidad de algunos sectores jóvenes para aspirar, e imaginar su participación como ciudadanos plenos de su sociedad, lo que se estaría reflejando en muchos otros aspectos de sus vidas, y multiplicando sus Estrategias de Reproducción Social (ERS), como parte de sus búsquedas por superar diferentes obstáculos.

Autores como Jorge Benedicto (2014) destacan que la devaluación del capital educativo para efecto de la inserción social se ha traducido en una experiencia vital que va más allá de la incorporación al mercado de trabajo, igualmente precaria, marcada por el desconcierto y la incertidumbre en torno al futuro, instalando nuevas maneras de ser y de actuar, que constituyen nuevas estrategias de supervivencia para hacer frente a la incertidumbre. En este sentido la experiencia generacional marcada por la precariedad estaría articulando procesos estructurales y subjetivos presentes en las ERS y en la capacidad de aspirar de los jóvenes.

MATALONI, BARBARA* (University of Vienna, Austria)

Young People's Possibilities to Maintain or Increase Their Action Space(s) in the Context of Changed School to Work Transitions

Young people, as labour market outsiders, are affected to a greater extent than other groups from difficult labour market conditions. Moreover, the resources to master school to work transitions, which often are individualized, prolonged and de-standardized, are not distributed equally among all young people. It, thus, becomes important to ask, what enables young people, especially in situations of vulnerability, to cope positively with the challenges they are confronted with in this life phase. Based on the first results of an ongoing dissertation project, the present contribution discusses young people's possibilities to maintain or increase their action space(s) through leisure life activities. In fact, leisure life activities can be a means for young people to think about themselves, construct interests, receive recognition from others or gain trust. They, thus, represent a suitable ground to bring about "'weak' forms of acting", which go beyond adaptation and which are potentially transforming (Soulet, 2004). Empirical basis is a mixed-methods longitudinal study, which follows the lives of young people in Vienna from the last year of 'New Secondary School' onwards (grade 8). The analysis will focus on the qualitative interviews and will be complemented with insights from the quantitative panel. The data is collected by the Department of Sociology of the University of Vienna in the context of the project 'Pathways to the Future'.

Modern Day Slavery: A Case of the Girl Child in Nigeria

A slave is a person who is treated like an object or property. The slave does not have the rights which ordinary people have. She belongs to someone and thus, is subject to that person who has the right to treat her anyhow. This study examine how the girl child is treated in selected communities in Anambra and Eboyi States of Nigeria and the effects of this treatment on the social wellbeing of the girl child. The objective of the study is to unveil the abnormal treatment given to the girl child and give suggestions on how to reduce such treatment. The study employed the mixed research method which involves the use of both quantitative and qualitative data collection technique. Data collected with the quantitative method was analyzed using frequency distribution tables and simple percentage and description while data collected through the qualitative method was transcribed and presented to support the quantitative data. The study found that the girl child in the selected communities do not have the rights which other children have. This affects their social and mental wellbeing. It also affects their opportunities to develop and make progress in life. Decisions on their wellbeing are taken on their behalf by father, mother, brother or uncle as the case may be. Based on the findings, the study suggests that there should be a re-orientation of the public on the value of the girl child and the dignity of human life. It also suggests that the girl child should be enlightened to know her rights through quality education.

MATIC, GORAN* (OCAD University, Canada)

The Systemic Design Model Relating Democracy, Environment, Inequalities and Intersectionality

This paper examines how the key conference themes might be related in a systemic design context from the perspectives of contemporary sociological theory – as emergent phenomena arising out of the confluences of *instrumental rationality* (Weber, 1905) that enable mechanisms of the late capitalism, and the influences of longer socio-historical arcs; such as the generative dynamics arising out of the dialectics between the *Romanticism* and the *Enlightenment*.

The paper further explores how the resultant tensions – including those between the embodied values and enacted world views – create unresolved dilemmas that give rise to post-modernity. The construct of *liquid modernity* (Bauman, 2000) is leveraged as a means of analyzing how the ever-complexifying environment of accelerated information availability, transaction-oriented economies and shifting social norms might be impacting our primary socio-cultural structures and edifices that were, until relatively recently, considered as quite 'solid'.

The resultant dynamics are considered through the lens of deconstructivism (Derrida, 1976) and the subsequent subaltern theories (Spivak, 2010), as means of exploring the morphologies of marginalization – posited as creating new forms of tension and temporal agency that are generating socio-topological spaces of reactionism. Such spaces are proposed to impact the concepts of 'self' as a performance (Goffman, 1978) while generating novel notions of 'identity' – in ways that are simultaneously both highly creative and yet reductionist in terms of their overall expressive dimensionality – through a new suggested theoretical mechanism.

Finally, the paper concludes with a visualization of the analyzed processes and their posited systemic impacts, influences and interdependencies – through proposing a socio-cybernetic model exposing the inherent radical constructivism of the considered phenomena, to help investigate temporalities with the *foresight* method of imagining possible futures (Curry & Hodgson, 2008); as means of exploring feasible approaches in the context of emergent sociological theory.

MATOS, CAROLINA* (City University of London, United Kingdom)

Gender, Health Communications and Online Activism in the Digital Age

Social, feminist movements and NGOs working for different causes have made wider use of communications and new technologies for advocacy, with the intention of influencing the political arena and shaping public policy. In the age of media saturation, research has shown that various NGOs face a series of challenges with their work on gender rights. These range from the growth of far-right movements and conservative resistance, including the expansion of the *Global Gag Rule* by the US government across the world, to cuts and pressures on public health services as well as the increasing climate of competition faced by organizations in their pursuit of more funds.

Sexual and reproductive health and rights (SRHR) matter both for gender equality as well as for democratic politics, whilst communications has potential for social change. *Gender, health communications and online activism in the digital age* seeks to advance research on the use of advocacy communications by a total of 52 feminist and health NGOs and networks located in both the North and the South, who work in Latin America and in large democracies such as India, but also in the US and Europe, including organisations from *Care International UK* to *CREA India* and *Anis*, Brazil. Core research questions are: How can communications be used for advocacy on SRHR? How are health and feminist NGOs making use of communication tools? and How do communication strategies reflect on daily activities, and what are the challenges that NGOs encounter for advocating around SRHR?

Funded by the GCRF, this research adopted a mixed methods approach. In depth interviews with CEOs from the organizations was combined with a questionnaire applied to the communication heads of these NGOs This was combined with content and discourse analysis (CDA) of the websites of the organizations, as well as their social media engagement.

MATOS ALMEIDA, MARLISE* (UNIVERSIDADE FEDERAL DE MINAS GERAIS, Brazil)

Gender Ideology, Anti-Gender Activism and Political Violence in Brazil

This paper analyzes the impacts of anti-gender activism (and also against anti-racist and anti-LGBT phobic struggles) within the Brazilian state and its impact in Brazilian democracy. Recent anti-gender activity transcends isolated and uncoordinated instances of resistance and instead operates within distinct and coordinated counter-movements to defeat feminist, anti-racist and LGBTQ+ policies. Anti-genderism and its adoption of gender ideology rhetoric in Brazil, associated with the diffusion of "Escola Sem Partido/School Without Party" bills is first and foremost an epistemological response to emancipatory claims about sex, gender, race and sexuality, and second, a political mechanism used to contain policy developments associated with feminist anti-racist and queer agendas. The advance of gender ideology on the different levels of the legislative branch in Brazil and the political violence against women and representatives of other political minorities are evidences and can be seen as a practical counterstrategy from new right movements in the country (a constellation of social actors, religious leaders, networks, and organizations of shared concern that make sustained contrary claims to an opposing social movement's objectives) that aims: 1) to refute claims concerning the hierarchical construction of the raced, gendered, and heterosexual order on the democratic advances in politics; 2) to (re)essentialize and delegitimize feminist, anti-racist and queer initiatives towards political institutionalized spaces, especially those related to Brazilian state; 3) to frustrate global and local gender mainstreaming, antiracist and ant LGBTQ+ policies efforts to transform politics and state in Brazil; 4) to thwart gender, anti-racist and LGBTQ+ equality politics and policies; and finally 5) to reaffirm white heteropatriarchal conceptions of sex, gender, race and sexuality in politics that are jeopardizing the very existence of democracy in Brazil.

"Will You Regret Raising Your Hand to Me"? Femicide, Rape and Domestic Violence in Latin America

The concern regarding violence against women is constant, to a greater or lesser degree, in various parts of the world. However, according to the 2018 United Nations report, the most dangerous regions for them to live in are in Latin America, considering the occurrence's amount of the crimes of femicide, rape and domestic violence. This scenario became a central theme in a research conducted by Centro de Estudos em Criminalidade e Segurança Pública, aiming to empirically understand the reality of violence against women in Latin America. Thus, sixteen Latin American countries were selected to rebuild the processing flow of these three crimes – femicide, rape and domestic violence – in the criminal justice system. In order to achieve this, a comparative analysis of the legislation of the countries researched about the aforementioned crimes was firstly performed. Then, the analysis focused on statistical data made available on the official websites of the Police, the Public Prosecutor's Ofiice and the Judiciary of the sixteen countries, in time series. From these data, the processing flow of crimes against women was reconstructed. The results obtained demonstrate a low standardization of Latin American's data, with no continuity of data regarding the three crimes analyzed in the selected instances. Besides, the diversity of legal treatment given to each of the crimes is perceived, ranging from the description of the criminal conduct

denotes a presenting author. Abstracts are organized by first presenting author's last name.

to the established penalty, as well as the high rate of violence against women. Moreover, the low degree of judgment, and subsequent conviction of the crimes, compared to the amount of occurrences that reach the Police, may indicate that despite the existence of laws on violence against women, their effectiveness has not proved to be efficacious in punishing those who violate them or in diminishing the incidence of violence against women.

Japanese Americans' Mobility to Japan as Return Migration: Students and Soldiers before and after World War II

This presentation examines Japanese Americans' back-and-forth mobility between the U.S. and Japan before and after World War II, and it explores whether mobility to Japan can be considered an example of the phenomenon of "return migration." Before World War II, many second-generation Japanese Americans stayed in Japan as students, while after the war, many remained as US soldiers of the occupation force and served in Japan as translators and interpreters. Various forms of mobility and their linkages will be examined by using individual life histories in books and newspaper articles.

Previous studies discussed return migration to Japan by depicting migrant workers of Japanese descendants, mainly from South America. Other literature followed other, broader forms of return migration, such as repatriation of second-generation Japanese from areas within the former Japanese Empire like Taiwan.

This study will contribute to research on return migration by discussing actors such as students and soldiers, who have not been the focus of previous research. In particular, this research will study whether the movements of soldiers should be considered return migration. Since soldiers can be assumed to have unquestionable loyalty to and belonging with the nation-state they serve, their dual identities or ethnic heritages can be easily overlooked. However, studying the experiences of Japanese American soldiers who served in the occupation force in Japan can help us understand the return migration phenomenon. Some of them had a strong desire to visit Japan to meet their families and relatives, while others had been students in Japan before their military service. These experiences shed light on Japanese Americans' ambivalent positionalities as nationals of the "victor country" and descendants of the "defeated country," even though this ambiguity has not been considered in Japanese American's memories, which mostly focus on their "American-ness."

Making Freelance Work Sustainable: Management and Mutual Assistance in a Japanese Animation Studio

Many animators work as freelancers in the Japanese animation industry. While they are given considerable discretion in their work, they also cope with low income and poor employment security. To address these issues, animators have formed a community of mutual assistance. In this presentation, I will elucidate how they are helping each other and protecting their livelihood as freelancers using a case study of a Tokyo animation studio called Studio X.

Studio X's animators are freelancers, yet they are expected to commute to the studio's worksite. Studio X has a manager who oversees the animators' progress and incoming work orders. Part of the team's income is commission-based and animators are expected to sign a long-term contract with Studio X, creating an atmosphere similar to a standard workstyle, where management holds power and makes that power known to staff.

The manager's presence appeared problematic, but she played an important role in supporting the animators. The manager collected information, such as an animator's job acquisition status and industry trends, and used it to refer animators towards desired jobs and stable income. In addition, when an animator was unable to meet a deadline due to sickness, the manager allocated that work to other animators with relatively free time, protecting the reputation of the ill animator.

In this way, we can see standard and non-standard work arrangements (Kalleberg 2000) operating at Studio X, a place where workers could enjoy greater benefits as freelancers. We argue that Studio X is a place where managers' and animators' "lay morality" (Sayer 2000), which stresses the importance of actor's fellow-feeling and interdependence for decent economic order, has been achieved. Considering Studio X, it is implied that studies on lay morality in workplaces are crucial, if we struggle to expanded non-standard work arrangements.

MATSUSHITA, KEITA* (Jissen Women's University, Japan)

"Community of Styles" Among Young Workers and Regional Migrants in Local Areas in Japan

This research explores the relationship between job precariousness and young people's everyday life in Japan. I mainly focus on work and life mix styles in local areas, such as workation (a phrase coined for working while on vacation) or work in residence, and nomad work based on ethnographic fieldwork in Kamiyama and Shirahama, Japan. Fieldwork includes depth interviews with young workers and regional migrants in Kamiyama, the center of work in residence, and Shirahama, an excellent place of workation in Japan.

The critical factor of work in residence and workation should be called "Community of Styles" among workers in coworking spaces. "Community of Styles" is applied not only among fashion bloggers but also among workers in coworking spaces. "Community of Styles" where workers or regional migrants share and enforce their nomadic work styles is regarded as contrasting with "Community of Practice" (Lave & Wenger 1991) in workplaces.

Pop-up community, such a "Community of Styles," reflects the desire of workation workers to avoid committing to a community permanently while also desiring a "sense of community" during their stay. This ephemeral value can also be said to reflect values that are important to digital nomads, namely mobility and freedom. From the viewpoint of actor-network theory, "Community of Styles," can be seen as a "hybrid collectif." "Hybrid collectif" includes not only goods to create cooperation or involvement, but also people such as digital nomads, workation workers and regional migrants, and immaterial aspects such as an insufficient explanation of lifestyle procedures and management systems (Callon & Law 1995).

We should focus on not only "Community of Practice" but also "Community of Styles" to reveal what happens when precarity is the "norm" among young people.

Ethnic Network for Aging and Care: Japanese Community in Germany

Düsseldorf is one of the cities which has a large scale of Japanese residents in Western Europe. Triggered by the offshore of Japanese companies, business expatriates have led to build an ethnic community. While most expatriates move back to their home country, some settled in the local community for their job or to maintain their family.

Relatively separated from new comers such as temporary expatriates, students, or working holiday visa holders, settled elder migrants need to build/strengthen networks with Japanese residents, German neighbors and the local government to prepare for aging of their community. How do they manage this new task? Based on the history and activities of an elder community, this paper shows the motives to build networks and the strategies for mutual support of a small-scale ageing migrants.

RC30-371.7

MATSUTANI, MINORI* (Doshisha University, Japan)

Illusion of Mobility?: Reconstruction of Employment System and Career Path "in Abroad"

How did reconstruction of the employment system affect the career path of the youth and how they react? This paper examines the linkage/gap of the reconstructed regular and irregular employment system in Japan, based on the case studies of young Japanese once worked as "irregular employees" in Japanese companies in abroad.

The general employment system has been reconstructed drastically in Japan since 1990s. Transformation of domestic industrial structure and overseas transfer of companies to Asian countries accelerated mobilization of the employment system, consequently the young generation faced limited access to the stable posts under "traditional Japanese employment system" with lifetime employment and seniority-based wage systems. Now they need to manage their career path by themselves in the new employment practices.

Because of the changing employment system and expanding offshore of Japanese companies to Asian countries, some of the marginalized youth move there by themselves to acquire positions in these Japanese branches. Their position is different from the company specific expatriates and their working conditions are close to the ones of "irregular employees" in the Japanese domestic labor market. Why do they choose these positions and how do they build their career? This paper focuses on these workers' career path and their motives to examine the difference or linkage of regular and irregular employment in Japanese labor market. Three discussion topics are: 1)polarization in regular employment, 2)linkage between regular employment and irregular employment, and 3)employment practices and size of the firm.

MATTUELLA, LUCIANO* (APPOA (Associação Psicanalítica de Porto Alegre), Brazil)

Psychoanalysis, Cynicism and Necropolitics

The recent times have been of growing disappointment in Brazil. Reproducing contemporary far-right discourse, Bolsonaro follows the necropolitical primer - term proposed by Achille Mbembe - which has been applied in various parts of the world. This agenda is woven from a cynical grammar, a mode of relationship with language that excludes the place of enunciation and also all the interpretative capacity of the one to whom the discourse is addressed. From the metapsychological point of view, cynical discourse produces perplexity and reduces the subject to an object status - the gaze is captured by the absurdity of showing deadly enjoyment. In this context, we raise some questions: Is not cynical discourse one of the finest forms of the production of alienation and self-alienation? Could we think the cynical grammar as an actualization of a perverse relationship with castration on the "scene of the world"? In a situation where culture demands death, how to find discursive breaches for the production of a subject's place, how not to resign itself to the position of scopic object?

RC36-460.1

MATTUELLA, LUCIANO* (APPOA (Associação Psicanalítica de Porto Alegre), Brazil)

Self-Alienation and Necropolitics in the Contemporary Brazilian Context

Abstract: The recent times have been of growing disappointment in Brazil. A country that was announcing itself as a standard for the defense of human rights and the access of disadvantaged classes to quality education and health is facing the systematic dismantling of its democratic and humanitarian foundations by current President Jair Bolsonaro. Reproducing the contemporary far-right discourse, Bolsonaro follows the necropolitical agenda - term proposed by Achille Mbembe - which has been applied in various parts of the world. This agenda is woven from a cynical grammar, a mode of relationship with language that excludes the place of enunciation and also all the interpretative capacity of the one to whom the discourse is addressed. In this context, we raise some questions: Is not cynical discourse one of the finest forms of the production of alienation and self-alienation? If interpretation is concealed from the horizon of narrative, how can we think that one can assume the position of authorship of one's own story? In a situation in which culture demands death and the trimming of history, how to find discursive breaches for the production of a subjective place? One hypothesis: the recovery of this place of authorship could be through the dilution of cynical discourse through the rescue of the creative and polysemic power of language and narrative.

MAUERER, GERLINDE* (University of Applied Sciences, Vienna, Austria)

Precariousness and Gender at Work

In my research on parental leave and part-time work, I discovered inconsistencies in defining the parents' labour market situation as precarious. In parallel to existing gender inequalities, I saw that quantifying both parents' breadwinning income is not sufficient enough to giving insights into individual families' financial background. Having included bi-national couples as well as employees of global enterprises in my research, parents working in a transnational context and/or getting informal support within the family or in a globalized informal labour market (household & care workers, au-pairs), labelling my research as 'national' partly seemed to be inadequate. Last but not least, some interviewees in my qualitative sociological research on parental leave and part-time working in Austria (2013-2017), had received financial support from their families (e.g. heritage and/or freehold apartments). However, finding consistent parameters for evaluating both partners and/or a family's general income situation, and connecting the results with the qualitative outcome in a gender perspective, was methodologically challenging. Finally, a quantitative survey asking for both parents breadwinning income and further financial sources had been included, nevertheless, these individual estimations were again mainly based on both parents gainful income. In my conference contribution, I would like to reflect upon and discuss these pieces of a puzzle in gender, family and empirical research and raise further methodological questions in the session on intersectionality, gender at work, precariousness and globalization.

Showing Lifestories in Pictures – Negotiating Methodological and Ethical Questions Concerning Visual Biographies

Visual self-presentation is an object of research that is being examined primarily in combination with social media, which are increasingly based on the use of images. The research perspective is often dichotomous in a sense that analogue and digital practices or online and offline identities are compared. Questions regarding the authenticity of representation and risks of digitalization are usually focused on. Little attention is paid to the concrete picture content, as well as visual practices and their biographical embedding.

This presentation focuses on (ethical) questions and challenges that arise while researching analogue and digital pictures and visual/photographic practices. The exemplary data material was collected in the project VIS_BIO – Visual Biographies in a Networked Life World.

During the research process, participants continuously negotiate implicitly how much they show and reveal of themselves and others to the researcher and what they make visible for whom with which pictures.

But what happens when interviewees provide photos, such as nude photos of others or children's photos without hesitation? How should researchers deal with the situation when one is allowed to look at certain pictures, but not to store or publish them? And how does one handle pictures if the person showing it to you is blind and does not know the exact image content?

These questions are discussed based on textual and visual data that was generated through triangulation (biographical-narrative interviews, photo interviews, ethnographic observations). Following the principle of communication in interpretative social research, both the negotiation strategies of interviewees and the position of researchers in regard to the use of pictures as data at different times in the research process will be discussed.

MAYER, ELISABETH* (University of Vienna, Department of Sociology, Austria)

Visual Biographies in the Context of Social Media – How to Get Access to Various (visual) Biographies within a Lifetime.

The rapid development and use of new media such as Facebook, Instagram and WhatsApp in which image-based communication plays an important role, raises the question of how visual self-presentations are biographically embedded. Visual self-presentations have been well researched in combination with social media. However, research is centered on the concept of identity and the topic of authenticity of representation. It is common to discuss visual self-presentations along dichotomies that compare analogue and digital practices without considering their connection. Furthermore, little attention is paid to picture content and visual practices. A process-orientated research perspective is almost completely lacking.

The multi-method approach presented in this article, which is located in interpretative-reconstructive social research, can be considered as an answer to this problem. The combination and triangulation of biographical-narrative interviews, photographic interviews and ethnography shows how research on visual self-presentations and its biographical embedding can be done.

For researchers, dealing with visual biographies in combination with social media means being confronted with very different data material (biographical narratives, images, technological platform structures) and a large amount of data. Based on a case study from my PhD thesis, it will become clear that several biographical arenas emerge over the lifetime of biographers, which can only be reconstructed through the multi-method approach. If one wants to obtain a differentiated picture of visual self-presentations in social media, all biographical arenas that become relevant for the biographer have to be considered, even if they are not available in digital but in analogue form.

Along the individual research steps within a case - from establishing contact to presenting the results - I show how the construction of visual (analogue as well as digital) self-presentations and its biographical embedding becomes possible and visible.

How Do Primary Care Organizations Respond to Adolescents' Health and Social Care Needs? an Ethnographic Study

Health care organizations encounter constant change and restructuring toward more comprehensive and responsive care. The shift towards interprofessional team work in primary health care services is intended to address health inequities and improve population health outcomes. In Quebec, Family Medicine Groups (FMGs) have been implemented to play this role. However, there is little

evidence of the responsiveness of the interprofessional teams towards the needs of vulnerable populations such as adolescents, assessing how these accountable health care organizations adapt through their dynamic process of change to deliver interprofessional care to underserved population.

This ethnographic study aims to understand how FMGs and their interprofessional teams are currently addressing the pressing needs of adolescents and the extent to which FMGs could adapt to better meet the health and social service needs of young people.

Through 9-month field observations in a FMG, this research will gather data to in-depth examine the individual, organizational, social and institutional influences that hinder and facilitate the delivery of responsive health services in respect to the needs of the adolescent population.

With a focus on how responsive provision of health and social services for adolescents occurs within FMGs, this research will 1) provide a deeper understanding of how interprofessional collective actions account for the responsiveness of health services, 2) contribute to health services' responsiveness theory, proposing a conceptual framework on primary health care responsiveness process towards vulnerable population, 3) guide specific improvements in the delivery of comprehensive primary care to this underserved and vulnerable population. The findings will finally show how primary care adapt to policy and institutional changes, especially with increasing demands for greater collaboration to improve the health and social outcomes of adolescents.

Using Fuzzy Cognitive Mapping to Uncover Power Dynamics in Discourse-Related Policy

Fuzzy Cognitive Mapping (FCM) is mainly used in participatory research to represent causal relations of a phenomenon by giving voice to under represented people, especially in the development of policy. While several methods of analysis are highlighted to draw on the dynamic systems of knowledge of populations, this paper argues that FCM may be used to uncover the differences of discourses including the vulnerable populations in policy discussion, design and implementation. This research draws on health policy assessment for adolescent-responsive primary health care in Quebec.

As a strong method used in participatory research, FCM provides grounded systems frameworks. These are built to represent the understanding of a group of people on a specific topic. The method acknowledges and embraces the variety and diversity of voices as well as the relations between the concepts listed by the group itself ('fuzzy'). This allows researchers to take into account the dynamic construction of the problem at stake as well as the differences with the dominant discourse on which policies are based.

In discourse studies, while the dominant discourse are often the focus to capture how it shapes behaviours and how behaviours are shaping discourses in turn, this study departs from the dominated voices to recentre the fundamental imbalances and differences in the priorities of health policies yet labeled as 'patient/person/user-centred'.

Bridging the Gap: Communicating Environmental Research with the Public

This study explores the public awareness and interest in research findings on salient environmental topics. A survey was conducted using a convenience sampling (N=186) in the United States exploring the public's knowledge and awareness of environmental topics to include air and water quality, ocean pollution, climate change, deforestation, and topics in aggregate. It was conducted to understand the information seeking tendencies and communication preferences of the public for learning more about those issues. Each year, numerous organizations support research with millions of dollars, but the questions are how much of that research reaches the public and how influential is it? The survey yielded current information sources, consumption frequencies, and influence of that information to support interventions. The findings indicate a need for more deliberate communication with the public about the research, specifically relevance to them and interventions or actions they can take to actively contribute to mitigate negative effects on the environment found through environmental research. The implications of this research are that it may increase the influence and public support of environmental interventions and decrease the consequences of anthropogenic pressures on the environment.

"Squaring up": A Research-Based Film about an Older Adults' Social Dance Community

When research focuses on the emplaced and embodied character of experience, and the things and practices of everyday life, methods of visual research and visual presentation have much to offer. Film, which involves both sound and moving images, is particularly apt for conveying material complexity, emotion, and the immediacy of presence, and can reach broader audiences than academic writing. In this presentation I will introduce and show a 12-minute film that my co-researcher, Barbara Schneider, and I produced with a local filmmaker, Salima Stanley-Bhanji, based on our ethnographic research within an older adults' square dance community in Western Canada. The film is intended for general audiences and for practitioners with interests in aging, disability, and dance. It highlights the material and sonic environment of square dance (community halls, music, the caller's instructions); the particularities of dance clothing, including shoes and club badges; the social physicality of group dance; and the affective experience of taking part. Showing the film in this session offers the opportunity to talk about the embodied materiality of community-based dance in the lives of older adults, as well as what was involved in finding and working with a filmmaker to produce a film that conveys our research learning in accessible ways.

Alt-Right: An Experience Movement

The growth of populist movements and political actors over recent years has seen a return to previously abandoned theories of strain and frustration. Emerging expressions of Alt-Right culture and action are often assimilated to such broader populism. However, while themes such white supremacy and racism are shared, the experiential grammar of the alt-right is very different, in particular in relation to digital culture. This paper explores the emergence of the alt-right in 4Chan and its interpenetration and radicalisation ultimately leading to its increasingly close association with Neo-Nazi cultural movements. However rather than return to theories of 'strain' or 'frustration', we need analytical frameworks able to engage with the 'affective public' constituted by the Alt-Right. This is built around cultures and modes of embodiment based upon irony, parody, and satire; the collapse of trust associated with the rise of conspiracy theory; practices of fascination; and a particular form of 'freedom' based on freedom from experiencing the pain of the other. While this affective grammar is generated across a wide range of digital platforms, in particular through memes, it is increasingly associated with acts of extreme violence. It is urgent that we develop the conceptual tools to understand the alt-right as a new form of movement.

RC48-596.1

MCDONALD, KEVIN* (Middlesex University, United Kingdom)

Social Movements As Affective Publics: Digital Media in the Alt-Right and Jihadist Movements

Initial explorations of the role of digital media in social movements focused on structure and morphology, influenced by theories of network and spatial imaginaries that that played such an important role in early theories of globalization. At this time, social movements were approached theoretically within two overarching paradigms: identity or organization. The period since highlights the limits of both these theoretical paradigms, as digital media open up increasing scope for new forms of practice, sociality and collaboration. Social movements, built though organization, are increasingly giving way to new kinds of 'affective publics' where digital media are central to collaborative practices and embodied experience, where communication increasingly involves 'affective intensification' and resonance. While the discipline of organization studies has undergone a profound transformation in the past decade as it grapples with digital communications, the study of social movements still remains largely shaped by categories that were constructed before contemporary practices of action built around digital media. To move from theory to empirical cases, rather that theorise networks and structures, this paper examines the place of memes and visual communications in two collective actions where digital communications are central: the emerging Alt-right, and forms of violent extremism associated with jihadist movements.

Assumptions of Teaching and Learning in the First Education Policy Promulgated in Post-Apartheid South Africa

Systems of education and what they are able to produce and enable remain central to processes of democracy and inequality. Fundamental to systems of education are processes of teaching and learning. Unsurprisingly research and scholarship abound with regards to strategies and techniques in this regard. Yet even as scholarship abounds and more people across the globe are gaining access to learning opportunities, so too is inequality increasing. South Africa is an apposite case in point. Following the democratic transition, the intention to transform the educational system was articulated clearly in education policies. Indeed, access to education has expanded greatly, particularly for the most marginalised during the colonial and apartheid past. At the same time, inequality in this country remains unprecedented. In an attempt to understand why this might be so, this paper interrogates the assumptions of teaching and learning that the first education policy, The South African Qualifications Act of 1995, promulgated in the post-apartheid era drew on. These assumptions are teased out from South African parliamentary hansards of the debates which preceded its promulgation as well as the policy document itself. The findings demonstrate that while the intention to increase access to education was intended to transform racial segregation in the country, the economic reproduction that is inherent in education systems was not addressed in the policy. In short, the policy sought to transform who learns, but not what would be learnt (or taught) or how it would be learnt (or taught).

Anti-Blackness, Knowledge Production and Power: A Case Study of American Sociology

In this paper, we seek to explore and uncover power relations and hierarchy (particularly along the lines of race and blackness) within the academic field of American sociology by contextualizing it mechanically, examining its racial discourse and analyzing it in the context of Foucauldian power dynamics. We posit that due to American sociology's development in the context of American socio-political anti-blackness, the field creates a structural power imbalance (by Foucauldian standards) within the discipline--one that is, like American history, specifically anti-black. Thus Black American sociological thought has been systemically excludes from the mainstream discipline and continue to be unexamined lest they appear through an euro-centric and structurally colonial lens. In short, America's disdain for Black America doesn't stop just at the bodily, but permeates the intellectual realm as well--with the American sociological discipline standing as one of its most egregious examples.

The Profession of Teaching in the 21st Century: Collaborative Work in the Context of New Public Management

Throughout the world, there have been extensive governance reforms in the education sector. Choice, competition, privatisation and marketization are hallmarks of education sector governance reforms, reflecting diffusion of New Public Management with its emphasis on economy, efficiency and effectiveness (Evetts 2009, Fitzgerald 2008). The professionals who works in these public-sector organisations, such as teachers in schools, are impacted by these governance changes, facing work intensification, distrust in professionals, and diminished autonomy (Wilkins 2018).

This paper considers how these reforms in two settings, Australia and Sweden, countries bearing both similarities and differences conducive to systematic scholarly inquiry. Using the education sector as illustration, it considers how the human services professionals, such as teachers in schools, are impacted by these changes (Noordegraaf 2016). In particular, it considers the implications for teachers' collaborative work.

Empirically based on three large Australian and Swedish surveys of teachers' work, we examine how this competing policy logic generates challenges and possibilities for teachers to identify through collaboration, recent changes to opportunities for collaboration in the changing governance landscape, the effects of these, and the support strategies that can enable and sustain collaborative activity. Although the findings provide important differences in the manner in which forms of collaboration manifest in these education systems, we find that across

the systems an increasingly 'managerial' aspect has brought about an interface between 'competitive' and 'institutional' forces which is challenging occupational professionalism (Evetts 2009), skill formation and commitment within the teaching profession (Vangrieken et al. 2015).

MCKELVIE, RHONDA* (Midland Cancer Network, New Zealand)

An Unimproved Improvement Project: Using IE to Interrogate Why a Nurse Staffing Strategy for Patient Safety Has Not Eradicated Short-Staffed Shifts in New Zealand Hospitals.

This session details how IE techniques contributed to a disruptive narrative about a nationwide improvement approach to nurse safe-staffing strategies for patient safety in New Zealand hospitals. Locating the study in the ontology of IE, and employing IE techniques - standpoint, account writing, research problematic, mapping and iterative analysis were instrumental to the discoveries of the investigation. Adopting a standpoint alongside frontline nurses aligned McKelvie with local interests and experiences producing the problematic of the project. Account writing uncovered the social construction of the context and implementing environment of the staffing initiative, but would have been superficial without the analytic insights of mapping and reflexivity. Mapping identified researcher location within the ruling complex as both designer of the nurse-staffing strategy and participant in orchestrating the experiences of thousands of frontline nurses. Reflexivity was an essential practice, employed throughout the investigation to monitor for institutional capture, and explicitly delineate researcher location in relation to ideology of the nurse-staffing project (work as imagined) and the confronting but unavoidable discoveries (work as done) (Wears, et al., 2015; Cupit, et al., 2018). Illuminated was the insertion of numerical tools into frontline nurses' work, translation of aspects of nurses' situated knowledge into data-based abstractions, and institutional circuits that took up this data and orchestrated what happened for frontline nurses and patients. The strategy made aspects of nurses' workloads institutionally visible and managerially available for standardized measurement, quantification and commodification, but failed to resolve frontline nurses' concerns about patient safety ten years after work on the strategy began. The investigation revealed that by "taking up the master's tools" (Turner, 2014) of measurement, abstraction and standardization, a patient safety and safe-staffing initiative by nurses for nurses had, unknowingly and unintentionally, displaced and subordinated what nurses know and do to keep patients safe under short-staffed conditions.

MCKELVIE, RHONDA* (Midland Cancer Network, New Zealand)

Where Did All the People Go? The Abstract Constitution of Patients, Nurses and Nursing Care.

For decades, New Zealand nurses' concerns about patient safety and eroded care environments have not been sufficiently influential to resolve staffing shortages. To enter into discourse with medical and managerial hegemonies controlling staffing policy and nursing budgets, the nurse staffing research and the strategies that emerge from it have reframed nurses' (supposedly) subjective concerns into quantifiable forms (Aiken, 2014). McKelvie describes how nurses committed to resolving short staffing, informed by the objectified research, developed a suite of abstract proxies to 'communicate' what nurses actually know and do to hegemonies that privilege objectified knowledge. Patients, nurses and care were translated into measurable units of time. Care became a labour hour's equation. Nurses started to talk about care and think about patients in 'hours'. The supply and safety of the care environment was coded into traffic light colours, with green being efficient and safe and red representing potentially fatal safety failures. Although they knew there was a fundamental rift between these objectified calculations and the real needs of patients (Melon, 2012), nurses began to compete for scarce staffing resources with 'hours' and 'colours' proxies. Not only did individual patients and their specific needs slip from view, nurses, along with their dynamic situated knowledge and practice, were also abstracted and standardised on organizational 'at-a-glance' dashboards. McKelvie's research illuminated the richness of nurses embodied knowledge and work in the field of action that is a short-staffed shift. Her explication revealed how, despite their best intentions, strategy developers organized frontline nurses across NZ to become active in translating their accomplished situated intelligence and embodied knowledge into proxies that serve managerial decision-makers. Embodied situated knowledge was eclipsed and nurses became unwitting participants in the operation of ruling which came to stand over and against them in their own field of action.

MCKENNA, AOIFE* (University of Edinburgh, United Kingdom)

When Is Medicalisation Experienced As Fufilling or Denying Agency? Intersectionality, Changing Socio-Political Contexts, and the Case of Sterilisation in Brazil.

This presentation explores women's accounts of accessing sterilisation in Brazil. Universal access to fertility control is a central goal of the United Nations General Assembly 2030 Agenda for Sustainable Development. Furthermore, the worldwide number of women using contraceptive technologies is projected to rise from 778 million in 2017 to 793 million women in 2030. Sterilisation in Brazil is a useful case study to examine how changing socio-political contexts influence experiences of contraceptive technology. Despite the fact that the operation was illegal, Brazil had the second highest rate of female sterilisation in the world in 1996, at 40.1%. The operation was then legalised, and rates of sterilisation subsequently almost halved by 2013 (U.N. 2018). This research compares the accounts of participants who were sterilised before and after legalisation in 1997, and those who were planning to sterilise in 2013. The data were gathered via in-depth interviews in Portuguese with 35 women from a variety of socio-economic and ethnic backgrounds in Rio de Janeiro.

The analysis demonstrates how the combination of structural issues with the health system, along with the shifting, ambiguous legal status of the operation, increases barriers to accessing sterilisation. The findings detail how participants employ 'workaround' - *jeitinho* - practices to bypass legal regulations and negotiate access to sterilisation. Health inequalities are thus further re-enacted, as these experiences are generally shaped by intersecting social categories such as class, race and gender. The analysis illustrates how the women's narratives critique issues of power relations and inequality. Cussin's (1996) concept of 'ontological choreography' is used to illuminate these processes of objectification, highlighting when they are experienced as denying or fulfilling agency. This concept helps to move theorisation of agency beyond the limiting 'agency versus structure' binary conceptualisations evident in earlier debates on medicalisation in Brazil.

How Institutional Forces Shape the Implementation of a Relational Coordination Program in a Large Australian Public Hospital

Effective implementation of change programs is critical for improving health care services.   The cost of ineffective implementation is damage to the budget, damage to the experience of those doing change work, and damage to the quality of care patients receive. Despite the experience of countless people involved in implementing change in health care organisations, and a plethora of extant literature in the related fields of implementation science, change management and quality improvement, the unfortunate situation is that implementing change rarely goes as well as intended. This raises the question – what are we still missing?

The focus of this in-progress study is the problematic work of implementing a team-based performance improvement program in a large Australian public hospital. This program applies 'Relational Coordination' – a theory and model of organisational change designed to improve organisational performance by improving relationships and communication in health care teams. As the project manager of this program I work within the institutional context under examination. In this study I used Institutional Ethnography as a novel way to see how the implementation of this program happens as it does, giving new insights into the intractable problem of implementing change effectively.

I would like to share findings from this study that reveal how the daily work of implementing performance improvement programs in health care organisations is shaped by a coalescence of dominating social forces that exist far beyond the bounds of the organisation itself – the forces of economic rationalism, professional organisation and gendered work structures. The implications of this are deep and wide. We may need to rethink how we implement change programs in health care organisations, and indeed we may need to pay more attention to the role of the wider socio-political context.

MCNICOL, EMMA* (Monash University, Australia)

Excluded and Included Bodies in the Second Sex

In this paper I argue that Simone de Beauvoir's The Second Sex identifies and instantiates the problem of essentialism.

Early into the text, Beauvoir indicts a broad gender essentialism whereby women's biology grounds their political and social subordination and explicitly rejects the idea that there is an "essence" of woman. Nevertheless, Beauvoir's argument has been consistently charged with modelling different forms of essentialism and I will explore the history of these essentialist critiques as they re-

late to Beauvoir's depiction of the female body. A wave of feminist commentary commencing in 1978 and ending in 1988, asserted that Beauvoir's depictions of the puberty, pregnancy, menstruation and childbirth suggested that women's bodies condemned them to alienation and misery, framing Beauvoir's argument as a fatalistic biological essentialism ("the biological essentialist critique"). In the late 80s and onwards – inspired by Elizabeth Spelman's notorious 1988 text *Inessential Woman – The Second Sex* was charged primarily with a form of essentialism that excludes women who are not white and not middle-class ("the exclusionary argument against essentialism").

In this paper I do not intend to inoculate Beauvoir against these critiques, however I will argue that the essentialist critique misses a key aspect of Beauvoir's program, specifically Beauvoir's engagement with the phenomenological conception of the 'living body'. I argue that if we take Beauvoir's engagement with the 'living body' into consideration, we start to see that Beauvoir critically *identifies* the problem of essentialism more than is commonly thought. In particular, Beauvoir carefully depicts women as *grasping* their bodies *as* alienated and negative, rather than condemning them to an alienated future relation to their body, as the essentialist critics contend.

MCNULTY BURROWS, CATHRINEA* (Queen's University Belfast, United Kingdom)

Ageing with Autism: What Do We Need to Do to Prove We Are Worthy of Care?

According to the London School of Economics (2014), autism is the costliest medicalised condition in the United Kingdom totalling around 32 billion pounds per annum in treatment, loss of earnings, support and care. More recently, researchers have discovered ageing autistic adults are at an increased risk of premature death averaging 16 to 32 years earlier than their neurotypical counterparts (Hirvikoski et al, 2016). However, the underlying factors for these premature deaths remain unclear.

This paper discusses the application of an institutional ethnographic (IE) lens to an exploration of the daily activities of autistic adults, their caregivers and the institution of health and social care. In this paper, I illuminate the everyday invisible challenges facing ageing autistic adults once they become institutionally classified as "patients" (including their caregivers) as they work (or not) to manage and maintain their health and wellbeing. More specifically, I will explore how social policies designed to remove barriers to accessing supports for those with disabling conditions (the standpoint informants in this study) have created a hidden hierarchy of need based on the misleading biomedical category of "functionality". Gaining empirical insights using IE into every day tensions of the ageing "patient" can help us move beyond the statistics and into the biomedical, psychological, political, social and economic discourses organising their lives. It is only when we understand the wider social organisation can we begin to make sense of the trend of premature deaths within the autistic community. To conclude, I argue the insights gained from conducting an IE are vital to understanding the complexities of ageing with autism often overlooked when devising services and supports.

Ideales De Autonomía, Influencias Del Entorno y Formas Cotidianas De Inclusión Social Desde La Perspectiva De Varones y Mujeres Jóvenes De Sectores Populares.

Esta comunicación se inserta en los debates sobre las formas contemporáneas de incorporación social de las nuevas generaciones y su vínculo con la producción y reproducción de desigualdades sociales. En particular, este trabajo aborda la relación entre la producción estatal de tales desigualdades y el discurso de la autonomía (como conjunto de ideas, prescripciones y expectativas institucionales sobre los/as jóvenes) presente en los programas de inclusión social y penales dirigidos a jóvenes en Argentina. La idea de autonomía, como categoría institucional, refiere a la capacidad que deberían tener (o adquirir) los y las jóvenes para tomar decisiones de modo racional e individual, orientadas a distanciarse simbólica y físicamente de entornos y figuras riesgosas. En esta comunicación me interesa reponer cómo los y las jóvenes "hacen cosas" y toman decisiones en sus vidas cotidianas, en relación a las influencias que valoran positivamente, y al lugar que ocupan los vínculos que mantienen con sus pares, familias y vecinos en la configuración de sus acciones. Procuro poner en relación estos datos con el discurso sobre la autonomía porque trabajo con la hipótesis de que en contextos especialmente marcados por múltiples desigualdades, éste opera más enfáticamente como una herramienta de desprotección que como una de inclusión social. Especialmente interpreto que, por un lado, refuerza estereotipos hegemónicos de la masculinidad que orientan a los varones jóvenes a desconectar el entendimiento sobre sus prácticas de las constricciones sociales y justificarlas como decisiones individuales, y en general, que desconoce y/o deslegitima

los elementos significativos que los entornos comunitarios, familiares y de pares proveen a los y las jóvenes y que operan como "soportes" para la inclusión social. Los datos que se analizan provienen de trabajo etnográfico realizado entre 2016 y 2018 en un programa de inclusión social juvenil en Buenos Aires.

MEDAN, MARINA* (Universidad Nacional de San Martín/ Consejo Nacional de Investigaciones Científicas y Técnicas, Argentina)

Spaces to Talk about Gender Inequalities in Social Inclusion Programs for Young People: Between Emancipation Proposals and Mute Voices.

This article addresses political and methodological dilemmas that "invited spaces" presents (Cornwall, 2008) when tackling gender issues in inclusion programs aimed to increase youth participation. The empirical reference of these reflections is a research and extension project that we developed in a social inclusion program in Buenos Aires, between 2016 and 2018. In 2016, as part of the institutional interest in increasing young women participation, the caseworkers asked us to organize a weekly meeting aimed to invite them to work on different aspects of their "life project"; we proposed to orientate it to gender inequalities. The work on these inequalities was carried out in a social and cultural context of effervescence -linked to gender violence in Argentina and discussions about the decriminalization of abortion-. During the development of the workshops, girls held different positions and perceptions regarding gender inequalities, as well as ideas associated with models of appropriate femininity. This paper focuses on those expressions, but also observes how the girls participated in the workshop (their absences, silences, gestures), and other aspects of space dynamics. The objective of this focus is to carry out a work of reflexivity - more acute than that expected at the beginning of the meetings - on how our proposal and position in the field (as middle-class, university, and adult women) enabled or not plural forms of participation. Our "emancipatory" message about gender could be decoded by them as a threat (Haney, 1996) to their gender ideologies and femininity experiences, which configured and effective in their particular context of life, could be being moralized, delegitimized, or silenced as an effect of the inequality of age and class that we maintained with them. The reflections include some comments on the lessons learned from this experience to modify our subsequent interventions in 2017 and 2018.

About Sugar Shoes and Afro-Transcendences: Black Experiences, Insurgencies and Subjectivities in Brazilian Visual Arts.

The representation of the black population in Brazilian visual arts has been increasingly a debate present among artistic, academic and militancy environments. If the portraits of French painter Jean-Baptiste Debret are one of the few visual references we have about colonial Brazil, it also represent an idealized narrative about the brutalities of the period. From museums to art portfolios and didatic books, Debret's images have long been a symbolic and representational basis for the construction of a nation narrative based on the idea of supposed softened racism and a supposed absence of black agency. Given this, we bring in this *paper* some initial reflections about these narratives of nation present in the Brazilian visual arts, and then we dissuade into a set of contemporary artistic proposals, mostly made by black artists. These are insurgent narratives, focused on the black subjects's agency throughout history, their subjectivities and contemporary issues faced in public and intimate experiences. *Sugar shoes* and *Afro-transcendences* are references, respectively, from artists and researchers Tiago Sant'Ana and Sidney Amaral, creators of some of the performances and installations discussed here. On the one hand, Tiago Sant'Ana creates a metaphor in the encounter between the image of the *shoe* (one of the symbols of social status in colonial Brazil) and *sugar* (a source of wealth for the elites and of suffering for the black people) to describe the sugar shoe about to melt, as well as the fragility of black freedom. On the other hand, Sidney Amaral *transcends* hegemonic narratives by portraying intimate, identity and subjectivities of the black subject. Based on Cultural and Postcolonial Studies, our goal is to reflect about the critical powers of these artistic productions for the emergence of other narratives, whose focus is the racialization of Black experiences in Brazil.

Role of Religious Leaders and Organizations in the Aftermath of Super Typhoon Haiyan in the Philippines: Policy Implications

The study examines the changing role of religion in the public sphere, more specifically the Catholic hierarchy in the Philippines in the aftermath of a major natural hazard- Super Typhoon Yolanda (Haiyan) in 2013. Using primary and secondary sources the role of religious organizations in the public sphere in the light of the disaster and as influenced by the prevailing historical, socio-cultural and political context is examined. Key informant interviews were also conducted in communities affected by the disaster in Tanauan, Palo and Tacloban in Leyte, Philippines, among religious leaders and lay parishioners. The study found out that the religious leaders and lay leaders have facilitated and assisted the distribution of relief and emergency supplies in affected areas and in support of rehabilitation efforts in communities devastated by the disaster going beyond their traditional religious roles.

Gaining Knowledge, Confidence, and Experience As Researchers Among Undergraduate Sociology Students

Advanced undergraduate students struggle with executing complete research projects that involve data collection and analysis. Research indicates that engaging in undergraduate research is a high impact practice, and the American Sociological Association recommends that sociology majors engage in research beyond their Research Methods and Statistics courses. We used a pre-/post-assessment model across three semesters in all upper-level elective undergraduate sociology courses at our institution. The assessment measured confidence, knowledge, and experience with research methods. Fifty-eight students completed at least one pre-/post-assessment pair. Of those, 27 students completed two pre-/post-assessments. We find that confidence, knowledge, and experience increase over a semester. An increase in knowledge, however, was only statistically significant for the group with two pre-/post-assessments and only for their second post-test (i.e., after two semesters). Compared to experience and knowledge, students had the smallest gains in their confidence doing research.

The Lived Experience of Succession for Muslim Women in Contemporary South Africa.

This empirical research explores experiences of succession in Muslim families, drawing upon case law, archival research and in-depth interviews with Muslim widows in Cape Town. I examine women's experience of intestate succession and their attitudes towards inheritance in Cape Town Muslim families. In particular, I investigate the ways in which patterns of inheritance are tied to gendered family practices, and how this relates to the principles of equality and diversity in the Constitution within a legal pluralist society. Findings indicate an interrelation between the "conditionality" of inheritance and the protection of a widow's socio-economic position. Gender justice appears to be enhanced through the practice of giving during one's lifetime within the family network, as opposed to a reliance on inheritance. Findings indicate a gender shift in property ownership across generations. This research contributes to the developing body of literature on Muslim family practices in South Africa and acts as a lens in which to understand links between wider family history, and established social and institutional systems; therefore, leading to an evaluation of the role of transformative justice in this instance.

Good Doctors and Bad Cops: A Sociological Investigation into the Mythologies of American Television's Fictional Institutions

American fictional television series have reached great acclaim around the world. Shows like the medical drama Grey's Anatomy and the police procedural Law in Order: SVU are some of the longest running shows in American television. However, the popularity of these shows may have less to do with their aesthetic qualities and more to do with their sociological ones. These productions, centered on everyday institutions, reveal a world of ordered meanings in which the institution plays a key role in maintaining the social order. Leading from a social con-

denotes a presenting author. Abstracts are organized by first presenting author's last name.

structivist framework (Berger & Luckman, 1966), we would like to explore these and other institutional dramas as important sources of information, as well as, instruments capable of naturalizing and propagating ideas and myths about US institutions. Whilst the literature usually focuses on how doctors or cops are represented in TV, as in Chory-Assad & Tamborini (2001) and Stark (1987), here, we would like to contest the strict division between fiction and reality, understanding that TV's fictional institutions contribute to our expectations towards the world around us. While the representation angle looks at fiction and seeks to understand how reality is constructed there, our purpose here is to examine the fictionalization of social institutions in order to better understand how these popular narratives influence the way individuals perceive them in the real world. Fiction, therefore, is not merely fiction. Fiction must also be analyzed as a reality and thus seen as a structuring form of reality. In other words, we propose that fiction can be sociologically considered a reality. In hopes of opening new analytical avenues, we propose the realization of a sociology of fictional institutions. We aim to investigate how fictionalized social institutions work, how they organize narrative universes and which myths they trigger in this process.

Micro-Entrepreneur Women: Between Religion and Neoliberalism

This paper expands the knowledge about women marginality and shows how, in a most contradicting context, women micro-entrepreneurs in a highly traditional and patriarchal society, can become agents of social change that reflects in adopting rather modern values and practices.

In recent decades, as part of the neoliberal reorganization of the welfare state and the emergence of workfare policies, micro-entrepreneurship has been introduced by many governments as a solution for unemployment and a method to reduce poverty among marginalized social groups, especially women. In the Israeli context, one such group is ultra-Orthodox (Haredi) women.

Haredi women are expected to be the breadwinners and caregivers, while their husbands engage in the highest calling of religious learning. Traditional values regulated by principles of exclusion and gender segregation are pivotal in their Haredi social order. These characteristics stand in contrast to the entrepreneurial spirit and practices that require adoption of modernity, innovation and openness practices.

Based on 27 life-story interviews with Haredi women entrepreneurs and participant observation of their networking group meetings, we argue that their unique position enables them to negotiate the degrees and scales of segregation, seclusion and openness. They use business entrepreneurship as a resource in negotiating the degrees of openness towards modernity when at times religious laws still dictate the terms, mobilizing neoliberal market values to justify certain practices as required for the development and success of their business. These are groundbreaking steps that bring the secular and modern world closer to the doorstep of the Haredi home.

MEJIA REYES, CARLOS* (Universidad Autónoma del Estado de Hidalgo., Mexico)

Riesgo Laboral En Profesionistas. Exploración Transversal Cuantitativa En México.

El riesgo laboral, entendida como la vulnerabilidad objetiva y/o subjetiva en la que se encuentran los sujetos en cuanto a la participación o permanencia en un empleo siempre y cuando esta pérdida potencial o imposibilidad de continuidad sea por razones involuntarias, conforma un rasgo inherente del capitalismo contemporáneo global en el que la flexibilidad y precariedad laboral imperan para definir la época. Tal condición impacta al total de los sectores laborales pero coexiste con un relato que señala a la formación profesional como garante para paliar o en su caso evadir las condiciones tácitas del este capitalismo en la biografía laboral. Para el caso de México, este metarrelato se mantiene vigente paradójicamente a las condiciones concretas documentadas del sector que logró estudios profesionales y que se insertan en funciones acordes a su formación. Sin embargo las percepciones de riesgo laboral se presumen menores en profesionistas frente a agentes en condiciones de trabajo distintas. Así esta disertación pretende explorar el riesgo laboral en informantes mexicanos con actividad laboral activa profesionista en jefes de familia de las submuestras de México de la encuesta Latinobarómetro de años 1995 hasta 2018; esto con la técnica estadística transversal cuya finalidad es identificar tendencias puntuales en espacios de tiempo específicos con intenciones descriptivas. Con los resultados se realizan interpretaciones coyunturales que puedan dar explicaciones de las fluctuaciones visibles.

Youth Attitudes Towards Their Future: The Role of Resources, Agency and Individualism in the UK

In this paper, we analyse survey data from a previous economic crisis to examine why young people remain optimistic about their personal futures, and to consider what lessons, if any, this can help us with thinking about Post-COVID future. Recent studies in England found that young people across all social classes can be optimistic, but the function that optimism plays in young lives is quite distinct. Positive perceptions of one's agency can help some individuals overcome structural constraints, such as social class, although there are limits to its transformative power.

The data in question are drawn from a unique cross-sectional survey of young adults aged 22-29 in England, Scotland and Wales, conducted in 2014, when youth unemployment in the UK was still extraordinarily high, at around 20%, just two percentage points lower than the peak of youth unemployment in 2001. We assess the effect of socio-economic resources and of personal agency on young people's optimism. Agency is measured through questions on perception of hard work, self efficacy, extreme individualism.

Multiple regression models of these data show that individual resources and individual agency not only have an independent effect on individual levels of youth optimism, but they also interact. This means that those with scarcer resources, such as the NEET youth in our study, are more pessimistic that their peers, only if they are highly individualistic, that is, if they have low trust on social support. Contrarily, for more socio-economically advantaged young people, such as those in education and in work, even if they are highly individualistic, their level of optimism is higher than for NEETs. Self-efficacy remains the strongest and robust predictor of youth optimism, together with socio-economic resources.

Social Media and the Redefinition of Everyday Life during the Lockdown. a Qualitative Case Study on Older People Living in the First European "Red Zone"

The social impact of lockdown and "social distancing" measures on the older population is currently overlooked. However crucial in containing the spread of the disease, these measures may also have a negative impact on older people's well-being, especially on loneliness and social isolation. Social media [SM] use may contrast this negative effect, contributing to maintaining older people's social connections. The aim of this study is to explore whether and to what extent SM contributed to overcome the challenges posed on older people's well-being by a long period of forced isolation. A qualitative case study was conducted between May and July 2020 on a cluster of ten municipalities in Italy placed under "de facto quarantine", thus becoming the first "Red Zone" in Europe. We collected data through semi-structured interviews carried out using video-calls on a purposive sample of 40 men and women aged 65 and over. In carrying out the study, we developed methodological protocols specifically targeted at older people, concerning remote recruitment, data collection and informed consent. A thematic analysis is conducted around the following topics: changes occurred in older people's everyday life, role of social relationship, SM use during the lockdown, impact of the lockdown on well-being. Preliminary analysis documented the key role played by SM use during the "suspended time" of the lockdown, facilitating older people's adaptation to the emergency phase. Moreover, embedding SM use into everyday life can help older people redefine everyday routines. The complexity and nuances of SM use in older people's everyday life are also discussed, as well as the social resources enacted, may enhance or, rather, limit its use. E.G., the presence of "digitally stimulating and digitally savvy" inter and intragenerational relationships can play a key role in overcoming older people's reluctance or inability to use SM.

The Spirit of Capitalism in Popular Management Content in Digital Media: The Case of Digital Influencers on Linkedin in Brazil

The paper analyzes the manifestations of the spirit of capitalism in contemporary Brazil. In a qualitative and abductive study, the research program proposed

by Luc Boltanski and Ève Chiapello was used to assess business management content published between 2014 and 2019 by digital influencers on LinkedIn. This provided an understanding of new historical developments in the ideological configuration of capitalism and the extent to which they present specificities in developing countries such as Brazil. Regarding dominant business models, there was greater emphasis on seeking to overcome deliberate planning techniques, risk as a way to stimulate learning, the sharing economy, diversity and the search for purpose by the workforce. Mobilizing dimensions of the spirit are no longer significantly influenced by the projective *cité* and, despite the rise in the influence of the inspired form of worth, there was a situation of ideological confusion, associated with the managerial domination regime.

Global Unions, Local Expectations and Transnational Corporations in Brazil: Dialogue and Conflict

Brazilian trade unions have enjoyed a longstanding cooperation with foreign allies and global federations. In a previous work focused on cross-border alliances within transnational corporations (TNCs) in traditional manufacturing industries, we argued that these efforts have benefited from and been constrained by a partial alignment of labor and corporate interests across multiple scales. In this paper, we expand on this idea comparing the adoption of company-based networks and Global Framework Agreements in different settings, which allows us to explore the connections between globalization, labor and democracy in Brazil. The research was conducted from 2014 to 2019, and included the observation of union activities, documentary analysis and semi-structured interviews with corporate managers and representatives of local, national, foreign and global union organizations.

First, we show that local unions have successfully taken advantage of the social dialogue approach favored by global initiatives without losing sight of the contested nature of labor relations in the country. In practice, politics of dialogue and conflict were combined in a method that spread from manufacturing industries to TNCs in the banking, services and commerce sectors. However, the efficacy of this strategy is limited by the prevalence of power imbalances and conflicting priorities among different union organizations as well as between workers and corporations. To highlight this point, we turn to the case of a Brazilian mining company which, advancing aggressive anti-union policies, used union commitments regarding pension funds and the government to block transnational solidarity with workers in Canada.

Our conclusion is that cross-border labor organization cannot be properly assessed without consideration for the uneven relations established between workers, unions, corporations and government powers. Accordingly, we argue that the incorporation of global unionism in Brazil has been shaped by a fragmented union structure and influenced by expectations aroused by the Workers' Party government (2003 – 2016).

MENDEZ, MARIA-LUISA* (Universidad Católica de Chile, Chile)

GAYO, MODESTO* (Universidad Diego Portales, Chile)

Socio-Spatial Trajectories into the Elites in Santiago De Chile: Adherence and Distancing of Cultural and Political Repertoires

In recent years, the dichotomous way of conceiving the political orientations of the most privileged groups between the conservative and liberal / progressive poles, has been problematized, pointing towards a process of internal fragmentation. This has been empirically explored in seminal studies (Lamont, 1992; Savage et al, 1992) and more recently by research on perceptions of poverty and inequality (Reis and Moore, 2005), ideological differentiation (Atria et al, 2017; Hay and Muller, 2012; Real-Dato, Lengyel and Göncz, 2012), cultural diversity (Moya, Pelfini and Novoa, 2018); demands for democratization (Pelfini, 2014); perceptions about gender divisions and roles (Madrid, 2017; Hjellbrekke and Korsnes, 2016); diversity in religious beliefs (Thumala, 2011; 2007).

Based on quantitative and qualitative data (survey of 400 upper and upper middle class families in Santiago and 40 in-depth interviews), this paper aims to characterize the socio-spatial trajectories into these group and the fragmentation of neoliberal cultural repertoires on issues such as autonomy, self-realization, globalization (Gerhards, Hans and Carlson, 2017) and meritocracy (Khan, 2016) that results out of this diversity of trajectories of social, cultural and residential mobility. Following *Upper Middle Class Social Reproduction* (Méndez and Gayo, 2019), the paper critically discusses the extent to which the same idea of "one of us mentality" would be stressed by repertoires that compete for the most privileged positions in the diversification process that affects the *new ordinary urban elites* (Cunningham and Savage, 2017). We address the reluctance to conduct themselves according to a "traditional" process of absorption and emulation process

(Reeves, Friedman et al, 2017; Sherman, 2017), and how these groups actually prefer a more complex exercise of adherence and distancing. We will show that a particular fraction named the *achievers* challenge the *inheritors'* cultural and political orientations such as that of networked pragmatism.

Social Capital and Democratic Governance in Colombia and Chile

Latin America is in the midst of a relatively stable period of democracy. However, some challenges remain such as processing the demands from citizens and increasing governance. Theories on political culture and citizens' participation have been the basis for an extensive set of studies relating citizens' attitudes to democracy. Yet despite the outpouring of research, there has been little attempt to test the micro foundations that explain democratic governance. In this article, we present a broader theoretical framework for conceptualizing democratic governance and analyzing it based on inter-personal dynamics related to social capital from a comparative viewpoint.

The article makes two assumptions: that the level of interpersonal and institutional trust affects the way people perceive democracy and that there is significant variation depending on how democratic processes have evolved in different countries. We draw upon survey data from the World Values Surveys to test the hypothesis of what factors affect the creation of governance. The contribution of this paper is to provide a depth discussion about how interpersonal attributes interact with institutional features from a comparative perspective.

Social Capital: Predictors and Discussion in the Colombian Context

From the literature on social capital, we know that networks and trust can have important impacts on the solution of the collective action problem in the communities. However, little empirical analysis has addressed what are the predictors of the variation of social capital at Colombia. We draw upon survey data from World Values Survey from Colombia to answer the question of what factors affect the creation of social capital. We also analyze how social capital has evolved across time in the country and how the change is also explained by the generational transformations in the country. The contribution of this paper is to provide a depth discussion about the predictors of social capital in the country, and to investigate about effects of the Colombian context on this variable.

Civil-Military Relations in Brazil: Neither Militarization Nor Exceptionality

There has been an ongoing discussion in Brazil regarding the frequent use of the armed forces in public security issues, especially since 2010. Guarantee of Law and Order operations (Garantia da Lei e da Ordem – GLO) have become more frequent in the country and at least two relevant documents were released by the armed forces specifically concerning pacification operations since then. During the 2018 electoral process, the influence of the armed forces in public debate became clear when several high ranking officials emitted their political opinions publicly which caused a resurgence in the debate of what should be the appropriate role of the armed forces in these scenarios. Although a part of the literature in civil-military relations explores this military intervention in exceptional terms, we understand that this has been the case in Brazilian civil-military relations since the country became a republic. Considering the above, our objective in this article is to discuss the current role of the armed forces in Brazil. We argue that the recent and frequent use of the armed forces in public security issues and their involvement in general political affairs in the country represents a historical continuity rather than an exception in civil-military affairs in Brazil. This continuity has emerged recently as the "militarization of public security", but we suggest that this militarization process is actually an aspect of specific civil-military relations that have deep historical roots. We believe our genealogical effort to understand military intervention in Brazil as a continuous process can shed some light on issues such as the type of professionalization that it entails.

MENDOZA HORVITZ, MANUELA* (UCL Institute of Education, Chile)

Ambivalent Emotions Towards 'the Other' in Socially Diverse Schools

Drawing on a global context of tension between national ideologies driven by democratic values and the challenges posed by increasing levels of social diversity, the paper reflects on the ways social diversity in a school may shape particular subjective dispositions (Bourdieu, 1990) to otherness on students and parents.

As the literature suggests, school mix (the school's social diversity) and school mixing (the interactions between students/parents from different backgrounds) may contribute to the development of democratic and inclusive dispositions; however, this is not a necessary condition, as exclusionary dispositions may also emerge (e.g. internal segregation and strengthening of prejudices) (e.g. Neal & Vincent, 2013; Reay et al., 2011; Wilson, 2011).

The discussion will be illustrated by the case under study in an ethnographically oriented research about friendship in two socioeconomically diverse schools: the Chilean educational system, a key country to observe both an exceptional socioeconomic educational segregation and an unusual process of educational reforms attempting to promote inclusion and diversity of school populations.

The findings reveal ambivalent emotions shaping the dispositions to otherness, specifically, a 'restricted openness to the other', even among the 'exceptionally open' families under study, due to a legitimation of fear and discrimination against certain others. I interpret these findings within the lens of the politics of emotions framework, which understands fear as not merely intimate or irrational: it is rather linked to a particular socio-political context, articulated by certain cultural narratives around 'the other' who is signaled as worthy of fear - i.e. as being 'not us' and endangering what is 'ours' -, usually following stereotypes associated with patterns of marginalisation and exclusion (Ahmed, 2014; Shirlow & Pain, 2003; Wise, 2014). I conclude with a discussion on the relationship between such restricted openness and the debate on reproduction/change through education.

School Mix and Subjectivity Change: A Discussion on the Concept of Habitus

Drawing on a global context of tension between national ideologies driven by democratic values and the challenges posed by increasing levels of social diversity, the paper reflects on the ways social diversity in a school may shape particular subjective dispositions to otherness on students and parents. In particular, based on Pierre Bourdieu's concept of habitus (1984a, 1984b, 1986, 1990, 1998, 2001)

and further sociological discussions on habitus disruption and reflexivity (e.g. Bottero, 2010; Decoteau, 2016; Farrugia & Woodman, 2015; Ingram & Abraham, 2018; Lahire, 2003; Mouzelis, 2008; Reay et al., 2009; Sweetman, 2003; Vincent et al., 2018), I outline an analytical sociological framework to conceptualise the possibilities for habitus to change through the experience of social-class difference.

As the literature suggests, school mix (the school's social diversity) and school mixing (the interactions between students/parents from different backgrounds) may contribute to the development of democratic and inclusive dispositions; however, this is not a necessary condition, as exclusionary dispositions may also emerge (e.g. internal segregation and strengthening of prejudices) (Neal & Vincent, 2013; Reay et al., 2011; Wilson, 2011; Reay et al., 2007; Vincent & Ball, 2006; Gurin et al., 2002).

The discussion will be illustrated by the case under study in an ethnographically oriented research about friendship in two socioeconomically diverse schools: the Chilean educational system, a key country to observe both an exceptional socioeconomic educational segregation and an unusual process of educational reforms attempting to promote inclusion and diversity of school populations.

It is argued that, unlike a pure Bourdieusian approach where first experiences (generally family-related and socially homogeneous) are the main element creating dispositions, understanding the concept of habitus as composed of a plurality of dispositions may contribute to revealing more nuanced and complex processes of habitus formation and potential cultural reproduction/change, in the context of socially diverse schools.

MENDOZA LUNA, FRANCISCO* (Universidad Iberoamericana, Mexico)

El Análisis De Sistema-Mundo: Producción Teórica Del Centro y La Periferia

La propuesta intelectual de Immanuel Wallerstein recoge, por un lado, la influencia de Fernand Braudel, y sus aportaciones sobre los estudios de larga duración, y por el otro, las contribuciones de Raúl Prebisch desde la CEPAL sobre la distinción entre los países de centro y periferia. Este dialogo entre la producción teórica de países centrales y de países periférico permitió desarrollar el análisis de sistema-mundo que se materializó en uno de los libros más influyentes de sociología en el siglo XX: *El moderno sistema mundial*.

El objetivo de la ponencia es discutir cómo el dialogo entre las distintas perspectivas conceptuales, provenientes tanto del centro de la economía mundo capitalista como de la periferia, construyeron un entramado conceptual de gran alcance explicativo. Me fijo en las condiciones sociales de producción y su impacto en el desarrollo de la propuesta intelectual de Wallerstein.

Este análisis resulta particularmente interesante en la medida que el autor desarrolló una fuerte crítica a la forma en que se habían configurado las ciencias sociales en el mundo, preocupadas principalmente, por atender los problemas de Europa occidental y de Estados Unidos, lo que se denomina el norte global. No obstante, nuestro sociólogo considera que es pertinente construir dialogo con la producción intelectual de los países del "sur" para construir ciencias sociales históricas de mayor alcance explicativo y que consideren en sus análisis a los fenómenos como producto de interacciones complejas del sistema mundo.

De acuerdo con Wallerstein, la crítica al eurocentrismo resulta en un reto intelectual preocupado por construir perspectivas analíticas de acuerdo con las necesidades locales, pero en constante dialogo con la producción de otras regiones. Su propuesta de análisis de sistemas mundo aboga por estudiar los fenómenos sociales de manera comparada entre distintas regiones.

The Role of Women As Traffickers of Human Beings for the Purposes of Sexual Exploitation: Victim to Traffickers

It has been suggested that in the trafficking of human beings for the purpose of sexual exploitation there is an unequal distribution of gender; Most of the victims are women and girls, and men are among the traffickers. However, this distribution has changed in recent years in Spain. Among those arrested and convicted of trafficking for sexual exploitation, 40% were women. In this paper, the roles acquired by women as traffickers in trafficking in human beings for the purpose of sexual exploitation are analyzed. A qualitative methodology has been used to obtain information through six interviews with people convicted of the crime of trafficking, who are serving their sentence and the analysis of more than 80 sentences on trafficking in human beings.The results indicate that women tend to play two fundamental roles in which they are especially successful: as captors in the areas of origin of the victims and as exploiters in the country of destination in which they are and bring their compatriots. Sometimes they can play different roles. Once they stop being victims, when paying their debt, they become exploiters of other women, or even at the same time that they are victims and are paying the debt to come to Spain, they are exploiters and traffickers of others women.

HERRERA LEIGHTON, ANAIS (Universidad de Chile, Chile)

How to Improve Civic and Citizen Knowledge? the Unexplored Role of Academic Performance.

The educational socialization required for our time must train participatory citizens, respectful with the diversity and committed to the human rights. Civic and citizen knowledge is currently promoted by the positive relationship that democracy and tolerance have with these specific objectives (e.g., intention to participate, respect for women, homosexuals or ethnic groups, support for the maintenance of democracy). Sociological studies indicate that civic knowledge is influenced by variables of socioeconomic background, as well as contextual variables of the school (e.g. classroom climate). However, there is no clear evidence of the relationship between civic knowledge and other areas of learning. This study evaluates the hypothesis that civic knowledge is highly related to the standardized academic performance test score, since both require a set of similar skills in the students (e.g. explicit understanding, analysis, interpretation). A multilevel analysis with random interactions and slopes was performed, using the international ICCS database, which evaluated the civic knowledge of eighth grade students, crossed with the SIMCE base, which measures the academic performance of Chilean students (N = 3015). It is concluded that the average in the SIMCE test has a larger effect on civic knowledge than the variables of socioeconomic background. A non-linear quadratic relationship was obtained, according to which, the relationship between civic knowledge and academic performance is stronger at the lowest scores. Besides, in terms of interaction, the higher the performance in language, mathematics and natural sciences, the less important the student's social background to learn civic knowledge. This evidence suggests the importance of improving the skills of students in general to develop the potential of civic education subjects and help training students and citizens more tolerant and committed with democracy.

Santa Marta Alerta: Urban Violence, Digital Technology and Internal Politics after Ten Years of "Pacification"

Ten years after the inauguration of the first Pacifying Police Unit (*Unidade de Polícia Pacificadora - UPP*), the daily life of favela Santa Marta, in Rio de Janeiro, is impacted by the resurge of intense shootings and a routine fragmented by violence, resulting in the perception of exhaustion of this important public safety project. In this ethnographic research, it is considered that the analysis of the "failure" of the project makes it possible to understand the effects produced and what remains of the experience governed by the "pacification" grammar. Due to the need to adapt to a new conjuncture, where political representatives appropriate war-related expressions for the establishment of a government of deaths over the favelas and their populations, it is necessary to develop new tactics of resistance to exception devices. In this article, we highlight part of a research related to the emergence of different shapes of sociability by the articulation between urban violence, digital technology and the local politics of the favela. "Santa Marta Alert" is a set of Whatsapp groups created by a local leader, to be used by favela residents. During the first three months of existence, the initiative projected significant outcomes: the claim for basic services, such as the distribution of water and light; the surveillance and sharing of descriptions and images related to police abuse; the organization of internal and external meetings with representatives of the military police and state services, and; the mobilization of protests and demonstrations of resistance on public space.

Revisiting the Horror Again: Hitler's Children (Chanoch Zeevi, 2011)

This paper aims to analyze the film Hitler's Children (2011) directed by Chanoch Zeevi that, in a documentary approach, look inside the life and the reaction of some of the Hitler's Inner Circle descendants to the legacy of being related to the commanders of the genocide perpetrated in WWII. Bettina Göring, Katrin Himmler, Reiner Höss, among others, deals differently with the heavy heritage of being associated with these mass extermination perpetrators and exchange with the camera their ways to live with this endless and terrible background.

The proposal is to discuss the relations between cinema and the production of knowledge in the Social Sciences, in order to highlight the problems of epistemological background and methodological issues concerning the use of film as a privileged research material.

The aim is to investigate the articulations proposed by the films, its formative aspects, evidencing the ways in which the relations between cinema and society are established, through detailed analysis of its narrative, its options, its silences. Certainly every researcher in Social Sciences gives the world a sense from the value options he makes. However, in doing so, he must be aware that there is not, as Weber pointed out, something valuable and worthy "in itself" to be investigated, an inherent or unique sense of things. In view of this, the researcher, looking to the film, exposes himself to the risk of sustaining the connections that he establishes, connections that are significant from the valuative options he makes. The perspective is that at the end of the analysis the significant blocks, reconstituted and highlighted in their various moments, point not only the common points with other possible interpretations, but above all, distances, dissent and disagreements between them.

MENOUX, THIBAUT* (EHESS, France)

Being an Artist and Free-Lancing for Another One. Is Non-Standard Employment in the Worlds of Arts a Springboard or a Dead End for Artists' Careers?

This presentation addresses what is at stake in the forms of son-standard employment through which artistic work is delegated. It explores more precisely the cases where the art works of a successful living artist are partially or totally produced by one or more other artists generally hired as independent workers by the first one, and who will not sign the final work of their own name.

Even though it is rarely known to the general public or considered a legitimate topic by professionals in the field (artists, gallery owners, curators, specialized journalists), this delegation is widespread on the visual arts scene, far beyond the giant studios of star-artists who, like Jeff Koons, employ a large number of invisible workers. This situation in which one artist employs another mostly relies on informal employment or freelance invoicing rather than on permanent contracts. Today, this type of activity can be a way for young artists whose careers have not yet taken off to support themselves, to build a network and finance their own production, or, for older and not yet recognized artists, to stay afloat and continue to train their technical skills or to keep a foot in professional artistic networks.

Based on a two-year and currently ongoing multi-site survey conducted in the United States and in Germany by observation and in-depth interviews (N=72) with contemporary visual artists and people working in their studios, this presentation will attempt to understand the social conditions of possibility under which this type of non-standard employment relationship may lead vulnerable "outsiders" to make a breakthrough or, on the contrary, deprive them of the spatial, social, financial and temporal conditions necessary to develop a career in their own name and take them out of the shadow of the artist they work for.

RC37-464.1

MENOUX, THIBAUT* (EHESS, France)

Invisible Workers in the Artist's Studio. Love of Art, Precariousness and Gender Division of Work

In the professional worlds of contemporary art, the depth of the gender gap and its effects are such that even though women are no longer excluded from learning (they are even the majority in art schools) nor from the practice of art, a whole series of factors contribute to the fact that women visual artists still struggle to have their talents recognized on the art market.

Based on a multi-site survey still in progress and conducted over the past two years in the United States and Germany by observation and in-depth interviews (N=72) with contemporary visual artists and people working in their studios, this presentation proposes to address the gender gap in the contemporary art world by focusing on the delegation of artistic work. More specifically, the presentation goes behind the scenes of the contemporary art world, and sheds light on artists who are employed by other artists to produce works that they will not sign.

The system in which one artist employs another is very common in the professional world of contemporary art, and is generally based on freelance invoicing rather than on permanent contracts. While women are under-represented among successful artists, the survey shows that they are over-represented among these invisible and precarious artists employed in the art studios of successful artists. For the women in this situation, what kind of effect does the "love of art" and a vocational and enchanted relationship to artistic work produce? Does the gendered division of labour induce a greater vulnerability of women to the artist's personal assistant tasks that are close to care? What are the possibilities these women have to protect their status within the studios? And how efficient can be mobilization initiatives such as W.A.G.E. (Working Artists And The Greater Economy) and their "Womanifesto" in protecting these vulnerable workers?

Neoliberal Policies and State Subvention Decline in Public Universities: An Investigation into Strategies for Mobilizing Internally Generated Revenue in Public Universities in Ghana

The role of tertiary education for socio-economic development in countries requires adequate funding to effectively train high-quality experts in the current knowledge economy. However, after independence the funding support from government for tertiary education institutions in Ghana declined considerably. The Bretton Wood Institutions compelled highly-indebted countries to adopt the Structural Adjustment Programme (SAP) as a major tool of neoliberal policies (Dobbin et al., 2007). The rationale for adopting the SAP was to reduce public spending in order to enable highly-indebted countries to recover rates of economic growth and reduce poverty to sustain development (Reimer 1997:4).

The objective the study was to examine the strategies that were adopted by public universities in Ghana to mobilize revenue to complement the dwindling state subvention in order to effectively deliver on their development mandate and remain internationally competitive.

The study employed a mixed methods approach to collect quantitative and qualitative data. Probability and non-probability sampling procedures were used to select respondents from four public universities.

The main findings of the study revealed that public universities have expanded their revenue base through; the introduction of academic programmes which were designed to attract high academic fees as well as increased commercial activities with increased service charges. These strategies have shifted the crisis of decreased state funding of the universities to students. This has had the impact of reducing access of prospective students from poor families who are unable meet these high costs. Further, the state has imposed certain regulations which have circumscribed the implementation of these strategies in universities in Ghana. These regulations have also impacted on the autonomy of the institutions.

MENTRUP, THERESA* (University of Mainz, Germany)

Framing Catastrophe: Media Representations of Recent Dam Disasters in Brazil

The dam disasters of Bento Rodrigues ("Mariana") and Brumadinho are often addressed together, being the most relevant and tragic incidents Brazil has experienced in recent years. However, both dam disasters, themselves expressions of Brazil's economy-oriented, neoliberal governmental support of extractive industries, are framed rather distinctly by government and media alike. Whereas the disaster of Bento Rodrigues stipulated categories such as "environmental accident", the collapse of the tailings dam at Brumadinho was primarily addressed as a "humanitarian catastrophe".

This paper sets out to unravel these "disaster narratives" (Samuels 2019) by closely analyzing a selective corpus of national and international newspapers' framings of both the disasters of Mariana and Brumadinho. The crucial question is, what political consequences emerge from the different ways in which the collapses of infrastructures are addressed? What different types of responses, politically, legally, and administratively arise from the rhetorics of disaster management? To what extent are these responses met by counter-narratives and resistance, if any? And to what extent do national and international newspapers frame the disasters differently?

Posing these questions, this contribution aims at scrutinizing the seemingly self-evident differentiation between so-called "natural" and "man-made disasters" (cf., e.g., Hoffman & Oliver-Smith 2002). It argues that it is not only crucial to destabilize the notion of an essential difference between these types of disasters, but instead focuses on the political implications of the rhetorical epistemologies of the daily catastrophes brought into our lives by newspapers, digital media and others.

La Dimensión Socio-Material Del Trabajo y De Las Identidades De Docentes En Materias Técnicas En Una Escuela Secundaria Universitaria Inclusiva y De Calidad

Este trabajo es un ensayo visual sobre la dimensión socio-material del trabajo y las identidades laborales de docentes de materias técnicas en una escuela secundaria que se inauguró en 2014 en la Ciudad de Buenos Aires, en un barrio donde no existía una oferta escolar vinculada a la temática. Como antecedentes tomaremos estudios sobre la producción social de las identidades y el trabajo docente, que han sido objeto de atención de numerosas investigaciones en Argentina (mayormente cualitativas). Partiendo de tomarlas en cuenta, presentaremos modos específicos de interrogar el carácter social, situado y construido del trabajo / la identidad docentes, usando para ello una metodología de uso y análisis de imágenes. Presentaremos datos de una escuela secundaria técnica creada en 2014 como resultado de un convenio entre una universidad nacional y el Ministerio de Educación de la Nación, con el objetivo de incluir a jóvenes de zonas vulnerables a través de una propuesta académica, temporal y espacial que modifica e interpela aspectos clave de la llamada "gramática escolar" o del "formato escolar" de la escuela moderna. En este trabajo analizaremos fotografías (de docentes y de una de las investigadoras), entrevistas y observaciones participantes durante el trabajo realizado por una de las investigadoras desde el 2015 hasta el presente. Las imágenes tomadas (en particular de los objetos, herramientas y espacios) nos abrieron una veta analítica que no se había contemplado originalmente: la centralidad de la dimensión socio-material del trabajo de docentes en materias técnicas. Partiremos de tomar la perspectiva de Latour para analizar las fotografías, relatos y registros de campo como huellas, inscripciones, de redes sociomateriales que producen cotidianamente sentidos sobre el "buen docente" en el área técnica en esta escuela que busca ser inclusiva y con calidad educativa; pondremos la perspectiva de este autor en diálogo con otra

Potencialidades y Desafíos Del Estudio Visual Del Muralismo Como Práctica Visual, Material y Productora De La Ciudad

En este trabajo analizaremos el recorrido analítico y metodológico que hemos encarado en el estudio de prácticas de producción de murales en las calles de Valparaíso, Chile. Nuestra investigación muestra que el hacer murales, grafitis y street art forman parte de una economía política y simbólica de la ciudad. En el caso de los murales, nuestra investigación evidencia que contribuyen, por un lado, a la mercantilización de la ciudad, a la gentrificación de ciertas áreas (llamadas cerros) y a su construcción como destino turístico. Por otro, el muralismo también es una práctica orientada a recordar eventos, personajes locales, y oficios y a visibilizar luchas sociales históricas y/o presentes. El muralismo es una forma artística de intervenir en espacios (públicos y privados) reconocida internacionalmente. En el caso de Chile, los murales fueron utilizados como propaganda política de agrupaciones de izquierda durante la década de 1970. En ese período, los murales eran hechos colectivamente utilizando imágenes familiares y de manera rápida. Se proponían no sólo convocar apoyo sino también educar e inculcar visiones sobre las disputas sociales y políticas contemporáneas. En esta ponencia mostraremos cómo el análisis de las imágenes de los murales fue punto de partida central para formular las preguntas de investigación y orientar la estrategia metodológica. También analizaremos cómo las imágenes (en particular prestando atención a lo visible, lo visual y lo virtual -Didi Huberman), los relatos y registros de campo nos ayudaron a desnaturalizar nuestras propias miradas. Realizamos nuestro trabajo de campo en setiembre de 2019 en Valparaíso y en Viña del Mar; el cual incluyó entrevistas caminando, dos entrevistas semi-estructuradas a un grafitero/muralista y a un "articulador cultural", y observaciones participantes en un evento de diseño, dos tours turísticos, y en la realización colectiva de dos murales (en uno participamos en el diseño y elaboración).

Globalization and Migration in the Tempest of the 'return of Borders'.

My conference is about globalization. It has a double ambition. On the one hand, it is a question of understanding the social and historical construction of productive systems embedded in globalization and their ability to fit into a global economic space. And, on the other hand, to tell a "different story" of globalization, from a triple point of view: goods (worthy and unworthy), people and territories. Globalisation is a complex phenomenon that we consider here mainly in terms of the transnationalisation of the economy, i.e. the emergence of "free zones" (Mercier, 1997, 2017) or "grey zones" (Azaïs, 2014) or corridors, one of the characteristics of which is to shelter the intensive exploitation of rich territories and to promote the circulation and circulation of the resources produced and transformed. These areas operate as capitations or concessions (A. Membe, 2013). They are made up either of abandoned territories or industrial parks, real extra territories administered under different direct regimes. This new warehouse economy is based on the commodification of relationships that, until now, have escaped, at least in part, the manufacture of goods.

We will try to analyze four phenomena : 1) the creation of new transnational productive territories, 2) the role of migrants in their emergence, 3) the impact on the socio-economic restructuring of 'local' companies, 4) the return effect on local labour markets and the mobilisation of freight forwarders.

Política Social De Nueva Generación, Pobreza Alimentaria: Los Saldos Del Sexenio 2012-2018. Los Retos Del Nuevo

El objetivo del presente trabajo es analizar la política social como el instrumento del Estado a través del cual se conciben, diseñan e implementan, entre otros, los programas de combate a la pobreza y pobreza extrema, con el propósito de explorar sus alcances en el corto plazo (sexenios), en un escenario de austeridad, desconcentración y descentralización. En particular nos interesa analizar la Cruzada Nacional contra el Hambre (CNcH), denominada en su presentación como una estrategia de política social de nueva generación, cuyo objetivo era la atención de la población en situación de pobreza extrema, con carencia alimentaria. En estas características radicaba su fortaleza. Dada la definición y características de la CNcH, se utilizará para el análisis el enfoque de la Nueva Gerencia Pública en su especificidad de la Gerencia Social, que se inscribe bajo el paradigma posburocrático.

Se contrastará con la política de atención a la pobreza anunciada por el nuevo gobierno (2018-2024), la cual se sustentará en los programas integrales de bienestar. A través de estos programas se pretende acabar con los intermediarios y el clientelismo, que los programas lleguen directamente a los beneficiarios, trabajando directamente con la gente a lo largo del país. Este ofrecimiento forma parte de su capital social y político, por lo que requerirá establecer una estrategia de corto plazo para remontar la pobreza extrema en la cual se encuentran 9.4 millones (7.6%) de mexicanos y 55.4 millones (43.6 %) en situación de pobreza.

Por último es importante identificar el saldo de seis años de política social y derivar los retos del nuevo gobierno en materia de política económica, política social y programas específicos que se definan. Entre los propósitos anunciados, se encuentran modificar la concepción bajo la cual se conciben los programas y la forma como se implementan.

Re-thinking transnational care circulation trajectories within immobilizing regimes of migration: implications for ageing and proximate care

In this paper we argue that the current political context of restrictionist migration policies resulting either in immobility or highly conditional mobility, is dramatically affecting people's capacity to cross borders to engage in proximate care with their families, which is a central feature of transnational care practices that is often overlooked. We examine how the wider context of temporality, restrictive mobility, and heightened uncertainty about the future affect people's ability to be mobile, to move back and forth for caregiving, and to what effect, in particular in relation to ageing. The first sections of the paper present the care circulation framework and the particular meaning and function of proximate forms of care, as well as the main categories of care-related mobility that support this. We illustrate the main dynamics and challenges faced by transnational family members who engage in these care-related mobilities, through three vignettes involving care circulation between India and the UK, China and Australia, and Morocco and Belgium. In the final section, we discuss our vignettes in relation to the political, physical, social and time dimensions of current regimes of mobility that impact on care-related mobilities. We argue that the regimes of mobility that currently govern care-related mobilities are best understood as 'immobilizing' regimes with important and undervalued implications for ontological security and wellbeing.

Argentina's Demographic Transition: A National-Level Analysis of Fertility Patterns (1980-2010)

Argentina's fertility declined relatively early, compared to most other Latin American countries, but it did not lead to a high period of natural population growth, as in the case of Western European fertility transitions. Yet, by the beginning of the current century, Argentina was experiencing fertility stagnation, despite women's increased formal education, greater female labor force participation and increased contraceptive availability. The most common hypothesis regarding fertility stagnation in Argentina relates high fertility to poverty at the household level in certain regions of the country. There is thus a question whether, in this context, Argentina will complete its transitional process in the near future.

Despite the relevance of this question, few scholars have analyzed fertility trends in Argentina since 2001. Has fertility in Argentina indeed stagnated? Is the decrease of fertility related to the emergence of an incipient second demographic transition, characterized by increased childlessness, or is it expressing the end of the first one, characterized by a decline of fertility towards replacement levels? Which are the birth cohorts that are driving this fertility decline? This article aims to answer these questions by examining the decrease in Total Fertility in Argentina between 1980 and 2010. Using the 1980, 1991, 2001, and 2010 Demographic Censuses, I argue that, counter to claims of fertility stagnation, fertility has continued its downward trend from 1980 to 2010. However, this is not an indicator of an emergent second demographic transition, but of the end of the first one. Indeed, changes in fertility behaviors are given by a decrease in the mean number of children per woman, but not by an increase in childlessness. Finally, I argue that this drop in the fertility rate is mainly driven by certain birth cohorts.

Complexity and Chaos As Persuasive and Performative Metaphors in Social Sciences

Complexity, complex, emergence, chaos, edge of chaos, non-linearity, self-organization and other terms associated with broadly defined complexity studies have become a part of vocabulary of social sciences already in the 1980s. Due to multiple uses and misuses, sometimes even as "buzzwords", their applications were challenged by the dilemmas: "Fad or a promising concept" or "Fad or radical challenge". In sociocybernetics the answer to these questions is already known. In social sciences they are still used without a deeper reflection. It concerns especially their applications as analogies and metaphors. Deeper studies show that due to ignorance, lack of specialized knowledge, those utterances have become dead metaphors with all negative consequences, e.g. reification, misuses, misinterpretations. A closer look allows to observe that applications of metaphors drawn from "complexity science" gives them an additional "scientific" value. A deeper analysis of origins and confusions associated with those terms, e.g. chaos theory as incidentally chosen label for a class of non-linear equations or misunderstandings associated with the term "edge of chaos", leads to the conclusion that their impact derives not from their usefulness as analogies and metaphors but from their emotional and persuasive value. The aim of the paper is to identify the applications of the complexity-related utterances – complex, complexity, complex adaptive systems, chaos, and the edge of chaos in social studies as emotional persuasive and performative utterances. The discussed cases will show, how for example, a highly emotionally laden term "chaos" is used in theory and practice of power-related areas such as management and security studies. The cases under study will show how the use of the terms complexity, chaos and edge of chaos creates additional possibility to create new power structures – the proponents of those terms as the actors with additional influence in creating social reality.

MESJASZ, CZESLAW* (Cracow University of Economics, Poland)

Paradoxes and Barriers of Sociocybernetics in Information Society

It may seem that the discussions on identity and self-assessment of sociocybernetics are counterproductive. It also seems that the answers to the question – what were the reasons that most promising ideas of human thought such as cybernetics, sociocybernetics, systems thinking did not meet their expectations created at the time of their origin have been already given in multiple critical and self-critical writings. The present status of sociocybernetics may seem pessimistic but a closer look shows that there are sources of optimism concerning the future status of this area of human knowledge. It is necessary to look at the present state and the future of referring to the paradoxes affecting sociocybernetics. The studies claiming to be sociocybernetical are not influential but at the same time, the term "cyber" is common in all areas where modern technology is entering the social life. The academic institutional status of sociocybernetics is not so influential but at the same time there exists something that I call the "Industry of Systems Research and Complexity Conferences" organized by multiple international organizations.

The main aim of the paper is to identify and to assess the most influential paradoxes, or in a broader sense, dualities (which will be defined in the paper) hampering development of sociocybernetics. The main conjecture of the paper is as follows: The better understanding of those paradoxes should help in overcoming the barriers of sociocybernetics. As the point of departure the following fundamental paradox (dialectics???) will be investigated. On the one hand sociocybernetics assumes a possibility of influencing the social processes at all scales. At the same time the core assumption of modern democratic liberal society is self-organization.

A broad survey of literature on sociocybernetics, systems thinking, and complexity studies will be the main element of empirical research.

MEYNERT, MARIAM* (Lund University, Sweden)

Problematizing Subalternity and Intersectionality within Childhoodstudies

Intersectionality is the new buzz word in academics that argues for inclusion of voices from various locations and is consonant with postmodern conceptualizations. In this paper I explore the concept of intersectionality and its history. *Intersectionality* is defined as the complex, cumulative manner in which the effects of different forms of discrimination combine, overlap, or intersect.

Antonio Gramscii coined the term *subaltern* to identify the social groups excluded and displaced from the socio-economic institutions of society in order to deny their political voices. Children have been in the past and within modernity treated as being subordinate to adults; of inferior status and have not been allowed nor had much voice or agency. They show characteristics of subalternity – located within a space of inferior status. Parellels can be drawn in the physical and epistemic violence with which colonized people were controlled and the treatment of children.

In this paper I problematize the notion of *Subalternity*. I argue that the subaltern other can be understood as having a voice and agency, but the powerful, knowledge producing other who interpret their voice and agency adapt, reframe, mis-recognize and suppress what subalterns actually do or would say. I also argue that childhood is socially constructed at the intersection of class, gender and sexuality, culture, ethinicity, race and age etc. I invoke Indian children and childhood as a case in point to problematize the notion of *intersectionality* by arguing that in the context of childhood studies, "essentialist notion" of the child and the victimized "girl child" while calling attention to situations of inequality and injustice, can ignore and devalue the common experiences of impovershed, lower caste, Dalit and Adivasi boys and girls.

RC51-628.2

MEZA CUERVO, MANUEL* (Bears and Guts, Mexico)

A Second-Order Observation to Prevent Bias on Big Data Analysis

The cyberspace is an excellent source of data about social practices. We can track how we travel in the cities, what we eat, what we buy, which brand we prefer, what movies and tv shows we watch, what we read, what music we prefer.

The big data analysis allows crossing all the information that we have from society and establishes a correlation between everyday practices and several social expressions, as political preferences.

In this paper, we will explore how a sociocybernetic approach helps to analyses all the data. Big data is a vast collection of data. When we play with that amount of data, we can get almost any correlation such as if you sell more ice cream, you would expect more shark attacks.

A second-order observation of the dataset analysis is a great tool to observe all the biases that modify the observation system that we construct to analyses all the available data.

Urban Violence in Brazil: Abuse of Power and Extrajudicial Executions Vis a Vis SDG 16

Since 2015, Brazil has taken a seemingly proactive role in implementing the SDGs. As co-convenors of the global Pathfinders Network for Peaceful, Just and Inclusive Societies, the country has a focused interest on SDG 16. Nevertheless, the national 2018 elections represented the rise of a nationalist and unilateralist new Right. The new political agenda supports gun ownership and more proactive policing when fighting violence, especially in connection with low income regions in which criminal activity has traditionally dominated the public scene. Research on police killings have shown a rise in excessive force, extrajudicial executions, accidental killing of innocents (including children) and more recently, public support for extreme policing methods from governors and high-ranking politicians.

This article explores the interpretation that SDG targets should not be exclusive of one another and should gradually be met with a minimum balance; the achievement of one target should not be in detriment of another. Therefore, reduction of violence and related deaths (16.1) should not be achieved through actions by police that in essence are in breach of the rule of law and equal access to justice (16.3), for example through the use of excessive police force or extrajudicial executions. This article aims to *a)* develop a holistic view of SDG 16 and particularly targets 16.1 and 16.3 *vis a vis* the current circumstances of policing in Brazil; *b)* reveal data around police killings and the use of excessive force in Brazil compared to related data from other countries; *c)* adopt Fairclough's Critical Discourse Analysis on select government texts on supporting such police methods; *d)* compare SDG 16 targets 16.1 and 16.3 adequate interpretations (item *a*)

with the current prevailing political discourse and police practice (items *b* and *c*). We conclude by revealing incompatibilities between practice and discourse of the Brazilian government and SDG 16.

Far Right Political Contra-Revolution and Critical Social Aesthetics

On the theoretical assumption that social pathologies are immanently related to the capitalist formation of society, the focus of this session is to render damaged life visible as it reveals itself within contemporary culture and everyday life. In relation to the ongoing process of globalization and the expansion of the (Western) culture industry, the reconciliation of the general and the particular seems to increase in everyday life, mirroring the flawless perfection of a shopping-mall atmosphere. However, with growing profits for the few and a tremendous increase in social inequality, and thus poverty, the sham world of perfection fails to eliminate the perception of societal power relations and violence as inevitable in related to capitalist society. By means of a critical concept of social aesthetics, bourgeois-coldness and its "alliance" with contra-revolutionary opposition is to be revealed. Is the contemporary far right political contra-revolution to be understood as a logical reaction to the experienced "aesthetical coldness"? To answer this question, the focus of analysis of this presentation will be on the relation between critical social aesthetics and the political far right.

MICHELSEN LA COUR, ANNETTE* (University of Southern Denmark, Denmark)

It's just Roskilde: Moral holiday among tolerant festival guests in Denmark. Theft, sexual assault and transgressional behavior.

130.000 participants with an average age of 24 join the Roskilde Festival every year in July. The festival is the second largest and youngest festival in Europe, for 8 days each year in July. After a sudden rise in the number of reported rapes, sexual harassments of girls and women and other transgressional behavior concern has led to undertaking an explorative study of festival behavior with specific regard to issues of safety. In 7 camps 51 interviews with 159 male and female festival guests between the age of 16 and 28 were conducted. Expert interviews with organizers and NGO's were also conducted. Findings showed that participants in general feel very safe due to a very friendly and tolerant festival culture, but also that sexual harassment of girls through verbal call-outs named "cat calling" and the belittling "tiger-mis" (baby tigress) as well as through physical attempts to force the girls to do lap dances, to grade their looks and breasts offering them a "free beer for free tits" are widespread. Many girls see this as a sexual assault. The findings also showed that both sexes can be aggressive in their sexual behavior. Theft from tents and camps played a major role in creating distress and insecurity and seems to accelerate due to the tolerant festival culture. Girls do take precautions, the study showed, and have developed strategies of resistance to unwanted sexual encounters in which the camps. Their camp mates play a significant role in enhancing security. The strategies can be seen as acts of resistance towards sexual consumption in the sexualized space of the festival. The understanding of transgressional behavior as "moral holiday" seem useful in order to explain both the behavior and the tolerance.

MICHON, PIOTR* (Poznan University of Economics and Business, Poland)

The Attitudes Towards Migrants and Refugees in Poland – the Study of Internet Forums.

According to Eurostat only in 2017 Poland issued more visas and legal residency to foreign workers (mostly Ukrainians) than any other country in Europe.

The practice of countries with experience with immigrants proves that effectiveness in managing immigrant streams and social cohesion depends on formulating goals and attitudes towards immigration in the form of immigration and integration policies. The latter is a derivative of the former. It is about formulating a clear position on whether - and to what extent immigration is needed or tolerated by a given country - and developing immigration strategies on this basis - especially provisions on legalization of residence and work permits and integration strategies

The survey studies show that Poles are not open to accepting refugees from countries affected by armed conflicts, although the willingness to give them at least temporary shelter depends on which country they come from. The percentage of Poles who are against receiving refugees from the countries affected by armed conflicts has risen from 21 percent in May 2015 to 60 percent in June 2018. The attitude of Poles towards asylum for Ukrainians from areas affected by armed

conflict is completely different. In 2018 over half of the respondents (56%) were in favor of accepting refugees from a neighboring country, while slightly more than a third (35%) was opposed.

This article presents study on attitudes towards immigrants expressed on Polish internet forums. Thanks to anonymity, the forums provide unique data on sensitive, difficult and complex topics. This article analyzes them in terms of attitudes towards immigrants and I am looking for answers to questions about immigrants' deservingness for help from the Polish society. I assess the perceived deservingness for help by analyzing six criteria for its assessment: reciprocity, attitudes, needs, control, identity, adequacy.

RC19-225.4

MICHON, PIOTR* (Poznan University of Economics and Business, Poland)

The Relative Approach to Families' Deservingness – Study of Internet Forum on Social Benefit in Poland.

The internet forums allow for analysis of typical discourses in different interest groups. They provide hierarchally structured, natural data; almost unlimited amount of material for social scientific analysis (Holtz, Kronberger, & Wagner, 2012) and constitute a kind of not moderated 'virtual focus group' (Moloney, Dietrich, Strickland, & Myerburg, 2003). The analysis of the internet forums aims to identify the sources of parental (un)deservingness for help and to learn about the popular images of the parents and families who are the welfare state target population. In contrast to face to face studies, internet forums are fully anonymous and motivate contributors to greater openness. It is planned to analyse minimum of 50 non-commercial internet forums and minimum of 1500 statements, which express peoples' views related to "Family 500+". In the analysis of internet forums we intend to concentrate on the way people in Poland perceive and understand the deservingness criteria: control, reciprocity, need, attitude, identity, adequacy.

Initial studies of ten Internet forums indicate that when assessing the deservingness, online forums participants very often use the *relative approach*. They formulate opinions on the functioning of the welfare state, obligations of citizens, fairness, reciprocity etc. by comparing the situation of the beneficiaries of the *500+* program with the situation of other potential beneficiaries of social programs (people with disabilities, childless young people, unemployed etc.), parents who did not acquire rights in the 500+ program, and their own situation. Thus the study aims to analyse *the role of relative approach* for deservingness evaluation.

Everyday Citizenship in the Contexts of Grexit & Brexit: A Study of Discourses in Greece & the UK

The paper interrogates constructions of citizenship in the UK and Greece and the categories made relevant in the contexts of Grexit and Brexit. Grexit and Brexit are treated in the research as contexts of meaning making and negotiation, and in that sense as verbal and rhetorical contexts of (i) contestation and mistrust, entailing arguments and counter-arguments related to the two countries' relationship with the EU and 'others'; (ii) critical junctures in the sense-making of mobility and belonging, with the potential to resource constructions of identity and citizenship in specific ways.

We focus on everyday discourse (semi-structured interviews), as policies and laws provide the institutional framework for membership and integration but these are *also* matters of everyday social relations and public debate. In the context of increased mobility into and across Europe since 2015 and of challenges to national policies and EU integration, lay theories of citizenship, whereby new or potential citizens are evaluated in terms of their cultural similarity, civility or willingness to abide by local law and custom become all the more relevant. We analyze these constructions drawing on discursive and rhetorical approaches.

Focusing on people's own orientations to the above provide useful insights into social action, as citizenship is viewed as a wide spectrum of different kinds of rights, duties and claims, describing and regulating the multidimensional relations between citizens and the state. Such a take on citizenship, as actively constructed by social actors, is important not only in claiming rights and political participation, but also in enabling citizens who do not qualify for the title of the citizen of a specific state to identify themselves as such. In this way citizenship studies can escape the narrow focus on traditional civic rights, shedding light to previously overlooked aspects of citizenship, while emphasizing social actors' agency and politicization.

MIEG, HARALD* (Humboldt-Universitaet zu Berlin, Germany)

Science As a Profession and Its Social Responsibility

Science is considered a necessary basis for professions. However, only a few scholars, such as Bed-David, considered science as a profession itself. Merton, in his reflections on the scientific ethos, spoke of the disinterestedness of scientists and justified this by the "virtual absence of fraud" in science. That has dramatically changed: Worldwide, we see an enormous expansion of the scientific sector, driven by growth in both the academic sector (universities) and R&D within industry; with this increased demand, fraud has also increased. Therefore, in 1992 (later even than belated professions such as psychology or social work), the National Academy of Science elaborated and published a codex for scientists. This paper presents data based firstly on an analysis of professional codes of ethics (including science as a profession) and secondly on epistemological beliefs (students) and trust in science (general public). It is argued that in the last 50 years the status of science has changed from "scientism" (science as "religion" and the last source for legitimization) to science as a profession, representing one voice among other professions. Accordingly, the social responsibility of science has also changed.

Shades of (Non)Belonging: Symbolic Boundaries within and Around the Bosnian Diaspora(s) in Austria

Within an ongoing research project, I have been focussing on the analysis of biographical identities of Bosnian diaspora(s) living in Vienna. Drawing on a reconstructive analysis of in-depth interviews conducted with Bosnian-Austrians of different ethnic/religious and social backgrounds as well as different migration histories, I aim to decipher the dynamics of their identity constructions and their senses of belonging, including the actual relevance of ethnic and other forms of symbolic boundaries.

Thus far, the analysis suggests that experiences of war as well as migration and life in minority settings have a strong impact on the interviewees' self-perceptions and their perception of others. However, war and migration are not only processed very differently depending on when and how they are experienced—as a child or as an adult, directly (as a first-generation migrant) or indirectly (as a second-generation migrant). People's social backgrounds, as well, seem to be of utmost importance regarding the questions of how individuals biographically process war and migration; of their self-identification and self-positioning, and of their reactions to being socially positioned by others.

Regarding both the self-positioning and the positioning by others, the analysis reveals that within and around Bosnian communities in Vienna, different symbolic boundaries are at work: Ethnic boundaries—(re-)constructed and (re-)enforced by the wars in former Yugoslavia; the symbolic boundaries between ex-Yugoslavian minorities and the Austrian majority, as well as the milieu-specific symbolic boundaries within the community itself. In my presentation, I will focus on a discussion of the intersections of these boundaries as well as the manifestations and ambivalences of belonging and non-belonging and the associated processes of identification and distinction.

Digital Vs. Social? for a Socio-Technical Theory of Mobilization in the Datafied Society

Datafication—the last transformation of digitalization—has brought about a fundamental paradigm shift in the contemporary socio-political order. On the one hand, the diffusion of 'big data' and artificial intelligence alters our conditions of existence in society, affecting also social movements. On the other, the crisis that has infected liberal democracy at the turn of the century has been accelerated by the so-called 'surveillance capitalism', with democratic norms being challenged by the new expression of power enshrined in the global architecture of data commodification—at the expenses of political mobilization. The state-industry surveillant complex is replacing governments as the primary holder of the monopoly over information and control, leaving little room for human agency.Linked databases, platforms and apps—the information architecture of datafication—are changing the definition of what constitutes public sphere and political participation in the datafied society—hence, of what constitutes democratic agency today. How are social movements changing? What makes collectivity nowadays? But also: What sort of spaces, mechanisms, and actors meet the growing demand for citizen participation?

This theoretical contribution addresses three notions, namely 'data citizenship', 'data activism' and 'data epistemology'. Taking data and datafication simultaneously as objects of contentions and elements of a novel politics of the quotidian, it explores how contemporary engagement with grassroots and top-down

data politics and practices alters the way people enact their democratic agency. Emerging data practices have the ability to give new meaning to the notion of democratic agency, forcing us to rethink the relationship between the state and its citizens. Data citizenship, data activism and data epistemology are offered as the building blocks of an emerging socio-technical theory of agency and mobilization in the datafied society, neededto meet the ontological challenges datafication poses to established socio-political practices and mobilization patterns in Western democracies.

The Invisible Governance of the Brazilian Black Population's Health in Local Bureaucracies in Rio De Janeiro

This paper analyzes the implementation of the National Integral Health Policy for the Black Population (PNSIPN), in Brazil, in local Health Care Units administering the Family Health Strategy (ESF), in Rio de Janeiro. Given the legal-institutional construction of the PNSIPN, the research analyzed its policy implementation process in three Units located in racially segregated areas in Rio, based on documents of the State, on twenty-two months of ethnography in these Units and on fifty-seven in-depth interviews with public health professionals working in that bureaucracies. Based on theoretical perspectives of public policy implementation, on racial relations and on the repertories of actions, the analysis revealed that the governance of the black population's health was effectuated in different ways among the fragments of the State. Regulation of health services for blacks was achieved by visible bureaucratic practices such as the institutional-legal engineering for focalizing public health. In parallel, it was constructed by less apparent bureaucratic practices such as the organizational silence regarding the Policy and racial inequalities, the repertories of actions of resistance and engagement to focused public health and mediations of the socially vulnerable user that were inclusive or exclusive, depending on whether they were allocated to the non-official category of *difficult service users*. The paper will focus on the invisible governance of the black population's health which boosted consequences in the process of continuous implementation of the focalization at the local bureaucracies, such as: almost total absence of practices with an public health focalized, enhanced rejection of regulatory and daily proposals for a focalized health, the reproduction of essentialist justifications for racial inequalities in health, the censure and disuse of existing local expedients for focalization, the reproduction of inter-sectional race, gender and class stereotypes and the evident discrimination in the care offer to service users classified as *difficult*.

Who Is the Slacker Here? Rethinking Organizational Misbehavior in the Digitized Workplace

This paper examines a series of factors that motivate employees to engage in personal Internet use at work (PIUW) and the ways in which such workplace arrangements as flexible employment, task-based work, and overworking affect the quality and the quantity of PIUW. It begins by conceptualizing PIUW in the context of multiple interconnected technological, socioeconomic, and cultural changes that have been shaping the world of work in the past three decades. In particular, this analysis draws inspiration from contemporary Autonomist theorizing of work and digital media (Berardi, 2009; Virno, 2004). In this context, it shows a highly multidimensional and heterogeneous nature of this phenomenon. This multidimensionality manifests itself in the idea that personal use of the Internet and digital technologies during working time can be understood as a social condition produced by the increasing digitization of all spheres of life. It can also be framed as a "cognitive navigator" that helps workers to make sense of their increasingly disjointed working time.

In order to test these propositions, the paper employs a mixed-methods approach by combining a survey of 650 respondents from a random stratified sample of workers in Canada, Sweden, the United Kingdom, and the United States with 50 in-depth interviews. The results show that both socio-demographic and occupational characteristics matter when it comes to the quantity and the quality of personal Internet use at work. Younger employees, as well as those who work on projects and experience job precarity, are more likely to engage in high levels of PIUW. Women's PIUW is motivated by uncertain job prospects, whereas men's use of digital technologies for personal purposes can be explained by high levels of job flexibility. Furthermore, restrictive policies on PIUW have a significant effect on the personal online activities associated with networking and communication but not on entertainment-oriented PIUW.

Transparency of Information on the Water Basin Committees Plenums in the Sao Paulo Macrometropolis, Brazil

The Sao Paulo Macrometropolis (SPMM) is the most important urban agglomeration in Brazil and includes more than 170 municipalities (including the Sao Paulo Metropolitan Region) and more than 33,6 million inhabitants. Recently (2014-2015) the SPMM faced a severe water crisis. This region presents complexity of water resources management, and there are eight Water Resource Management Units (UGRHI) completely or partially in the area of the SPMM. The National Water Law in Brazil was created in 1997, incorporating modern water resources management principles and creating the "Water basin committees", which incorporate civil society actors on decision making. The transparency of information on water resources management are one of the fundamental conditions for achieving good water governance, along with promoting participation, inclusion, accountability, predictability and responsiveness. Considering the importance of the transparency of information on water resources management, we aim to evaluate whether the plenum's minutes of the Water Basin Committees that are part of the SPMM are made available publicly on the Portal SigRH - Integrated System of Water Resources Management of the State of Sao Paulo. Considering the plenum's minutes encountered, we also aim to identify the most discussed subjects in plenary sessions using text mining methods.

Think Tanks Latinoamericanos y Sus Conexiones Con El Gobierno y Las Corporaciones De Estados Unidos.

Reconocidos como "actores" importantes en el proceso de formulación de políticas públicas, los think tanks (grupos de expertos) reciben actualmente la atención de una extensa bibliografía. Su influencia efectiva y su definición siguen siendo controvertidas. Generalmente identificados como organizaciones que investigan y formulan propuestas de políticas públicas, el número de think tanks ha aumentado significativamente en América Latina en los últimos veinte años. Muchos de ellos establecen diversas formas de relación con think tanks, agencias gubernamentales, corporaciones y universidades estadounidenses y, según diversos análisis, han contribuido para la expansión y consolidación de políticas neoliberales en el continente. Específicamente, através de esta investigación se identifican las conexiones de los think tanks latinoamericanos con el Center for Internacional Private Enterprise (CIPE), una entidad privada financiada por el Gobierno de los Estados Unidos y vinculada a la American Chamber of Commerce y al National Endowement for Democracy (NED), también financiada por el gobierno de ese país. Con la propuesta de democracia y libre mercado, de acuerdo con las estrategias geopolíticas de los Estados Unidos, el CIPE actúa a través de la "cooperación" con organizaciones locales en los países donde opera, especialmente con asociaciones empresariales y think tanks, entre ellos, el Centro para la Implementación de Políticas Públicas para la Equidad y el Crecimiento (CIPPEC - Argentina), la Fundación para la Educación Superior y el Desarrollo (Fedesarrollo - Colombia), Fundar - Centro de Análisis e Investigaciones (México), Centro de Divulgación del Conocimiento Económico para la Libertad(CEDICE- Venezuela) y el Instituto de Ciencias Políticas (ICP - Colombia). El período considerado es del 2012 al 2018 y los procedimientos metodológicos incluyen la investigación bibliográfica y documental y el análisis de redes sociales, utilizando el software Ucinet6, que permite la evaluación de las conexiones entre las organizaciones y la visualización gráfica del fenómeno estudiado.

ARANCIBIA, MILENA (FLACSO, Argentina)

Place, Belonging and Intersectionality: The Daily Construction of Young Women Segregation in the Metropolitan Area of Buenos Aires.

In recent years, youth studies have assimilated the dimensions of time, place, belonging and affectivity in the daily construction of young women segregation in the Metropolitan Area of Buenos Aires as key elements that allow to think locally the construction of subjectivities. The development of territorial and temporal studies has been especially prolific in Latin America, where class, gender, ethnic and age segregation give great diverseness to the life trajectories of young people. The conceptualization of place and belonging has generated a number of debates about youth subjectivities with strong territorial anchorage, contributing significantly to diversity in the field of youth studies. Gender perspective and the

study on the sexual division of labor represent a strategy of great importance when explaining inequality and its consequences, which becomes intersectionally evident through the daily life of young women.

This presentation suggests the analysis of evidence generated within the framework of the project 'Colectiva Joven', carried out thanks to the support of FAPESP and Canada's IDRC, through a qualitative research in urban relegated neighborhoods of Argentina. Specifically, it presents the results of an action research that is being accomplished together with territorial social movements, where 'collectiveness' is the main survival strategy. By analyzing the testimonies of women affected by problematic drug use in the Metropolitan Area of Buenos Aires, this presentation tries to evidence the emergence of inequality intersected in territorial fragmentation and the sexual division of labor. Finally, the conclusions reflect upon the notion of intersectionality and place based on life trajectory stories of young women, while seeking to support proposals to overcome vulnerable trajectories through the creation of community projects.

ARANCIBIA, MILENA (FLACSO, Argentina)

Trayectorias Laborales y División Sexual Del Trabajo: Territorio e Identidad Barrial Entre Mujeres Jóvenes En El Gran Buenos Aires.

Los y las jóvenes que habitan en barrios marginalizados enfrentan mayores obstaculos sociales, asociados a la desigualdad espacial que se manifiesta en territorios caracterizados por la privación, contaminación ambiental. La desigualdad espacial afecta en particular niños, mujeres y jóvenes, quienes conviven de forma cotidiana con distintas expresiones de la violencia discriminatoria, así como por la violencia común, la mafiosa o la política.

La persistencia de la división sexual del trabajo en las trayectorias juveniles de quienes habitan en barrios informales puede observarse de forma interseccional a través de las vivencias de jóvenes mujeres, sus narrativas en cuanto a sus interacciones cotidianas y sus estrategias en relación a sus barrios y grupos de proximidad. En efecto, la organización de la vida y las situaciones de privación que enfrentan las mujeres que habitan en barrios informales, ocupan la mayor parte de su tiempo vital que se dispone para la reproducción del grupo familiar de pertenencia. Entre los/as jóvenes que viven en barrios relegados, el acceso al empleo o a actividades económicas y el lugar de residencia impone mayores obstáculos, y el estigma y la criminalización se convierten en un factor de riesgo de exclusión y de exposición a la violencia.

La presente ponencia expone los primeros resultados de Colectiva Joven, un Proyecto de investigación – acción realizado de forma conjunta entre UFSC Brasil y FLACSO Argentina, gracias al apoyo de FAPESP e IDRC. En este caso, se presentaran los hallazgos de una investigación entre pares, realizada en conjunto con la Federación Hogar de Cristo en el Gran Buenos Aires.

MIRANDA, NATALIA* (CriDIS / Université catholique de Louvain, Belgium)

Digital Practices and the Emergence of the Indignant Citizen

This presentation aims to examine how, through the intensive use of digital platforms, a particular identity develops within a social movement, related to the indignant citizen.

Using the empirical case of the Chilean movement struggling against the private pension system, I will show how "citizenism" (Gerbaudo, 2016, 2017) emerges as a core ideology within one of the activist cultures (Pleyers, 2010) that comprise this social movement, from the use of social media.

Thus, digital platforms such as Facebook, allowed these prospective activists to solve the dilemma of being dispersed but wanting to participate in public discussions, also, without having strong previous political trajectories and affiliations, giving them the freedom to join as far as possible and accommodate their involvement, according to their personal commitments.

Therefore, citizenship is built through online daily conversations in Facebook groups, sharing their views and indignation about the pension model through posts, memes, and videos. This ensemble of digital practices develops a collective identity based on indignation when realizing that, as ordinary–average people, they face common challenges on an everyday basis, in other words, the fear of small pensions once they retire.

Later, their levels of agency and power are recognized, producing a sort of populist discourse, posing the indignant versus political and economic elites that take their rights to a worthy retirement. Lastly, they claim digital platforms as their arsenal, the 'weapons of common people' to regain their sovereignty, that is to say, a fair pension.

Conclusively, the presentation will emphasize the fecund uses of this framework using a particular case from the South, stressing some resonances with the global post–2008 wave in terms of political and digital practices.

MIRANDA DE ALMEIDA, CRISTINA* (University of the Basque Country, Spain)

Collaborative Collective Art Actions .

There are countless examples of collaborative artistic action. We will explore 2 kinds of collective art strategies, those that (1) make visible the problems of the public sphere in postmodern and hypermodern society and those that (2) aim at creating new forms of common through art.

The methodology used is mixed, based on a review of various theories of collective action applying them to art (LeBon; Blumer; Kornhauser; Smelser; Davies; Gurr; Morrison; Olson; Lichbach; Chong; Opp; MacCarthy; Zald; Benford; Snow; Diani; Jasper; Emirbayer; Cefaï; Meg McLagan and Yates McKee) and a series of interviews.

Orsi proposed the concepts such as 'economy of sharing', 'politics of sharing' and 'practices of sharing' and of truly collaborative economy. The hypothesis is that the concept of Collaborative Collective Action (CCA) amplifies Orsi's concepts by posing that collaborating is more than sharing and, therefore, collaboration in art is more than sharing art.

CCA in art involves actively enrolling society in all phases of a process so that the ultimate goal is the development of a sense of belonging, a recovery of social bonds between equals, through a conscious commitment to the commons and society. Art, thus understood, would contribute to restore the bonds between subject and community lost with modernity from its specific creative processes, and emerge through collective practices generated by individual artists and collectives that focus on the relationship and the creation of bonds, not on the creation of objects for the market. Common strategies are, among others, the creation of platforms and events, actions of empowerment and education to recover the commons in the public sphere. When art is understood as collaborative collective action there are impacts in relation to various dimensions of the art system.

MIRET-GAMUNDI, PAU* (Centre for Demographic Studies,)

Welfare and Marital Status in Spain in the 21st Century: Gendered Models and New Immigration Patterns

Spain went through certain labour market prosperity and an unprecedented immigration increase at the beginning of the 21st century. Indeed, both the quantity (higher activity and occupation rates) and the quality of employment (higher proportion of tenure contracts) rose during the first years of the current century. Young people have also benefited from this improvement. Some demographic indicators, particularly those related to leaving home, partnership formation and fertility, grew in parallel to these former trends. The issue analysed in this proposal has to do with the second phenomenon mentioned: did young people take advantage of the improvements in labour market conditions in order to form more partnerships with an earlier timing? Or, on the contrary, was this rise in the number of couples being constituted due to the fact that immigrants are importing their behaviour patterns in this matter from their countries of origin? And, finally, has the gender model changed among these new couples?

The Spanish Labour Force Survey (SLFS) is an excellent source of data to capture this phenomenon. It can be considered as an excellent primary dataset as it appears every three months, fieldwork is punctual and micro-data is rightly spread. Moreover, 60,000 households which are representative of the whole Spanish territory are interviewed for each wave. The first time in which the SLFS asked for the marital situation of all the members in the household was in the first quarter of 1999. Therefore, the latter has become our initial observational point. Our independent variable is made up from these two factors and identifies the individuals who have never been married (they are single as a civil status) and who were not living with a partner when the survey was carried out (as nobody in the household could be identified as so).

MISHEVA, VESSELA* (Uppsala University, Sweden)

Researching a Pandemic with a Macro-Micro Focus on Alienation

At the beginning of the Covid-19 pandemic, a group of RC36 members organized a number of colleagues from eight countries in preparing a survey that had an overall focus on the levels of worry, stress, alienation, as well as the coping strategies of different population groups during the early stages of the crisis. The questionnaire was translated into several languages, and our international research team collected comparable data from Sweden, Bulgaria, Italy, China, Brazil, Germany, Israel, and the United States that was uploaded on our quick-survey platforms. The results of these quantitative studies will first be analyzed on the national level, followed by qualitative interviews and comparative analyses regarding selected themes of universal significance. The latter include the underlying factors determining the feeling of alienation, the level of stress, optimism and

well-being, national and individual differences in the areas of greatest concern, manifestations of gender, educational and age differences, choice of information sources, and so forth.

This presentation will report on certain preliminary survey findings concerning changes in the nature and quality of experiences of alienation in modern societies that are consequent to the pandemic. It will discuss these changes in relation to structural changes. It will also argue for the need to elaborate a theoretical framework for analyzing our survey results that reflects the transformation of alienation into a macro-micro research field. Finally, it will propose that the Covid-19 pandemic has had a significant impact upon the field of alienation theory and research, moving it towards the center of modern sociological debate at a time when the foundation of the social has come under attack.

Combating Environmental Crime in the Ecological Biosphere of Similipal and Bhitarkanika: A Search for Environmental Sustainability in India

Environment explains the reciprocation of biodiversity within itself, their relationship with abiotic components in the ecosystem and is the reason for our sustenance. But, humans have made irrevocable changes to the environment through over-utilization and over exploitation of natural resources. This has caused different kinds of pollution and has driven various species of plants and animals to near extinction. Such threat to biodiversity has brought in catastrophic impact on Earth which also include environmental crime. To prevent environmental crime, legislation and policies have been enacted to empower governmental agencies to conduct surveillance and take suitable action. Policing is one such strategy used against environmental crime. But it is important that policing involve procedures which are sustainable for the environment. In the state of Odisha which is rich in its biodiversity, environmental crime is increasing swiftly. There are several wildlife sanctuaries but the difficult ecosystem of Bhitarkanika Wildlife Sanctuary and Similipal Biosphere Reserve deem some portions of it inaccessible. Bhitarkanika Wildlife Sanctuary nospans across a proud 672 square kilometre. of wetlands and mangroves, and is a home to several species of flora and fauna. The Similipal Biosphere Reserve includes Similipal National Park and the tropical monsoon climate provides ideal circumstances for the development of a distinctive biodiversity. The following is case study that has been conducted in the two ecological biospheres which seeks to assess the measures adopted by the forest officials and indigenous people in curbing environmental crimes. Further, the study shall also evaluate whether the steps undertaken by both the forest personnel and residents are in unison with the principles of environmental sustainability.

COVID-19 Pandemic and the Marginalized Women in Tourism Sector: A Study of Hill Station Mussoorie

The tourism and hospitality industry faces a severe threat from the coronavirus pandemic and is the hardest hit among other sectors. Looking at the depth and breadth of the current pandemic, it becomes imperative to analyze its impact on the vulnerable population engaged in the tourism and hospitality industry. Recognizing that women are mostly involved in low skilled jobs in the tourism sector, and due to the current cataclysmic event, they have lost their livelihood and therefore facing existential threat now. In light of this, the present paper discusses the impact of the COVID-19 pandemic on the lives of marginalized women (local, migrant, and Tibetan women) who are mainly involved in low skilled jobs in the tourism sector. The paper also assesses these women's livelihood alternatives at current times and its prospects, thereby demonstrating resilience in COVID times. The study is empirical and exploratory and employs qualitative data from fieldwork. The study is conducted in Mussoorie, a famous hill station in Uttarakhand (India) and is popularly known as 'queen of hills.' The paper suggests that despite being at higher risk, women involved in Mussoorie tourism are more resilient, which is evident in their negotiation strategy with the current pandemic situation. This study delivers an urgent need to address the equity issues concerning women involved in the tourism sector by developing a gender-inclusive approach.

Role of Micro-Credit in Empowering Women : Best Practices

Micro-credit has been considered as an effective tool in empowering the women. Empowered women play an important role in alleviating poverty through

income generating activities under micro-credit. Empowerment is a multidimensional and multi-facet concept. It refers to a strategy to achieve gender equality, which builds up their capacity to deal with the various factors. For the development of women, it is essential to improve their socio-economic status in the society. It is considered as women empowerment. Micro-credit plays an important role in reducing poverty, empowering women and creating awareness which finally results in sustainable development. Socio-economic status of women is being empowered through income generating activities under taken by SHGs. Such programmes have economically empowered women which have resulted in a greater influence in decision making along with improved status of women in their families. Micro-credit helps poor women in getting them employed, increasing their confidence, enhancing their communication skills, thereby empowered women gain major control over resources, which has been proved with the various best practices prevailing in different parts of the country. The present study would aim to examine and evaluate the development of women and their empowerment through best practices prevailed in various regions in India. The present paper highlights the effectiveness of microfinance as an important tool for women's empowerment. Further paper talks about the best practices of micro-credit prevailed in different parts of the country.

DORNELAS CAMARA, GUILHERME (UFRGS, Brazil)

The Space Produced By the Undesirables in Porto Alegre (Brazil)

Cities has always been "centres of conflict, change and transformation". Therefore, we have "to regain some notion of the city [...] as a kind of body politics to which we can reconstruct, not only the cities, but can reconstruct human relations and ourselves", understanding "that this is a political project, a class project" (Harvey, 2007: 13).

We started with this quote because it provides the context for the theme we address in this paper: the space produced by the undesirables in Porto Alegre (Brazil), By undesirables, we refer to unorganized individuals and groups of homeless, to organized street population struggling against racism, hygienism and genocide (such as the Movimento Nacional da População de Rua), and to organizations that support the people living in the streets (usually providing food routinely).

We analyze the spatial practices by which individuals and organizations produce temporary places of convergence, differential spaces in which each place and each moment exist within a whole, "through the contrasts and oppositions that connect it to, and distinguish it from, other places and moments". They produce heterotopies: places of difference "with respect to the initial place"; a difference that "can extend from a highly-marked contrast all the way to conflict" (Lefebvre, 2003: 38). The existence of these heterotopies, some more permanent, others more temporary, makes the contradictions in which we are embedded aggressively visible. Drawing on Lefebvre's work on the production of space, we analyse the ways in which they disturb the experiences and routines of everyday life; as well as the subversion of the conceived ordered space by the concrete and symbolic use of its objects (Lefebvre, 1995).

MISRA, RAJESH* (University of Lucknow, Lucknow, India)

From Retrotopian Politics to Dystopian Future: An Appraisal of Contemporary India

India is a glaring example of the rise of retrotopian politics and authoritarianism in recent times. Though in India the retrotopian politics started emerging a century ago during the independence struggle but started thriving for the last three decades. The last three decades are particularly marked by a variety of collective initiatives and politically organized mobilizations by a right-wing socio-political formation to transform India from a conglomerate of diverse identities to a singular Hindu nation by recalling past and by provoking disenchantment from the present. At the substantive level, a century-old highly organized militarist initiative (National Associations of Volunteers) may be underlined to bring about change in the *Zeitgeist*, in order thereby to hegemonize collective conscience, to gain control over repressive state apparatuses as well as ideological state apparatuses, and to attain the final goal of a totalitarian regime. This has given rise to subversion human rights and democratic institutions, on the one hand, and on the other hand ascent to a brutal ochlocracy characterized by lynching mobs and the police state. Nevertheless, in India, there is a history of dissent, democratization and people's struggles for rights, equality, and freedom. This ostensive contradiction gets expressed in people's resistance and engagement with alternative visions of the future vis-à-vis the nature of intensification of the totalitarian state

power. A conceptual and theoretic explanation is called for. To explain the interplay between people/citizens and the emerging authoritarian state the two fundamental issues are addressed in this paper, (i) to what extent and in what ways the present and the future of India as democracy have shrunk and entered into a dystopian condition? and (ii) the possibility of reconstruction of history (democracy) by the people as collective agencies in terms of enlarging the public sphere.

RC08-94.3

MISRA, RAJESH* (University of Lucknow, Lucknow, India)

Tradition Vis-à-Vis Modernity: Some Reflections on a Practice of Sociology in India

The history of institutional Sociology of India is coterminous with the history of Sociology in academic institutions in Europe, particularly in England. As a matter of fact, there is a colonial connection. There emerged two distinct institutions and practices of Sociology, one at Bombay and another at Lucknow just after the death of Max Weber and First World War. Both have a deep-rooted impressions on the nature and practice of Sociology in India in the initial phase of development of Sociology in India. The Lucknow tradition of Sociology has been characterized by an intellectual encounter with the history and society, the concomitant substantive concerns, and a shared perspectival orientation among the followers. Two of its prime concerns can be identified (i) the Indian tradition in opposition to the Western tradition, and (ii) the rational modernity as reflected in planned social change. This can be understood in socio-political context of its founders. On the one hand, the academic practice was located in the colonial framework of the university functioning, and on the other hand, it was closely connected to the ongoing national movement of India's independence. This can be observed in the practice of Lucknow tradition as it has not replicated the western theoretical perspectives, rather it has tried to develop an alternative approach by critically relating sociological perspectives to the distinct context. The substantive problématique is also positioned in the times and the specific cultural context. The sway of the tradition outgrew and informed the debates and discourses of Indian Sociology that need to be analyzed from a Sociology of knowledge point of view.

Quantitative Policing and Violent Crimes in Rio De Janeiro

Performance-related pay policies applied to the Police have been implemented in Brazil and Latin America since the 2000s in an attempt to reduce the main indicators of violent crime. The Integrated Targets System (Sistema Integrado de Metas - SIM), initiated in the state of Rio de Janeiro in 2009, sought to reduce the "strategic state crime indicators" whose results are monitored by the civil police record data. In order to understand how these policies have been implemented in the state of Rio de Janeiro between 2007 and 2018, the study adopts a quantitative approach upon criminal analysis and a qualitative one based on interviews and field observation at police stations and military police battalions. The data are analyzed considering the "strategic indicators of violent lethality", the murders and those resulting from police intervention, as well as the indicator of missing persons. The brief analysis covers the years immediately before (2007-2008) and after (2016-2018) the implementation of the policy, including the period of the financial and political crisis that began in 2015 in the state of Rio de Janeiro. Some of the policy limitations become more noticeable in criminal records in 2013, when there is a greater challenge and crisis of the Pacifying Police Units (Unidades de Polícia Pacificadora - UPP). In 2016, the delay in the payment of the bonuses and salary supplements referring to the SIM and the Additional Service Regime (Regime Adicional de Serviço - RAS) interrupts the policy. In 2019 the government resumed the pending payrolls and excluded the murders resulted by the police intervention from the strategic indicators of violent lethality.

Foreign Communication during Disasters: A Sociocybernetics Exploration of the Role of Kumamoto International Foundation during the Kumamoto Earthquakes

The Kumamoto earthquakes in Japan in 2016 led to dozens of deaths and almost two hundred thousand residents as evacuees in its aftermath. Many foreign residents faced unique challenges due to language barriers, cultural differences, and lack of preparedness. One NPO which aided the foreign community and acted as a bridge between the government, various organisations, and individuals, was Kumamoto International Foundation (KIF). KIF worked with various foreign organisation to help provide aid, liaison with evacuation shelters to help any foreigners there, and look after the people who took shelter in KIF's own facilities. Not only was this complex in itself, other unanticipated problems were encountered (such as issues between the Japanese and Islamic communities).

Using sociocybernetics principals, namely ones from Luhmann's body of work such as communication across different social levels and system/personal trust, I shall discuss how KIF organised itself and acted as a conduit for communication across and between organisations and individuals. This was of great importance when typical Japanese societal norms could not be relied on as connective mediums due to the heterogeneous nature of the actors involved. I shall also explore how these experiences helped build resilience into KIF's operations, and what can be gleamed from this experience to strengthen resilience within Japan's other prefectures at the local level.

Urban Work Environmental Violence: Challenges of Women Domestic Workers in Bhubaneswar, India

Today's educated working women face role conflict and stress in meeting the expectations of family and worklife. The only solace or relief that they find is through the cooperation of the domestic helps that they hire to perform household chores. Urban India provides a lot of employment to these women domestic workers in unorganised sector that is in the domestic sphere who migrate from the rural areas to meet their daily needs and help their family in meeting the demands of a better livelihood. Some of them work full time and some perform hour based part time work in different households to earn a living. Even children are also employed to work in the domestic sphere. The diverse work that they perform includes looking after children and elderly, cooking, cleaning, washing and managing the household.The present study attempts to explore the challenges that these women domestic helps face in the urban household environment. Contentions for a better pay, respect and empathy of the employers, perks and day breaks are some of the things that they face in their work-life. However,these women end up being starved, battered, neglected, deprived and even physically and sexually assaulted by the employers. Further, since laws protecting the rights of these women domestic workers are ignored and lacks awareness, these domestic helps are deprived of the basic rights of a worker.The present study is a humble endeavour to bring to light the demands that the women domestic helps encounter in their urban work environment in the smart city of Bhubaneswar, India, thereby looking for possible remedial measures to make the work environment flourishing, amiable and lucrative.

Past or Future: Where Is the Vector of Development of National Culture in the Post-Soviet Space Directed?

In modern post-Soviet society, the existence of national cultures occurs in two directions: traditional and post-traditional. Such coexistence often ends in intergenerational conflicts and cultural shocks. At the same time, this opposition does not in the least prevent some cultural samples from peacefully coexisting with each other.

In our study, we asked ourselves what determines the development of post-Soviet countries — synthesis or disagreement. To do this, we carried out a secondary analysis of opinion polls conducted in 2016/18 in two cities – Vologda (Russia; 189 people) and Yerevan (Armenia; 250 people).

Based on the example of the study, we saw that radiation and innovation are now in the phase of co-evolution. So, a significant role in the life of young people is played by traits that are still characteristic of the image of a "simple Soviet man". This applies to the special cost-effectiveness and frugality that the generation of melennials inherits from their parents. The exclusive authority of money is recognized by 82% of young residents of Yerevan, and a third of Vologda residents consider money more significant than knowledge. At the same time, the binary phenomena of the new culture are gradually penetrating into the life of the two countries, as a result of which the youth environment shows an orientation to the sides of life that are not related to the profession – this is a social mood (this factor is highlighted by 34% of young residents of Yerevan), a healthy lifestyle (which more important for Vologda residents).

From our point of view, the relations between traditions and innovations in the post-Soviet society should develop around the idea of the family, which will protect the society from such phenomena as "migration into the digital space", and hostility to following the social example of parenting.

MOCELLIM, ALAN* (Bahia Federal University (UFBA), Brazil)

The Birth of Psychopolitics

From Foucault we learn that biopolitics emerges in an injunction between state and capitalism, with the appropriation and use of modes of control of life. Unlike disciplinary power, which was based on direct control of space, time and circulation, on the progressive conditioning of behavior and bodies, biopolitics appropriates calculation and management to transforms control into life administration, into productivity management. Centered on the state and the market, biopolitics makes life its subject. As opposed to biopolitics, psychopolitics is a term often used by Byung-Chul Han to refer to a new power dynamic in the early 21st century. It consists in new forms of control, internalized as self control. This kind of power does not works as repressive coercion, but as drive to doing and suceed. Psychopolitics is inserted in the dynamics of an information capitalism and operates not as a repression of unwanted behaviors but as impulse to action - to work more and harder - through the internalization of social demands and self-monitoring. Psychopolitics propels the birth of a society of tiredness that, as opposed to disciplinary society, operates through a psychological discipline, moving from the individualizing pressures of the division of labor to the narcissistic pressures of self-affirmation in an information-driven global collectivity. In this paper we will discuss the birth of psychopolitics and relate its forms of power, first, to the new directions of the demands of the civilizing process as internalization of self-control and, second, to the demands of autonomy and performance of the new capitalism.

MOCTEZUMA MENDOZA, VICENTE* (Universidad Nacional Autónoma de México, Mexico)

Armed with Words: The Resistance of Street Merchants to the Gentrification Process of the Historic Center of Mexico City.

This paper is about a struggle over the spatial order of the Historic Center of Mexico City. This area has been undergoing a process of gentrification for some years now. This has meant, as one of its main features, an effort to eradicate local street vendors. The expulsion has taken place, in large part, through the criminalization and police persecution of the vendors; but also, through negotiations with them, given the resistance of the street merchants to leave the space, in spite of punitive measures.

Indeed, street traders have not been passive in the face of a process that seeks to deprive them of a place where thousands of families in poverty have accessed to sources of income, in a city that both lacks types of formal employment, or instead has extremely precarious ones. So, through persistence, cunning and solidarity, many of they have managed to resist their expulsion, although in greater conditions of precarity and vulnerability.

But the impassivity of street merchants that defies and transgresses the distribution of the sensible (Rancière) that seeks to establish the urban renovation, also take place by appropriating words. The vendors arm themselves with words and present a dissenting voice to the distribution of the sensible that assigns the places for functions, bodies and meanings; as well as what has to be felt and ways of perceiving. A distribution that establishes and orders where the street merchants are a part without part, and are identified as the despicable and the abject.

Thus, in this paper I am interested in exposing the way in which the urban poor, "the people of noise", take up words, establish new meanings and, demonstrating their equality, fight to define the coordinates of the common world.

MOCTEZUMA MENDOZA, VICENTE* (Universidad Nacional Autónoma de México, Mexico)

Control Social, Discursos Sobre La (i)Legitimidad Del Crimen y Las Desigualdades De Clase Urbanas.

En esta ponencia exploro una dimensión poco analizada en los estudios sobre inseguridad. Se trata de la descripción y análisis de cierta forma social de procurar condiciones de seguridad, que no se vinculan ni con el mercado, ni con las autoridades públicas. La forma de control social de la violencia criminal que me interesa analizar, tampoco está asociada con el despliegue de fuerza; ni con el levantamiento de murallas; ni con estrategias de evitación y elusión. Se trata más bien, de una forma de control social que opera a través de la circulación de discursos con los que se erigen marcos morales que definen la legitimidad de formas criminales.

En mi investigación etnográfica en un barrio popular central de la Ciudad de México, la Merced, me he encontrado en la voz de sus habitantes discursos que se escinden de los discursos dominantes sobre los actos criminales y los sujetos que los cometen, en los que avizoro lo que parece ser un mecanismo de contención popular de la violencia criminal: en su magnitud y espacialidad.

En estos discursos, la criminalidad no aparece necesariamente encarnada en un "otro radical" (como el que puebla maniqueamente el paradigma dominante sobre la inseguridad y sostiene la lógica punitivista). Por el contrario, en distintas conversaciones me he encontrado que cierta criminalidad es construida como "comprensible", en un contexto caracterizado por la precariedad de acceso a fuentes de ingresos tanto formales como informales. Sin embargo, al mismo tiempo, los discursos sobre el crimen, que circulan en el barrio, procuran también contener su presencia local al establecer elementos morales que median la "legitimidad" del crimen, asociados ya no sólo con las condiciones de su emergencia (la privación/necesidad), sino con sus víctimas (con relación a geografías de clase) y sus formas (en particular, respecto al uso de violencia).

MODESTE, ABATE* (Université de Douala, Cameroon)

Les Leçons De La Trajectoire De Réussite d'Un Entrepreneur Transculturel Au Cameroun

Avec le doublement de la population continentale prévu d'ici à 2050, passant de 1,2 à 2,5 milliards d'habitants (Severino et Hajdenberg, 2016), si elle veut occuper sa jeunesse, l'Afrique devra être en mesure de créer pas moins de « 450 millions d'emplois sur les 20 prochaines années », indiquait en 2017 la Banque Africaine de Développement (BAD). Face à ce grand défi, l'entrepreneuriat est présenté comme la solution.

Cependant, si ce nouveau paradigme de développement est à soutenir, Kamdem et Nkakleu (2013) estiment que, l'une des faiblisses de l'Afrique est que, hier comme aujourd'hui, dans la littérature les entreprises et les entrepreneurs africains sont peu connus chez eux-mêmes, encore moins à l'étranger. Il est donc important d'intensifier les études sur les entrepreneurs et les entreprises qui réussissent.

Considérant que les trajectoires font référence aux mouvements et donc à la dynamique, à l'évolution, au processus de développement des parcours des acteurs sociaux, nous avons fait le choix de la méthodologie de récit de vie comme grille explicative et le moyen d'ouvrir les lieux et les paroles inaccessibles autrement (Bah, Ndione et Tercelin, 2015).

Nous avons alors identifié et étudié le cas d'un entrepreneur qui peut s'inscrire dans la nouvelle génération de réussite en affaires et dont le profil et le parcours peuvent inspirer. En effet, la trajectoire ou l'évolution du parcours académique et professionnelle de de M. NOA correspond donc à l'évolution de ses besoins en connaissances, compétences, capacités et habilités dans le cadre de la construction de son parcours. De Yaoundé à Rennes il est passé d'étudiant généraliste à Technicien de laboratoire. Et la formation à Sciences-Po Paris, lui a donné les compétences en management, passant d'Entrepreneur à Entrepreneur-Manager.

Occupational Stress of Working Women: An Empirical Study of Women Employees of Private Hospitals in Bhubaneswar

Society has assigned women the responsibility of ensuring peaceful domesticity and skillful upbringing of the future generation. Today's society has added a new task to women that is contributing to family earnings. In her attempt to do justice to both the public and private sphere she is stressed out to juggle between career and family. The growing prospects of health care institutions, and cut throat competition for success creates occupational stress and role conflict, which can greatly affect the family life of working women. The current study is an attempt to explore the role stress of working women of private hospitals in Bhubaneswar. The present study is **exploratory** in nature. Two hundred (200) women employees from different private hospitals of Bhubaneswar city is the sample of this study. The objective of this study is: (a) to assess **psychological stress** of working women due to stress at work place; (b) to explore the **social stress** caused due to familial and social responsibilities. As women break away from their traditional roles and begins to struggle in the workforce, there is a growing concern of risk towards their well-being. Due to constant stress most of the women employees faced life style disorders and anxiety. Colossal proportion of women employees experienced role conflict and stress due to work family incompatibility. Inadequate time for children, parents and other relatives sometimes act as a major stressor and hamper the social relations. The social stress caused due to familial and social responsibilities, working women face role stress and severe strain due to the juggling burden between work and social life. The study also provides recommendations and suggestions to overcome stress.

Situating Parental Care in Everyday Life of Children with (Dis) Abilities in Kolkata : A Quest in Intersectional Inequality

Caring for the child amounts to the most critical aspect of parenting practices worldwide and everyday parental care plays a decisive role in facilitating conceptions that dominate children's world view. Care giving attains special significance for children with (dis)abilities who due to their differential needs and inaccessible infrastructure, have fewer social contacts and depend primarily on their parents to interpret their surroundings. While disability scholars conceive disability not as a state of being but that of "becoming" (Erevelles, 2011), produced by multiple social factors, sociological discourses on care state that care roles frame and are framed by the existing social arrangements (Bruhn & Rebach,2014) and hierarchies. Against this backdrop the paper attempts to explore how the process of "becoming" disabled is shaped for children with (dis)abilities through everyday care giving practices of their able-bodied parents. The paper also attempts to find out how intersecting identity parameters of adult-ability, child-(dis)ability influences decision making with regard to and performance of daily life activities by children with (dis)abilities within the private sphere, in a developing country like India, where opportunities for participation by (dis)abled in public life are sparse. Mixed method research procedure has been applied in this study to analyze primary data on 15 children with (dis)abilities residing in Kolkata and their parents, collected through face-to-face interview from two genders and different social classes. Though parents run from pillar to post to provide comprehensive care to their wards, they were found to have ablest perceptions which get subtly exhibited in everyday interactions, and accentuate the already prevailing narrative(s) regarding (Dis)abled in society. (Dis)abled children, conform to disabling practices adopted by their parents, but also in some instances demonstrate resistance to the same whenever possible.

History, Objectivity and Subjectivity in the Class Struggle inside the Brazilian Press

Upon its arrival in 1808, the Portuguese Royal Family implements a set of tools for maintaining the legitimacy of the monarchical system vis-à-vis the colonies, including the Royal Press. In its early years, it devoted itself to the dissemination of scientific, cultural and artistic content, aimed at the production of knowledge about the uncovered territory within the continent. The second moment of the production of content aimed at the public debate is related to the aggravation of the crisis of colonial society and the development of the debate in defense of Independence, the founding of the Republic and the free market, as well as abolitionism. The leaflets produced were ephemeral and conjunctural, produced by family or individual initiatives to express their own opinions about the events of the effervescent public life of the period. From the advancement of technologies, journalism enters the 20th century in the process of maturing the technique of its production, with the formalization of the labor market and, therefore, the capital-labor contradiction; journalistic production is linked to a Taylorist-Fordist form, with journalism workers having more stable work conditions and life planning. In the 21st century, the consequences of the productive restructuring that, in Brazil, gains a systemic character and reaches the press in the 90's are verifiable from the analysis of the monopoly concentration level of the media and the contemporary organization of journalistic work. The present work seeks to understand how the Union of Journalists (FENAJ) acts in the face of the challenge of adapting to the new organizational dynamics of news production, which is problematized as a challenge that, not yet overcome, is treated as one of the reasons for the impossibility of massifying the debate on the democratization of communications not only in the area of consumption but also of production.

MOLINA DERTEANO, PABLO* (Programa Cambio Estructural y Desigualdad Social, Argentina)

Las Elusivas Formas Del Racismo En La Argentina ¿Un Caso De Nomenclaturas Equivocadas?

La presente comunicación es un ejercicio léxicométrico sobre las formas en que la discriminación por motivos étnicos aparece solapa en el lenguaje cotidiano en adolescentes y jóvenes residentes en el Gran Buenos Aires. La discriminación por motivos étnicos es un objeto de estudio complejo en América Latina, pero en el caso argentino, se encuentra bastante invisibilizada inclusive en el ámbito académico. Numerosos trabajos académicos suelen subsumirla bajo las categorías analíticas de xenofobia o desigualdades socioeconómicas y/o socioterritoriales.

El término coloquial "negro", en el caso argentino, tiende a referirse a sujetos miembros o descendientes de poblaciones originarias que son identificados como miembros de las clases trabajadoras. Una descripción más precisa encuentra una yuxtaposición entre identificaciones étnicas, migratorias, de clase y orientación política. El objetivo de este paper es desarmar la densidad de estas yuxtaposiciones y sus efectos estratificadores en el lenguaje cotidiano y en la construcción de esquemas discriminadores.

La estructura de la indagación parte de recuperar el concepto de matriz de racismo en los trabajos de Mario Margulis y de aplicar el concepto de interseccionalidad para desarmar la yuxtaposición de la categoría "negro/a" en el lenguaje cotidiano. Seguidamente, se analizan las verbalizaciones de 6 grupos de discusión de adolescentes y jóvenes de ambos sexos residentes en el Gran Buenos Aires y pertenecientes a hogares de clases medias y trabajadoras urbanas. Utilizando técnicas de análisis factorial se reconstruye la asociación entre términos y sus efectos estratificadores, que son reforzados por la yuxtaposición antes mencionada. Las conclusiones señalan que la implementación de la categoría "negro/a" como clasificador cotidiano tiene efectos de segregación tanto horizontal como vertical. A su vez, resulta necesario separar analíticamente el componente étnico, para profundizar políticas tendientes a promover el pluralismo y la inclusión.

MOLINA DERTEANO, PABLO* (Programa Cambio Estructural y Desigualdad Social, Argentina)

Reformas Educativas, Federalismo y Reducción De Las Desigualdades: El Caso De 3 Aglomerados Urbanos Argentinos Entre 1997 y 2018.

En los últimos 25 años, se dieron dos reformas educativas globales en la Argentina destinadas a producir cambios en la educación básica y media. Uno de los objetivos explícitos de dichas reformas fue aumentar la terminalidad de la educación media y reducir las desigualdades de los hogares de origen, mediante la expansión de la oferta y el corrimiento de la obligatoriedad de la educación de los 12 a los 18 años. La evidencia empírica señala que, en términos globales, hubo un aumento del logro educativo medio. Cabe interrogarse en qué medida influyeron las reformas educativas por separado y qué impacto tuvieron en la reducción de las desigualdades.

El presente paper propone el análisis comparativo de dos cohortes. La primera está formada por quienes ingresaron a la escuela media en 1997 teniendo doce años y quienes podrían haber terminado el ciclo secundario en 2007, año en que se aprueba la reforma y se implementa al año siguiente. La segunda cohorte repite los procesos de selección, pero entre los años 2008 y 2018. El universo de estas cohortes proviene de la Encuesta Permanente de Hogares para los aglomerados de Córdoba, Partidos del Conurbano Bonaerense y Capital Federal. Este último resulta importante ya que nunca aplicó ninguna de ambas reformas.

Utilizando regresiones logísticas por paso, se toman como variables estructurales el clima económico y el clima educativo del hogar y el sexo. Como variables coyunturales, el aglomerado y la cohorte, buscando precisar en qué medida se redujeron las desigualdades de origen, teniendo en cuenta además las desigualdades de género, jurisdiccionales y el impacto de las reformas. Las conclusiones indican divergencias de grado y de alcance entre la primera y la segunda cohorte, durante la cual la reducción fue más pronunciada.

MOLINA-SALDARRIAGA, CÉSAR* (Universidad Pontificia Bolivariana, Colombia)

Del Constitucionalismo Aspiracional Al Fracaso Del Activismo Judicial. El Caso De La Justiciabilidad Del Derecho a La Paz En Colombia

El 24 de noviembre de 2016 el Gobierno Colombiano y las Fuerzas Armadas Revolucionarias de Colombia, Ejército del Pueblo –FARC-EP- suscribieron el "Acuerdo Final para la terminación del conflicto y la construcción de una paz estable y duradera" –Acuerdo. Este incorpora un preámbulo y 6 puntos, derivados del proceso de negociación y los puntos definidos en la Agenda, que debían ser incorporados en el ordenamiento jurídico colombiano mediante una serie de reformas constitucionales, desarrollos legales y reglamentaciones, a través de un procedimiento normativo especial denominado *fast track*. En el marco de este procedimiento los desarrollos normativos estuvieron sometidos a control de constitucionalidad automático a cargo de la Corte Constitucional. El presente trabajo tiene como objetivo analizar el impacto sociopolítico del control constitucional -a partir del análisis de su alcance y contenido- ejercido por la Corte Constitucional colombiana sobre los desarrollos normativos tramitados y aprobados en el marco del proceso de implementación del Acuerdo Final suscrito entre el Gobierno Colombiano y las FARC-EP, a partir de un marco de referencia que incluye el "constitucionalismo aspiracional" y el "activismo judicial". Se concluye, entre otras cosas, que la eficacia del discurso judicial de la paz en Colombia es limitado y mínimo, y resulta sustituido por un discurso guerrerista pragmático y limitante de derechos fundamentales. Para ello se hace un análisis dogmático-jurídico de las sentencias

de control constitucional del proceso de implementación del Acuerdo, se contrasta con el análisis dinámico de las decisiones en materia de paz y se evalúa a partir de datos sobre violencia política entre los años 2016 y 2019.

(Micro-)Pharmaceuticalisation in the Workplace? Digging into the Lifeworlds of Workers and Their Use of Anti-Depressants Using a Social Representation Approach

The existing literature on pharmaceuticalisation has tended to emphasise the creeping borders of medicines use in new contexts where medicines had previously not been employed, as well as the institutional dynamics and pressures which shape these borders. A smaller body of work has analysed pharmaceuticalisation and its social dynamics at a more micro-level, exploring 'lifeworlds' of medicines use in ways which denote not just the creeping 'breadth' of medicines use, but also the changing depth (taken-for-grantedness) and texture (meanings and emotions) of medicines use over time. This latter approach highlights that pharmaceuticalisation involves the gradual sedimentation of knowledge, representations and assumptions regarding types of medicines and their (in)appropriateness for use to solve particular 'problems' in particular contexts.

Taking as its focus the social representation and understandings of anti-depressant medicines to maintain workplace participation and performance, this study draws on 40 semi-structured interviews with Brazilian workers diagnosed with depression (stratified by age and gender) to consider: how explicit knowledge and more implicit assumptions regarding anti-depressants shape their (non-)usage and, in particular, how the role of work place performance pressures and social relations shape meanings of changing (non-)usage over time.

Our analysis is sensitised to gendered dynamics as evidence shows that Brazilian women are much more likely to use anti-depressants than men. We supplement this knowledge of differing breadth of medicines use by investigating the underlying assumptions and normalisation (depth), emotions and meanings (texture) of (non-)use. In this sense we explore how cultural representations of medicines, interactions amid social networks, and everyday performances of gendered identity interact to shape differing norms and expectations of anti-depressant use.

This Brazilian study enables the exploration of the relationship between everyday pharmaceuticaliastion and the workplace in a context beyond (northern) European welfare states, thus where the imperative of work and related pressures have different meanings.

CANDIDO, ANA CLARA (Federal University of Santa Catarina, Brazil)

Introduction to the Relation between Technologies and Inequalities: Can Innovations Drive Social Change?

Some innovative tech companies are presenting gender equity problems like the low participation of women and wage gaps. For example, in order to train their AI algorithms, several companies use crowdsourcing platforms to offer simple tasks - such as tagging images - and pay workers very little for each task. Later, these companies are sold for millions of dollars making a few people richer while intensifying economic inequality.

These issues lead to questioning how much of the new technologies being developed are gender-biased and tend to perpetuate the prejudice towards women still present in society. They may, as well, promote employment polarization increasing the number of unqualified jobs. This kind of examples show how technologies may act as drivers of different inequalities such as economic, gender, and political. Understanding the recent wave of emerging technologies (for example, additive manufacturing, robotics, assistive technologies, care and health technologies, quantum computing, etc.) becomes a necessity for researchers, politicians, companies, and citizens in general who are interested in ensuring that the impact of these innovations on society is positive.

The interplay between emerging technologies and inequalities represents a recent and major topic of sociology of technology. We intend to introduce the theme of how emerging technologies can impact the different types of inequalities, and how current inequalities shape emerging technologies.

VETTORASSI, ANDRÉA (Universidade Federal de Goiás, Brazil)

Intersectionality As Process: The Trajectories of Men and Women Who Migrate from Northeastern Brazil to the Interior of São Paulo

Intersectional categories are not fixed and permanent, because their meanings are socially constructed and reconstructed over time. The meaning of such categories, and the experience of those in them, are influenced by people's locations and previous experience in trajectories such as the life course, family formation and dissolution, occupational careers and migration histories, among others. The nature of these trajectories and intersectional identities within them also changes over time. The paper is based on interviews with male and female migrants from a municipality in northeastern Brazil to the interior of São Paulo state, where northeasterners are racialized and stigmatized as backward and violent. Migrants cope with stigmatization by maintaining strong ties to their region of origin and forming separate residential communities in São Paulo. Since the 1970's, the nature of migrant employment has changed twice, with consequences for migratory trajectories and intersectional identities. In the 1970's, entire families moved to São Paulo to work in the cane harvest. Starting in the 1990's, a shift to payment based on production led to an all-male harvest workforce, and a tendency for circular male migration, with women and children staying in the Northeast and the absence of husbands and fathers for about nine months each year. This led to increased female autonomy, even the formation of female agricultural cooperatives, in the Northeast, generally considered the most traditional and patriarchal region of Brazil. Recently, with the advance of mechanized harvesting, many male migrants now work year-round at other jobs, especially in construction, and women have again been migrating to São Paulo, finding mainly urban employment, especially in domestic service. Single women now also migrate to São Paulo, a form of autonomy which is facilitated by both changes in Brazilian culture and the prior experience of female autonomy in the Northeast.

Migrations to, from, and within Brazil: Historical and Global Perspectives

Brazil received about half of the enslaved Africans brought to the Americas. Portugal also stimulated the settlement of Azorean families, especially in southern Brazil. After independence, the monarchy continued settlement programs, but favored mainly Germans and Italians. After abolition of slavery, São Paulo state subsidized immigration of mostly Italian, Spanish, Portuguese, and Japanese families to work on the coffee plantations. After the populist Vargas government limited immigration and restricted employment of foreigners in the 1930's, large numbers of people from the poor backlands of northeastern Brazil began moving to the industrial cities and more productive plantations of the Southeast, especially São Paulo, a migration stream which continues today. More recently, many Brazilians emigrated, temporarily or permanently, to the US, Europe or Japan, although there has also been significant immigration from neighboring countries, especially Bolivia, and from Haiti, Senegal and other African countries. Bolivians generally work informally in the São Paulo garment industry, sometimes in conditions resembling slavery. They usually remain undocumented, but some have benefitted from amnesty programs. Haitian immigration began when the US closed its doors and Brazil became visible in Haiti by leading the UN peacekeeping mission. African immigration increased after Brazil eased visa requirements during the 2014 World Cup. Due largely to pressure from employers, the government began issuing "humanitarian" visas to Haitians, permitting long term residence, and letting Africans apply for asylum, which allows them to work during case processing, although most do not gain asylum. With the current crisis, there is less demand for immigrant workers. Some Haitians have developed circular migration patterns between Brazil and Chile, or between Brazilian regions, working in fruit or coffee harvests occurring at different times of year. The Senegalese have become particularly visible in city streets selling cheap goods from China, generally imported, or smuggled, from Paraguay.

Impacts of the COVID-19 Pandemic on Life of University Students in Italy

The emergency arising from the spread of Covid-19 on the global stage has affected lifestyles, the enjoyment of needs and the functioning of social institutions: among the latter, the regulatory restrictions have also changed the relationship between students who join academic life in presence and non-attending university students. Student life has experienced a unexpected transformation primarily on the educational sphere; at the same time, this change affected other aspects of the students life.

To understand the consequences at the level of the dailylife of university students in Italy, a national-scale research was launched, based on an online survey which was addressed to all Italian Universities. Over 16,000 students responded to the surveywhich has investigated 4 different thematic areas: education, social capital, digital capital and housing capital, as well as psychological and social well-being. The areas were questioned in relation to structural elements according to the theoretical approach of relational sociology.

We aim to present the main results of the survey which show a student population that is significantly differentiated by: condition, digital equipment, social capital and social participation. A part of the students refer to the value of the University as a "place" of life in which both purposes are interrelated: on the one hand the instrumental ones, on the other hand all those expectations consisting of meaning and knowledge of social reality which are not solely confined to the relationship with the higher education offer and simply notional contents. For other students the university represents a weak place, almost a transit space: the sense of membership is weak but not absent.

This research focuses on a transitional phase which helps to design the former model and concurs to reconfigure the forthcoming one, as well as it shows how probably we are encountering a new scenario for university life.

The Migrant Caravan As a Mobility Strategy: Lessons and Challenges for the Central American Region

Despite the fact that for decades there have been important movements of Central American people moving through Mexican territory in search of reaching the United States, no such large group had been observed traveling en masse, as was the case with the Central American migrant exodus that went through Mexico in 2018. This exodus has unprecedented characteristics in terms of human mobility in the region. First, there were a massive number and heterogeneity of people – young families, single mothers with children, unaccompanied minors, LGTBQ people, and elderly and handicapped people – who so rapidly joined the caravan. Second, there was the swiftness of their organization. Third, there was the abandonment of secrecy and invisibility of thousands of immigrants crossing the Mexican territory. Finally, there was the determination of thousands of Central Americans to travel main roads, demanding their right to free and safe transit through the territory. In this paper, I reflect on my encounters with participants of the Central American caravan that in 2018 crossed Mexican Territory in their quest to reach the U.S.-Mexico border. Drawing on open-ended interviews with members of the caravan, scholars, and volunteers, I address the following questions: What are the possible scenarios for thousands of Central Americans already in Tijuana, particularly when seeking asylum in the U.S. is not as easy as they originally thought? What are the challenges they may face by staying in Mexico? Can we talk about the caravan as a mobility strategy for the thousands of Central Americans who continue to leave their countries? My preliminary findings report that while the collective mobilization of people who joined the caravan was one of the decisive factors that helped them reach the border, today, that collective mobilization is gone leaving caravan members in a high position of vulnerability.

MOOKERJEA, SOURAYAN* (University of Alberta, Canada)

On the Communicability of the Future: The Class and Cultural Politics of Energy Democracy and Climate Action in Canada

The class and cultural politics of low-carbon energy transition now imposes itself on an ever widening range of social movement mobilization, both explicitly and implicitly, as the role of environmental crises in the making and unfolding of social injustices comes to be more widely understood (global warming especially). In the oil producing Canadian province of Alberta, social justice movement articulations of alternative visions of the future, in order to be possible must not only be communicable, but must also negotiate with (in order to criticize or displace them) scientistic, technocratic and "business as usual" models, projections and transition pathways constructed by a nexus of governmental agencies, energy industries and ngos like the World Energy Council as well as with racist and neo-fascist conspiracy theories and apocalyptic fantasies. This paper, drawing on my ongoing research, Feminist Energy Futures: Powershift and Environmental Social Justice, examines the ideological, media, and cultural-political strategies of climate action, energy democracy and just transition activism, protest and movement-building across a range of social movement organizations and popular cultural formations in Canada including Indigenous Climate Action, Blue Green Canada, The Leap, Climate Justice Edmonton, Extinction Rebellion, Our Time (for a Green New Deal), the Alberta Federation of Labour and their publics and constituencies. In doing so, I take an intermedia ecological approach which draws upon the theoretical insights and methodological strategies of Canadian communication theory, cultural studies, political ecology, the critique of political economy, post-Western Marxism, critical race theory, social reproduction and subsistence perspective feminism in order to interrogate the conjunctural conditions of communicability of regenerative futures and real utopias. The paper thereby seeks to draw lessons from the contradictions of proprietorial class power and of anti-systemic social movement futurism for the theory and praxis of degrowth, commoning and eco-socialism.

MOOKERJEA, SOURAYAN* (University of Alberta, Canada)

Utopian and Regenerative Praxes, Degrowth, Crises and the Revenants of Racial Capitalism

Fredric Jameson's injunction to "always historicize" (1984) applies no less to our conjunctural proliferation of crises. Not only have these all been long in the making but the 20th century trajectories of the exhaustion of historical natures (Moore 2015) ensure that environmental crises will continue to constitute the fulcrum around which class politics and imperialist war on a planetary scale will turn. This paper argues for a spatialized theory of class politics adequate to contemporary racial capitalism's twinned auto-immune reactions of green passive revolution and fascism redux. Paramilitary violence against environmental justice and anti-poverty activists and, more generally, militarized policing and (extra-)legal repression of subalternized classes and communities in the name of climate action, resilience infrastructure and national security are emerging modalities of development dispossession resulting from speculative investment opportunities provided by smart green urban renewal (Caprotti 2014), industrial corridor geopolitics (Ramachandraiah 2016) and land grabs for solar farms (Yenetti et al. 2016, Rignall 2016), wind farms (Cormack 2018), biofuels (Renzaho 2017) and carbon sinks (Fairhead et al. 2012). Drawing on research conducted through the University of Alberta's Feminist Energy Futures initiative on the class and cultural politics of renewable energy democracy and bringing together the theoretical insights of the literatures on varieties of capitalism, the multiple colonialisms framework, feminist social reproduction and subsistence perspectives as well as post-Western Marxism's account of interlocking systems of oppression, this paper examines the prospects for the Left's intervention in the speculative complex of passive revolution and fascism redux. The paper takes up the debate on the state between eco-socialists (Burkett, 2006, Lowy 2015) and the degrowth movement (Jackson 2017, Kallis 2017, Mies 2000, de Angelis 2017, Federici 2011) through the detour of a critical engagement with Jameson's redeployment of Lenin's classical transition theory of dual power. MOORE, ELENA* (University of Cape Town, South Africa)

Under Pressure: Women's Responsibilities in Financing Household Social Reproduction in Multigenerational Households

Despite the expansion of the welfare state in South Africa, many poor individuals receive no public support and remain dependent on family for support. This paper examines how low-middle income, employed black South African women in multigenerational households are key providers and face numerous demands for economic and practical support from a wide range of dependents. The findings uncover multiple pressures on the providers including the precarity of work, problems with debt, the demands of larger, dependent families, the high level of care required and the limitations of the welfare state. The author argues that existing inequalities of gender, race and class are deepening in South Africa. This is due to the need for lower middle-income families to stretch their resources across their families to take physical and financial care of them. Women's role in financially supporting families is not a new phenomenon, however, the co-existence of high levels of care and the changing socio-economic context, including the welfare system, low marriage rates and higher levels of female employment, has created new conditions for caregiving responsibilities in multigenerational households. The paper fills a theoretical gap in the understanding of the hidden abode of reproduction and the full array of women's responsibilities in financing household social reproduction.

Liquid Gold? the Reconfiguration of Social Reproduction through Water Grabbing in Australia and Ireland.

The commodification of water sources and privatisation of water services reconfigures the boundaries between social reproduction, the circuit of commodities, and nature. Water Grabbing includes the transfer of wealth, control, and risk, and as water is such an essential part of life, these shifts can ultimately determine who has the right to survive under neoliberal capitalism and who is deemed excess and disposable. Water Grabs can be less visible than land grabs, but are global phenomena operating through regulation facilitated by state (in)action, often pushed for by financial institutions, and benefiting investment funds, at the expense of effected communities. Critically, they are often integral, and should be seen in relation, to dominant accumulation regimes. However, communities are resisting; they are not passive objects of abstract forces, but have agency, and particular collective political subjectivities are developing in response to water grabs. This paper explores the particular contradictions that such "water-based" accumulation strategies and the extension or intensification of the market into nature and social reproductive infrastructure such as water sharpen in the age of climate catastrophe, as well as the particular collective political subjectivities that have developed on the terrain of social reproduction as struggle. By linking the different processes of water commodification within the global dynamic of water grabbing, it asks the questions: what is a contemporary water grab? Why and through what processes is water becoming such a valuable commodity? And how have tensions between social reproduction, nature and accumulation strategies been heightened and contested? The paper draws on extensive field research in both Australia and Ireland through an incorporative comparison.

Navigating the Everyday Maze of Bureaucratic Commitment: The Role of Voice in Indian Public Bureaucracy

Almost every civil service reform instituted thus far in India focuses either on improving civil servants performance or their accountability while neglecting the adverse institutional conditions in which they operate. Where such conditions are acknowledged, it is symptoms such as penal transfers and solutions such as secure tenures that draw attention rather than the cause – the voice of a civil servant or the act of speaking out. This article explores the contradictions of Indian public bureaucracy that demands honest and impartial voice from civil servants to fulfil their mandate while being vilified at the same time for doing so. The result, there is very little steel left in the 'steel frame', a sobriquet attributed to the Indian civil services. Further, it examines the everyday maze of bureaucratic commitment, and argues that voice – within and beyond one's workplace – is compatible and essential for the health of the institution and the practice of democracy.

EL Cuidado Como Factor Limitante De La Participación Económica Y Productiva De Jovenes Mujeres Agrícolas

Aunque en Chile la participación productiva de las mujeres agrícolas ha aumentado, su trabajo sigue limitado por las actividades de cuidado que realizan en el hogar, sin que se cuente con información sobre las formas en que opera esta relación ni sobre las implicaciones del cuidado sobre la productividad femenina. En este escenario, la investigación se propone responder a la siguiente pregunta de investigación: ¿de qué manera las labores de cuidado infantil condicionan la participación económica y productiva de las mujeres rurales productoras de Chile? La investigación responderá esta problemática desde el punto de vista de jóvenes mujeres agrícolas de la región de la Araucanía, ubicada en el sur del país. Se trata de un estudio cualitativo, que se implementará por medio de revisión de documentos, entrevistas semi-estructuradas, observaciones participantes y grupos focales. La relevancia del estudio reside en su foco en el cuidado infantil como factor relacionado con la participación económica y productiva de las mujeres rurales y, por otra parte, en la perspectiva de mujeres jóvenes adultas, cuya trayectoria laboral toma lugar en un escenario en que la ampliación del transporte público y los medios de comunicación, el aumento de la escolaridad y la disminución de la tasa de natalidad, les abren nuevas oportunidades económicas y laborales, a la vez que siguen limitadas por sus responsabilidades domésticas y de cuidado. Se espera que los resultados se difundan, entre otros medios, en el IV ISA Forum of Sociology.

Is Digital Political Participation Substituting Other Political Participation Forms? Evidences from the Local Democracy Index in São Paulo, Brazil

One of the features of digital democracy is fostering participation into civil society (Gomes, 2016). However, it is still not clear if this new political arena complements others or grows at their expense. As technological change and political modernization go hand-in-hand (Bijker, 2006), technologically advanced societies transfer innovative and highly educated outlooks to politics, favoring democratic institutions and more active and demanding types of participation (Inglehart and Welzel, 2005). Still, users of mass media technologies could also be seen as more prone towards isolation, apathy and distancing from community life (Putnam, 2000), although studies have shown that preexisting behaviors and mass media consumption are positively associated with political participation (Zúñiga and Diehl, 2019). After all, digital technologies might be characterized as either a 'new era' or a 'false hope' for democracy (Diamond, 2016). This study sheds light at this issue by investigating forms of political participation among citizens in São Paulo in 2019. Based on a representative sample of 2,417 household interviews, we aim to verify whether there is evidence that digital participation is becoming a surrogate to other participation forms. Besides, we also investigate correlations between types of political participation and trust levels among interviewees. Our findings point out that individuals who engage more frequently in digital political participation tend to engage less in other forms of participation, especially more conventional ones, while the opposite is not true. In addition, we also found that individuals who participate in political life tend to have higher trust levels, especially generalized interpersonal trust, which is worryingly low among the whole population. Overall, trust levels correlate positively in particular with unconventional political participation. The results suggest that, while digital political participation seems to be supplementing, but not necessarily substituting, other participation forms, the trust level apparently benefits from alternative forms of participation.

Elite Perceptions of Cash Transfer Programs in Brazil and South Africa

Cash transfer programs have gained rapid popularity among policy researchers and funding agencies due to their low-cost and high-efficiency (Leisering 2018). The popularity of cash transfer programs has been attributed to the fact that they do not rely on further taxation and have no clear pro-incumbent effects, allowing (limited) redistribution without penalizing those at the top (Correa and Cheibub, 2016). Nonetheless, there has been little research on how elites perceive cash transfer programs, which can play a key role in their further expansion or overturn. In this paper we analyze elites' views on cash transfer programs in two similar social landscapes with very different policy implementation strategies: Brazil's *Bolsa Familia* and South Africa's social grants. Looking at the responses from randomly surveyed political, technocratic and economic elites in both countries, we find that elite perceptions about cash transfers range from strong support to strong rejection. We also found that perceptions are partly shaped by national political contexts and debates, but also vary within countries. Our analysis show that where elites locate themselves in this spectrum depends on multiple dimensions, such as their potential electoral impact, trust in other elite sectors and moral assumptions about poor people behavior.

Digital Inclusion for Rural Youth (IDJR): Notes on the Articulation of a Youth Public Policy

This article presents the initial description and analysis, based on two case studies, over the implementation of a Brazilian Federal Government program called "Digital Inclusion for Rural Youth" or "IDJR" (Inclusão Digital para a Juventude Rural) - started in 2011, during former president Dilma Rousseff first term. Through a partnership between Brazilian Federal Government and Federal Institutes of Higher Education (IFES – Institutos Federais de Ensino Superior) and maintaining dialogue with rural social movements and organizations, the pro-

gram aimed at training young people from rural areas to use information and communications technology (ICT), respecting cultural and regional diversity. According to the authors' perspective, the IDJR is an articulation of subjects inserted within the state institutions field – Federal Government Ministries and Federal Higher Education Institutions (IFES) - and civil association subjects, with emphasis, in one of the researched cases, on young rural people struggling for land reform (named "De Olho na Terra"); and, in the second case, indigenous associativism (named "Mĩtãrusu Mbo´epy: Peteî Tape. Formação de jovens: um caminho").

The two IDJR program case studies were conducted by: documentary research; visits for direct observation; and semi-structured interviews with the project managers and social leaders (young and non-young) of the organizations. The fieldwork conducted in the first half of 2015 and documentary data were analyzed from the beginning of the initiative (2011). We draw attention to the the the descriptive dimension of the current stage of the investigation, yet our partial analysis results indicate that the interaction between associations, universities and actors of state institutions was an original articulation between elements of a Youth Public Policy, digital inclusion and notions of rural development.

Material and Spiritual Entanglements in the Ceramics' Making Process of Western Migrant Artists in Japan

This paper looks at the case of Western artists who have crossed national borders to practice ceramics in Japan from the 1960s until today. Drawn by images of Japan centered on ideas of craftsmanship and spirituality, disseminated throughout the West from the mid-nineteenth century, these artists have searched in Japanese aesthetic traditions for something beyond the normative patterns of their societies.

In this sense, traditional Japanese craft making processes and philosophies have functioned as instruments for these artists to explore deeper bodily, sensorial, emotional and affective relations with the material world. By leading alternative lifestyles in close contact with nature and producing artworks meant to be used in the everyday life of their costumers, the relationships they establish with materiality reflect particular aesthetic sensibilities, (hi)stories and sociabilities.

Thus, in this paper we will explore the relationships that these potters' establish with the processes, materials, techniques and philosophies of Japanese pottery making, marked by spiritual concepts deriving from Japanese Taoist and Buddhist traditions which stress the idea of mind-body unity, as well as Shintoist non-binary conceptions of humans and nature.

Drawing on Clammer's (2002, 2015) view of aesthetics, spirituality and creative expression as basic human needs, I will suggest that the trajectories, bodily practices and worldviews of Western potters in Japan reflect a search for self-realization, happiness and well-being through the establishment of a closer contact with the material world.

MORCILLO-LAIZ, ALVARO* (Free University Berlin, Germany)

Introducing Rational Organizations into Patrimonial States? a Comparative Study of Donors' Impact on Latin American Social Sciences (1940-1970)

Within the comparative study of organisations, academic ones like universities and research centres have received limited attention (Turner 1990; Geiger 2018). This is even truer if we focus on the available sociological literature about how *Latin American* universities and research centres have developed since the early 20th century. In these countries, the passage from patrimonial to more rational academic organisations occurred within states in which patrimonialism was more widespread (Lempérière 1992; Roniger 2001; Mabry 1982) than in the advanced Western countries around 1900, the time at which rational scientific organisations first emerged (Rüegg 2004; Turner 1987). Despite the unfavourable environment in Latin America, some organisations moved away from employing members of the professions like lawyers and doctors as part-time teachers. Instead of this personnel, who was selected in consideration of their political and personal connections, and was also uninterested in, and unqualified to conduct research, some academic organisations began to hire full-time teachers and researchers with graduate degrees (Morcillo Laiz 2019). Correspondingly, graduate students also "professionalized". Approximately at the same time, differentiation within the traditional departments like law and philosophy led to the rise of new degrees, and then departments, in sociology, political science, economics etc. Through a comparison of the Mexican, Brazilian, and Argentinean social sciences, this paper studies how the Rockefeller and the Ford Foundation as well as UNESCO contributed to facilitate the passage of Latin American universities and research centres from patrimonial to more rational organisations. Particular attention is given to a) the different local responses to donors' policies designed for the whole region; b) to local resistance to adopting the research agendas favoured by donors; and c) the unintended consequences of foreign donors' attempts to rationalise the Latin American social sciences. The evidence used in the paper stems from donors' and recipients' archives.

MORCILLO-LAIZ, ALVARO* (Free University Berlin, Germany)

Turning the North Against the North. Dependence Theory As a Southern Alternative to Talcott Parsons' Weber

South America gave birth to one of the most successful adaptations of Northern social science to Southern social reality, the *teoría de la dependencia*. The present paper analyses its origins as an adaptation of the late Weber and as an instance of resistance against Talcott Parson's structural functionalism and his reading of Weber. The paper does so by following these steps: it first summarises the current discussion about Weber's reception in the US and comparing these events with the early reception among Spanish intellectuals before the Civil War. Some of them would seek refuge in Mexico City and translate there *Wirtschaft und Gesellschaft* for the Fondo the Cultura Económica. In a second section, the paper focus on the main Spanish translator and interpreter of Weber, José Medina Echavarría, who around 1960 proposed an adaptation of Weber for Latin American in the form of a sociology of development, which he devised while working at the ECLA under Prebisch and who was conscious of the epistemological and political limits of Parsons' structural functionalism. The third section centres around Medina's interaction with Fernando Henrique Cardoso and Enzo Faletto, one of Medina's student. It adapts a *material perspective*, identifying the iterations of two papers, one by Medina and collaborators, the other by Cardoso, which were discussed in different settings and then eventually merged into *Dependencia y desarrollo en América Latina: ensayo de interpretación sociológica*. The fourth section examines the Weberian elements grafted into the widespread Marxist explanation of underdevelopment to which South American sociologists had stuck until then. In the conclusion I discuss how Guillermo O'Donnell built upon Weber – and Cardoso – in his theory of bureaucratic authoritarianism and argue that neither Cardoso's nor O'Donnell's successful adaptations of Weber to the South would have been possible on the basis of Parson's translation.

MOREIRA, MAIRA DE* (Pontifícia Universidade Católica do Rio de Janeiro, Brazil)

Analysing the Sociology of LAW WHEN the LAW Is a Network: POWER and Politics in Discussion

This work constitutes a theoretical consolidation in the field of sociology of law, based on two empirical researches. The first was carried out under the National Institute of Colonization and Agrarian Reform of Rio de Janeiro, from which I sought to recompose the network around Article 68 of the Constitution, which gives Quilombola Communities the title to traditionally occupied territories, an award winning master's research. as the best dissertation under the Postgraduate Program in Sociology and Law (PPGSD-UFF). And, secondly, the research carried out at the Observatory of the Metropolis (Institute of Urban and Regional Planning - IPPUR/UFRJ) about the configuration of tenements (collective rental housing) in the port region of Rio de Janeiro. Both researches have in common certain epistemological perspectives better explained in the context of socio-technical studies, or from Action-Network theory, from which it is possible to go beyond the normativity of law to achieve its social construction. So when it comes to acting, it means what many others lead to acting. The actor in the expression actor-network is not the source of an act but the moving target of a wide range of entities swarming towards it. The insolubility of the problem of who is performing the action makes it perceived nonlocally, displacing the researcher, who must be intrigued with the identity of the participants in any course of action in order to explain their links. For the sociology of associations, translation is a connection between two mediators that carries transformations. We propose that such an approach not only allows us to approach "the [anthropological] field" from premises that put traditional sociologies in check, but also allows us to reformulate the relations between law, politics and power, restoring to actors the agency and the right to social construct them. This discussion yields results for pragmatist approaches.

Engaging Family Caregivers of Elderly People: Fighting Inequalities and Providing Psychosocial Intervention in the Rural Context of Valle Camonica. the Place4Carers Project

"Ageing-in-place", that elderly stay at home as long as possible, is recognized as a crucial strategy to improve the quality of life of elderly citizens as well as

the sustainability of social and welfare systems. However, there is a dearth of knowledge on the role of the caregivers in the ageing process in hard-to-reach areas. Engaging family caregivers in the care network could be a critical asset to make the "ageing-in-place" a reality. This is particularly evident in remote and rural areas, where family caregivers – if effectively engaged – can fill the inequalities that exist due to the fragmentation of the social and welfare system. However, to date, there is little knowledge about family caregivers of elderly citizens unique needs and expectations towards health and care services and scarce attentions has been devoted to their perspectives and communication needs in the health-care environment.

Place4Cares is a community-based participatory research project aimed to co-design an innovative organizational model of social services for family caregivers of elderly citizens living in the remote area of Vallecamonica. This innovative service model should be a way to guarantee ageing-in-place processes as well as higher families' inclusion and engagement in a more effective partnership with the welfare system and the local health organizations. Focus groups with caregivers have discovered a lack of information and of psychosocial and networking support and co-created a structured pathway of education and psychological counselling dedicated caregivers and co-lead by the caregivers themselves. Place-4Carers' results are going to contribute to deliver more value to elderly citizens and health and social system, while making the welfare processes and organization more efficient and accessible and with a peculiar attention to a sustainable and inclusive co-production, avoiding the risks of reproducing inequalities present in the society.

MORELLI, NICCOLÒ* (Catholic University of the Sacred Hearth, Italy)

Fighting Inequalites in Metropolitan Peripheries: A Case Study on the Civil Society Elites of Milan Functional Urban Area

In many peripheral contexts, where it is possible to find a pauperisation of associations and social bonds (Wacquant, 2010), associations that still resist and work in these contexts seem to play a fundamental role of socialisation that is different from the role of associations present in social centres of the main metropolitan contexts. However, major studies have not focussed on advocacy, negotiations and conflicts between civil society and institutional actors, other associations and philanthropic foundations. This research particularly focus on questions about the participatory background of civil society leaders in the biggest Italian metropolitan area: Milan. At present, it is important to study the actors involved in metropolitan peripheries because there is a new tendency to represent extreme right movements as the voice of the periphery. However, some articles have highlighted how these movements tend to use the peripheries to capture the attention of mass media, but in fact, they do not represent the peripheries at all; this has especially been noted in Italy (Castelli Gattinara et al., 2019). Associations and residents of these areas tend to be scared by the extreme movements, and so they remain silent in front of these acts of violence, but associations are promoting solidarity to fight the economic crisis, with inclusive initiatives on a local level; here, the political action remains slightly in the backdrop of the behaviours of these associations.

The main questions on civil society elites are: where they have learnt how to deal with other associations and institutions? Have they learnt this from previous experiences? Does this background influence the relationships with other actors? Qualitative methods are used in order to answer to these questions, in particular semi-structured interviews and etnographies will help to understand mechanisms, arguments and objectievs of these civil society leaders.

Personas Mayores y Cuidados, En El Marco De La Desigualdad Social.

Personas mayores y cuidados, en el marco de la desigualdad social.
María Sara Moreno Sandoval
Universidad Autónoma de Querétaro, México.
El informe mundial sobre salud y envejecimiento de la Organización Mundial de la Salud, ha hecho la advertencia sobre el reto de los cuidados de larga duración en las personas mayores. Este asunto debe ser analizado desde diversas perspectivas: la causa del número de años de vida saludables perdidos (que se vuelve a su vez causante de dependencia y demanda de cuidados), la ineficiencia de los programas de medicina preventiva, la poca previsión de cuidados para personas mayores dependientes por parte del estado, la situación de desigualdad social que impacta en la disminución en los recursos destinados hacia personas que requieren cuidados de manera particular a las personas mayores.

De acuerdo al informe del INEGI a propósito del día internacional de las personas de edad 2016, en el 20% de los hogares en México vive alguna persona mayor, asimismo en los hogares donde vive una persona mayor destina más recursos a medicamentos y atención médica, lo que implica un incremento de hasta el 150% en comparación con otros hogares, de igual forma una sexta parte de la población de personas mayores está en condiciones de dependencia, principalmente adquirida por malos cuidados de enfermedades no transmisibles.

Actualmente se han extendido y diversificado la oferta de servicios gerontológicos privados; sin embargo, solamente una parte de la población de personas mayores o de sus familiares accederán a ellos. Frente a esta perspectiva, será necesario fortalecer las redes de apoyo familiares, comunitarias y sociales, así como la vinculación de diferentes sectores públicos, privados y civiles. Particularmente, los servicios públicos deberán mostrar su eficacia, disminuir duplicidad de acciones, des-centralización y ampliar la cobertura en materia de protección social.

Palabras clave: desigualdad social, envejecimiento, cuidados.

Institutional Violence in Gender-Based Violence Services in Catalonia

This paper analyzes gender-based violence services for migrant and refugee women in Catalonia. While there is statistical evidence of the overrepresentation of foreign national women in sexist violence, the results of the research show that the gender-based violence services in Catalonia do not offer the adequate response to these women. These services are also fundamentally characterized by institutional violence and the absence of intersectionality.

In the first place, although sexist violence suffered goes through the entire migratory process -from decision-making in their countries of origin to their daily lives once in Catalonia-, care tends to focus on the "here and now" of women. Thus, a comprehensive approach to all the violence experienced throughout the migration project is completely absent.

Secondly, gender-based violence services mainly focus on intimate partner violence, leaving aside other forms such as sexist violence at workplace, which mainly affects migrant women working as domestic workers and caregivers.

Third, the interaction of certain articles of the immigration law and the legislation on sexist violence, added to the pre-eminence of the immigration regulations, creates significant obstacles in the relationship between women in situations of violence and public services due to the fear and mistrust they feel.

To conclude, this paper shows that these services do not adequately respond to the individual circumstances of migrant and refugee women, and do not take into account the differentiated effects of violence on the various situations of women. This mean that gender-based violence services are not complying with international human rights standards, which establish that the State must provide services that assist and care for all women in situations of sexist violence and for survivors.

MORETTI, SABRINA* (University of Urbino, Italy)

SACCHETTI, FRANCESCO (Universita degli studi di Urbino, Italy)

Patient Engagement and Relationships between Stakeholders in the Biotech Sector

Although the issue of patient engagement has been debated for several years, research in the health sector continues to be mainly conducted *on* patients, seen as a source of data, and not *with* patients, considering their active contribution in the research process.

The concept of *patient engagement* implies the need for integration between scientific competence regarding a given illness and knowledge based on the direct experience of the illness itself. In this sense, patients should be involved in the identification of health priorities/outcomes.

Italian biotechnology companies interpret *patient engagement* as *patient centricity*, an organizational model that includes the patient's experiential knowledge in research and development processes. This means passing from an illness-centered model to a patient-centered one, and, consequently, interacting constantly with the regulatory agencies and their request for a result produced accordingly. Nevertheless, many factors contribute to the spread of skepticism regarding patient engagement in many pharmaceutical industries: uncertainty about patients' ability to contribute to research, additional costs, slowdown and interference with the research process, uncertainty about how to resolve conflicts, confusion about how to implement a patient-centered approach, uncertainty about the financial value that patient centricity provides. So, patient engagement is often limited to participation, clinical trials, or education about a new drug using health professionals as proxies.

The interrelation between regulatory agencies, patients and industries is shaping the contemporary healthcare research and development landscape. Each of them in various forms is involved in a process of organization and change of perspective. Nevertheless, there are no common or shared protocols or best practices, and the initiatives of companies and patient organizations are generally sporadic and inconsistent, which limits their effectiveness. In the Italian context, as in all Western countries, patient participation is seen as a fundamental process, but its implementation is still a *learning by doing* performance.

MORETTI, SABRINA* (University of Urbino, Italy)

The Combination of Paradigms in Participatory Agent-Based Simulation

Currently, agent-based simulation models are the most common type of computational model among social scientists, so much so that the term *agent-based model* (ABM) has become almost synonymous with *simulation model*. ABMs allow the construction of artificial societies with which to explore scenarios and verify which properties emerge at the global level of a given system as the cause of the interactions that develop at the local level.

This work is intended to analyze the ABMs that are constructed by means of a process of direct participation by stakeholders, called *participatory modelling*. Such ABMs allow stakeholders to be actively involved in the different stages of the process: definition of the model's elements, choice of scenarios to be explored during simulations, validation of the model. Participation is achieved through strategies that combine quantitative and qualitative methods, ranging from ethnographic research to the use of statistical and environmental data, from role-playing games to experiments with different degrees of structuring. Through the study of some participatory modelling applications used in the fields of renewable resources management, social policy analysis and organizational studies, this work aims to classify these strategies by combining two criteria. The first takes into consideration the main objective for which the simulation model is constructed; the second is related to the epistemological perspective that steers the work of the developers.

In summary, it can be concluded that participatory modelling requires a research design in which are included both quantitative and qualitative methods, which can assume variegated combinatorial forms and which see the emergence of practices and formalizations of procedural research schemes that can contribute to the definition of new Mixed Methods Research strategies.

True Strength of Creativity; Human Relationship As Social Capital Combined with Creativity Enhances Business Performance

Researches (Saxenian 1996; M. S. Granovetter, 1973; J. E. Perry-Smith, 2006) show that human relationship still matters, that neither financial capital nor personal talents are sufficient to maximize a business's performance. Elements that are part of this human relationship are things such as trust and respect for one another as well as communicative attitude and fluid transaction of knowledge

among people – a set of values sometimes called the Social Capital(Colemann 1988). Social Capital matters, and when combined with financial and human capital, it can catapult the performance of a business in meaningful ways.

Also, exercise of creativity was found to have direct effects on the outcome of people's work performances. This is particularly true when people engage in - in addition to or in place of execution of a set of given tasks - volitional behaviours such as the Organizational Citizenship Behaviour (OCB) (Eschleman, et al., 2014). The concept of OCB is very closely interlinked with the quality of people's relationship, the Social Capital, making Social Capital and people's exercise of creativity highly correlational.

The author with a background in sociology and working experience in the Japanese advertising industry for many years closely examines the past researches conducted on these topics, and explores the applicability of their theories to the workers in Japan. A mass market research (n=2143, age 20 to 69, male and female) conducted by the author reveals findings that are statistically significant (p<0.01, Pearson correlation coefficient 0.32 to 0.45).

Aging and Frail Elderly: A New Research Perspective to Innovate Local Welfare

Services for the elderly in Italy, traditionally aimed at the needs of non-self-sufficiency, are moving towards an expansion of the audience of users, compatibly with an integrated approach to life extension (Leichsenring, 2018). In this context, the category of frailty - conceived as a multidimensional concept that includes biological, psychological and social factors - has become a new key for reading elderly needs. The project Redesign – frail elderly, intergenerational solidarity and ageing friendly communities (2019-2021)- carried out by the Catholic University of Milan, the University of Verona and the University of Molise in partnership with several Italian municipalities, is a participatory research aimed at co-building knowledge on the transition to old age in situations of vulnerability. The goal is to develop and implement new community networks of care, promoting health and well-being, active aging and solidarity between generations. In order to investigate the *role played by* critical events on the life trajectories of the elderly, the study design has adopted both a qualitative and a quantitative approach. Diadic qualitative interviews have been conducted with the elderly and their reference persons, while quantitative analysis of secondary data has been carried out to build and validate an age-friendly index about the 8 cities involved in the project. The first results highlight how resilience is a crucial factor to protect the elderly after the occurring of a stressor event, in a context of the multidimensional crisis due to the Covid-19 pandemic. To reduce frailty among the elderly, three strategies seem to be strategic: (1) the collaboration between caregivers and communities; (2) the contribution of intergenerational solidarity to foster elderly and family resilience; (3) the provision of tailored interventions for the specific needs of the elderly and their families.

The Interplay between Child Educational Poverty and Family Relationships: Some Results from an Italian Project Based on the Family Impact Lens

Educational poverty concerns children's access to educational resources and families are recognized as crucial subjects to facilitate this access. Hence, to contrast educational poverty, family-based interventions are advisable. This paper focus on an project aimed to contrast educational poverty in an Italian marginal neighbourhood, in the city of Novara (Piedmont), adopting the 'Family Impact Lens' (Bogenschneider et al, 2012), a family-focused approach to policy and practice. This model was applied for the monitoring and the impact evaluation of the project 'Open Doors', realized in childhood services 0-6 years old. A theory-based participatory methodology was deployed: both monitoring and evaluation were intended as accompanying processes of the project, leading the operators first to share the theoretical model and subsequently to assess their ability to apply it in their work. The research conducted aimed to strengthen family and social educational relationships of children by acting on the 5 guiding criteria of the

Family Impact Lens and the path carried out, consisted of a survey on 140 families target of the services, 4 metaplans involving all the different typologies of operators working on the project (social workers, educators) and an auto evaluation checklist filled in by 105 of them. Results point out some first operational guidelines regarding the improvement of integrated networks between services, as they still appear fragmented, except in emergency cases. The other focus that must certainly be implemented is related to working with families of other nationalities and/or with special needs, in fact the training and sharing of good practices on these targets is still not optimal.

MOSSERI, SARAH* (University of Sydney, Australia)

Mixing and Matching: The Meaning of Trust in Precarious Work

In an era of deinstitutionalisation, informal mechanisms of ordering social life become increasingly salient. Sociologists have long viewed trust as central to the establishment of social order, yet previous accounts of trust have under-theorised its emergent, contested and performative properties. In this piece, I use the case of the American workplace – where traditional structures such as stable employment contracts, internal labour markets and unions have fractured and weakened and where interpersonal trust in co-workers and managers remains surprisingly high – to examine how trust is negotiated and performed within the context of structural insecurity. Based on fourteen months of comparative ethnography and 120 in-depth interviews, I find that workers do not simply trust or distrust, as if turning a light switch on and off. Instead, they act like sound mixers, experimentally turning up or turning down the volume on different logics of trust within specific situations until a meaning resonates. The polysemy of trust enables its accomplishment. I conclude that this accomplishment is the discursive mechanism that 'greases the wheels' of precarious work by facilitating a sense of loyalty within employment relations, and in concert, encouraging and enabling workers to justify or disregard actions that undermine their interests.

MOSSI, THAYS* (Universidade Federal do Rio Grande do Sul, Brazil)

Designers Graphiques Indépendants : Entre Formalité Et Irrégularité

Le débat sur les zones grises du salariat a été inauguré par Alain Supiot, qui a constaté que l'opposition entre travailleurs indépendants et subordonnés, très claire dans le modèle tayloriste-fordiste, était devenue fluide. La continuité de ce débat au cours des dernières années a mis en évidence une prolifération des catégories d'emploi, en introduisant notamment l'axe formalité-informalité dans l'analyse des relations de travail.

Au Brésil, le statut de microentrepreneur individuel (MEI) est une formule qui produit de l'hybridation. C'est une politique publique qui vise à la formalisation des petites entreprises et à l'inclusion dans le système de sécurité sociale. La création de nouvelles entreprises formelles est encouragée afin de stimuler l'activité économique et de formaliser l'entrepreneuriat informel existant, à condition qu'il ne s'agisse pas des activités de nature intellectuelle, artistique et culturelle.

À partir de l'étude empirique des utilisations pratiques du statut du MEI, nous examinerons comment formalité et informalité s'articulent dans les trajectoires individuelles des designers graphiques indépendants. En raison de la nature à la fois technique et artistique de leur travail, ils font face à une ambivalence. En effet, le statut de salarié est rare dans le domaine artistique mais, dans le même temps, ils sont aussi confrontés à une nécessité de formalisation pour travailler pour des clients plus importants.

Outre le brouillage des statuts du travail dans les trajectoires des designers, nous avons identifié une nouvelle forme hybride de mise au travail : la "formalité irrégulière". L'irrégularité découle de l'injonction à la formalisation elle-même, puisque le statut du MEI exclut de son système fiscal et de protection sociale les activités intellectuelles et artistiques, telles que celles exercées par les designers. Dans l'injonction entre la demande d'indépendance, le besoin de formalisation et l'insécurité économique, l'utilisation du statut du MEI, tout en permettant la formalisation, produit des formes d'illégalité.

The Psychologization of Religion: Moralizing and Rationalizing Religious Behaviour

Ethnographic observation conducted among believers of various traditions has documented the use of psychological resources (Neurolinguistic programming, Emotional-rational theory (from behavioral theories, etc.) to monitor behaviours and head towards the model of the perfect believer and practitioner. Tools stemming from movements of personal development are equally used to work and better the pious self under the «spiritual» canopy. While this trend is mediated

by new religious authorities who act as spiritual coaches, it gains its legitimacy by relying on scientific progress aimed at rationalizing behaviour. Drawing on fieldwork conducted among converts to Islam, I show how the use of these rationale techniques frame believers' bodies, grid of perception, affects and behaviours according to specific moralities. I then examine how these moralities articulate with neoliberal and religious ethics before discussing their conditions of circulation on a transregional scale.

Simmel's Relational Dualism

Relational sociology emerges as a promising theoretical turning point in Social Theory. Among its canon of influences, Georg Simmel's thought stands out. However, something distinguishes this author from most relational sociologists, both classical and contemporary: his recourse to dualisms. In this work we seek to understand the role of dualisms in his sociology to analyze whether they are incompatible with relational thinking. We find dualisms throughout his work, from sociological to ontological, alongside the defense of a methodological pluralism and multidimensional theory. These dualisms are essential to questions central to sociology, such as the relationship between the individual and society, with its modern synthesis in individualisms. The apparent contradiction comes from a mistaken notion of what the simmelian dualism is, a vitalist dualism formed by a dialectic of the irreconcilable. This dualism is not formed by separate substances, but by opposite poles of an original unity. An exception is his metaphysics of the sexes, which had its contamination by common sense exposed by Marianne Weber's criticism. However, confronted with the methodological history of the German sociologist, this metaphysics emerges as a point outside the curve, not being enough to disfigure its relational sociology. We conclude with the affirmation of the simmelian relationism as composed of the dualistic relationship between opposite poles, fundamental to his method, because they consist of fixed points to be overcome in new historically observable syntheses.

Solitude and Sociability in Older Persons

Loneliness, as a feeling, can be present in all ages. Meaning a lack of connection and emotional satisfaction of one person in relation to others, feeling without affection, support or acceptance, it can happen in several circumstances and situations that would not affect some people, but could affect others deeply. It can happen when there are few people present in one's life, but also when the available people have no special significance... In the case of old age, it acquires special configuration, because it refers comparatively to past positive experiences. The point of arrival of a long life trajectory reveals losses and, not exclusively limited to subjectivity, expresses, above all, the social marginality that every old man or old woman is an object of. In the research, the complaints point to situations expressed in terms of "I spend the day alone, at night the children come from work, take a shower, dine and go out to meet friends. I'm still lonely" or, "There is a lot of people at home, but I feel lonely." "After I got old, I have become invisible". In more general terms, the elderly person feels the experience of those who do not receive invitations, of whom he or she does not arouse interest; of someone who is "different". It is the sensation of the one who sits out, precisely because, materially or symbolically, he or she is actually put on the sidelines. Yet, the natural human inclination to sociability remains even among the very old people, but it hardly attains significative expression. These are experiences of the oldest people, as found in research in Bahia, Brazil.

Allowing Rural Difference to Make a Difference: The Brazilian Marcha Das Margaridas

The *Marcha das Margaridas* is a Brazilian grass-roots mobilization of rural working women that started in the year 2000 and takes place every four years since 2003 to claim for their rights. The *Marcha* is led by the Brazilian trade union movement of rural workers and counts on partnerships with more than ten different movements and organizations, including women's movements, trade unions, agrarian movements, environmentalists, as well as transnational feminisms like the World March of Women. Based on a discussion of Mohanty's "common contexts of struggles" as well as the concept of "common differences", we analyze how the *Marcha das Margaridas* has been constructing alliances over time through an intersectional analytics. We found that work (class), gender and ruralities appear as main axis of difference already in intersection. Ethnicity, race, and generation are other axis that structure the narrative of the difference, but that are not

core translated into proposals for the Marcha's list of demands until recently. We argue that the Margaridas are actively constructing their common differences. Their commonalities are thus a result of an ongoing political work of building solidarity as well as a condition to the success of their politics of alliance. In terms of data and methods, the research is based on analysis of the documents organized in the *Marcha das Margaridas'* archive, interviews with some of the coordinators of the *Marcha*, as well as on-site observation of the 2015 and 2019 editions of the march.

Feminist Solidarities and Coalitional Identity: The Popular Feminism of Marcha Das Margaridas

The Marcha das Margaridas is a mass mobilization in Brazil that started in year 2000 led by women organizations within rural trade unions in alliance with other social movements and NGOs, including transnational partners like the World March of Women. The main political subject are "rural working women", in a political process that articulates gender, class and urban-rural inequalities that are foundational for the "popular feminism" of the Marcha. At the same time, the Marcha das Margaridas emerged as part of a network of solidarity, which resulted in what I have identified as a coalitional identity, that of Margaridas. The Marcha became an important collective action of feminist movements and workers movement along the years. In its 6th and last edition in 2019, it was perceived as a key mass movement to show the strength of popular resistance to the right-wing government in Brazil. Guided by a theoretical discussion between poststructural feminism and postcolonial feminist around the role of political identities in building coalitions, I examine the negotiations and tensions over such a coalitional identity in what regards, first, its relationships with the left and its understanding of popular feminism, and second, its politicization of racial, ethnic, decolonial and sexual differences.

The System of Relevance in Alfred Schutz´s Work

In *Reflections on the Problem of Relevance,* Shutz shows that in order to study the problem of relevance in the sphere of perception, it is necessary to state that all perceptions imply the problem of election. This difficult problem makes us go to phenomenic field differentiating those elements that are to be interpreted afterwards. However, phenomena are not completely new: these have been already thematized, and they are a true possesion of the I, which have their origin in the correlation between empirical types and habits. Things that we find in this world are not just things, they form a type, i.e, they look familiar to us. This way, considering the problem of relevance as the ripest fruit of the constitutive phenomenology of the natural attitude, we present notions like selection, interest, attention, association and motivation, that contributed to clarify how social environment is organized upon typifications that deal in a direct way with the acts of conciousness and their cognoscitive modifications

Macaúba As an Internationalizable Object: Connecting Diverse Sociotechnical Imaginaries

This article seeks to investigate at the process of internationalization of science taking as its starting point a research laboratory in the field of agrarian sciences. Based on the literature produced in the field of Science, Technology and Society (STS), especially actor-network theory and socio-technical imaginaries, the paper seeks to understand the relations, agents and symbolic configurations involved in the formation of an international research network about Macaúba, a Brazilian native plant. Based upon interviews with laboratory researchers and an ethnography performed in this space, the analysis argues that the process of internationalization of macaúba occurred in a process of co-production of nature and society, in which its potential as a plant and source for knowledge were built together with its adherence to diverse socio-technical imaginaries and to networks of different scales. Thus, aspects related to environmental and sustainable imaginaries are linked to geopolitical imaginaries around elements of knowledge, such as center and periphery, to allow the displacement and production of macaúba as an

object of knowledge throughout the international space. The research aims to contribute to the field of research on the internationalization of science, bringing attention to symbolic and imaginary aspects of these processes.

Searching for an Educational Shelter: Classification, Racialization and Genderization in the School Choice Experience of Migrant Families in Chile

Latin families moving to a different Latin American country are placed in a dominated and oppressed position by what Quijano (1992) called "coloniality". Therefore, the social order as well as the racial hierarchies of those host countries they encounter are still located in terms of the "colonial difference" (Walsh et al, 2006); which defines society in "ranks, places and roles within the social structure of power" (Quijano, 2000). In this sense, we will argue in this presentation that the processes of classification (in terms of social class), racialization and genderization that Latin families experience when choosing a school for their children in the Chilean contextcan be a form of encounter with this coloniality.For this, we show narratives from in-depth interviews conducted in the central coast of Chile with families who applied to schools under the new admission system.

In the Chilean educational context, migrant families are placed in a disadvantaged position regarding their peers, by a new Chilean educational system that assumes to be universal. In this sense, narratives show that process of classification, racialization and genderization, as socio-cultural productions, are intersected in the migrant families' experience of school choice. These intersections emerged when families match the school choice with an imaginary shelter search, as they manifest their interest to protect their children, avoiding contexts with "marginal children", racial bullying and safeguarding gender expectations accomplishment.

We believe that the figure of "the shelter" represent in a good way a material and symbolic space where the three processes intersected for these parents. Shelter as protection of something that could threat their children's development in Chile. However, their interpretation towards this protection is not linked to diversity acceptance, by contrast, the schools that are "appropriated" for these parents -which reproduce coloniality order-, are those where discipline prevail over academic or inclusive features.

Assessing the Moderating Effect of Socioeconomic Status between Perceived Supervisor Support and Student Internship Satisfaction at a Historically Black College and University

When it comes to preparing for life after college, it makes sense that students would want to increase their competitiveness in the job market. Due in part to this concern, experiential learning is highly valued in educational and job-related settings as a means for preparing students for real-world work (Hora, Wolfgram, & Thompson, 2017). Internships—short-term work experiences—enable students to apply their academic knowledge to real-world settings (Hora et al., 2017).

The research question: To what degree does SES moderate the relationship between perceived supervisor support (PSS) and student internship satisfaction (SIS) at HBCUs?

The theoretical framework used for this study was the Minnesota Theory of Work Adjustment (MTWA; Dawis & Lofquist, 1976, 1984). This theoretical approach asserts that the experience of work can be conceptualized within the reciprocal interaction of the individual and the environment. This approach allowed for the observation of SES as an environment.

Data were collected as part of a larger study on internships at an HBCU in the southeastern U.S in the Spring of 2018 (Hora et al., 2019). Regression analyses examining perceived supervisor support, internship satisfaction, and socioeconomic status were executed. Results indicated that although there was a significantly positive relationship between PSS and SIS, there was no significant relationship with SES as the moderating variable. The absence of a significant effect did not negate the presence of an effect at all. Results showed students from middle-income households had an initial high level of satisfaction with their internship choice prior to the experience of supervisor feedback, while low- and lower-middle income students had the second highest rate of satisfaction prior to supervisor feedback compared to upper-middle income students.

MUELLER, GEORG* (Univ. of Fribourg, Switzerland)

Computer Models As Pilots Thru the Space of Qualitative Social Dynamics

Computer models of social dynamics generally have a formal core of quantitative equations. The temporal dynamics of their output variables may however be categorized according to qualitative typologies: depending on the model parameters, output variables may fluctuate, steadily increase or decrease, converge to an equilibrium, etc. Hence the present paper suggests to explore - either by computer simulation or formal reasoning - the critical parameter values, which trigger a transition from one type of qualitative model dynamics to another. The result may be mapped in a multi-dimensional parameter space.

Maps of qualitative model dynamics are useful tools for systematic empirical tests, which are more rigorous and complete than the usual checks with particular data sets, often chosen for practical reasons of easy availability. Like in theoretical sampling in the tradition of purely qualitative studies, they enable the researcher to find similar or contrasting cases and guide the investigator to rare phenomena, which otherwise would be overlooked. If reality and qualitative model predictions systematically coincide, the tested model has an unusual degree of empirical validity. Otherwise its equations and the underlying theories have to be modified.

The use of quantitative computer models as pilots thru the space of qualitative social dynamics is illustrated by an analysis of a simulation model of Thomas Kuhn's theory of scientific revolutions. Depending on the parameter values of the model, it has three possible qualitative outcomes: the persistence of the old paradigm, its complete replacement by a new one, and the coexistence of the old and a new paradigm. The analysis of the model by computer simulation allows to draw maps of outcomes, which can be used for theoretical sampling of situations that represent the mentioned dynamics of paradigms.

MUELLER, GEORG* (Univ. of Fribourg, Switzerland)

Information Theory As a Toolbox for Comparative Analyses of Social Signals

Social status is often not directly visible. Consequently, privileged social classes use status symbols like luxury cars, precious jewelry, or prestigious residences in order to display their social standing. Similarly, important beliefs and attitudes are often not sufficiently perceivable and thus need to be communicated to the public by means of symbolic acts "proving" religiosity, honesty, generosity, etc. However, such signals are often copied and "misused" by bluffers, posers, and hypocrites and consequently contaminated with a lot of disturbing statistical noise.

The amount of information and noise contained in signals is a classical topic of abstract mathematical information theory, originally developed by C. Shannon and W. Weaver. Thus, the proposed paper tackles the phenomenon of social signaling with concepts borrowed from information theory such as synentropy, information gains/losses, redundancy, etc. One of the important advantages of the use of information theory in this context is the high comparability of different concepts and analyzed social groups, which is due to the existence of a common scale based on bits.

In order to illustrate the proposed methodology, the author analyses signals of religiosity: regular church going, religious education of children, and volunteering in religious organizations. For this purpose, survey data of the European Values Study EVS 2008 referring to Jews, Muslims, Protestants, and Catholics are used to compare different denominations with regard to the amount of information, which is contained in the previously mentioned signals of religiosity. Their redundancy and contamination with noise are other important topics, which are also explored with the survey data of the EVS 2008.

Livelihoods and Climate Change: Impact on Children and Their Lives

Climate change is one of the biggest threats posing the humanity today. It poses risk to lives, livelihoods and resources. India is one of the most vulnerable countries to the impact of climate change. According to Global Climate Risk Index released by Germanwatch, a Berlin based NGO, India is 6th most vulnerable country in terms of vulnerability to climate risks. Children are widely considered as one of the groups most vulnerable to the impacts of climate change (IPCC). It is widely acknowledged that children, as a broad group, are particularly vulnerable to the impacts of climate change for reasons related to their physical and mental development as well as their general exclusion from decision-making processes (Save the Children, 2009).

Save the Children has conducted a research study in partnership with PriceWaterhouseCoopers India (PwC) to understand the impact of climate change on children in vulnerable areas in India. The study is aimed at assessing the impact of climate change on children in a climate change sensitive area and identify the adaptation and mitigation measures in short, medium and long term to reduce the impacts.

The study has used multiple criteria for selection of states including exposure to hazards, availability of ecosystems and density of child populations. Basis these criteria states of Uttarakhand, West Bengal and Madhya Pradesh have been selected. The study has used mixed methods approach involving both qualitative and quantitative methods. A household survey has been conducted on a selected sample for quantitative data.

Qualitative methods have helped us in understanding the critical nuances, which may not have been captured adequately in quantitative methods. In addition, children, who are our main stakeholders, may not have responded to a face to face questionnaire regarding climate change and their response to climate change, as they have in a FGD.

RAY, STHITAPRAGYAN (,)

Gender and Technology in Everyday Urban Space: A Study of Smart City of Bhubaneswar in India

Smart Cities represent a neo-liberal response to the urban crisis in the world, particularly in the global south. Driven by the logic of techno-urbanism, Smart Cities seek to use market and technology particularly ICT as a panacea to address the development challenges created by the withdrawal of the state in delivering urban infrastructure and services to the citizens, particularly the vulnerable. As a typical post-industrial strategy, the use of ICT for bringing about urban transformation in developing countries is fraught with potential risks. Among others, the technology-induced transformation of urban space has implications for gender groups including that for women and third gender groups. Urban space plays a key role in shaping social identities like gender and allows for certain social processes to flourish while inhibiting others. The intersection of gender and urban space mediated through technology assumes significance as gender is both a marker of identity and serves as a matrix of inequality as well. This intersectionality feeds into the bivalent dimension of gender which involves both political-economic and cultural-valuational aspects. The gendering of access to and use of technology in the everyday urban space of Smart Cities raises fundamental questions about issues of redistribution, representation and recognition. The social embeddedness of digital technologies and their interface with gender, therefore, have significant policy and theoretical implications. The present study seeks to explore this interface between gender and technology in Bhubaneswar – a Smart City of Odisha[1], India, where following the global urban trends, the Smart Cities Mission (SCM) was launched in 2015. The study findings might contribute to establishing the 'Right to the City' by the marginalized gender groups.

[1] Odisha being one of the poorest states in the country posits a hopeful picture in terms of it urban development with Bhubaneswar ranking 1st during 2015 Smart City selection.

MUNGUÍA GALEANA, FERNANDO* (FCPyS/UNAM, Mexico)

Is There a Historical Sociology in Mexico? Expressions and Disputes of a Field Under Construction Since the Global South's View

The objective of this working paper is to point out the tensions between the academic exercise of sociology and history in Mexico and provide some elements that allow establishing if it is possible to recognize, within the broad and diverse set in which these disciplines have been developed in specific academics centers, the field of Historical Sociology as a space of hybridization and articulation between these two disciplines for the production of concrete investigations that give it particularity and autonomy. In the first part of the work I concentrate on identifying some features of this "dispute between members of the same family", as Peter Burke named it, that allow to trace the boundaries of the field that interests me. I propose the consideration of the following elements: a) recognize the influences and local structuring of some of the main veins from which the development and possible confluences between history and sociology have taken place; b) identify the substantive issues addressed in the works that can be recognized as socio-historical research; and, c) mark some of the current challenges and possibilities that are foreseen in the horizon of their academic practice. This discussion will allow, in the second part of the paper, to argue why the approach of Historical Sociology, from the Global South view, can be considered as a perspective in constant construction (the different waves of Historical Sociology that are distinguished at various times in the American academies and in certain European spaces), and expose that it is in conditions of social crisis when this, from its methodological and theoretical contributions, can be configured as an intellectual dispute field capable of articulating different temporal and analytical records that helps to subvert the conditions of "entrenchment in the present" and promote critical dialogues between various academic spaces and regions.

Cultural Critique and Environmental Crisis: The Contribution of Theodor Adorno and Max Horkheimer

In Dialectic of Enlightenment, in reference to the evolutionary history of humanity, Max Horkheimer and Theodor Adorno describe the development of a dominant reason which is the basis of the relationship between humans and nature in the current society. This mastery of nature logic (in which subject and object are rigidly separated) spreads, according to the authors, to all the relations in human society, including its cultural aspects, as it is made clear in the chapter about the Culture Industry. The goal of the discussion proposed here is to present some fundamental elements of Adorno's and Horkheimer's critique of domination, focusing on its cultural aspects, in order to assess its possible contribution to the critical debate of processes that the authors couldn't envisage more than 70 years ago: the environmental crisis and also the advent of the Internet. In other words, if the present communication provides the image of a nostalgic return to nature (which is critically innocuous), may Adorno's and Horkheimer's cultural critique (which is imbricated to their social critique) contribute to an approach that goes beyond this image, reaching the immanent contradictions in the current social process that led to the present environmental crisis?

VERD, JOAN MIQUEL (Universidad Autónoma de Barcelona,)

Desigualdades Sociales En Clave Comparada: La Potencialidad De La Perspectiva De Trayectorias Sociales Para Una Análisis Comparado De La Desigualdad.

La presente ponencia se inscribe en las discusiones sobre las desigualdades sociales comparadas desarrollando un análisis teórico-metodológico que aporta a la construcción de miradas críticas sobre el fenómeno en un contexto en el que se hace necesario promover políticas públicas que propicien la igualdad.

En particular, se estudian las desigualdades sociales a partir de la perspectiva del curso de vida que promueve análisis multidimensionales a lo largo del tiempo. Más concretamente se propone actualizar las discusiones en torno a las potencialidades, métodos y estrategias de análisis existentes en el marco de esta aproximación para la aplicación de un modelo teórico-metodológico que profundice los desarrollos actuales en torno a la Perspectiva Biográfica Comparada.

El modelo que se propone se aplicará de forma empírica en el análisis de las carreras laborales de trabajadores y trabajadoras con distintos niveles educativos en dos empresas, una argentina y una española. Se realizará, en particular, una comparación identificando similitudes y diferencias, para mostrar la forma en que las transiciones en el marco de las carreras constituyen pasajes institucionales y subjetivos que construyen situaciones y lugares de privilegio y privación, reproduciendo es este proceso las desigualdades sociales.

Esta mirada centrada en las trayectorias de vida y las desigualdades se inscribe y pretende aportar a la construcción del Modelo AMOSIT (INCASI), en tanto analiza las desigualdades sociales y las trayectorias productivas y reproductivas entrelazando los análisis macro sociales con las miradas meso institucionales y las representaciones subjetivas de los actores sociales.

MUÑIZ TERRA, LETICIA* (UNLP/CONICET., Argentina)

Trayectorias Laborales Ascendentes En Argentina (1990-2019): Un Análisis De La Importancia De Las Disposiciones Subjetivas En La Movilidad Social.

Los estudios realizados sobre desigualdad y movilidad social tienen una amplia tradición Argentina, y se han concentradoen la disminución de la movilidad ascendente desde los estratos de clase trabajadora a los de clase media de 1960 a 1995 (Jorrat, 2000) y a principios del sigloXXI (Benza, 2010; Dalle, 2011), sugiriendo que la transformación estructural neoliberal indujo un cierre progresivo del sistema de estratificación, que logró modificarse levemente entre 2003 y 2015 (Plá, 2012, Dalle, 2012) Chávez Molina, 2013)

Los estudios realizados desde una perspectiva cualitativa, se han dedicado,a estudiar los procesos de movilidad descendente de las clases medias durante la década del 90 (Minujin y Kessler, 1995; Kessler y Di Virgilio, 2005), las formas de sobrevivencia de las clases populares tras la pérdida del empleo fabril (Salvia y Chávez Molina, 2007, Muñiz Terra, 2012) y la movilidad ascendente de corta distancia (Dalle, 2012, Plá 2012).

Hasta el momento son escasos los trabajos que se preocupan específicamente por recuperar el lugar que tiene el capital social desde la perspectiva de los actores sociales. A partir de un estudio basado en 20 entrevistas biográficas esta ponencia se inscribe en la perspectiva de las trayectorias sociales y recupera la forma en que los sujetos construyen sus trayectorias laborales como resultado de una sedimentación entre los constreñimientos estructurales, los factores in-

stitucionales y las acciones individuales a lo largo del tiempo. En particular, se hace hincapié en la forma en que los actores sociales que llegaron a la clase de servicios (desde las clases intermedias y trabajadoras) tomaron decisiones y actuaron considerando sus experiencias individuales, sus disposiciones culturales (hábitus), sus cálculos de costes y beneficios, su evaluación de la estructura de oportunidades y sus respuestas frente al azar o la indeterminación, logrando salir de la conducta/elección/camino esperado en función de su clase social de origen.

Social Movement Organizations and Food Markets: The Meetings and Mismatches in Brazil and Chile

The consequences of the expansion of the corporate food regime have led to a series of countermovements, which combine a civic critique based on the societal demands for equity, justice, social participation and sustainability. This paper presents a comparative analysis between the strategies of social movement organizations in Brazil (MST) and Chile (ANAMURI, MAELA and MUCECH) that represent challenging actors to the corporate food regime. The survey was conducted from 2016 to 2018, through interviews with leaders of social movement organizations, technical teams of economic enterprises and consumers of selected marketing channels, as well as direct observation of marketing practices. While in Brazil, the MST mobilizes and develops a diversity of productive and commercial actions, in Chile it is exposed that ANAMURI, MAELA and MUCECH have difficulty on achieving the same advances. This led to a change in the Chilean case, where INDAP, or the State, assumed centrality in the food markets. The main results of the research indicate that, in the last two decades, countermovements to the expansion of the corporate food regime opened spaces for different food market modalities, attributing new roles of economic agents to social movements' organizations, which enabled the emergence of innovative trajectories of development. However, such initiatives do not represent a dispute for a capitalist market *per se*, as the mainstream of economic theory devises. It is the social construction of markets that may have multidimensional viability (social, economic, environmental and cultural), at the same time as it is articulated with the principles and values that guide the organizations of family and peasant farming social movements, where political flags such as food sovereignty, agroecology and *buen vivir* have gained centrality and reveal attempts to re-embeddedness these markets.

Trayectorias Sociales En El Proceso De Individuación De Los Profesionales Titulados De Universidades No Metropolitanas Chilenas

La presente ponencia muestra las trayectorias sociales en el procesos de individuación de los/as titulados/as de universidades no metropolitanas chilenas. Ello a través de un análisis de las narrativas biográficas, creencias, experiencias y capitales asociados a las estrategias de posicionamiento de los titulados en el mercado laboral y/o continuidad de estudios. Importa también analizar las tensiones entre producción y reproducción social en tanto pruebas estructurales, como también el rol de las universidades y carreras de egreso en la transición universidad- trabajo, desde la perspectiva del capital institucional y su conversión.

El actor social que estudiaremos culminó con éxito el largo proceso de escolarización y educación terciaria en un sistema universitario masivo, desregulado y jerarquizado en cuanto a calidad. Estos sujetos de interés conforman una nueva fuerza de trabajo profesional siendo primera y segunda generación de profesionales en sus familias, hombres y mujeres jóvenes entre 25 a 35 años, todos titulados de universidades tradicionales y no metropolitanas chilenas

El enfoque propuesto para este estudio es la interseccionalidad, desde donde las posiciones sociales y subjetividades son analizadas a partir del entrecruce de distintos sistemas de diferenciación social y dominación. En este marco, una sociología de las trayectorias sociales y la individuación posibilita conocer el efecto de la individuación meritocrática y neoliberal sobre las trayectorias familiares, las redes de relaciones, afinidades y estilos de vida, la transformación de tareas productivas y reproductivas, la singularización de las biografías y las desigualdades, en tanto obstáculos y riesgos acaecidos, ligados a la inseguridad, la precarización y el desempleo, en la transición universidad-trabajo.

Analysing the Fossil-Fuelled Climate Crisis Using the Social Closure and Social Practices Frameworks

Fossil fuels have been the energy source powering modern societies, currently providing 81% of the world's energy. However, fossil-fuelled practices of huge oligopolistic companies and of eight billion people generate greenhouse-gas emissions causing costly global warming. These externalized costs to the atmospheric commons used as a carbon dump constitute an enormous environmental debt to be paid by future generations in disasters and costs of disaster preparedness and adaptation. This paper shows how my social closure framework based on monopolisation, exclusion, and usurpation can be integrated with Shove's social practices framework to analyse the accelerating treadmill of carbon-polluting fossil-fuelled practices. It investigates how environmental social closure involving the appropriation of biophysical resources including carbon sinks by the present generation, disproportionately benefiting some of its members, results in excluding latecomers and other species from such benefits. Latecomers consist of poor individuals, poor societies, and future generations. The global biophysical environment, particularly the atmosphere, is a medium carrying social relations of monopolisation and exclusion across space and between generations over time. Priority given to near-term economic benefits to the exclusion of long-term costs, which are discounted, results in social closure embedded in culture, practices, and physical infrastructures. Usurpation is led by environmental movements, impact scientists, social democratic governments, and nature whose biophysical dynamics strike back, with fossil-fuelled global warming unleashing intense wildfires, hurricanes, flooding, etc. The paper also examines environmental regulations as undermining monopolisation, and deregulation as strengthening monopolization. It explores whether reluctance of carbon polluters, big and small, to modify fossil-fuelled practices and pay the full cost of fossil fuels upon use through carbon taxes, etc., motivates reliance on future just-in-time technological remedies, conceptualized as "faith 2.0 in the mastery of nature". The paper concludes with three possible energy futures and relates them to whether foresight or discounting danger will prevail.

Children's Experiences of Living in Joint Physical Custody in Italy : Norms and Practices.

This paper presents new results that emerged from an innovative research grounded in a yearlong fieldwork in Turin, Italy, where I exchanged with 22 children living in JPC, aged 10 to 16. The data presented, as well as the creative methodological design that was put into place, comes from an ERC Starting Grant funded research project entitled *MobileKids: Children in Multi-Local, Post-Separation Families* (supervision, Prof. Laura Merla). The problematic is to understand how the lives of children are affected by divorce, mobility and multilocality in the context of shared custody arrangements, and how children accommodate to this family situation. Considering children as active social actors that can, to various extents, exercise agency and influence on their own lives as well as on the lives of the people surrounding them, while being constrained by institutions (James & Prout 1997, Sirota 2012), I look at the *process* of moving from one house to the other every week and ask *how* children maneuver inside this mobility. In this perspective, I look into *the work that is done to move from one home to the other*: what are the children in charge of, what resources or infrastructures are made available to them, what skills/competences do they have (had) to acquire, where is there coordination with the work of others (parents, siblings, etc.)?

The overarching question being: *how these children's family practices are socially organized (what discourses/norms/ideologies shape them) and, especially, what role children play in this context?*

Critical Analysis of the Use of the Socio-Spatial Network Game in a Study in Shared Physical Custody to Capture the Children's Standpoint.

Based on an ongoing research project entitled *MobileKids: Children in Multi-Local, Post-Separation Families* (*ERC Starting Grant project* – supervision: Prof. Laura Merla), this paper critically examines the use of the Socio-Spatial Network Game (SSNG) as an innovative method to observe children in shared physical custody's experiences of multi-locality. The problematic is to understand how the lives of children are affected by divorce, mobility and multilocality in the context of shared custody arrangements, and how children accommodate to this family situation. The SSNG is a board game where children can concretely construct the experience of their multi-local everyday life (Schier et al 2015). In other words, it is as a space sensitive tool for qualitative egocentric network analysis, that is developed for research with children and allows great creative freedom in an aim to capture information about social relations and their spatial dimensions. This paper will thus start by exposing the method, its pertinence to capture the children's standpoint, as well as an ethical reflection of its use with minors. As we all mobilize the SSNG during our first encounter with children, we then propose a critical and reflexive analysis on the strengths and weaknesses of using this method in a collective project such as *MobileKids* – where each researcher focuses on a specific research question. In particular, we present how the method was used to document social networks in two separate sub-cases: one that focuses specifically on children's social networks, and the other that is framed as an institutional ethnography, documenting everyday practices.

MUSIC, LEJLA* (University of Sarajevo, Bosnia and Herzegovina)

Female Sociology As a Source of Women Empowerment in Academia, and Society

Even though there are many influent female sociologists they are not well introduced in literature and academic journals because of double standards in recognition of academic works of women. Jessie Bernard (Wharton, 2012, pp. 5) strives for the female enlightenment, questioning the sociology as male stream, and therefore focused only to male experiences, in famous statement: „Can sociology become science of society rather than science of male society?" (Wharton, 2012, pp.5). Dorothy Smith wrote her famous work Sociology for women as antecedents of later formed discipline of sociology of gender. She was lecturer at University of Oregon, where in the academic staff of 44 persons she was the only woman: „The chilly climate for women"(Ritzer, 1997, pp. 308-309), is the way in which Dorothy Smith explains her experience in teaching Gender studies in early seventies. Radical feminism, with its notion of violence over the women in public and private sphere, demands the identification of these spheres, in order for women to be involved in academic life with overcoming the negative stereotypes regarding the roles of women and man. CEDAW convention, Istanbul convention, and Peking platform for action influenced changes for the role of the professional female in Science.

Building Group Collective Agency in Youth Led Initiatives in Palestine

This paper will look into How do youth led organizing groups in Palestine build their collective Agency. The paper researched five youth initiatives that have been active for more than three years, interviews were conducted with groups leaders and members, in addition to observation for groups activities. The groups indicated that building internal trust among members, finding ways to share power, and the joint learning process are all factors that developed the individual and collective power of the group. The world view of the group members for their social and political role impacted the process of building power of the group through the mechanisms and approaches it utilized. A group who perceived its role in working without any dependency on organizations, meant that it needed to find new ways to channel resources into their activities which varied through creating new income generating projects, or sharing the personal resources. While groups who perceived its role in supporting the local community could depend only on networking for conducting its activities.

Individuals showing commitment to the group, sharing their personal knowledge, resources, and networks, in addition to finding ways for alternating power of decision making were all ways that the groups utilized to build their agency.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Founders of the groups played an important role in enhancing the positive atmosphere in groups and in providing a sense of assurance to group members, in addition, mentoring in the groups especially for young women was vital in enhancing the inclusion of young women in the groups. Engagement in Palestine is not risk free, in such context, collective power is essential for the sustainability of the work and to create an impact for youth group members in particular, and in the community in large.

Formation of Gendered Spaces in Youth Engagement in Palestine

During the last 7 years,Active young women have been more visible in leading roles within youth organizing initiatives and programs in Palestine. Hence, being more noticeable meant facing more criticism for the role that they are claiming in the public sphere whether in political or civic engagement. This paper aims to analyze the dynamics that forms the gendered spaces within a colonized context, in which youth initiatives and organizations are aiming to create social change. This paper will look into the creation of gender divide among youth whether in their engagement in youth initiatives and youth organizations. Within youth groups, differences in roles played by youth groups based on their worldview, background of their members, and the role of founders in setting the gender divide among members within the groups. Additionally, the paper will analyze the role played by group founders in setting the gender divide in the group. As for organizations the paper will look into the type of programs implemented and how it shape the roles, networks, capacities of both young women and men. This paper utilizes qualitative research methodology in which interviews were conducted with members and leaders of youth groups, and youth workers, and observation took place during meetings of youth groups and activities conducted by organizations and youth.

Diversa Pros and Cons Perpectives and Attitudes Towards Sociolinguistics

With the advent of sociolinguistics as a wide-ranging interdisciplinary field in the 1960s, language was considered a part of society and culture and was studied in relation to social factors. Within this vein, sociolinguistics and English language teaching have had a lasting and close relation as evidenced by the influence of social and cultural variables on the environment of foreign language teaching in both theoretical perspectives and concrete guidance for language teaching. However, in the wake of extensive globalization, migration, and as a result the spread of English, great diversity of social and educational contexts has led to some hot debates over the monolithic and superior position of the Standard English in schools. In fact, spreading multilingualism has made the society environments of today's schools diverse and pluralistic. Therefore, this paper intends to analyze different pros and cons perspectives and attitudes toward the idea of language as a means of social control and discrimination in this recent diversity of language and social backgrounds in order to better understand the ways in which language might be used to perpetuate social discrimination and power differentials and the ways in which sociocultural aspects of development and the concerns of various individual with diverse language and social backgrounds can better be taken into account.

Key words: Sociolinguistics, English Language Teaching, Pedagogical Applications, Pros and Cons

MWANGI, PHYLLIS* (Kenyatta University, Kenya)

Sacrificing a Woman'S Dignity at the Alter of Euphemism: The Portral of Women By Panelists Discussing Taboo Topics on Kenyan TV Shows

Language is a powerful tool that can be used to create and entrench gender discrimination. Women often have the short end of the stick given that cross-linguistically, language is replete with sexist terms that objectify women while glorifying masculinity. What is intriguing is the fact that women are sometimes willing partakers at the altar of linguistic stereotypes that demean them. This study looked at the portrayal of women in Kenyan TV shows that deal with taboo marital issues. It sampled the two leading Gikuyu TV stations, three programmes in each. Gender asymmetry was clearly brought out by these TV family shows that are supposed to help couples build and maintain successful modern marriages. It emerged that, in a bid to avoid taboo language, the panelists, both men and women, used euphemistic metaphors that cast women in dim light. Guided by the Conceptual Metaphor Theory, the paper discusses the portrayal of the woman as a garden to be tilled, a car part, a currency denomination, snuff, prey and so

on. In contrast, the man is seen as a fierce or virile animal that devours, garden tiller and choice maker among other attributes. In some cases, female panelists even advocated gender-based violence in which they are on the receiving end. It was observed that callers, again men and women alike, raised no objection to the blatant gender bias. The study therefore argues that language use in these programmes mirrors how the Gikuyu community in particular, and the African society in general, perceive women and their role in society. It concludes that unless women begin to linguistically and mentally emancipate themselves, it will be difficult for them to take up their rightful positions domestically and socially.

The Climate Emergency, Young People and Resistance: A Case of Generational Metamorphosis?

In recent times, media and political discourses around the problem of environmental risk have undergone something of a transformation. Alongside public lobbying of politicians, waves of protest against climate change have taken place outside of the formal democratic process in many countries across the world. What has been remarkable about protests against the intransigence of the State in addressing the climate emergency, has been the central role of young people - particularly those under eighteen - in mobilizing to highlight the immediacy and severity of the problem. Young activists such as the 16 year old Swedish student Greta Thunberg have captured the attention of the media and are part of a geographically diverse and powerful movement involved in raising awareness of the transnational nature of climate change and using direct political action in order to pressurize government's to act with urgency.

Given the material impact and novelty of these practices of political resistance, there is a need to explore sociological frameworks that can enable us to understand rapid, underlying transitions and interventions by contemporary youth that emerge in response to systemic environmental risks engendered by profit driven forms of turbo capitalism. To this end, we explore the explanatory potential of the theory of metamorphosis proposed by the German Sociologist Ulrich Beck in his last contribution, *The Metamorphosis of the World*. Drawing on cross-continental vignettes of patterns of environmental activism among young people, we explore both the sociological explanatory potential of key Beckian concepts - including 'anthropological shock', 'moral volition' and 'emancipatory catastrophism' - and identify notable elisions. Further, utilizing the theory of metamorphosis as a framework for analysis, we consider the implications of the 'metamorphosis of generations' for both risk perceptions and future cultural and political practices.

Globalization, Communication Technologies and Cultural Change Among the Middle Class Youth in an Urban Setting of Northern India

The era of 21st century, a number of changes have been observed every walk of social life including the field of art, economy, culture, technology. The technological advancements in communication technologies haven't only brought the mass-media at centre-stage but also affected the material and non-material cultural life of both the rural and urban dwellers. The traditional cultural norms and values of the society have given space to new cultural patterns among the youth who have high mass media exposure. The communication technologies developed a potential for flow of ideas, public contents through mass media (i.e. newspaper, television, magazines, radio etc). In last three decades of twentieth century, the emergence of "new media" (Facebook, Whatsapp, You tube etc.) have also affected the values and cultural patterns by facilitating the free flow of the cultural artifacts through web based global connectivity. While the mass media like print media (Newspaper) and audio-visual media (television) are still popular in society, It has an impact both on the material and the non-material culture. In material culture, its impact can be observed in changing lifestyle and living standards of people whereas in non- material culture it often help to create a more liberalized society by developing 'Cultural Homogenization'. Sometimes it also showcases a dualism between two different values and culture and creates 'digital divide' within the society. The present paper is based on an empirical study of the impact of globalization and communication on life style and cultural patterns of the middle class youth in an urban setting of a northern Indian, namely, Allahabad city in Eastern Uttar Pradesh. The study is focused on the youth of two middle class localities of the city.

NAGAMURA, YUKAKO* (JICA Ogata Research Institute, Japan)

Self-Government of Nikkei Citizens and Their Participation in Local Politics

-Case of Municipalities That Originated from Japanese Settlements at Sao Paulo State -

Before World War II, several Japanese settlements were built in an undeveloped area in Sao Paulo State, Brazil, that have since become independent cities, with a large Japanese descendant (called Nikkei) population and economic activities sustaining the locals' development. Nikkei from these municipalities started to participate in city governance and congress, motivated by community activities.

This presentation clarifies how the self-government consciousness of Nikkei citizen in Brazilian municipalities originating from Japanese settlements and their participation in local politics from the 1950s to 1980s formed. We examine major Japanese settlements considering Brazilian Nikkei's experiences: persecution by being the national enemy of the Brazilian government during WWII, the Kachimake conflict (between Nikkei who believed in Japan's victory and Nikkei who accepted Japan's defeat after the war), and ethnic relations with other non-Japanese citizens in a particular geographic space. We consider the cases of Bastos, Registro, and Promisson cities, using field surveys, interviews with Nikkei citizens, and examining Japanese local newspapers and administrative materials.

To analyze micro-histories, we focus on three different layers of identities: local, community, and ethnic. In Japanese settlements, Nikkei have developed a feeling of belonging and identification because of the strong and sustaining settlement memory, which motivated the Nikkei's participation in local politics. This work shows the various motivations for immigrants' political participation and suggests reconsideration of the modernization of Brazilian rural areas from an immigrant's viewpoint.

Ethnicity, Inequality, and National Statistics: The Israeli Case

Ethnicity is a core issue politically and economically embedded in the nation-building process. Although ethnic groups are imagined, socially constructed categories, they do have real effects on people and on state policy. One of the effects of categorizing people by ethnicity in Israel is the creation of an ethnic stratification. Namely, the correlation between Mizrahim (Jews who immigrated from Arab countries) and working-class, and Ashkenazim (Jews who immigrated from Europe) and middle/ upper classes. But, while inequality tends to perpetu-

ate, the ethnic categories in formal Israeli statistics have an expiration date: two generations after immigration. The massive immigration to Israel occurred during the 1950s. Thus, in the last two decades, third and fourth generations of Mizrahi ethnic group has become untraceable by official statistics.

About the time the ethnic category faded out from formal statistics new indexes were developed by the Israeli Central Bureau of Statistics (CBS) in order to measure inequality: The Socio-Economic Cluster Index in 1987 and the Peripherality Index in 2008. While the Socio-Economic Cluster Index echoed the initial rationale for the distinction between Ashkenazim and Mizrahim, in the Peripherality Index, ethnic indicators disappeared completely.

I discuss the implications of the "ethnic-blind approach", arguing that the absence of statistical measurement of intra-Jewish ethnicity hinders proper analysis of current inequality in Israeli society.

Discourse of Indian Mainstream Media in Creating Nationalist Approach to Kashmir : A Failed Watchdog of Human Rights

Indian administered kashmir which is also the world's most militarized zone is fighting from the last six decades for its right to self determination. In the recent move Indian Government has scrapped Article 370 of Indian Constitution which gave special status to Jammu and Kashmir. Following the abrogation of Article 370 Indian Government has also suspended communication services including telephones and internet which is also the violation of Article 19 of the Universal Declaration of Human Rights.

This move of Indian Government and Communication blackout had been supported by Indian mainstream media and the huge propaganda done to show the normalcy in Kashmir by fake news, censorship. Shockingly the Press Council of India had also moved to the Supreme Court of India supporting the India Government and Jammu and Kashmir government's decision to impose restrictions on communication in the state by saying due to security concerns there can be reasonable restrictions on the media.

Using a framework set by Noam Chomskeys Propaganda Model how the media form a decentralized and non-conspiratorial and a very powerful propaganda system that is able to mobilize an "elite" consensus of masses. This paper will examine the Discourse of India media in creating the Nationalist approach to Kashmir within the masses and its recent coverage on the Atrocities in Kashmir leading towards the failure of being watchdog of the Human Rights in India and in Kashmir.

Justice Means Annihilation of Caste

The prevalence of caste based occupation like manual scavenging is a prime example of how caste is a social construct, pervades economic activities and perpetuates discrimination, exclusion, ostracization and victimization. Dalit castes engaged in manual scavenging (Valmiki, Mehtar, etc)are compelled to perform the task of cleaning human excreta with bare hands or to clean sewer lines and septic tanks.

Narratives from the families of manual scavengers suggest that the manual scavengers who are asked to change livelihood don't get the dignified jobs when they try. When they try to start their business of their own, social psychology of the society does not allow them to buy from the scavenger who has turned into businessmen.

Manual scavenger and sanitation workers are only left with two options either to migrate to the city or to get educated. But even if they are educated there won't be change in discrimination and atrocities towards him. In that case, so the educated workers are left with only one option which is to migrate to the cities. But through case studies the paper argues that, even after migrating they are actively discriminated against by dominant castes. Urbanization reinforces the caste stigma and harassment they have always been facing at the source.

The paper adopts the critical framework of Ambedkar, that argues that until annihilation of caste is not achieved the caste based work will be continued and Dalits will be carrying this undignified work. Dr. B. R. Ambedkar (1936) in his book Annhilation of Caste says that nothing can emancipate the outcaste except the destruction of the caste system. Within this framework this paper argues how the dominant narratives of providing them the alternative livelihood or introduction of advanced technologies are limited in their scope in ending caste based occupation.

Genders in Focus: Depression Symptomology and Its Multilevel Correlates Based on Pooled Data from 18 European Countries

Aims: To identify men's and women's interpersonal but also individual, community and country level correlates of depression symptomology based on pooled

data from 18 European countries. *Methods:* The study is primarily based on the European Social Survey 2014/2015 and includes 14,003 men and 15,133 women (15 years or older). WHO's Mental Health Atlas 2011/2014, OECD Health Statistics, Eurostat and Nahkur et al. (2016) were used for country level data. Data were analyzed by means of multilevel linear regression models. *Results:* Men's and womens's higher level of depression symptomology was associated with more frequent interpersonal destructiveness in family during childhood, lower level of emotional support, less frequent social meetings, same or lower level of participation in social activities compared to others of same age, being unmarried and living alone; poorer economic coping and housing conditions, higher level of physical health problems, having caregiving responsibility and problems accessing healthcare services, lifestyle factors like lower physical activity and smoking; perception of belonging to a discriminatory group and less safe neighborhood; lower effectiveness of his/her country's social system on poverty reduction. Increasing age, lower education, higher BMI and smaller number of psychiatrists per 100 000 were significantly associated with higher level of depression symptomology only among women and higher societal level of interpersonal destructiveness only among men. *Conclusions:* The level of depression symptomology is higher among women than men, even after taking into account all other selected factors. Women's risk of depression compared to men is more determined by individual characteristics and healthcare services availability, and their interpersonal relationships seem to have more protective effect.

Lead and Lag Times of Countries in a Gentler World

According to Pinker (2011), Ingelhart (2018) and Welzel (2013), the human world has been moving toward more tolerance and less violence. We aim to quantitatively specify this trend toward "a kinder, gentler world" for various indices using extrapolations from previous decades. Linear extrapolation from previous decades is the simplest, but when indices are defined to run from 0 to 1 (100%) or vice versa, it risk leading to absurd values, negative or exceeding 1. We avoid this by using exponential approach to a ceiling of 1 or a floor of 0, over time. Integrated Values Database 1981-2014 and dataset "WVS Wave 1 to 6 Key Aggregates" are used in these analyses.

We first, compared to world average, list the lead and lag times of 26 countries for Welzel's Gender Equality (*TGE*) and for Nahkur's Societal Index of Interpersonal Destructiveness (*TSIID*) scores. This will illustrate the type of results the method used can produce. For example, we found that *TSIID* ranges from a 158-year lag (Russia) to a lead of more than 300 years (Sweden) compared to world average, while *TGE* ranges from a 46-year lag (Philippines) to a lead of 67 years (Norway).

Next, the method leading to such results is explained and applied to measures like Welzel's Emancipative Values Index and question about respondents' locus of control (both ranging from 0 to 1)

Finally, we compare the patterns in time for all indices/measures investigated, as well as the lead and lag patterns of individual countries.

Age Identities, Ageism and Reverse Metamorphosis - a Gender Perspective on Well - Being of Aged Women in India

Age identities – self and social - are intricate to the fabric of well being in old age. In a multi – cultural society like India age identities are shaped by socio-cultural constructions. In the context of graying population with feminine touch, the paper tries to explore how self and social identity constructions are mutually influencing and how they impact life satisfaction and subjective well-being of aged women in India. Analysis of primary data collected using mixed methodology [survey (n=300) and case studies (n =14)], showed that sweeping social changes are influencing age related identity constructions more negatively than positively. Positive identity constructions act as support mechanism for navigating through old age. Negative *Self identities* and *Social identities* bring forth attitudinal moulds that act as cocoons which nestles the aged women. Unlike biological metamorphosis– where the process carries life to an active, vibrant and beautiful stage before ultimate death, ageist self and social identity brings Reverse Metamorphosis. These cocoons of identities and images correlate their life as a passive, inactive and shade less period. Changes in tastes – dress, food, entertainment, possessions, preferences and resources - all undergo transformations. Daily life practices like asceticism, vegetarianism, spiritual orientation etc are certain manifestations. While positive identity constructions consider these changes as a major coping mechanism that provides life satisfaction, inner strength and provision to shed sorrows, negative ageist identity constructions results in self neglect, marginalization, depression and dependency. Hence strategies are to be developed at both individual and societal level to break the clutches of negative socio cultural constructs of identities. Personalized, gender sensitive approach needs to be de-

veloped taking into account individual necessities, priorities, and life experiences. It is also suggested that 'Conditions' in the life of aged women have to be changed to make positive 'experiences' in their life.

RC11-144.2

NAIR, CHITRA* (Govt. K NM College, India)

Dialectics of Identity Constructions – the Concept of Reverse Metamorphosis Reinforcing Ageism

Self identities and social identities about aging are designed on the basis of 'conditions' and 'experiences' in the life of the aged. Often these identities are responsible for ageist socio-cultural constructions that depict old age as passive, sacrificial, dependent and unattractive. Using Bourdieu's Theory of Habitus, the study intended to understand the dialectics of self and social identity constructions on subjective well being and quality of life of oldest old women. Qualitative analysis (n=14) using narratives and photo elicitation method was undertaken. Age, education, marital status, living arrangement, life satisfaction and happiness were the major variables selected. Results showed that perceptions about age identity have both direct and indirect impact on subjective well being. Corresponding to the nature of self identity, both positive and negative social identities were observed. Disengagements from active roles and power positions, attitude towards old age as a definite period of dependency, belief on inevitability of ill health, pessimism about cure for health problems, fear and anxiety about miseries and unpredictability in life were the leading self identity statements. Identity constructions when used deliberately as a tool of oppression results in Reverse Metamorphosis. Unlike biological metamorphosis– where the process brings life to active, vibrant, beautiful stage till the end of life – in Reverse Metamorphosis, aged women enter into cocoons of identities and images that label their life as a passive, inactive, shade less and unattractive period. Gender and widowhood add to the process by setting limits to the conditions of life. Reverse metamorphosis is reinforced through marginalization, isolation, neglect and abuse leading to depression, poor subjective well being and reduced quality of life. Suggestions are made to use Social, Cultural, Economic and Symbolic Capitals envisaged by Bourdieu to design Inclusive Social Spaces and gender sensitization to reduce ageism.

Right Wing Nationalism and the Rewriting of History in India

In 2016 a 14-member committee was set up by the ruling Hindu nationalist party, the BJP named, 'a holistic study of origin and evolution of Indian culture since 12,000 years before present and its interface with other cultures of the world'. Its mandate was to use archaeological artifacts as well as DNA evidence to prove that Hindus are the original inhabitants of the Indian subcontinent and ancient Hindu scriptures are based on facts and not myth. For India's Muslims, who have faced communal violence and discrimination under the BJP, this move was seen as another attempt to marginalize a minority community. My paper explores the process and agenda of re-writing History in India under the aegis of right-wing nationalist party, the BJP. It contextualizes the current debates on development and democracy in India in the area of school textbooks. By focusing on various attempts made by the BJP to promote the idea of a Hindu India through interventions in education as well as mass-media propaganda campaigns, my paper analyses the shifting notions of democracy in India. It finally evaluates the role of India's PM, Mr. Narendra Modi in creating the idea of a 'global Hindu' by addressing events like 'Howdy Modi' attended by US President Mr. Donald Trump and over 50,000 people in Houston, Texas on September 22, 2019. The support of the Hindu diaspora to Mr. Modi reveals the transnational appeal of his brand of right-wing nationalism, and hides the disturbing reality of minority persecution in India. I argue that Mr. Modi's populist politics mask the failures of the Hindu nationalist project in creating a unified idea of India.

Accountability and Social Theory

The present paper explores what is the role that the concept of accountability plays in social theory. The interplay between the different manifestations of violence at the structural and individual level expose certain elements that cannot be explained by focusing on one side alone. The act and social phenomena of harming others has been a topic that has been treated throughout the entire

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

spectrum of the social sciences but what has baffled researchers is that there are characteristics in structural violence that cannot be found in the violence done at the individual level and vice-versa. The most notable characteristic being the perpetrator-less aspect of structural violence and the dissipation of accountability. Even at the individual level, properties such as (un)intentionality and unintended consequences of action also undergo complex social processes when the harm is committed by collective and organizational agents. The key issue then is to connect violence at the individual, collective and organizational levels with structural violence to shed light on issues that entail its social processes and determine what happens to accountability when harm is done by a collectivity or organization.

Transformarionof Reflexivity in Global Society

The purpose of my presentation is to discuss the transformation of reflexivity and to suggest Market Reflexivity, Media reflexivity. In addition, comparing reflexivity in Japan and West, I anticipate the transformation of reflexivity in capitalist global information society.

Reflexivity is the concept of reflecting on oneself in the presence of others, and changing oneself in relation to others. By repeating this process, the agent changes. Scott Lash criticizes the reflexive modernization theory of Ulrich Beck and Anthony Giddens, as they presuppose that reflexivity is essentially cognitive and institutional. Lash draws attention to the aesthetic dimension of reflexivity over the cognitive. He insists capitalism opens up possibilities for, not only cognitive but also aesthetic reflexivity. He also discusses hermeneutic reflexivity.

I suggest that new reflexivities can be born and transform in and through markets, which I call market reflexivity. I also suggest media reflexivity, which can be born and transform in and through medias.

Lash and John Urry discuss Japanese systems involve collective reflexivity. Sometimes Japanese society and policies are changed without explicit discussion. Market reflexivity and media reflexivity with collective reflexivity work very well in Japanese society. In a global information society, reflexivity changes the reflexive tying together of knowledge and action, so that there is no distance between them, which Lash terms phenomenological reflexivity. In capitalist global information society, they will continue to change us ever more radically and quickly.

In capitalist global information society, as reflexivities can be automatically transformed by market and media, including platform capitalism without our realizing it, it is very important for us to be conscious of the current transformation of reflexivity and build an awareness of its effects at social level to try to communicate and criticize it.

Movilización Y Participación Política De Jóvenes Brasileños EN La Escuela Y EN EL Entorno Social: Indicativos De Experiencias De Estudiantes De Educación Secundaria De São Paulo

Se pretende aquí presentar parte de los resultados obtenidos en la investigación Ciudadanos inteligentes para ciudades participativas, una iniciativa de estudio colaborativo, financiada por la Unión Iberoamericana de Universidades, que reunió investigadores de la Universidad Complutense de Madrid, de la Universidad de Barcelona, de la Universidad de Buenos Aires, de la Universidad Autónoma de México, de la Universidade Federal de São Carlos y de la Universidade de São Paulo. Realizada entre 2017 y 2018, los objetivos de la investigación fueron aprehender y analizar la laguna existente entre la experiencia cívica de los jóvenes estudiantes dentro del mundo escolar y sus vidas como ciudadanos en el entorno de las ciudades, en las redes sociales y canales tecnológicos, y las concepciones que los jóvenes-estudiantes desarrollan sobre la diversidad social y cultural en que están inmersos. La etapa empírica de la investigación se llevó a cabo mediante la realización de grupos focales con estudiantes de enseñanza secundaria, del entorno de las cinco universidades, y produjo innumerables hallazgos acerca de la participación estudiantil-juvenil en diversos espacios de integración y expresión. En esta comunicación, se presenta el análisis de los datos obtenidos de los estudiantes de secundaria de cinco escuelas públicas del Estado de São Paulo, marcadas por procesos de movilización estudiantil (por ejemplo, las llamadas ocupaciones estudiantiles de 2015, debidas a determinadas directrices político-pedagógicas impuestas por los gestores de la política educacional del gobierno local). Dialogando con las contribuciones de la teoría social y de la filosofía, que contribuyen para la comprensión de la juventud en la contemporaneidad, los análisis reflexionan acerca de las múltiples formas de participación política y de compromiso de los estudiantes, y la pluralidad de sentidos del término no participación para los jóvenes investigados, ampliando los usos habitualmente presentes en la literatura académica e indicando nuevos sentidos de la acción.

Post Separation (Co) Parenting Styles As Family Practices

In the context of increasing 'family instability', parenting symbolizes the "long-lasting commitment". The new awareness of childhood's value and the increased responsibility put on parents has led to disputes about what constitutes appropriate care for children and who is a 'good mother' and a 'good father', even more so for separated parents. In Italy, as it is increasingly common in many Western countries, shared child custody is the standard arrangement for separated and divorced parents since a 2006 law, aimed at the "best interest for the child". As the law does not explicitly state the time each parent should spend with children nor the trade-off between time of custody and child support payment, though, separated couples experience a wide array of child custody arrangements.

Drawing from Morgan's conceptualization of family practices, which sees everyday activities and experiences as pivotal for interpreting family as a "set of activities", we aim at exploring the relationship between physical child custody arrangements and post-separation co-parenting practices and routines.

How do parents in shared custody interpret and enact their role in everyday life? How are care practices/management allocated within the former couple, and which circumstances contribute to hindering or fostering the development of different co-parenting styles?

The study draws on qualitative interviews with 40 Italian separated mothers and fathers, including 7 former couples, all with a – formal or informal – shared child custody arrangement. Results show a variety of trade-off between financial provision and care co-existing with interrelated dimensions to cope with conflicts between the parents and to define and pursue the best interest of all family members. Three post-separation co-parenting configurations emerge: "parallel", "cooperative" and "competitive". These results are of interest especially in the Italian context of the persistent gender asymmetry in care and financial responsibilities before separation observed in most families.

Exploring Young People's Perspectives on Precarious Employment and the Emerging Digital Technologies in Namibia

The realities of work have been changing and job stability has become a phenomenon of the past. Some organisations have adopted precarious employment as a way of minimising wage bills at the expense of employees, leading to exploitation of workers. These conditions tend to weaken job security and limit workers' legal protection and entitlement. The youth and women are the hardest hit by the phenomenon. Precarious employment is understood as employment which is insecure, uncertain or unpredictable from the point of view of the worker (Kalleberg, 2009). Some scholars argue that informality accompanied by precarious employment and economic inequalities are now the norm. The rapid technological changes that have permeated the labour market are the major drivers. Emergence of digital technologies and automation has resulted in diminishing employment opportunities and surge in precarious employment. A particularly striking phenomenon in Namibia is the increasing automation in various sectors. For instance, automated parking ticket machines in major shopping malls mean parking assistants are no longer required. Furthermore, cell phone banking apps are replacing the bank teller. Such automated activities signify the beginning of a worrying trend characterised by job losses, insecurity and uncertainty. In a country like Namibia, where unemployment is high and precariousness and uncertainties define informal life-worlds, particularly among the youths, an understanding of young people's perspectives on precarious employment and the emerging digital technologies becomes essential. This study used qualitative and quantitative approaches, which included semi-structured interviews and questionnaires. The results paint a picture of how automation and digitalisation contribute to growing insecurity for the youth. The participants pointed out that the reality of a street airtime/recharge voucher vendor losing their work to vending machines, or a customer service employee to cell phone apps signifies the social inequalities and insecurities, which contribute to high youth unemployment in the country.

Teaching and Applying IE Policy Analysis in Higher Education

It is unsurprising to say that feminist pedagogy and institutional ethnography are mutually constitutive forms of praxis as they are developed from and contribute to the creation of critical knowledges for social change. This paper reflects on the outcome of working with graduate students from diverse institutional locations across the university who are exploring different policy arenas as they relate to experiences of student mothers, students experiencing racism, and those experiencing sexual and other forms of harassment within higher education. The presentation highlights how the students' personal experiences with these different abuses in the university setting and their attempts to address these issues when brought into light through learning about institutional ethnography led to greater understanding of the complex structural and discursive context which contributed to the replication of the problems over time and inhibited their social change efforts. With this new understanding students were able to generate new knowledge about higher education policy construction and implementation as well as a more effective approach to policy analysis. The paper draws on teaching and mentoring over twenty-five years and in two different university settings. It highlights both the teaching process and research mentorship that also deepened the knowledge gained by the instructor to further develop pedagogical tools and research strategies.

Possibilities and Limitations of the Comparative Research: Additional Difficulties When Happiness Is Involved

In recent decades, sociologists have become used to media criticism of the results of public opinion polls on electoral behavior and of mass surveys on political issues. However, in recent years, we see a new ground for reproaching sociologists – quite positive assessments by the population of their lives in terms of well-being and happiness (people declare to be happy and to live a decent life) despite objectively depressing social-economic and political-legal realities. Unlike representatives of other, more metaphorically free disciplines and journalists, sociologists are limited by the requirements of the scientific method. Therefore, such reproaches require a dual response: on the one hand, an intradisciplinary study of the methodological limitations of the survey techniques used in public opinion polls; on the other hand, public discussions of these techniques – for explaining the wider audience the general possibilities, limitations and prospects of empirical sociological methodology. Thus, since 'happiness' does not have a clear and unambiguous definition, in general and in most empirical projects, sociologists study rather well-being than happiness, and the latter turns out to be an empirical 'indicator' of 'subjective well-being'. The situation gets even more complicated in the comparative, cross-national perspective. However, even small comparative projects, which focus on happiness (or subjective well-being), can provide significant comparative descriptions of the priorities of younger generations through similarities and differences in their life strategies, horizons of social action, criteria for assessing events and situations, value orientations and patterns of self-identification. Some results of our comparative research in the post-socialist countries turn out to be strikingly similar, while other, on the contrary, are unexpectedly different. For instance, in some indicators, the Russian student youth is closer to their peers from other countries than to the Russian younger generation that is just ten years older.

Settlement Intention of Japanese Young Adults in Rural Regions

This report aims to examine the tendency that Japanese young adults have of settling in rural regions. I focus on the following two points: 1) the relationship between the desire to settle and the history of residence, and 2) the difference between more disadvantaged areas and comparatively urban areas in rural regions. Data were obtained from men and women, aged 20 to 40, living in two municipalities in Aomori Prefecture, Japan.

The analysis revealed the following four points. First, young adults living in disadvantaged areas were less likely to settle in their current areas. Second, in both regions, about 60% of young adults living in the area were originally born there, of which about 25% had never moved from their birthplace. Third, residents in disadvantaged areas and urban areas followed distinct employment patterns. The young adults in disadvantaged areas were divided between highly educated, high-income immigrants and unstably employed people who had not

moved from their birthplace. Those in urban areas were typically married and either regularly employed or domestic/unemployed. Fourth, local factors negatively and positively affected men's domiciliation preferences. High satisfaction with local opportunities, many local friends, and the size of their city all positively affected where men wanted to live. Conversely, young, relocated residents and non-regular employment opportunities in disadvantaged areas and the relocated residents and university graduates in urban areas negatively affected where men wanted to live.

These results suggest possible methods for retaining young adult residents. At present, local governments in Japan are engaged in a variety of projects to prevent young adults moving away from rural regions into metropolitan areas. If the local governments can help young residents to maintain local networks of friends and increase local satisfaction, they may increase the number of returnees who want to settle in the future.

NASCIMENTO, MARIA LETICIA* (Universidade de Sao Paulo, Brazil)

Estudio Sobre Participación Infantil / Protagonismo Infantil: ¿Qué Revela La Investigación Sobre El Tema?

El campo de los estudios de la infancia en Brasil continúa expandiéndose tanto en el ámbito académico como en el educativo, especialmente a través de investigaciones y publicaciones basadas en las ciencias sociales, como lo comprueban las ediciones especiales de revistas, que contienen artículos cuyo apoyo teórico y metodológico está en el campo de la sociología de la infancia o la antropología de la infancia, o en la conexión de estos campos con los campos clásicos de los estudios de la infancia.

Uno de los temas más provocativos de los estudios de la infancia es la participación, que, por un lado, forma parte de un conjunto de derechos que se encuentran en tratados internacionales, como la Convención de las Naciones Unidas sobre los Derechos del Niño (UNCRC) de 1989, y en La legislación nacional, como la Ley de la Infancia y la Adolescencia (ECA) de 1990 y, por otro, forma parte de un discurso predominantemente social, que habla sobre redes, inclusión, relaciones entre adultos y niños, prácticas participativas. (Thomas, 2007). Además, los conceptos de participación y protagonismo se confunden con frecuencia (Ferretti, Zibas, Tartuce, 2004).

Esta investigación en curso (FAPESP 2018/15700-1) tiene como objetivo identificar, examinar y analizar la producción bibliográfica sobre participación / protagonismo en la producción académica brasileña y latinoamericana, para reconocer diferencias conceptuales, autores que discuten el tema, para mapear la producción. Se examinarán las bases epistemológicas que respaldan los estudios publicados, sus influencias teóricas y los elementos constituidos de la investigación. La recopilación de esta información ayuda al análisis de las concepciones de participación / protagonismo y permite investigar cómo se retrata a los niños y las diversas formas de estudios de la infancia. Este análisis está claramente vinculado a la identificación de factores que se consideran indicadores de participación / protagonismo infantil en la sociedad.

Nursing Actions for Mental Health in Primary Health Care: Preliminary Considerations

The acting of a nurse in the countless scenarios for health care has been demanding the incorporation of new knowledge and skills by the professionals to exercise the Nursing. In the field of health and Nursing, the context of work nowadays has been generating reflections on the nursing actions towards mental health in the Primary Health Care in order to favor the consolidation of Psychiatric Reform, as well as the effectiveness of care related to psychosocial rehabilitation and family insertion into therapeutics. In this study, we aim to understand the meaning of nurses' actions focused on mental health in the Primary Care, from the perspective of nurses, users and families. This is a research of qualitative approach. Theoretical-methodological framework is the phenomenological sociology from Alfred Schutz. A survey will be conducted in Primary Care in Porto Alegre, Brazil. Information collection will be carried through phenomenological interviews with nurses, users and family members. Results will be analyzed to the light of phenomenological sociology framework. With the study, we expect to contribute both scientifically and in the Care aspect, for the construction of knowledge in the fields of Health and Nursing. Thus, we hope to collaborate for mental health care in the context of territory, raising reflective processes that allow the nurses and the health managers to settle mental health actions inspired on the psychosocial care, in which the user and the family can be the protagonists of therapeutics. Furthermore, the study is developed in a context of questioning about the regressions that can be seen in mental health policies in Brazilian scenario, as well as a possibility of reflection on the need to consolidate Brazilian Psychiatric Reform.

PATERSON, LINDSAY (The University of Edinburgh, United Kingdom)

Why Swedes Trust the State and Scots Don't. an Exploration of the Religious Foundations of State - Citizen Relations in Modern Welfare Systems.

In Scottish political debate, Scotland is often likened to the Nordic countries in its views about social justice. Yet social policy making in Scotland has followed 'un-Nordic' routes. An immediate explanation would be that Scotland, as part of the United Kingdom, is also part of its liberal welfare regime. This explanation may, however, be too simple. This paper explores how the Protestant traditions of Presbyterianism and Lutheranism have shaped state-church relations differently in Scotland and Sweden, resulting in different understandings of the role of the state and civil society in public welfare.

Until recently, the dominant understanding in comparative research was that religion mattered for the development of the welfare state in predominantly Catholic countries, but not for Protestant ones. A growing body of research is countering this view and pointing to Lutheran influences in Nordic welfare states. There exists however, little systematic research on differences within Protestantism and their distinct contributions to social policy development. This paper explores how Scottish Presbyterianism and Swedish Lutheranism, respectively, conditioned public debate on the welfare of children from the late 19th to early 20th century. It finds similarities in the moral attitudes towards children that can be traced back to the common Protestant roots, and differ from those of social Catholicism; yet, attitudes towards the role of the state and civil society in providing education and welfare for children differ between Scotland and Sweden. It concludes that high levels of public acceptance of the state's authority and state intervention in Sweden can be traced back to Lutheran doctrine and institutionally close links between the Swedish (state-)Church and the state, while in Scotland emphasis on an independent civil society and its responsibility for welfare reflects the distance of the Presbyterian Scottish Kirk to the state both in theological and institutional terms.

Procesos De Interculturalización Entre Docentes y Estudiantes En La Licenciatura De Educación Indígena, Upn

Nos interesa debatir sobre los procesos de interculturalización que se generan en la Licenciatura en Educación Indígena de la UPN. Intentamos problematizar cómo se van construyendo interacciones entre docentes y estudiantes, y cómo a través de éstas se van generando procesos formativos, interpelaciones, cuestionamientos, en los que se juega un debate sobre el currículum, la noción de interculturalidad en el mismo y el tipo de sujeto ético que se pretende formar. Esto no ocurre al margen de tensiones, reconociendo que en los procesos educativos y en los espacios universitarios se hacen presentes diversos conocimientos y saberes, vinculados a sus lugares de origen y contextos socioculturales. Algunos puntos que pretendemos revelar refieren a cómo viven los estudiantes su estancia en la universidad, qué tipo de vínculos establecen con sus profesores y sus pares indígenas y no indígenas, cómo se relacionan con los conocimientos que entran en juego, y en ciertos casos en conflicto, en su formación. A partir de ello preten-

demos explorar posibles relaciones entre los procesos de interculturalización y de empoderamiento que aspiramos promover. Reconocemos que en el acceso, permanencia y egreso en educación superior siguen prevaleciendo inequidades sociales y educativas, tales como discriminación y exclusión. Pero es en esta realidad que es necesario analizar el papel que ocupan los profesores universitarios para revertir estas inequidades, lo que nos lleva a pensar en los alcances éticos de su actuación.

NAYAK, AKHAYA KUMAR* (Indian Institute of Management Indore, India)

Emerging Trends in Indian Anti-Displacement Movements

Development-induced displacement in India for long has remained a bone of contention. Between 1951 and 1990, 21.3 million people in India are displaced due to development projects, out of which 40% are tribals. Consequently, there emerged numerous anti-displacement movements in several parts of India. The purpose of this paper is to explicate the trend of these anti-displacement movements in independent India. This conceptual study is based on the information derived from secondary sources such as published academic literature and government records. It critically analyses several cases of anti-displacement movements using the frameworks of New Social Movement Perspectives (NSM) and Resource Mobilization Theory (RMT). Based on the nature of mobilization, tactics used by movement actors, and the outcomes, the author discusses the anti-displacement movements originating in Independent India through three separate phases. The paper concludes that the existing social movement theories explain these movements to a certain extent. However, these theories are inadequate to explain the emerging trends in the Indian anti-displacement movements originating in the last (third) phase. The nature of mobilization of the movements happening in this phase usually follows a 'controlled from the top" approach. Opposition parties highlight the tribal identity to mobilize the aggrieved mass and use the protest as a means, not to protect the interests of the tribals, but to discredit the political party in power. Indian legal system being negligent towards the interests of marginalized eases the endeavour of opposition. In this process of politics of development, identity politics, and the battle between political parties, the project affected people, particularly tribals, stand losing a lot. The paper adds a fresh dimension to the existing social movement perspective and has significant policy implications.

NCUBE, NOLWAZI* (University of Aberdeen, United Kingdom)

A Reproductive Childhood: The Beginning of 'Work'

In a forthcoming publication (Ncube, forthcoming 2020), I introduce a concept I refer to as 'reproductivity'. It is defined as "the confluence between reproduction and productivity". In this paper, I will expand reproductivity to invert visualisations of childhood as the idyllic frolicking and playing of games with others as integral parts of child development. I will use the case study of rural Zimbabwe to demonstrate how following ménarche (the first period), the reproductively capable bodies of girls must equally be productive bodies. This productivity is achieved through their participation in the division domestic of labour within the family household. Puberty evolves a young girl's once seemingly gender-neutral torso into a sexualised reproductive body. This sexualised reproductive body lies at the intersection of childhood and adulthood. The intersection is characterised by outward, conspicuous signs of reproductive maturity – thelarche (breast development) and differentiation of hip width as well as concealed signs of reproductive maturity such as: ménarche, menstruation and differentiation of pubic hair contour. These images of a girl's early pubescent childhood evoke imagery of a body that is reproductively capable but simultaneously perceived as too young to be sexually active. Douglas reminds us that, "Danger lies in transitional states, simply because transition is neither on state nor the next" (1966:97). Reproductivity marks work not only for the girls in the way of participation of chores and a childhood that lies on the cusp of adulthood but also the work of protecting from these children from the danger of 'premature' sexual debut with childhood peers or even through violation by surrounding adults. This childhood transition exposes the dangers that may exist in kinship structures, because whilst this work is morally expected of the parents, guardians and caregivers of the child, it is sometimes these same adults who exploit this vulnerable childhood.

NEDERVEEN PIETERSE, JAN P.* (, USA)

After Populism

Most discussions of populism and authoritarianism focus on their outward manifestations. But let us take a step back and consider underlying enabling factors. A key factor in authoritarianism is the weakness of institutions; a key factor in right wing populism is the weakening of institutions. This is the point of convergence of right wing populism and authoritarianism. A key factor of neoliberalism

or permissive capitalism is the weakening of institutions via deregulation. Weak institutions enable the concentration of wealth and power. Forty years of neoliberalism have paved the way for right wing populism. Political authoritarianism prepares the way for market authoritarianism; alternatively, market authoritarianism prepares the way for political authoritarianism. The Sustainable Development Goals are inclusive and sustainable development; weak institutions enable the opposite -- exclusive growth and transactional and unsustainable policies.

NEGRI, MICHELE* (University of Tuscia - Viterbo - Italy, Italy)

Citizenship and Civic Culture of Adolescents: A Comparative Study on Opinions, Attitudes and Experiences of Migratory Phenomena in Italy

The migration phenomenon has recently experienced a strong acceleration in Italy, making the process of intercultural relations more urgent and complex and requiring the educational institution to take on the role of a crucial actor in the socialization to integration. The question appears to be particularly relevant in a historical phase of politics marked by populism and social media communication. An innovative decision making in migration policies in Italy could certainly be based above all on observing attitudes and listening to the opinions of the young generations. The paper describes the outcomes of a survey about the identity and cultural models being developed in Italy, with specific regard to students of the secondary schools.

The IMPACT of Airbnb on the Affordable Housing Market in Hong Kong

Over the last few decades, urban tourism has experienced huge growth and has become an extremely important activity in many cities, including Hong Kong. Pressure from tourism has intensified because of the availability of services such as Airbnb, and the sharing economy is continuing to trend upward.

According to Inside Airbnb, an independent organisation that provides data on Airbnb usage, most Airbnb rentals in Hong Kong (almost 6,500 listings as of October 2018) are unlicensed and thus illegal. According to Hong Kong's Hotel and Guesthouse Accommodation Ordinance, premises that offer sleeping accommodation for a fee for any period less than 28 days must be licensed. However, it is almost impossible to find any Airbnb premises in the public registry of licensed guesthouses. Despite the enormous public interest in and growing policy regarding the impact of short-term rentals on housing affordability, to date there has been little scholarly investigation of this problem on a worldwide scale, and no scientific research has been published concerning this issue in Hong Kong. The research presented in this paper addresses this deficit by presenting a framework for analysing Airbnb and gentrification via an exploratory case study of Hong Kong.

The results, obtained through qualitative methods, help identify the scale of Airbnb's impact on Hong Kong's housing market, the gentrification of neighbourhoods and the displacement of local residents.

NELL, CHARLOTTE* (Friedrich-Schiller-Universität Jena, Germany)

Emotional Communities and Their Collective Memories: Reconstructing Contested Commemorative Spaces within the German Society Using the Example of the Media Career of the "Munich Terror Shooting" 2016

Taking the Shooting in Munich 2016 as an example, this paper aims to investigate socio-cultural images, framings and reservoirs of violent incidents and the role they play on a societal level for constructing and also denying spaces of (national) commemoration. Understanding how voices of the public (i.e., media, legal and civic action) are not solely reflective of micro-phenomena transmitted to a social public, but play a role in shaping and modelling "emotional communities" (Rosenwein) and orders of "legitimate" emotions, this paper will describe the conflicting negotiations of public processes of situation-definition ("terror"/"right-wing-extremism) that shape and further structure collective memories.

The "Munich-Attack" is used as an example as the first occurring assessment of an Islamist terror attack proved false, as a motive of right-wing extremism became more plausible, which however was ultimately dropped and the case was ultimately ratified as an incident of "personal trauma". Drawing on an ethnomethodological discourse-analysis (Sacks), Munich can be considered as a „Diagnostic event" (Moore) for the German society, in which it shows that the terror category is closely interwoven with a racist notion „othering" (Said). It shows that while "Islamist terror" is considered as a specific threat to Germany at a whole, right-wing

extremism is not considered a national fatality. Also, the migrant victims of the Munich Shooting appear as outsiders to a "German" civil society. Altogether the elasticity of terror and amok within the Munich example and its respective definition of the situation, seem to have allowed for both, an othering of the attacker *and* the victims, who could not be seamlessly integrated into a story of national spaces of mourning and thus into an "emotional memory-storage".

Overall, the presentation will contribute to a better understanding of public debates that structure images and narratives of violence, memory-spaces and cultural knowledge.

Meta-Modernism in the Modern Russian Theatre: Analysis of the Leading Directors' Opinions

This report discusses secondary analysis of interviews with major Russian theatre directors on the issue of theatre transformations. The results suggest the emergence of elements of the so-called new atmosphere and new sincerity in the Russian theatre, which are characteristic of the socio-cultural phenomenon of meta-modernism which makes the turn to the individual, reconsiders such concepts as "social interaction", "daily life', "space", including the space of the theatre.

The request for transformation of the modern Russian theatre is dictated by the change of one of the subjects of communication - the appearance of a new type of spectator, an individual of new responsibility, preferring to communicate with God and art without intermediaries. The theatre of the old type, which previously transmitted the viewer a model of unbalanced relations, contributed to a distorted, unhealthy perception of their personality by both the viewer and the actor, today can't adequately answer such a viewer to the main question: why does individual need it? The theatre of illusions stagnates as a genre. This condition challenges theatre to search for new models and methods of communication, forms of expression adequate to the modern audience. At the heart of this quest lies a central value which is the utmost degree of respect for any human being, their personal boundaries, freedom, development and responsibility. The basic principles of this theatre are as follows:

developing partnership relations with the audience,

rejection of the role of the preacher,

refusal of flirting with the spectator, of task to sell an idea or emotion to the audience,

rejection of playing as insincerity (there is not an actor, but storyteller),

alive, sincere communication is not limited to the interactive practices,

rejection of conceptualism for conceptualism, of revolutionary for revolutionary,

statement instruments can be very bold, however, content should not carry "negative energy".

Imaginary Risks: Social Science-Fiction

Since there has been no empirical evidence for fearing AI, the harm it can cause has been imagined as something likely not for the present but for a possible future. The conception of possible worlds from the actual world as a result of a technological advancement is an imaginative exercise undertook by science-fiction. In the possible future worlds sci-fi conceives, it is committed to explore the effects of the undesired side effects of the development of a technology such as AI. Among the exemplars of science-fiction from Mary Shelley's Frankenstein to Netflix's Black Mirror there is a sub-group of social science-fiction that explores the impact in society. This is the group that envisions powerfully future risks of AI. The goal of this paper is twofold, a) to give an account of the development of how the real technological changes impact in the construction of these possible worlds and the undesired effects of AI in society; b) how the social science-fiction can be a thinking style per se, independent from the pure fictional world. We conclude the paper demonstrating that as a style of thinking, social science-fiction cannot be the source of the fear of AI, but only the imagination of future risks of it.

Local Level Political Communication in Ghana in Times of Covid-19: The Role of Social Media

Ghana is one of a few African countries that have consistently decentralized their political structures allowing locally elected councillors and mayors to decide on local political issues. Social media especially Facebook and Twitter have become a new channel of political communication for these decentralized struc-

tures. With its commentary functions, social media offers a platform for intensive political debate, particularly in crisis situations. Although the topics of debate often vary according to local contexts, the outbreak of Covid-19 presents a cross-cutting issue that affects both urban and rural districts. Drawing on an ongoing online study on Ghana, we analyze local political discussions on social media in three selected districts. We ask the key question: what topics are communicated and how do local people react? Based on an earlier field study, our analysis also compares the relationship between the topics of social media debates with the everyday contents of local political debates. We conclude with observations and hints on methodological challenges of online research.

The Expansion of Flexcrops in Non-Traditional Agricultural Exports (NTAEs)

Inside the variety of phenomenons and concepts studied in the corporate-financial food regime approach is present the intensification of FlexCrops. The agricultural crops and commodities in 21st century are defined through the principle of flexibleness and 'multiple-ness'. With the financialization process, agricultural crops assume a function of inputs for different industrial segments. Also, the expansion of the Flex Crops changes social relations among proprietary rights, landowners, industrial segments, traders, peasants, habits of consumption and others. This process is investigated mainly in the 4F Crops: Food, fiber, fuel and forest, represented by case studies such as soy, sugar cane, corn and palm oil. However, researchers appoint the rise of flexibleness and 'multiple-ness' in other crops (manioc, coconut, sunflower, etc) (Borras et al., 2016).

In this sense, the research has as objective understand the relations between flex crops and 'non-traditional' agricultural exports (NTAEs). To achieve this goal, a comparative-historical method articulated with a case study is used to analyse the phenomena. The object of study is the Açai (Euterpe oleracea Mart.). This case was chosen for a few reasons: 1) Açai is a non-traditional agricultural export. 2) The crop has socioeconomic and environmental importance in the northern region of Brazil and the Amazon ecosystem. 3) Contacts made with important food industry opened connections that allowed interviews with actors from the financial, industrial and extractivist segments. 4) Since mid-1980 studies developed shows evidences of the insertion of the fruit in the corporate food regime (1980-). 5) finally, the crop is used as input for processed foods and cosmetics industries.

Saturnino M. Borras Jr., Jennifer C. Franco, S. Ryan Isakson, Les Levidow & Pietje Vervest (2016) The rise of flex crops and commodities: implications for research, The Journal of Peasant Studies, 43:1, 93-115, DOI: 10.1080/03066150.2015.1036417

What Factors Can Affect Hegemonic and Counter-Hegemonic Discourses about Women, in Mass Media

Representations of women are significant to understanding and interpreting the cultural sites of hegemonic and ideological systems of power. To understand the hegemonic and counter-hegemonic discourses in the US and Canada's mass media and the factors that affect this representation, this paper asks: how the discourses, including texts, language, and images in US and Canadian mass media, have changed? How are resistance against oppression, or accepting the oppression integrated into networks of power and how do they challenge or maintain inequality and the dominant discourses of the media? Through a critical discourse analysis of four most circulated national newspapers in Canada and US (*The Globe and Mail*, *National Post*, *The New York Times*, and *USA Today*) and using theories of hegemony, counter-hegemony, and intersectionality, this research shows that the patriarchal system in Iran reinforces race-based and ethnicity-based oppression systems in western countries. Moreover, resistance against oppression can be connected to resistance against other systems.

Living with Nature Peacefully in Political Conflict: The Interaction between Taiwanese and Mainland Chinese Environmentalists

After the Chinese civil war, the Kuomintang of China (Chinese National Party) then settled in Taiwan as a self-ruled state and the Chinese Community Party officially in 1949 established the People's Republic of China on the Chinese mainland. The civil war was over, and they have both experienced their economic miracle as well as neo-liberal development. However, political disputes between two political regimes in the Greater China region has seemingly not yet ended. In recent decades, though, peaceful interactions between two societies, namely some of

their local environmentalists, have occurred under the threats of climate change, cross-border pollution, and the like environmental risks. It is interesting to examine what makes them interact constructively with each other in spite of the difference in political identity. Besides, it is noteworthy to investigate the "convivial" tool of these environmentalists, i.e., the ways in which they can live together with nature and stay together in political conflict. This presentation, therefore, focuses on the peaceful interactions between Taiwanese and mainland Chinese environmentalists affiliated with local-based environmental non-governmental organizations. More specifically, it will first present the peaceful interactions of these environmentalists. It will then turn to examine their convivial tool, which facilitates their exchanges and cooperation for environmental protection. The presentation will end with a convivial implication for post-national solidarity.

NGAI, STEVEN SEK-YUM* (The Chinese University of Hong Kong, Hong Kong)

An Exploration of Best Practices for Promoting Sustainable Development of Self-Help Organizations

Self-help organizations (SHOs) are formed when members with a common chronic illness come together to share their perspectives and knowledge in problem solving with the support of helping professionals. SHOs in Hong Kong have been developing rapidly in the recent two decades and today there are over 170 SHOs in the city. Despite the rapid development of SHOs, there are very few studies that examine the success factors and well-consolidated models for sustainable SHO development. Most of the available SHO references are from Western contexts. Moreover, Hong Kong's self-help movement has reached a stable but stagnant stage, and obstacles such as issues associated with the succession of leadership and the paradigm shift from mutual support to membership welfare may hinder the development of SHOs. There is an urgent need to build an indigenous model with best practice guidelines for local SHOs that best fit their needs and concerns. Such a model of development will help SHO leaders identify unique developmental needs of their SHOs and what strategies SHOs can use to meet these needs. Accordingly, this study examines best SHO practices in Hong Kong by using data collected from a territory-wide survey of 232 SHO leaders. We will report findings on nine best practice strategies for sustainable SHO development. These include success factors for good SHO leaders, team building and managing to achieve SHO goals, working with paid staff in daily SHO operation and development, development of effective mutual support core services for members, development of participation ladder for members, engagement of community resources for developing long-term collaboration, raising or applying for different funding in cost-effective ways that fit the development of the SHO, facilitating members to participate in policy advocacy for promoting their well-being, and raising public awareness and understanding of chronic illnesses and SHOs.

NGAI, STEVEN SEK-YUM* (The Chinese University of Hong Kong, Hong Kong)

The Mediating Roles of Training Adequacy and Self-Actualization on the Effects of Vocational Training on Work Motivation of Unemployed Youth

Vocational training has become a key service of the human capital development approach that is emphasized in China. Nevertheless, official documents and empirical studies have primarily focused on employers' skill requirements for young people in transition to the labor market, and in most cases have relied on single indicators, such as the participation rate or employment rate. Further examinations of the factors motivating young people's will to secure jobs will likely enrich our understanding of the volume and quality of the training. Accordingly, this study investigated work motivation, along with its associated factors, among unemployed young people participating in vocational training schemes in Tianjin, China. Derived from a sample of 209 young trainees (mean age = 22.67, SD = 1.93), the results supported the hypotheses that training adequacy and self-actualization showed positive effects on work motivation. Furthermore, training variables (the number of training courses attended and duration of workplace training) did not present any significant direct effect on work motivation; however, they predicted the outcome variable indirectly through the mediating effects of training adequacy and self-actualization. The study shows that power, skills, and other resources gained during the training provide fuel for motivation and performance. It also advances the human capital development approach by unraveling the mechanism through which hard skills and soft skills contribute to youth empowerment and employment. The implications of these findings for theory, practice, and policy will be discussed and presented.

NGCWANGU, SIPHELO* (University of Johannesburg, South Africa)

"Long Transitions" – Community and Organizational Responses to Youth Unemployment in Daveyton, Ekurhuleni, South Africa

Youth unemployment is featuring strongly in South Africa's development debate. At the core of these debates is the construction of policy and programmatic responses to integrate young people into the labour market in order to provide them with better economic prospects. In the case of South Africa the challenge is shaped by the skewed patterns of racial inequality which by design have produced a society in which the black African community are disproportionately the most highly affected by challenges of high levels of youth unemployment. This article examines the question of youth employment challenges within the community of Daveyton, a black African township situated in the Ekurhuleni Metropolitan Municipality area in Gauteng, South Africa. The paper focusses on two main issues: (1) how community based organizations and NGOs within Daveyton are grappling with the question of youth development in conditions of high levels of unemployment and widening inequalities in South Africa; (2) how the youth are grappling with challenges of unemployment and what strategies they are using to make a living in conditions of a deepening economic crisis. There has been proliferation of projects that are orientated towards self-help, work preparation and means of creating transitions to employment for the youth. Within Daveyton some of these organizations operate within a framework of micro-level bureaucratic arrangements which are not connected to party political interests and vary in support from the state. The study is based on qualitative interviews, informal conversations, group discussions with twenty two participants who include the unemployed youth, leaders of community organizations and local activists involved in youth development. The findings point to three overarching issues that shape the struggle of the youth to gain employment or gainful economic livelihood:(1) entrapment, frustration and hopelessness; (2) loose connections to the labour market and; (3) spatial inequality.

NICOLSON, MARCUS* (Glasgow Caledonian University, United Kingdom)
FOLEY, JAMES (Glasgow Caledonian University, United Kingdom)

The Production of "New Scots": Welcome Cultures, Nation Branding and Anti-Racist Strategies

This article investigates the complex relationship between official welcome cultures, nation branding and the experience of racism. Recent critical scholarship on racism and migration has focused on themes of (authoritarian) populism, where political entrepreneurs have appealed to "the people", promising them greater sovereignty and control over borders, migration and national identity. Our aim is to look at the impact of an opposing scenario. In the United Kingdom, the devolved Scottish Government has pursued what can be conceived as, formally speaking, the opposite of a populist strategy, seeking to incorporate expert opinion and civil society leadership in a top-down idea of an open, inclusive national identity. A series of programmes and political discourses have promoted Scotland as a welcoming place, often with an implicit contrast to other parts of the UK. We argue for developing a critical stance on the impact of this. Firstly, we ask the question of whether differences in macro-level national identity discourses manifest themselves in micro-level racist behaviours. Secondly, we then examine how intermediary actors in civil society respond to and are incorporated into the government discourse. Thirdly, we look at how micro-level actors incorporate the discourse of Scotland as a welcoming culture into their everyday narratives, sometimes to the point of excluding their own experiences of racism. Fourthly, we ask what mechanisms have been designed to link the broad macro discourse of inclusion to everyday behaviours. We find that the measurable difference in behaviours between Scotland and comparable countries is not significant; that, in some circumstances, the depoliticised discourse of inclusive Scotland has made it harder to challenge everyday racism; that micro-level actors feel the compulsion to integrate to "Scottish" behaviours, especially in terms of accent; and that government programmes have not designed sufficiently robust mechanisms to link official good intentions to institutional behaviour changes.

RC16-199.2

NIELSEN, GREG* (Concordia University, Canada)

Populism, Journalism (real and fake), and the Flight from Democracy.

The flight from liberal democracy toward oligarchy has spread out from the unexpected results of the 2016 American presidential elections bringing in a wave of reactionary populism, climate-change denial, anti-"globalism" (islamophobia, a push toward white supremacy, anti-immigrant, anti-refugees, anti…the non-documented, DACA, LGBTI, and many other vulnerable communities). There are questions as to what role fake news plays in this and of how much of this flight is about populism, what kind, and of how much of it is baked into ethnic nationalism, a 1930's style racism, or a reaction to decade's long expansion of inequality. But if this is not a flight from democracy, it is a distinct erosion of its principles and a freezing out of its preferred legitimation operations through deliberation as can be seen in voter suppression, the never ending Brexit referendum, a new Cold Trade War, the globally publicized impeachment ("constitutional coup") of the President of Brazil, Dilma Rousseff, followed by perhaps the most spectacular election built from fake-news of one more of the world's most extremist politicians in Brazil just as large swaths of children from the failing part of the triangle in Central America are joining caravans to nowhere and other American iron cages.

Real fake-news cannot simply be explained via public relations strategies that shift toward post-truth where emotion triumphs over reason; computational propaganda over common sense, or sheer power over knowledge. The paper tries to asses claims that the political field is weakened to the point of absurdity (not just endless spin, but constant fake claims that real journalism is fake-news); that journalism's professional culture (as gatekeeper of democratic values) is simply a cover for the interests of the most well off globalists, liberals, or other equally conflicted progressives; and that social science (cultural Marxism) is falling victim to the same charges.

NIENHAUS, SYLVIA* (, Germany)

Advancing social-emotional skills in early childhood? Discussing possible impacts of education plans in kindergartens on the (re-)production or reduction of educational inequalities

Even before going to school education is central to children's lives (OECD 2018). In Germany, this can be concluded from the expansion of institutions of early childhood education and care: today, 93 % of the 3- to 6-year-olds visit kindergarten (education report 2020). However, as educational inequalities are still prevalent (Kruger & Peter 2019), educational plans, which are still a quite new phenomenon in Germany (Meyer 2017), may be seen as a chance to compensate for educational inequalities (German education report 2020) in the way that educationally relevant skills are promoted (Conference of the German Ministries of Youth & Culture 2004). Here, advancing socialemotional skills (SES) becomes especially important (NICHD 2001, Sylva et al. 2011) as children's deviant behavior increases in German ECEC (Klipker et al. 2018).

This in mind, the aim of my postdoc project I would like to present and discuss in my paper is to show how educational plans in German kindergarten, in particular the educational plan of the federal state of Lower Saxony (Ministry of Culture Lower Saxony 2005) interrelate with educational inequalities in early childhood focusing on children's SES. To do so I am working on three studies based on qualitative multi-level analysis (Hummrich & Kramer 2018) featuring expert interviews with kindergarten providers in rural and urban areas, interviews or field talks with parents and educators in socio-culturally contrastive kindergartens and observations of formalized meetings of the same parents and educators in the same kindergartens focusing on children's SES before and after their transition to formal schooling.

The interviews with kindergarten providers I conducted so far show that while the promotion of SES is seen as central to future educational success, it often remains unclear how heterogeneity is to be dealt with (Meyer 2017), so that, for example, "unequal" children are treated "equally" (Author, forthcoming).

La Influencia Del Capital Social Sobre El Logro De Prestigio Ocupacional En Chile y México

El trabajo explora en que grado la calidad de las redes de contacto y la asociatividad cívica influyen sobre el logro de prestigio ocupacional en Chile y México, controlando el efecto del nivel educativo y el origen social. Para ello, se construyeron dos modelos de ecuaciones estructurales con los datos de la encuesta ENACOES del año 2014, de COES y EMOVI del año 2011 (EMOVI), levantada por CEEY.

Los hallazgos de ambos país fueron disímiles, en Chile los mayores niveles de capital asociativo se relacionaron con el género masculino y con niveles terciarios de educación, mostrando una desigual participación en la esfera cívica. Por otro lado, destacó la alta movilidad educativa intergeneracional, aunque las transiciones fueron de corto alcance. Además, se observaron diferencias en el estatus de las redes de contactos a favor de los hombres. Por último, el modelo de medida para Chile mostró un efecto positivo y significativo del capital social, en términos de redes de contacto y asociatividad sobre el logro de estatus, no obstante, estos factores eran influidos por la educación de ego que, a su vez, recibía el efecto del origen social. En México destacó el menor porcentaje de personas que movilizaron sus redes de contactos en la búsqueda de empleo, las redes

fueron movilizadas para acceder a los grupos ocupacionales, 'Trabajadores de los servicios y vendedores ' y 'Oficiales, operarios y artesanos ', esto es, dos grupos que no requieren de mayor calificación. Otro punto a destacar es que en México el acceso a la educación terciaría está más restringido que en Chile, lo que podría explicar los resultados que arrojó el modelo de ecuaciones estructurales. En el modelo se observó una asociación negativa entre educación y movilización del capital social y este no influyó sobre el logro de estatus ocupacional.

Professionalization in the Era of Globalization: How Mexican Nurses Are Coping with It?

The efforts of professionalization of nursing in Mexico encompass already four decades that started with the training of nurses at university level. Achievements in the progress of the professionalization of nursing are clear, but challenges are still monumental in order to achieve autonomy of practice and capacity of self-regulation. In this period, the training of nurses and the labor market have shown the effects of a market oriented rationality that transformed processes of high state control towards processes where new actors participate according to a competitive rationale, downplaying the consolidation of professional and institutional capacities, as the case of the certification of nurses. Various authors have attributed these effects to the globalization in the fields of education and health. Evetts proposes a change in the focus to shift from the definition of an occupation as a profession to use the concept of professionalism as a means to adapt to changes in the labor market in order to preserve service orientation that would allow the achievement of professional and institutional objectives. In Mexico we have observed a marked increase in the production of university-trained nurses in the last 20 years as part of a process of substitution of ancilary and technical nurses by university-trained nurses to increase professionalization. However, the access of new generations of nurses to the labour market is already marked by cost contention policies producing partial and precarious incorporation to the labour market. Specific aspects of this integration are analyzed in order to understand the mechanisms that have been developed by nurses to consolidate its participation, social prestige and their capacity to put in practice their technical capacities in the production of health services in an environment that is increasingly characterized by a weakened role of the State.

Is Returning Home a Sweet Dream or Bitter Reality?: Preparation for Retirement of Thai Middle Age Female Migrants in Japan

Currently, some of the numerous Thai female migrants who have resided in Japan since the 1980s have started to visit Thailand to prepare for retirement. Previous studies have argued that the return of migrants to their home country is the "myth of return" (Anwar 1979) or a "dream" of going home (Gardeners 2002). However, for Thai middle age female migrants who are retiring from the role of parenting in Japan, returning home may become their reality. This paper explores Thai female migrants' "return" home with a focus on their mobility, remittance and transnational family ties between Thailand and Japan after several decades of migration to Japan.

The data are based on field work from 2016 to 2019 in Japan and Thailand. I analyzed the narratives of three Thai middle age female migrants who resided in Japan for more than two decades and built their own families in Japan.

The research results show that long-term separation from the Thai family, due to their vulnerable situation in Japan, including visa problems with human trafficking, domestic violence, and poverty, has created a range of challenges for transnational families. However Thai families tend to lack sympathy with the hardship in Japan, while retirement, Thai economic growth and affordable travel promotes mobility. This mobility leads to the decision to return, the reasons being that they are tired of working as low-wage workers in Japan and choose the cheaper cost of living in Thailand. Once they return home, however, they find that their remittances, based on their huge sacrifices, may not cover all their retirement costs, including what they require for their daily needs, such as housing. These findings show consequence of long-term separation as bitter realities. Thus, this study contributes significant discussion points on the mobility and transnational family ties.

Rural Development and the Similarities of Social Differentiation Processes in Brazil and Russia

Despite very different historical formations and cultural backgrounds, Brazil and Russia have shaped models of agrarian and rural development with multiple similarities. Based on recent data from National Agricultural Census and fieldwork we have carried out since 2017 in Brazilian (Santa Rosa and Passo Fundo) and Russian regions (Rostov-on-Don, Krasnodar, Kolomna), this article propose a comparative analysis focusing on seven differentiation processes we identified in both countries: i. Economic regional differentiation ("rich" and "poor" regions); ii. Rural-Urban differentiation; iii. Socio-demographic differentiation (rural poverty, generational and gender imbalances, rural migration); iv. Institutional and structural differentiation in agrarian areas (the so-called "large" versus "small" agricultural production); v. Technological differentiation in agriculture ("modern" and "backward" models of agri-food production); vi. Infrastructural differentiation (health and education systems); vii. National-cultural differentiation (nationalism and interethnic migration in rural areas). By using a comparative methodology that focus on compare the cases and inside them some key dimensions, in the end of the paper we present some ideas to identify commonalities in the pathways of rural development in both countries which can be useful to think about social differentiation and agrarian changes as a whole.

TSANGARIS, MICHAEL (University of Piraeus, Greece)

Gender and Hotel Management in Greece

Tourism industry apart from being an important factor for the economic development of Greece it is also one of the major sectors of women employment. A review of past studies reveals that the proportions of employed women and men are approximately equal in the hotel sector, if all types of employment are included. Nevertheless, women are generally under-represented concerning leadership as most of them are associated with middle or lower management positions. Women working at hotels are often trapped in the frozen middle or faced with glass ceiling problems that prevent them in accessing higher management posts; most of those issues are related frequently to the business culture and gender stereotypes. This study examines basically the main problems of women managers in the hotel sector. Based on semi-structured interviews, we present opinions coming from women employed in hotels regarding problems they are facing in their everyday managerial practices as well as the usual barriers for their career advancement. The interviews revealed that there are still problems of inequality between men and women in the world of hospitality. Although education plays the most significant role for professional development, there are still discriminatory employment patterns that stress and strain working women in Greek hotel management.

Varieties of Unionism and Welfare State Development: A Qualitative Comparative Analysis of the Evolution of Unemployment Funds in France

Welfare states vary widely in the manner in which they choose to redistribute the unemployment risk among workers. This paper examines how institutional configurations, not single institutions, provide labor unions with unemployment funds (Caisses de chômage). Building on the power resource theory, varieties-of-capitalism, and insider-outsider theory, it is argued that unemployment insurance in labor unions may be supported by combinations of certain institutional conditions: High unionization rate, high risk of unemployment, high skilled-labor intensity, small-size company, and low level of labor market duality. These hypotheses are tested on industry-level data for 12 sectors in the early 20th century France. Unlike previous studies, a fuzzy-set Qualitative Comparative Analysis (fsQCA) reveals two different paths to increase in the number of unemployment funds. High unionization rate leads to the unemployment insurance development in labor union if it is combined with low risk of unemployment. However, the low unionization rate combined with low degree of labor market duality offers high outcome as well. A high skill intensity and small-sized firm are complementary institutions associated with the growing number of unemployment funds. Implications of these findings for theory and policy are developed.

The Nigerian Family in Change: A Study of Selected Traditional Families in Glocalism

The Nigerian family is intersected by an increasing glocal force such that a focused study on it portrays a hybrid trado-modern family. The aim of this study is to ascertain the trend of change and the effects of global family issues on the traditional family structure among families in Ikwo local government area of Ebonyi state. The paper examined the influence of the issues of gender equality and family planning on the traditional family structure on a sample of 200 randomly selected respondents. Adopting mixed methods, regression analysis was carried out. The results show a gradual slackening of the traditional values and a mix up of the features of the global modern family which increases its proneness to crises and change. The consciousness of gender equality was significantly related to family structure. Family planning was also positively related to family size. The findings suggest that the current structure of the Nigerian family is important for policymaking.

Gender Relations and Women's Resilience amidst Marginalization in a Cash-Cropping Community in Rural Eastern Kenya

Dramatic changes, including colonial land redistribution, introduction of cash crops, neoliberal policies, and other recent rural social changes have affected agrarian practices and rural livelihoods with important repercussions on social differentiation and gender relations. Drawing on ethnographic research with married couples in a small-scale tea and coffee farming community in Kenya, this paper examines how these structural forces configure household gender relations and, particularly, create women's vulnerabilities. I begin by briefly locating tea and coffee cash-cropping households within the wider social and political-economic context, taking account of colonial and post-colonial state policies on land and agriculture, land shrinkage, structural adjustment programmes, and institutional practices of the tea and coffee industries. I then examine how these intersecting capitalist relations create vulnerabilities for both men and women, shape gender relations, and re(produce) hierarchies of power that make women relatively more vulnerable and risk eroding spaces of recognition, autonomy and agency they once had. Yet, for some women, these changes might mean enhanced opportunity for autonomy and agency within their household. Finally, going beyond discourses of victimhood, I discuss how women made vulnerable by these social forces attempt to deal with their disadvantaged position through collective networks. The paper argues for the need for agricultural policies and development initiatives to pay attention to how wider social contexts of agrarian change affect men and women in cash-cropping in order to support sustainable approaches for addressing their disadvantage and, particularly, women's vulnerability.

Educational Inequality, Student Emotional Repertoires and Subjective Forms

Argentina's secondary school has been politically sanctioned as the legitimate space for the social integration of adolescents. Although progress has been made in democratizing access, the education system still constitutes a space marked by the inequality that affects students' educational pathways. The forms of interaction and the links impregnated by school logics of merit that are generated in everyday school life preserve the capacity to model youth subjectivities that are far from being homogeneous.

These logics of merit, in dialogue with the psychic and emotional economies of the subjects, contribute to generating different forms of the "self", some as "intitled" subjects, with the capacity to project their future lives and experience a feeling of vital control, while others lead to the acceptance of a subordinate position that limits the possibilities of personal development.

Within the framework of a project that aims to reconstruct the meritocratic expressions in different secondary schools of the metropolitan area of Buenos Aires, this paper aims to investigate the emotional repertoires that delimit the subjective ecology of those who pass through high school as students. These repertoires will be read with the underlying concern of investigating the way in which emotions contribute to the reproduction of class positions, thus exploring the emotionality that permeates the students' discourse. Thus, students' emotional expressions will be problematized, whether they speak of recognition, pleasure, contempt, shame, fears, among others.

The Search for Metropolitan São Paulo Planning: The Case of the 2014 City Master Plan

In 2010, the population of São Paulo Metropolitan Region - the Brazilian largest urban agglomeration - was approximately twenty million inhabitants, corresponding to 12% of the Brazilian population, half of it living in the City of São Paulo. From an economic point of view, the metropolis and the municipality held respectively 19% and 12% of national GDP. Its growth happened in the last century in a Dependent Development context, resulting in an extreme uneven society in which only 6% of households earns more than twenty minimum wages, whereas 43% earns less than three. The physical result of this proccess was a fragmented space where the higher income strata have appropriated the central areas, best endowed with jobs, services and infrastructure, while the poorest were "expelled" from these areas, living in the precarious outskirt with huge deficits in mobility, infrastructure, services and public facilities, sometimes even occupying environmental protected areas of greatest risk. Since the 1970s there has been many attempts to plan this metropolis with little results. In 2014 the City of São Paulo enacted a new master plan, with a metropolitan vision, trying to promote a more environmentally balanced and socially equitable urban development. The plan proposed a series of new planning tools to cope with these problems. The aim of this paper is to analyse the partial implementention of this plan and its tools, considering the principles of socio-territorial equity and inclusion and the Right to the City, checking its limits and possibilities to revert this problem. An evaluation of the application of the instruments so far will be carried out, with emphasis on access to urbanized land for social housing as well as the financing for urban intervention projects, specially related to mobility and public services. This project has been partially financed by CNPq and FAPESP.

Feeding (from) the Crowd: Implications of Social Finance for Alternative Food Networks

Alternative food networks (AFNs) emerge as spaces of resistance to the global food system by establishing a place-based approach to food production, distribution and consumption. Through the (re)articulation of multiple stakeholders and resources, these networks aim to promote social justice, ecological sustainability and democratic participation in food systems. Common examples of AFNs are community supported agriculture programs, farmers' markets, organic food buyers' clubs, community gardens, urban agriculture initiatives, and food box schemes. Some AFNs combine social and market approaches to develop a viable model to pursue transformative outcomes. These AFNs operate in ways that are different from the conventional social or for-profit initiatives. For them, among other challenges, access to adequate funding in different stages of development has been considered a barrier to achieve viability, scalability and replicability.

In this context, alternative finance offers funding possibilities beyond the conventional financial system or government grants. Some examples of alternative financing can include crowdfunding, peer-to-peer lending, solidarity finance, and impact investment. Most recently, digital platforms have been used to intermediate funding and reach out to a broader 'crowd'. Several AFNs have adopted alternative financing to raise funds within their community and expanded network to support their organisational goals. However, there is limited research on the effects of alternative financing to the broader community ('crowd'). This paper reflects the starting point of a three-year study that aims to understand the implications of alternative finance to AFNs, particularly in terms of social justice and democratic participation.

The Progression of Hazard: Discussing the PAR Model

Blaikie et al. (1994) elaborated an important theoretical-methodological reference for the analysis of social risk construction based on PAR (Pressure and Release) Model, highlighting different spatial and temporal scales in the vulner-

ability analysis as a socio-historical process of developments and interrelationships. This model considers that vulnerability evolves progressively influenced by root causes (e.g. distribution of resources, neoliberalism), dynamic pressures (e.g. lack of local investments, rapid population change and displacement) and unsafe conditions (e.g. dangerous locations, poor social protection), producing risk and disaster situations. Although Wisner, Gaillard and Kelman (2012), reviewing the PAR Model, emphasize the "accentuation of some (not all) hazards" by anthropic action, it is crucial to complement the right side of the PAR Model (hazards) for a better understanding of the risks and disasters causalities, without which risk reduction actions are limited and insufficient, demonstrating the role played by different interest groups and social actors in the *catalyst actions* of *hazardous events, processes or phenomena* and their historical evolution. Thus, we propose to work with a focus on the *progression of hazard* composed by these *catalyst actions* that are related to the dimensions of: Food Security (e.g. use of pesticides, fires); Water Resources (e.g. unconscious water consumption, lack of environmental sanitation); Biodiversity and Ecosystem Services (e.g. wildlife hunting, deforestation); Health (e.g. insalubrious housing; use of fossil fuels); Human Habitat (e.g. soil movement, improper waste disposal); and Infrastructure (e.g. dams, nuclear power plant). These dimensions can generate or intensify *hazardous events, processes or phenomena* of different categories, such as: biological (e.g. epidemics, invasive species), environmental (e.g. air pollution, contamination of water sources), geological and geophysical (e.g. landslides, subsidence), hydrometeorological (e.g. floods, heat islands), technological (e.g. nuclear explosion, dam collapse).

The Future of Work

This paper is the first of a three-stage project that investigates the impact of innovations in the labour market in OECD countries. We focus mainly on how occupations are being transformed, as well as tasks performed by workers. During this phase, we look at the socio-economic and political characteristics of different economies and how they affect the introduction of two main innovations: process and product innovations. This distinction is crucial as these innovations tend to have different outcomes: complementarity or substitution of work. We use a multilevel model analysis with simultaneous equations with two dependent variables: the number of patents and the number of new firms in each country and year. We assess how different countries' characteristics inhibit or enhance the adoption of innovation.

Todas Las Ciencias Están Hechas Por Cuerpos: Notas Teórico-Metodológicas Para Reflexionar Sobre La Ciencia De La Partería En Una Comunidad Indígena Mexicana

En este trabajo discutiré los aspectos metodológicos de una investigación que realicé en Presidio de Los Reyes, Nayarit, México, junto a parteras voluntarias del Instituto Mexicano del Seguro Social (IMSS). Con esta investigación, criticamos el racismo/sexismo epistémico institucionalizado en el IMSS, que da más valor a los médicos titulados en universidades oficiales que a las médicas parteras del contexto local. Para tal trabajo, dialogué con las metodologías horizontales y su crítica a la noción de autoridad científica. Sin embargo, en este marco teórico-metodológico, si bien hay una crítica a la autoridad científica desde una crítica al eurocentrismo y a la posición histórica de europeos como los "más" o los "únicos" científicos, no está explícita una crítica a la imposición del sujeto masculino como el sujeto "racional", de manera que integré a las metodologías horizontales la dimensión de un racismo/sexismo epistémico constituido históricamente en el marco de la colonialidad. Las parteras reclaman un sueldo más justo y que sus conocimientos sean considerados tan válidos como los conocimientos de las médicas alópatas, una vez que la institución no las contrata como trabajadoras asalariadas, y mantienen el rol de "voluntarias". Para realizar esas críticas, dialogué y escribí un texto con María Asunción, partera que fue mi par investigativo. La práctica de la partería como ciencia médica, la cual es realizada y teorizada por María Asunción, es, explícitamente, hecha cuerpo a cuerpo, lo que me llevó a enfatizar que toda ciencia está hecha por cuerpos. Lo anterior me llevó a las preguntas ¿Por qué, entonces, ciertos cuerpos son considerados autoridad científica y otros no? ¿Solamente se debe a la literacidad universitaria o también hay otras marcas significativas usadas para valorar en los cuerpos su capacidad de hacer ciencia? ¿La literacidad está, acaso, como constructo social, racializada y sexualizada?

¿Viejo Vino En Nuevas Odres?: Revisando El Concepto De Estructura Social En Las Sociedades Del Siglo XXI

El tema central de esta ponencia es el análisis actual de la estructura social en términos teóricos. Aun siendo un concepto muy trabajado en el marco de la Teoría Social, muchas veces queda acotado en sus usos a variables clásicas: los niveles de ingresos o la ocupación, sólo por poner unos pocos ejemplos. Sin embargo, en la sociedad actual, diversas variables afectan la conformación de la estructura social. Cuestiones territoriales, de género, etnia o religión, entre muchas otras inciden necesariamente en la dinámica de cambio de este concepto. Esto no resulta una novedad y más bien supone un desafío permanente en términos de investigación y de respuestas posibles. En esta ponencia se propone una revisión literaria de los estudios de estructura social en la actualidad desde tres líneas: 1) relación agente-estructura, 2) la construcción de la desigualdad y 3) las estructuras del bienestar. Se considera que desde estas líneas es posible recuperar análisis innovadores y no necesariamente muy trabajados desde los estudios sobre estructura social. En este sentido la metodología para la elaboración de la ponencia es de carácter cualitativo: se construirá una muestra intencional de autores y artículos en términos de lo anterior, con un carácter exploratorio y con el fin de contribuir al debate.

NOIA, ELEONORA* (Catholic University of the Sacred Heart, Milan, Italy)

Cultural Production in Rural Italy

In recent years, the debate on production and consumption within the Alternative Food Networks has intensified. Literature has highlighted many aspects: the new contacts that arise between the countryside and the city; the relationships established between producers and consumers. The literature on *prosumers* has shown new meanings produced by consumers, especially when purchasing choices are covered by ethical, political and identity issues. Meanwhile, there has been less talk about cultural production by producers' side. The overlapping of production and consumption, in fact, has always characterized the model of management of the peasant economy. However, at nowadays this model seems to change its meaning, considering both the production and the country lifestyle choices related to environmental and cultural issues.

The aim of this research is to show how farmers produce culture within AFNs.

The research uses 17 interviews with farmers from Piedmont, Northern Italy, and 5 interviews with farmers from Basilicata, South Italy, participating in the WWOOF Italy network (World Wide Opportunities on Organic Farms, since '70s, internationally promotes organic farming and sustainable lifestyles through the work-hospitality exchange).

To verify how farmers produce culture, a new model has been developed hybridizing two analytical instruments: the Theory of Practices (Shove, Pantzar, & Watson, 2012), and the Circuit of Culture (Du Gay, 1997). Considering AFNs as sets of practices, the model developed shows how, starting from the self-production practice, farmers 1) convey new meanings, 2) create new spaces of representation, 3) outline alternatives aimed at preserving the environment and the small-scale agriculture, both from a socio-economic point of view and from a regulatory point of view, developing proposals answering to farmers' needs.

Into the Sacred and Symbol of Peace: Memorizing Atomic-Bomb Survivors in the Post-War Japan

This paper explores the process in which atomic-bomb survivors acquired a sacred status in the social memory of the post-world war II Japan.

On August 6, 1945, the drop of the atomic-bomb to the city of Hiroshima drove tens of thousands of people to instant death. It also left another tens of thousands of survivors, who later came to be called "hi-ba-ku-sha (atomic-bomb survivors)". Initially, those survivors were socially seen as ominous and untouchable as, with deformed faces and bodies, they were feared as a source of disease infection. However, as years went by, they came to be regarded as carrying a divine nature, even becoming a symbol of peace.

Studies exist that point out the acquisition of a sacred nature by the atomic-bomb survivors throughout the post-war historical process in Japan. However, many do not provide an insight with which to understand the mechanisms through which the deformed were transformed into a symbol of peace.

This study intends to clarify the mnemonic practice that has led socially avoided individual to a divine symbol. Employing as data national newspaper articles, I performed trend analysis and network text analysis. The results show that the survivors went through stages of change in the way they were remembered; (1) transforming real individuals into generalized collective entity by becoming a collective actor, (2) change in the meaning attached to the survivors, from negative to positive, (3) acquiring a sacred status through being honored in the process of historicization, and (4) becoming a symbol of peace through abstraction from history. In sum, two processes are distinct in the mnemonic practice associated with atomic-bomb survivors: meaning alteration from negative to positive, and status alteration from mundane to divine.

While having limitations, this study adds another insight into the mnemonic practices associated with human disaster.

Competing Nationalisms: Distinctive Language Policies in Two Post-Soviet Systems of Higher Education

This paper examines the distinctive trajectories of two systems of higher education. Ukraine and Uzbekistan both gained independence in 1991. In the Soviet period, both countries had systems of higher education dominated by the Russian language. The primary language of instruction at flagship universities in both countries was Russian. Academics in both countries shared strong intellectual and personal ties with colleagues across the Soviet academic landscape. Similarly at the institutional level, universities throughout the Soviet space engaged in close collaboration with one another. After 1991, with the introduction of nationalist language policies, the higher education systems in both countries adopted distinctive paths forward. Universities in Uzbekistan now have quite low rates of Russian language usage in the classroom. We argue that the nationalist trend in Uzbekistan resulted less from a top down effort to impose Uzbek as the language of instruction and more as a result of demographic shifts that have resulted in fewer and fewer Russian language students. The nationalization by default path in Uzbekistan contrasts markedly with the Ukranian case. In the aftermath of the Maidan movement in Ukraine, the state oversaw a campaign to limit the use of Russian in Ukrainian universities. This top-down effort to enforce language use has met resistance from both students and faculty. Drawing from interviews with faculty members and academic administrators at universities in both countries, our paper engages in a comparative analysis of both cases.

Believe It When You See It: Dyadic Embeddedness and Reputation Effects on Trust in Cryptomarkets for Illegal Drugs

Large-scale online marketplace data have been repeatedly used to test sociological theories on trust between strangers. Most studies focus on sellers' aggregate reputation scores, rather than on buyers' individual decisions to trust. Theoretical predictions on how repeated exchanges affect trust within dyads and how buyers weigh individual experience against reputation feedback from other actors have not been tested directly in detail. What do buyers do when they are warned not to trust someone they have trusted many times before? We analyze reputation effects on trust at the dyadic and network levels using data from an illegal online drug marketplace. We find that buyers' trust decisions are primarily explained by dyadic embeddedness - cooperative sellers get awarded by repeated exchanges. Although buyers take third-party information into account, this effect is weaker and more important for first-time buyers. Buyers tend to choose market exit instead of retaliation against sellers after negative experiences.

NORKUS, ZENONAS* (Institute of Sociology and Social Work, Faculty of Philosophy, Vilnius University, Lithuania)

Are There Progressive Social Restorations?

Sociology of revolutions is well-established research field, while sociology of restorations is almost absent, although two great modern revolutions (French 1789 and Russian 1917) both ended with restorations. This asymmetry reflects a dominant assumption of both modern societies and social sciences that social revolutions are intrinsically progressive, while restorations mean reaction or regress. This contribution provides prolegomena for comparative historical sociology of restorations arguing that some revolutions may be reactionary while some restorations may be progressive. Taking departure from the classification of social restorations into micro-restorations (e.g. of friendships, families), mega-restorations (e.g. of empires, international systems), and macro-restorations (of states, political regimes, socioeconomic system), we focus on the issue how to distinguish progressive and regressive macro-restorations. In this analysis we differentiate between successful/failed and progressive/reactionary macro-restorations. A restoration is successful if restored social system survives longer than prerevolutionary (original or status quo) and intermediate post-revolutionary systems. Restoration fails, if path-dependent reproduction and evolution of restored social system is interrupted by new revolution. Restoration is progressive if restored social system performs better than prerevolutionary and post-revolutionary systems. Although underperformance increases chances of new revolution, there can be non-progressive successful restorations as well as failed progressive restorations. Using cross-time cross country comparable GDP, life expectancy, HDI data we explain by example and demonstrate the fecundity of this framework in the case study answering following question: was the restoration of capitalism as a socioeconomic system in the formerly communist countries successful and/or progressive? According to proposed criteria, survival of restored capitalism for some three decades indicates the success of restoration. However, restored capitalism demonstrated its progressiveness only in those countries where GDP growth did accelerate in comparison with last three communist and precommunist decades, with HDI and life expectancy improving more than during these communist and precommunist periods.

NOVELLI, JOSE MARCOS* (Universidade Federal de São Carlos,)
GALVÃO, ANDRÉIA (Universidade Estadual de Campinas, Brazil)

The Dismantling of the Environmental and Labor Policies UNDER Bolsonaro

The economy of the Bolsonaro administration is characterized by the resumption of a radical neoliberal project, which some researches call ultraliberalism. The policies we intend to investigate fall into two fields: deregulation and labor re-regulation; and the dismantling of the environmental inspection state apparatus. Both policies are related to accumulation and valorization of capital, and are important to understand the nature of political project sustained by Bolsonaro administration.

Regarding the environmental inspection apparatus, the Bolsonaro administration has placed several military officers at the head of the institutions such as IBAMA and ICMBio; cutting budget resources of the Ministry of the Environment (an agribusiness friendly institution since Bolsonaro inauguration) and failed to support - with members of the repressive apparatus, police or military - the enforcement actions leading to a record increase in burning in the Amazon and invasion of indigenous reserves for candlestine mining.

Regarding to labor legislation, Bolsonaro administration seeks to deepen the flexibility enshrined in the reform promoted by his predecessor, assuming the objective of bringing labor relations closer to informality. In this sense, we highlight the proposal for a "green and yellow" work card, which aims to ensure direct negotiation between employer and employee without respecting the existing rights and collective agreements; the economic freedom law, which, among other measures, reduces the mandatory Sunday break and ends double pay on Sundays; the establishment of a Labor Studies Group, whose task is to promote a new round of changes in legislation, focusing on occupational safety and health standards and trade union organization; and the "New Social Security" based on capitalization model. This set of measures makes the state not responsible and

assigns the individuals the task of ensuring their present and future well-being according to their ability to contribute and their employability, promoting the "commodification" of the workforce.

Alternatives to the Binary Conception of Epistemology in Mixed Methods for Social Sciences

Decolonizing social science methodology is a topic that, as researchers, we have to both deeply investigate and bear in mind when we approach a study, not only acknowledging our positionality, but truly reflecting on what are the changes we aspire to produce with our work (Tuhiwai Smith, 2013). With this contribute, we do not necessarily aim to examine methods in relation to the study of indigenous and/or marginalized people – the original meaning given by Tuhiwai Smith to "decolonizing methodologies". However, even the most allegedly "neutral" topic in social research remains part of structured power dynamics, investing also the methods we use to study social phenomena and the epistemological issues at its basis.

The Western conception of science as a male, white, able-bodies field is linked with the intentional processes of building and maintaining of separations: separations between hard and soft sciences, and within social sciences, separations between qualitative and quantitative methods of inquiry.

Moreover, separations between quantitative and qualitative methods have been sustained on the epistemological level by the idea that positivism and co-structivism are polarized "mental models" (Greene, 2007). Nevertheless, similar separations are mostly the result of processes of social construction within academia and, as such, can be easily deconstructed.

Within this paper, we attempt to show various lines of deconstruction of the separations between qualitative and quantitative, as well as between positivism and constructivism, keeping in mind the consequences that a similar operation has on shading light on power dynamics, while still inevitably being influenced by them. Ultimately, we aim to show possible alternatives to the dominant binary conception in social sciences, borrowing from both feminist epistemologies and critical realism.

NOVELLO, NOEMI* (Università di Milano-Bicocca, Italy)
DECATALDO, ALESSANDRA (University of Milan Bicocca, Italy)

Networks of Authors within a the Mixed Methods Academic Community

This contribution focuses on networks of authors in the academic and methodological community of mixed methods in social inquiry. Social sciences see the presence of multiple methodological communities and the ways in which knowledge is produced and constructed are rarely explored in their connection with relationships among scholars in the academic world. While the mixed methods field generally suggests for modalities to overcome separations between qualitative and quantitative ways of thinking about research, the field itself is indeed not exempt from the broader issues comprises the academic world. As such, this specific field of knowledge is still part of a system that is built and maintained through power and privilege dynamics.

The paper will present results from a doctoral research, which applies a methodological research synthesis of published articles that declare to use a mixed methods approach. Through a citation network analysis (CNA), I aim to show how the production and circulation of knowledge in the context of an academic community is influenced by structures of power. The act of publishing papers in academic journals is part of the reward system in academia, with citations representing a way of granting recognition (and authority) to the author(s) of the cited article. Looking at networks of citation, thus, allows us to identify some structures and shapes of power within the academic system of knowledge production and circulation. In addition to the identification of most cited authors and works, CNA allowed to identify relatively enclosed groups of related papers and scholars adopting a similar approach to a topic – or similar understandings of methods, as in the case of this study – underlining the existing paths, structures and networks among citations in the mixed methods. Through CNA it was possible also to point at relationships among these specific smaller communities.

NOVO VAZQUEZ, AMPARO* (University of Oviedo, Spain)
VICENTE, MARÍA ROSALIA (Universidad de Oviedo, Spain)

Investigating Political Consumer Types: Some Evidence for Spain

During the last years a series of economic, political, social, technological and environmental changes have raised the awareness of many citizens about their role as consumers. Political consumerism, understood as citizens' deliberate deci-

sions to buy or avoid specific products for political, ethical or environmental reasons (Stolle et al., 2005), is at the heart debate about the possible ways in which citizens, with their daily-life acts, can make a substantial contribution to shape a more sustainable and equal society. In this context, it has become crucial to better understand the different forms of political consumerism.

Hence, this paper presents an empirical analysis of political consumerism in Spain. To carry out this analysis, a specific survey was designed. Data were collected during June 2019 from a representative random sample of the Spanish population of 18 years-old and older. From respondents' answers, a typology of political consumers is identified: (i) citizens who both boycott and buycott; (ii) citizens who only boycott; (iii) those who only buycott; and finally, (iv) those who do not carry out any act of political consumerism. By estimating multinomial probit models, we investigate the main factors that shape the different types of political consumers. Results show that any of form political consumerism is mainly associated to other forms of political engagement and moreover, there is a clear relation with certain political partisanship.

Keywords: political consumerism, boycott, boycott, partisanship, citizen, political engagement

NOWAK, JOERG* (Universidade de Brasilia, Brazil)

Success or Failure? the Brazilian Truck Drivers' and Petroleum Workers Strike in 2018

The Brazilian Truck Drivers' Strike 2018 could be treated as a model case for the successful applicatio of the power resources of workers in logistics and transport: About 300.000 truck drivers made road blocks for 11 days and brought the Brazilian economy to a halt. But the results of the strike put into question if the strike was actually a success since they were short term solutions and ran out 7 months later. Another interpretation is that the threat with a new strike led to renewed negotiations in 2019 which were able to attain better conditions for truck drivers. But also this second partial success came with rather ambiguous results. Thus I want to ask in this talk if the problem is located with a lack of ability to transform the economic power of truck drivers into political power, or rather with the fact that an improvement of the situation of truck drivers would require a larger political agenda that does beyond the sector of transport and would include energy policy and the sectoral composition of the Brazilian social formation.

NOZAWA, ATSUSHI* (Japan Society for the Promotion of Science, Japan)

Bridging Environmental Sociologies in Japan and the Mainstream in Global Context Via "Kogai" Perspective

Environmental Sociology was developed and matured in the U.S. and Europe. Although the mainstream has still remained these countries, the situation will be shifted by inches. Western environmental sociologists have gradually paid attention more to Environmental Sociology in other regions. This paper will link Environmental Sociology between Japan and a global context by applying *Kogai* perspective from Minamata Disaster.

Minamata Disease refers to methyl mercury poisoning caused by eating fish and shellfish polluted by wastewater from a large chemical factory in Kumamoto, South Japan, poisoning that creates devastating health problems for victims and stigmatizes them. In total, approximately 2,000 people have been officially certified as the victims, and over 60,000 people are registered as uncertified victims. 2016 marks the 60th anniversary of the discovery of the disease, and it negative health and social consequences are still evolving. This paper will draw a character of environmental sociology and its perspective in Japan: "victimology" and *Kogai*.

This unique perspective can be understood as an equivalent of environmental justice framework, one of the influential concepts in a global context. Those who suffered from Minamata Disease were overwhelmingly from socially and economically disadvantaged groups, especially residents of local fishing communities, while the economically advantaged and politically powerful parties responsible for the pollution were unaffected. This injustice has continued from the original contamination to the recognition and then social treatment of the victims. Differing dimensions of injustice are apparent at different stages of the six-decade long Minamata conflicts.

The paper will conclude with a comparison of environmental justice frameworks in Japan and the U.S. to show the similarities and some differences due to national settings. The goal will be to contribute to the development of a common EJ perspective for use in environmental sociology in comparative context.

Single Motherhood in Africa: Prevalence, Associated Factors, and Multidimensional Poverty

Increase in single parenting especially among women has become a global concern as existing evidence continues to show that single motherhood is associated with higher risks of poverty, reproduction of poverty and other negative outcomes that affect the wellbeing of single mothers and their children. Understanding the demography of single parenthood in Africa especially among women is of importance because single motherhood could be more detrimental within this region considering the prevalence of poverty and the economic status of women in Africa. Recent estimates show that out of 1.3 billion people who live in multidimensional poverty in developing countries 605 million are in Africa. Using pooled data obtained from the Demographic and Health Surveys in 31 African countries, this study examined single motherhood in Africa with a specific focus on the prevalence, determinants, and association with multidimensional poverty. Descriptive statistics and multilevel logistic regression were used for data analysis. The results show that 22% of women ages 20-49 years in Africa were unmarried mothers. Distribution within the sub-regions shows wide variations with 50.5% never-married mothers in Southern Africa and 15.7% in Western Africa. The significant factors associated with never-married motherhood include current age, place of residence, level of education, occupation, household wealth quintile, birth order as a first-born child, the experience of intimate partner violence by respondent's mother, access to the media, community-level of poverty, and community level of female education. Notably, most of the determinants were similar across the sub-regions in their direction of association. Among all categories of single mothers in the region, the never-married were the most vulnerable in all eight indicators of multidimensional deprivation. In conclusion, unmarried motherhood is a common nuptiality pattern in contemporary Africa. With its diverse implications for wellbeing, family-oriented policies and programmes in Africa have become imperative.

Utilization of Maternal Health Care Services in Nigeria: Are Internal Migrants and Ethnic Minorities Disadvantaged?

In 2015, the World Health Organization estimated that about 58,000 maternal deaths occur in Nigeria annually, accounting for 19% of global maternal deaths. The high maternal mortality is primarily attributed to low utilization of maternal health care services and existing evidence indicate that large inequalities exist between different population groups in access and utilization of maternal health care services. Although several studies have been conducted to identify the factors associated with low maternal health care utilization in Nigeria, negligible attention has been paid to the likelihood that internal migrants and ethnic minorities in the different parts of the country may be disadvantaged in access and utilization of maternal health care services. Therefore, this study examined the utilization of maternal health care services among women of reproductive age who are internal migrants and ethnic minorities in Southwest Nigeria. Available evidence shows that 23% of Nigerians are internal migrants and the Southwest region is a major destination for internal migrants in the country. Data were obtained from the 2013 Nigeria Demographic and Health Survey and the study population comprised a weighted sample of 4365 women in union aged 15-49 years who were residents in Southwest Nigeria at the time of the survey. Results of multivariate analyses show that migrants and ethnic minorities were significantly less likely than non-migrants to complete a minimum of four and eight antenatal contacts (five in the third trimester, one contact in the first trimester, and two contacts in the second trimester), holding other factors constant. Migrants and ethnic minorities were also more likely to deliver at home and in private hospitals instead of government hospitals, and less likely to present for postnatal care compared to non-migrants. Social policies and programmes to address the maternal health needs of migrants and ethnic minorities in Southwest Nigeria are recommended.

Actors That Influence Social Acceptance, Attitudes and Perceptions Towards Solar Water Heating, a Case Study of the Communities in the Mangaung Metropolitan Municipality of South Africa.

South Africa is among other developing countries that have been experiencing inadequate energy supplies often resulting in a crisis of 'load-shedding' in which the national energy supplier shuts-down supply of electricity on a rotational basis to various zones. This crisis affects everyone in South Africa, from local business to residential areas, but low-income households are particularly doubly impacted due to already being impoverished. To minimize the energy crisis, in 2009 the South African government has introduced a programme of efficient energy conservation called, the solar water heating (SWH) programme, with the aim of relieving pressure on the electricity grid. The programme is also intended to create employment opportunities and alleviate infrastructural poverty by providing access to hot water to low-income households. After ten years since its inception, there is limited research that has been conducted on the programme and key actors that influence its acceptance, perceptions and attitudes among users and non-users of SWH in municipalities of SA. This paper aims to identify key actors that influence acceptance, perceptions and attitudes of SWH at the municipality level, in providing a multi-case study approach that was undertaken in such communities using survey questionnaires and in-depth interviews with users and non-users of SWH. The results indicate that local politicians and councilors were identified as top actors that influence acceptance, perceptions and attitudes of SWH in the Mangaung Metropolitan Municipality. Issues of 'trust', 'past experiences' and 'party loyalty' also play a role in influencing users and non-users. Door to door campaigns, public meetings and non-scientific language were strategies used by local politicians and councilors to influence users and non-users perceptions and attitudes towards the acceptance of SWH.

NUGGEHALLI, ROSHNI* (Youth for Unity and Voluntary Action (YUVA), India)

Relevant and Radical Youth Work Praxis in India

Amidst shifting political and social contracts in India, young people are positioned as a peg onto which several aspirations are simultaneously hooked. They are viewed as a labour force that can propel economic growth, as a troubled homogeneity that must be restrained, and also as a canvas for imbuing an often divisive political agenda. The meanings and manifestations of youth work in this context have moved along the spectrum of inertia to dynamism. This paper argues for situating youth work within a normative frame in order to ensure young peoples' agency and provide space for their critical reflection and purposeful action. It uses examples from the Youth for Unity and Voluntary Action's (YUVA, an Indian non-governmental organisation) experience of working with marginalised youth guided by principles of justice and participatory democracy to highlight the challenges and possibilities that exist for contemporary youth work in India. The need for conceptual clarity on the why and how of youth work is emphasised through examples that point to the influences of a rapidly changing political economy juxtaposed on youth transitions. Further, these examples help to raise key contestations that are relevant for contemporary youth work in India and also in other countries. Professionalisation poses a significant challenge to the inclusive and expansive nature of youth work, and the paper questions the rationale and relevance of a professionalisation journey for youth work in India. The need to ensure flexibility and a recalibration of the measures of youth work's success are discussed. The challenges of balancing the principles driving youth work with prevailing financial and politico-legal constraints are raised. Methods by which youth workers can support young people's journeys through democratic processes and reclaiming the shrinking space for youth voices are highlighted.

Migration, Labour Market Integration and Third Sector Organisations' Relative Autonomy

Third sector organizations (TSOs) play a crucial role in the implementation of labour market integration policies and services. After the so-called "migration crisis" in 2015, the importance of TSOs has even increased as well their interactions with the public sector that not only opened up new opportunities for TSOs but at the same time represents a potential threat to their autonomy. However, the role of TSOs in integration policies and services remains rather unexplored. Against this backdrop, this paper aims to explore the relation between the public sector and third sector in the delivery of integration services and the impact that these connections have on TSOs autonomy across different countries. In particular, we address the following questions: How is TSOs' autonomy vis-à-vis state and market institutions maintained, reinforced or challenged? How do these processes differ across national contexts? What are the key ambiguities influencing TSOs' autonomy? By focusing on the role of TSOs in different institutional, political and socio-cultural contexts, the analysis has been carried out in the Czech Republic,

Finland, Greece and Scotland. The data that underpin the analysis are drawn on the qualitative study, based on semi-structured interviews with TSOs representatives and policy-makers, complemented with a review of existing documents. We conclude that the position of TSOs can be viewed through the lens of relative autonomy. Furthermore, we argue that TSOs' autonomy is influenced by TSOs actions alongside four structural ambiguities: between independence and dependence, between conflict and collaboration, between precariousness and security, and between bureaucratization and socio-cultural understanding. We conclude that, on the one hand, TSOs have potential to provide critical, alternative and innovative approach towards labour integration and reinforce thus their autonomy. On the other hand, TSOs frequently end up as uncritical extenders of national labour market integration services and their autonomy is hindered.

CAITANA, BEATRIZ (Centre for Social Studies / University of Coimbra, Portugal)

FERREIRA, ISABEL (Centre for Social Studies / University of Coimbra, Portugal)

Intersectional Challenges in the Emergence of Social Innovation for Active Citizenship

The present paper proposes to focus on the visibilization of solutions and experimentations that have been emerging as alternatives and socially innovative practices for the promotion of citizens' participation and the appropriation of citizenship rights, namely in the context of urban local governance. The three authors have been developing a research dialogue combining the studies of urban sociology, sociology of law and the approach to social innovation, ranging from the reinvention of the social in times of crisis, to the emergence of alternative emancipatory and democratic practices based on rights and participation, and the social co-production in urban regeneration solutions. In conceptual, methodological and practical terms, both interdisciplinarity and intersectionality constitute challenges in building up innovation and for the production of knowledge. Starting from their interdisciplinary research dialogue, the authors will specifically address intersectionality also taking into account the approach being applied in URBiNAT, a project funded by the European Union, tackling urban regeneration in seven European cities through the co-creation of healthy corridors in the public space connecting social neighborhoods, based on the co-creation of nature based solutions with citizens. In this context, co-creation frames participation as a means and as an end, where the intersectional approach constitutes an explanatory element to understand the complexity and respective factors that influence a given reality, as a complex combination of different specific modalities of oppression and discrimination experienced by individuals and groups. The recognition of theses modalities allows greater precision of what is to be achieved, that is aiming at equality and equity for each and all, trying to play also in favor of differences and diversities. Finally, the authors propose to discuss the key foundations but also main obstacles in setting-up a co-creation environment, building on different visions, perceptions, agendas and interests, and establishing a cultural platform for mediation.

Bibliotecas Comunitarias: Diálogos Interculturales y Protagonismo Infantil Desde Las Metodologías Colaborativas

Se presenta una propuesta de investigación, centrada en la instalación de una biblioteca comunitaria, generada por relaciones de colaboración en la investigación social, en una comunidad ch'ol del municipio de Salto de Agua, Chiapas, México; la cual ha sido previamente consensuada entre las familias, los niños y las autoridades comunitarias. La investigación plantea la instalación de una biblioteca comunitaria, como dispositivo metodológico, sustentada en los estudios críticos de la literacidad, la teoría crítica en la educación y la decolonialidad del saber. Esta propuesta de trabajo flexible y situada se propone para generar espacios de diálogo para reflexionar las practicas lectoras y su potencialidad para la transformación personal y colectiva, en la cual, se integran actividades de juego, arte, lectura y narración que permita un acercamiento sensible y progresivo de la niñez con la literatura científica y artística, pero sobre todo, la producción de literatura propia que permita espacios de reflexibilidad, para visibilizar la desigualdad en la producción hegemónica de conocimientos y las posibilidades de transformarla. En esta propuesta se considera la participación colaborativa entre los actores y la investigadora, propiciando la formación y apropiación de las familias y las niñas y los niños de la organización y gestión de la biblioteca, con el objetivo de promover el protagonismo infantil desde las prácticas culturales de la comunidad.

La propuesta integra los diversos sentidos e intereses de los actores involucrados en la propuesta, desde las familias con una necesidad de contar con material bibliográfico para atender las tareas escolares; el interés de los niños y las niñas por contar con espacios propio para el juego, el arte y le lectura, personal y col-

ectiva; el interés de la investigadora por promover espacios de reflexión dialógica entre la comunidad y la escuela y construir espacios de diálogos interculturales visibilizando la estructura de desigualdad.

A Los Que No Nos Mataron y Sobrevivimos: Jóvenes Sujetos y Objetos De Violencia En Las Agrupaciones Juveniles De Calle

Los jóvenes de las agrupaciones juveniles de calle (*pandillas, bandas latinas, Naciones* o *gangs*) suelen ser "sujetos" u "objetos" de las distintas formas de violencia en las sociedades donde han surgido, pero por lo general se asume que sólo son sujetos de violencia, es decir, que sólo la ejercen. Más allá de los enfrentamientos entre agrupaciones rivales hay también otras formas de violencia que no siempre se visibilizan, lo que hace que se estigmatice aún más a los integrantes de estas agrupaciones. Este artículo se desprende del trabajo de campo realizado en N.Y., República Dominicana y Madrid sobre las agrupaciones de los Trinitarios (Trinis) y Dominican Dont Play (DDP) que han surgido en estas tres ciudades. En cada una de estas sociedades ha prevalecido las políticas restrictivas, de mano dura y en algunos casos de "limpieza social" (o "juvenicidio"), muchas veces sin tomar en cuenta el contexto socio familiar de estos jóvenes, ni la posibilidad de intervención y prevención con los jóvenes y menores de estos barrios. Tomando en cuenta la observación realizada, se plantea un análisis de las violencias a la que son sometidos/as los/as integrantes de estas agrupaciones, la violencia que reproducen y el contexto social, económico y familiar de jóvenes integrantes de estas agrupaciones que han participado en la investigación.

Biographical Research in the Period of Lockdowns: Fragmentation, Vulnerability and Distancing

This presentation focuses upon the place of biographical research in reconsidering its response to the unprecedented circumstances of researching lives during conditions of COVID-19. It reflects on preliminary findings and critical discussions from the ESA RN03 and BNIM SAI conference in September 2020 which addressed a range of questions eliciting biographical responses to new societal circumstances of physical distancing and isolation, social fragmentation, and increased risks of trauma and vulnerability to populations from European social researchers. In sum, critical discussions focused on theoretical, empirical/practical and analytical/interpretative perspectives of biographical research during lockdowns, researcher identity and self-care in this new reality.

Successive Covid-19 lockdowns further expose European societies to unprecedented economic and social fragmentation with regards to education, mobility, health and social care, (re)-shaping previously taken-for-granted aspects of our role as researchers. Outreach to the most vulnerable, silent minorities becomes even more problematic during Covid. The new social present challenges core aspects of biographical methods; how we conduct interviews and exercise care for participants whilst being socially distant. Questions of building trust, responsibility for interviewees' welfare during and after interviewing and data reliability assume greater prominence. Reflecting on our experience, this paper assesses pros and cons of online interviewing; balancing "immersion" in people's lives whilst maintaining social and physical distance. Analysis and interpretation of biographical narratives are discussed; how new social conditions affect how we collect, analyse and disseminate biographical data.

NUSS, SHIRLEY* (Usa, USA)

Gender and Age Inequities in National Data Collection

Despite recommendations initiated during the first World Conference on Women in 1975 and reiterated for decades thereafter, national census and survey data reflect little improvement. Nowhere is this lack of improvement more apparent than their continued failure to provide statistical recognition for the economic contributions of women, especially rural women, to the System of National Accounts (SNA) and the Gross Domestic Product (GDP).

Most women are still assumed to be housewives when, in fact, they are major actors in national economies with essential economic contributions to agricultural production, processing and exchange. While a framework for correction of these limitations is possible flowing from further elaboration for SNA in a national context, continued failures flow from lack of concern for women, especially rural and poor women.

Not only are women the primary agents of household production, many of these agents are older women whose essential economic activities continue to be excluded from enumeration.

The most glaring failure to collect accurate information about the economic contributions of older women in rural areas of most countries flows from continued exclusion from collection by censuses and surveys of any economic information about older people, including older women, above an upper age limit. Some countries do not collect any economic information about men or women above ages 60 or 65 years, while others set an even lower age limit.

Even when data collection is encouraged, international standards recommend these data about older people for exclusion from data processing and, thus, publication and dissemination. As a result, economic contributions of older women and men, especially in rural areas, continue to be excluded from recognition in available data for most countries. In consequence, national policies and programs direct little or no attention to older persons.

National Indicators for the Advancement of Women: Construction and Use By Researchers for Formulation and Evaluation of Policies

Indicator development responded to statistical needs of researchers participating in the first meeting of ISA Research Committee on Women (RC-32) at the World Congress of Sociology held in Toronto in 1974. The author assumed responsibility for addressing these needs beginning with contacting the UN Secretariat responsible for research in preparation of recommendations for the first World Congress on Women in Mexico City during 1975. The Secretariat had no data, and both UN and UN agency personnel responsible for collection and publication of national data refused to construct any indicators from their published data. In response, the author organized an underground network of women within the UN system to smuggle out publications for compilation of data and construction of national indicators.

Thus, the first global data bank on women came into being, featuring 217 indicators for 214 countries and territories. It was shared with the UN Secretariat as statistical input for this first World Congress on Women. Shortly thereafter, the most reliable indicators were published with an assessment of international standards guiding collection of these data.

This paper discusses construction of national indicators for four world conferences on women, 1975-1995. It traces their development, and notes there continues to be little change in basic construction. However, preparations increasingly rely on population estimates and projections, some of which are produced for countries without any baseline census data.

As participant in UN preparation of indicators and research supporting recommendations for regional and world conferences, the author gives emphasis to use of national indicators for evaluation of progress and formulation of global, regional and national plans, policies and programs of action.

NUSSBAUM BITRAN, ILANA* (University of Duisburg-Essen, Germany)

Processes of Inclusion/Exclusion of Latin American Physicians in Foreign Labor Markets

Physicians can be described as professionals possessing a specific capital based on a technical and practical knowledge. Given that medicine is a regulated profession, this knowledge can only be used in the framework of specific local and transnational regulations. Focusing on migrant professionals, the inclusion/exclusion dynamics that these regulations promote are decisive to understand the value foreign knowledge can adopt. The paper focuses on Latin American migrant physicians working in Chile and Germany. Following Bourdieu's social theory, it is possible to understand the health labor market as a field, where physicians compete for better positions drawing upon the capital they possess. This competition takes place not only in one given country, but also internationally. Assets such as a given (hegemonical) language or a certain nationality can help or hinder the valuation and recognition of foreign capital making it easier or harder for foreign physicians to find a work position and to rise in the host country's labor market. The paper presents findings based on biographic narrative interviews with Latin American physicians in two countries: Germany and Chile. Showing highly skilled Latin American immigrants' experienced situations in the labor market, the importance of non-written rules regarding the valuation of cultural capital will be highlighted based on categories such as nationality and class. Physicians are in high demand in the Global North as well as in the Global South; therefore, moving between countries is a possibility. Whether Latin American medical doctors find an adequate occupation in the country of arrival depends on their ability to negotiate their acquired capital under a different social setting. The health sector presents an exceptional case of study since it is a legally as well as socially regulated professional field.

The Challenges of Policing Handling of Juveniles in Nigeria

The Juvenile justice system in Nigeria was formed to protect the young child from the adult systems of justice and also to permit discretional decision making in the best interest of the child. The police being the first juvenile justice agent that the child meets, have a wide range of discretional responses available to them. In line with these discretional powers there have been concerns about police handling of juveniles because the Police officers often work alone, without direct supervision, and are saddled with the burden of much discretion. It is difficult to know what officers do during their shifts and many of their contacts with youth go without documentation in official records. Using data from a survey done on police-juvenile interactions in nine States in Nigeria between the years 2000 to 2019, it shows that there is a negative attitude towards the police by the Juveniles due to the way they are handled by the police. Furthermore, the class and status of the juveniles determine their treatments and handling by the police, with juveniles from lower class families being treated unduly unfairly by the police. According to the police, the juveniles represent a special set of problems with a majority of them being involved in cult related activities, thereby forcing the police in using a more proactive approach such as class and status profiling in handling juveniles. This study recommends that there should be mechanisms put in place to check the way in which the police handle juveniles, especially juveniles from low income families in order to increase the confidence of the public to the efficacy of the police in crime control in Nigeria.

NWANKWO, IGNATIUS* (Nnamdi Azikiwe University, Awka, Anambra State, Nigeria, Nigeria)

Quadruple Global Challenges of the 21ST Century and the Nigerian State: Finding Key Mitigatory Templates to Safegaurd the Nation

Many independent states across the globe after decades of nationhood are yet to attain optimal heights in their sociopolitical and economic goals. In particular, in the 21st century, most nation states (Nigeria inclusive), have groaned under quadruple global challenges that have grossly limited their capabilities. Such challenges include failing democracies; steady expansion of degenerated environments ; widening inequalities among individuals and across social groups; as well as broader forms of intersectional realities. The hope that high powered meetings held by international bodies and governments, with their emergent policies could address and fully mitigate the problems has remained a mirage. To this end, this paper anchored on cultural relativism theory interrogated two major objectives. First, it examined how the aforementioned four global challenges of the 21st century have manifested within her territory and affected the Nigerian state. The second objective was to earmark key templates that could mitigate negative effects of global challenges on the Nigerian state. One of such key templates as outlined in the paper is the need to adopt an indigenous brand of democracy knitted with basic elements of the traditions, belief systems and culture of the people. The option of traditional democracy is particularly relevant to Nigeria given the colossal waste of resources and operational hiccups that have characterized the experiment of Western democracy in the country over the years.

Sport, Sustainable Development and Human Rights

Despite the UN bodies' call for more attention to the interconnection of sport, sustainable development goals and human rights the empirical and theoretical ramifications of this connection are almost unresearched. According to the 2025 Kazan Action Plan – the UN's desired 'pivot point' for policy coordination on sport's contributions to the 2030 Sustainable Development Goals (SDG) – failure to address this interconnection involves 'a high risk that SDG-orientated policy interventions *in and through* sport [which includes human rights] will be neglected, ineffective and/or insufficiently recognized'. This paper fills this void by offering a conceptual analysis of what the The Danish Institute for Human Rights, through its 'The SDG – Human Rights Data Explorer Tool', has identified as the most critical links between sport, sustainability and human rights – children's rights, gender equality and the processes of democratisation.

Managerialism: Its Practical Limits for International Enterprise in India

This is a critical study of the limits of instrumental practices of Western managerialism, found to accord poorly with enterprise activity in Non-Western countries. These limits are exposed by qualitative research done in India, as the basis for proposing how socially responsible management action might better fit with India's cultural institutional orientation. Over the 20th century, Western managerialism became ensconced in a self-certifying ideology; materialized as means of enterprise action, for maximizing capital concentration as unquestioned macro-institutional end. Although the universalizing ambition and practical objectives of that approach are appealing for Western-trained managerial technicians, at least in reference to work in India, it encounters serious problems. After an opening to present a conceptual frame based on a system-culturalist model, and a detailed discussion of managerialism as ideological project, the second part of the paper includes a dozen examples of contradiction of practices oriented by Western managerial ideology, with the Indian Way for enterprise action. We close with proposals intended to alert Western managers—and the business school professors who instruct them, about areas of caution for enterprise projects in that country.

Data were drawn from original field-work by the second-author, in India. A panel of engineer-managers from the industrial sectors were interviewed, following a year-long up-grade training for the Indian equivalent of MBA. The training was intended to develop a managerial view more in keeping with the US-driven model as global standard. The ethnographic field interviews were oriented by rigorous application of a grounded-theory strategy, with five iterative cycles of field work, concluding with a modified Delphi validation phase, to assure that our interpretation of the ethnographic data fit with Indian cultural understanding. Tactics of accommodation and resistance were identified as these managers labored to meld the Western managerialist model with the Indian Way of enterprise development.

Exilic Spaces and Practices

Recent work by Denis O'Hearn and Andrej Grubacic proposes that "exilic spaces and practices" are a hopeful model for progressive change and, ultimately, for social revolution. Exilic spaces and practices can be defined as those areas of social and economic life in which people attempt to escape from capitalist relations and processes, whether territorially or by attempting to build structures and practices in everyday life that are autonomous of capitalist accumulation and social control. The primary social relations of exilic society are ones of mutual aid. Politics is autonomous, consensual and self-governing. Work prioritizes opus (creation) over arbeit (toil). And value is measured by the extent to which we would exert effort on an activity if we were free to apply it for the social good (including the "work" of building community through mutual joy) instead of for the creation of exchange value. Building on our recent book "Living at the Edges of Capitalism", we discuss examples of territorial escape and expand this with a discussion of exilic practice in everyday life. We end with a discussion of how practices with the above character can be expanded as a way of achieving desirable social change.

The Stateless Diet: Navigating Food Banks during COVID-19 While Seeking Refugee Status

Many view the current moment as offering an opportunity to transform food systems (Blay-Palmer et al. 2020, Hawkes 2020a, 2020b). While a range of transformational strategies have been suggested, it is important to remember that "… when we embed food systems, we embed other systems as well" (Hawkes 2020c). Put differently, the values and meanings that make some actions and outcomes more sensible than others are built into our strategies that move food from farms to plates. This means that strategies that aim to address problems in food systems act along multiple axes of power, and these axes warrant attention.

This paper examines the experiences of refugee-status seekers in Montréal, Canada during the COVID-19 pandemic as they experienced food insecurity, and approached food banks to address their food needs. In Canada, food banks were established almost forty years ago to tackle food insecurity. Research examines why food banks have not solved the problem of food insecurity, and how food banks are fundamentally at odds with social justice ideals. However, more attention is needed on how people navigate food banks, and have multidimensional experiences of food banks. This paper takes an intersectional lens (Crenshaw 1989) to experiences of people using food banks, with the purpose of providing data to underscore why strategies to address food insecurity need to take multiple axes of power seriously.

RC26-321.2

OBRIKIENE, ALVYDA* (Klaipeda University, Lithuania)

Transformations of Democracy: An Impact of Inequality

Nowadays the world is facing democracy in decline, it is dealing with growing inequality and declining voter turnout as well as weak participation in other traditional political forms.

Inequality divides the society by pushing its significant part into the bottom of the social structure. Social exclusion reduces the opportunity to participate in the political processes equally with the rest of the society, and this accordingly strengthens the political influence of the groups above. Inequality and not equal redistribution leads to greater social polarization which is understood as a widening distance between groups. When there arises too much inequality, it can mean that much of the social-economic conflict will stay in the social order. Growing inequality creates difficulties for democracy which is as a guarantee of equality in the society.

The growth of absenteeism leads to the fact that democracies are ruled or captured, when the ruling minority – the representatives – are democratically (?) elected by the minority of the society. Elected representatives no longer represent all the people equally and this may lead to an erosion or changes in democracy. Democracy is forced to respond to ongoing processes. The question is – is democracy backsliding or is it transforming to the new quality?

Elections are not the only one essential form of participation and this attitude is changing. The forms of political participation and the majority of the society, which is necessary for democracy, shifts from the stage of politics to the stage of policy.
