GROTHE-HAMMER, MICHAEL* (Norwegian University of Science and Technology, Norway)

Meta-Organizing for Climate Change

Meta-organizations i.e. organizations which members are themselves organizations, often play an important role in addressing a variety of grand societal challenges (Berkowitz, 2018). Meta-organizations such as the International Whaling Commission, the World Meteorological Organization, the United Nations Environment Programme, or the European Women's Lobby, have been crucial in tackling such diverse challenges like the ozone hole, environmental pollution, species extinction, and gender inequality. These meta-organizations enable member-organizations to address grand challenges through self-regulation or capacity building and, hence, allow for collectively designing solutions to environmental or social problems (Berkowitz, Bucheli, & Dumez, 2017; Chaudhury et al., 2016; Karlberg & Jacobsson, 2015).

However, meta-organizations themselves create certain difficulties that arise from the attempt to organize organizations on a meta-level. Meta-organizations place an autonomous organizational system on top of existing organizational systems, thereby threatening the autonomy of the latter (Ahrne & Brunsson, 2008). As a consequence, meta-organizing collective action raises issues in terms of decision-making capabilities, accountability, and the maintenance and responsiveness of organizational boundaries.

Meta-organizations attempt to create social orders by making decisions that become accepted as premises for actions by member organizations and others. However, there are certain difficulties correlated to creating and maintaining such decided social orders, especially in the case of meta-organizations in which social orders are produced on different but related levels of organization (cf. Ahrne et al., 2016).

Against this backdrop, we shall explore how these meta-organizational peculiarities enable and hinder the possibilities of tackling the societal grand challenge of climate change. In particular, we will investigate 1) the micro-foundations of setting up a meta-organizational decided order to tackle climate change, 2) the necessary mechanisms to maintain decidability and accountability in the meta-organizational space as well as 3) the potential drivers of undecidability, its impacts on the meta-organization and on its ability to tackle climate change.

BHADRA, BULA* (Sister Nivedita University, India)

The Obdurate Persistence of Substantive Gender Inequality in Democracies of Formal Equality: India As an Archetype

Despite the swelling mantra of women's empowerment and proliferation of gender-sensitive approaches, the snail-like advancement of women in developing countries continues indicting the best efforts. *The McKinsey Global Institute Report* on how gender inequality affects GDP and the economy of India states for the first time (2018) that "Gender equality in work is not possible without gender equality in society." India was ranked 108 among 144 countries on the economic participation and opportunities index in the *Global Gender Report 2017*. Gender inequality in India is extremely high also on three dimensions in MGI's framework—gender equality in work, legal protection and political voice, physical security and autonomy along with below average scores in educational attainment, political representation, and health and survival ratio of women. In South Asia, women's representation in parliament ranges from 33 % in Nepal to 14% in Indian current Parliament to a fewer than 6% in Sri Lanka. But supposedly high representation of women in Nepal does not equate to substantive participation in decision-making. Women politicians have frequently complained that the numbers represent tokenism and that their opinions are largely discounted. Programs that push for a specific percentage of participation by women overlook a deeper, structural cause of the feminization of poverty and the underrepresentation of women in all spheres of public life.

Women in these democracies have intersectional, layered identities deriving from social relations, cultural milieu, history and structures of power. The purpose of this presentation is to provide an intersectional analysis of substantial covert gendered inequalities to reveal complexities of everyday life and expose discrimination and disadvantage in spite of formal equality that occurs as a consequence of the combination of identities and the intersection of gender with other social factors especially in this heyday of neo-liberalism with fresh authoritarian methods of control in India.

BHAGAT, RAM* (International Institute for Population Sciences, India)

Census, Politics and Construction of Identities in India

Census enumeration is considered to be a scientific exercise in order to know the size, growth composition and characteristics of population. The mandate of census is derived from the state- an institution embodies the relationship between a territory and its people. How state views its people and their characteristics is very much a political phenomenon which changes according to the nature of state and its strategy to maintain power. In this situation, census turns out to be an instrument of state; it converts people into population and uses a classificatory principle to divide them into mutually exclusive ethnic, religious, racial and caste groups. This is being done under the assumption that the methodology of natural sciences as such could be applied to the social reality as well. In the context of India, historical records show the interwoven and inclusive nature of social identities in many spheres of life. Further, there are people with multiple identities but there is no multiple choice given in reporting identities in many censuses including the census of India. The paper argues that this has deep impact in creating a contrived social reality and unfolding of identity politics suitable for the statecraft. In India, this has begun during the colonial regime and the process has not changed after independence, rather reinforced and reemerged in various new forms. Apart from ethnic categorization, size and growth has also been added to the construction of identities in the era of democratic politics influenced by emerging demographic reality.

BOATCA, MANUELA* (Albert-Ludwigs-Universität Freiburg, Germany)

Global Inequalities Avant la Lettre: Immanuel Wallerstein's Contribution

The topic of global inequalities has only entered mainstream academic debates in the last two decades. By that time, Immanuel Wallerstein's world-systems analysis had dealt with global inequalities for more than thirty years, although it employed a different terminology and a more encompassing historical perspective. Unlike in current debates, and against the views of many of its critics, world-systems analysis has never understood global inequalities to be of a mere economic nature. On the one hand, Wallerstein contended that the economic division of labor between cores, semiperipheries and peripheries had characterized the capitalist world-economy since the late fifteenth century. On the other hand, the report of the Gulbenkian Commission on the social sciences, which Wallerstein chaired, argued that the intellectual division of labour established among the social sciences in the nineteenth century reflected a corresponding geopolitics of knowledge production and reproduction with respect to different positions in global structures of economic, political, and military power. Drawing on these arguments, the presentation zooms in on the enduring impact of the nineteenth-century intellectual division of labour on the sociological analysis of inequalities and points to the contributions that Immanuel Wallerstein's approach has made possible. I argue that, for sociology as a discipline of Western modernity, claiming universal relevance required erasing the particular historical circumstances of the European colonial expansion in the Americas, of the colonial and imperial conquest of the non-European world, as well as of the impact of slave labour on colonial plantations upon the development of Western societies from the elaboration of its categories of analysis, and that world-systems analysis was instrumental in revealing these theoretical and methodological blind spots.

Comm-12.5

BRAGA, RUY* (Universidade de São Paulo, Brazil)

From Participatory Budgeting to Agro-Ecological Production

The trajectory and historical destiny of Porto Alegre's participatory budgeting inspired the sociological imagination of many analysts worldwide. Among them, Erik Olin Wright stood out for the breadth and depth of his theory on "real utopias". At a time when the participatory budgeting has become exhausted, weakening itself as a tool for political mobilization of workers, we saw in Rio Grande do Sul the emergence of another successful real utopia: the agro-ecological production of the rural cooperatives led by the Landless Workers' Movement (MST). The purpose of this presentation is to analyze these participatory experiences, showing how Wright's real utopias persist in the Global South, reinventing themselves in different political contexts.

Comm-20.1

BRINGEL, BRENO* (State University of Rio de Janeiro, Brazil)

Challenges Facing New Generations of Global Social Movements

The World Social Forum was a crucial space for the transnational articulation and convergence of diverse struggles against neoliberal globalization. The achievements were many: the discursive rupture with the inevitability of "There is no Alternative", the creation of regional and thematic networks, the unified but decentralized coordination of protests and political proposals. In short, the WSF followed a cycle of global struggles and was one of its main actors. However, it was unable to articulate a compelling response to the 2008 global financial crisis and act as a catalyst for global alternatives from that moment on. The WSF continues to exist, but with a different role in view of the emergence of a new global power configuration and new generations of global social movements. The purpose of this presentation is to discuss how the WSF relates to the new generation of emerging social movements in the last decade and what are the main challenges in this new historical moment.

Comm-13.4

BRINGEL, BRENO* (State University of Rio de Janeiro, Brazil)

Knowledge Production, Asymmetric Diffusion and Hidden Genealogies: the Case of Internal Colonialism

The construction of the academic debate on internal colonialism is an emblematic case of asymmetric diffusion of knowledge, marked by the hegemony of English, Western institutions, and mainstreaming journals, that hidden the main political and conceptual genealogies of the global discussion on this topic. Internal colonialism debate results from the 'Third Worldism' movement and spread in various ways from the world periphery to the centre, more specifically from Africa and Latin America for the rest of the world. There is some consensus in the international debate that the first to systematically develop the concept was the Mexican Pablo González Casanova. The problem is that what is known of Casanova's work is an English article (1965), seen as the foundational text. However, this 'foundational narrative' hides the whole process of conceptual construction and its intellectual genealogy. Through a seven-year research, I intend to reconstruct the hidden conceptual genealogy of the debate on internal colonialism that actually began in the late 1950s, mainly from the exchanges of Mexican and Brazilian intellectuals, of which Pablo González Casanova is one of the exponents, along with Rodolfo Stavenhagen and Roberto Cardoso de Oliveira. The initial debates and publications on the subject were the result of collective research and intense discussions that also involved intellectuals from the Global North, particularly Wright Mills in the US and Georges Balandier in France. On the other hand, I seek to reconstruct the properly political genealogy of the debate that allows a strong bond between the struggles for decolonization in Africa and the black movement in the United States. As a result, it is possible to expose the multiple genealogies and the variation in patterns of internal colonialism, as well as why and how social sciences only partially filtered a much richer debate of a truly global sociology.

BURAWOY, MICHAEL* (University of California, Berkeley, USA)

Decolonizing Sociology - The Significance of W.E.B. Du Bois

W.E.B. Du Bois is enjoying a renaissance as a major figure in or even the founder of US sociology if not world sociology. He not only foregrounds the importance of race but also class and gender; he is a spontaneous intersectionalist; he brings a Pan-African perspective to the different dimensions of global inequality and domination; he centers the importance of capitalism – its history and the challenges it faced; and he had a radical view of democracy. What more could one want? Actually, Du Bois offers a lot more but this will do for starters. What then is the significance of Du Bois for sociology? Does taking Du Bois seriously mean the end of the sociological canon as we know it? Do we just dump Weber, Marx and Durkheim for endorsing, overlooking, marginalizing or repressing colonial rule and its racial dimensions? Or does it mean an entirely new canon that centers Du Bois? Can we rescue the canon by articulating Du Bois to Marx, Weber and Durkheim? Alternatively, should we abandon the very idea of a canon, and announce the end of foundational thinkers? If so, will the abolition of the canon throw us into the eager arms of positivist science – science defined as forgetting its founders and its history? Does this mean that Du Bois becomes a historical figure whose ideas are largely confined to the 20th century? Or does embracing Du Bois, who did not recognize academic boundaries, simply mean the end of sociology as a distinct discipline?

CARDENAS TOMAZIC, ANA* (Institut für Sozialwissenschaftliche Forschung e.V. (ISF München), Germany)

The Allocation Conflict: Gender, Labor Markets, and Prison

In recent decades, female prison population rates have increased dramatically worldwide. Many countries in Latin America today have among the highest female prison population rates globally. How can we understand this trend? Based on classical and contemporary research in the fields of Political Economy, Social Theory, and Feminist Criminology, as well as my own primary research on female prison populations, I introduce an alternative labor market sociological approach to female incarceration which I call the "three-segment labor market" (Cárdenas Tomažič 2018). In so doing, I aim to offer a theoretical perspective to better understand increasing female incarceration as a contemporary labor market phenomenon.

Comm-14.1

CHAN, CHRIS* (Chinese University Hong Kong, China)

Between Authoritarian and Liberal Capitalism: Generational Shift and Youth Activism in Hong Kong

Global attention has been paid on the rise of authoritarian China since the economic recession in the West in 2008. As a liberal city-state in the territory of China, Hong Kong has been regarded as the frontline of the 'liberal' capitalism resisting the expansion of Chinese authoritarian capitalism. During the students-led 'Umbrella Movement' in 2014, more than 200,000 citizens took to the street demanding the universal suffrage in this former British colony, followed by 79 days of street occupation. Hong Kong people's protest has been further expanded and radicalized in 2019 when a movement took place to oppose the amendment of the Extradition Law which allows residents in Hong Kong to be sent to mainland China for trial. Millions participated in the demonstrations, and disruptive actions have taken places in many corners of the city for months. With a strong sentiment to oppose the authoritarian China, people's demand has gone beyond Anti-Extradition Law to include democratic election as one of the key demands. The two movements have led to the rise of localist populism and generational shift in politics, and changed dramatically the established consensus in the liberal capitalist city. The paper analyses the causes, characteristics, consequences, and changes of these two movements, and draws implication for the future of global capitalism.

Comm-19.5

CUELLAR VAZQUEZ, ANGELICA* (Universidad Nacional Autónoma de México, Mexico)

La Desigualdad En El Acceso a La Justicia: En El Caso Iguala

La desigualdad en el acceso a la justicia en México ha sido permeada por la ineficacia de las instituciones de impartición de justicia. El objetivo de esta ponencia es describir la desigualdad existente en el acceso a la justicia que se dio en un caso emblemático en México: el caso Iguala. Se elaboró una investigación documental que parte de la pregunta ¿cuáles fueron los factores que influyeron para vulnerar el acceso a la justicia de los familiares de los normalistas desaparecidos?

El 26 de septiembre en Iguala, Guerrero, elementos de la policía municipal atacaron a estudiantes de la escuela normal "Raúl Isidro Burgos" que iban a bordo de cinco camiones. Como resultado de estos ataques hubo 6 muertos, más de 40 heridos y 43 estudiantes desaparecidos.

El caso lo atrajo la Procuraduría General de la República quien se encargó de construir la denominada "verdad histórica" que contenía errores y omisiones en la investigación, por ello instancias internacionales y nacionales intervinieron para visibilizar a las víctimas y sus familiares. Estas instacias aportaron recursos jurídicos para la construcción de la Comisión de la Verdad, quién se encargaría más tarde de garantizar el acceso a la justicia, derechos que fueron vulnerados por parte de la PGR.

Comm-17.1

DE MATTOS ROCHA, LIA* (Universidade Estadual do Rio de Janeiro, Brazil)

The Life and Struggles of Marielle Franco.

Marielle Franco was a favela-dwelling black woman from the city of Rio de Janeiro who was murdered on March 14, 2018 at the age of 38 in an attack that also killed Anderson Gomes, her driver. Marielle, also a friend and colleague, represented to many of us the possibility of a new way of doing and living politics, and of fighting the inequality and oppressions that characterize Brazilian society. Her body carried all our claims: she was a black woman, a *favelada*, a mother, a lesbian, a socialist. Her death, still unsolved, illuminates the entanglement between politics, police, paramilitaries and crime in Rio de Janeiro and in Brazil - an articulation that became more complex after the most recent elections. In this communication I analyze the political and social contexts where the political project that Marielle Franco personified arose, as well as its development. Finally, I seek to understand the political and social meanings of her death and of the movement that demands justice for Marielle.

Comm-12.1

DE SOUSA SANTOS, BOAVENTURA* (University of Coimbra, Portugal)

Popular Education and the Future of Democracy

The three main modes of modern domination (capitalism, colonialism, and heteropatriarchy) are reaching a form of articulation that erodes even further the always problematic credibility of liberal democracy. Without any apparent constitutional breakdown, liberal democracies, by electing anti-democrats and neo-fascists as political leaders, run the risk of dying democratically. To counteract this process and deepen democracy it is imperative to revolutionize democracy and democratize revolution. Such a project calls for a broad range program of popular education based on different grassroots knowledges and experiences of democratic deliberation and citizenship building. In 2003 the World Social Forum proposed, as a real utopia, the Popular University of the Social Movements. Since then dozens of workshops of the PUSM have taken place in different countries.

Plen-1.2

DE SOUSA SANTOS, BOAVENTURA* (University of Coimbra, Portugal)

The Utopia of Democracies or the Democracy of Utopias

As the extreme right rises all over the world and anti-democrats go on being elected in apparently fair and free elections, it is imperative to refound the democratic popular will based on new a vision of society and on the idea that another democracy is possible. Such imperative must rely on the diversity of the experiences of democratic deliberation around the world, what I call demodiversity.

FEIXA, CARLES* (University Pompeu Fabra, Spain)

Transnationalism and Post-National Identities: The Three Lives of a Latin King

César Andrade, aka King Manaba, born in Manabí, Ecuador, in 1980, has lived three lives, in three different nations. The first lived in Ecuador, from birth to age 23, in 2003, when he decided to emigrate to Spain, following the exodus of Andean citizens, fleeing the economic and political crisis that had affected the country in recent years, and looking for the "promised paradise" in a "mother country" in full economic expansion. The second lived from that date to 2010, when he was convicted of traffic and entered prison for the first time, living as migrant and as a member of a street youth organization the rise and crisis of the Hinospanic immigration process. The third lived to obtain the freedom letter, in 2013, reintegrating into the civil life of his new country. In those three lives, he felt part of three "nations." In addition to his home country and his country of destination - which in this case was also bi-national, by mixing Spanish and Catalan identities -, King Manaba is attached to a third "transnational nation", since he was crowned as Latin King when he was 18 years old, becoming part of the Almighty Latin Kings and Queens Nation (ALKQN). Thanks to this experience, King Manaba currently lives in a "nation of nations" -according to his own words-, and thanks to the internet he is connected daily with "hermanitos" and "hermanitas" of Spain, Italy, Ecuador, almost all Latin America countries and the United States. Through the life story of King Manaba, which I have collected in multiple conversations during the last 15 years and that is about to be published, in this paper I intend to reflect on the relationships between transnational migration processes and post-national identities.

Comm-17.2

FRANCISCO, MÔNICA* (Universidade Estadual do Rio de Janeiro, Brazil)

Intersectionality As an Everyday Life Experience. Marielle's Life and Struggles

Marielle Franco was a 38-year old Brazilian sociologist, a single mother, a defender of human rights and a local councillor of the city of Rio de Janeiro. She was murdered on March 14th 2018. Ever since, she has become a global symbol of a struggle against racist, colonial, hetero-patriarchal domination and police violence and for social justice, human rights and democracy.

Her life as a black woman from the favelas shows that intersectionality is not only a theoretical concept. It is a daily life experience for millions of women living in slums all over the world, suffering from racism, patriarchal and economic discriminations. As a single-mother, black, homosexual and politically active woman that lived in a favela, she also shows how paths of personal and collective emancipation find their roots in daily life experience, communities, feminist conviction as well as in social policy and in the right to higher education. Her life also exemplifies the importance of opening careers of sociology beyond the middle and higher class. Sociology played indeed a major role in this path towards emancipation, as she attended classes in her favela and then graduated at the university. She kept acting as a sociologist, a social activist and a political actor until the end, as she was in charge of a report on military violence in Rio's favelas, which is the most probable reason of her assassination.

Plen-3.2

GARRETON MERINO, MANUEL ANTONIO* (University of Chile, Chile)

¿Puede la democracia resolver los nuevos problemas de la sociedad en AL?

La democracia en América Latina enfrenta ciertos retos que provienen de su propia trayectoria post transiciones, donde se ha analizado en diversos Informes lo que puede llamarse el déficit democrático. Pero a partir del término del llamado ciclo de gobiernos progresistas, la cuestión de los déficit que se expresa en problema como la judicialización de kla polýtica, presidencialismo que deriva en autoritarismos, crisis de representación y de los partidos, corrupción y desconfianza y, como consecuencia, ruptura creciente entre política y sociedad, la cuestión adquiere otro carácter. Hay transformaciones en la sociedad contemporánea que amenazan a la denmocracia como irrelevante en su dimensión de reguladora del poder poklítico en la sociedad. Luego de analizar los principales déficit y referirse a la cuestión de la irrelevancia democrática, se discute si los nuevos clivajes y conflictos como el cambio climático, las migraciones, el poder fàctico de las redes, las consecuencias de la revolución científico tecnológica pueden ser resueltos por la democracia o debe repensarse la teoría democrática en téminos de una nueva matriz de relaciones en tre Estado, régimen políticos, actores sociales y orientaciones culturales.

Comm-18.2

GUTIERREZ, FILOMIN* (University of the Philippines Diliman, Philippines)

Rethinking the Sociological Arsenal: Ambivalences and Dissonances in the Philippine War on Drugs

This contribution shows that the ambivalences and dissonances of realities, practices and discourse surrounding the Philippine war on drugs demand that local social researchers rethink existing theories and methods in their sociological arsenal.

Since the presidency of Rodrigo Duterte in the Philippines in 2016 a renewed penal populist discourse steered not only a brutal war on drugs but efforts to revive capital punishment and lower the age of criminal responsibility. The spate of killings in the war on drugs with a death toll running to more than 20,000 attracted international attention and protests from human rights groups.

The paper makes sense of contradictions attending the war on drugs in the Philippines. The high public support for Duterte's approach met human rights violations protests over increasing violence and extra-judicial killings. Arrested drug suspects who admitted to drug use claimed false imprisonment and police torture and, incongruously, expressed support for Duterte's anti-drug campaign. The study is based on the narratives of arrested drug offenders, family members of those killed in the anti-drug operations and so-called *vigilante* killings, and police officers who served in police operations. The ubiquitous (*talamak*) sale and use of *shabu* (metamphetamine) in marginalized communities reveal how drugs became a normalized feature of precarious economic conditions, and how anti-drug campaign was both welcomed by residents as necessary intervention to a *very real problem* but that which rendered them powerless (*walang kalabanlaban*) before the state forces and victimized by errant policemen.

Comm-13.1

HANAFI, SARI* (American University of Beirut, Lebanon)

Academic Journals: A Global Academic Division of Labor? or Self-Sufficient National Fields?

Scientific social research requires both local relevance and internationalization. Is the internationalization sufficient to insure a global sociology? After I unfold different approaches to internationalization and their indications, I will distinguish between good and bad internationalization. A bad internationalization would be when there is a global division of labor in which only hegemonic countries are allowed to theorize. I will conclude by an attempt to answer the question whether the internationalization requires universalism.

This paper will be based on multiple fieldworks in the Arab region and content analysis, particularly the analysis of some academic journals, national and international, focusing on the different ways in which authors use geographic markers.

Plen-8.1

HOUT, MIKE* (New York University, USA)

Why the Relationship between Education and Social Mobility Might be More Complicated Than You Think

The pay gap between university graduates and less educated workers has risen in many nations. If university graduates come from higher social classes, then a bigger pay gap implies less social mobility. However, research over the last decade has shown that the returns to education are biggest for the workers with working class roots who achieved a university degree. My talk will explain how these relationships fit together and illustrate them with data from several countries.

K

Comm-18.1

KOTHARI, ASHISH* (Kalpavriksh, India)

Radical Democracy, Ecology, and Social Justice: Initiatives in the Global South

Across the global South, there is considerable churning of two kinds: resistance to the dominant politics and economics of exclusion, inequality, and ecological devastation, and a search for practical and conceptual alternatives to these that meet people's needs and aspirations in harmony with the rest of nature. At any given time there may be thousands of such instances, from the tiniest (an individual) to large-scale (several communities and regions). These include the assertion of self-determination and self-rule, in which indigenous peoples and other local communities are claiming political and economic power where they are, rather than leave it to the state or to corporations. They include struggles for justice amongst marginalised poeple, including women, oppressed classes, ethnicities and castes, the 'disabled', and others. Even though these are still marginal compared to the mainstream of unjust structures, they provide glimpses and signals of what kind of (and how) other worlds are possible. The presentation will give a few examples of these from different parts of the world, and draw on them to outline alternative frameworks of political governance, economic democracy, and social justice, built on a foundation of ecological wisdom. It will also present the book 'Pluriverse: A Post-Development Dictionary', which presents over 100 essays covering radical alternatives from around the world.

Plen-1.3

KOTHARI, ASHISH* (Kalpavriksh, India)

Radical Ecological Democracy: Towards a Sustainable and Equitable Pluriverse

Global crises of ecological collapse and socio-economic inequities are prompting a search for alternatives to the currently dominant economic and political models. While various approaches to 'green' the economy are being suggested, these are often managerial or technofix-dependent, without fundamentally challenging entrenched political, economic, cultural and social structures.

Are there alternatives are systemic and transformatory, already existing and/or conceivable? If so, what principles can be derived from them? How can we transition to such a future? How can these confront the growing trend towards right-wing, authoritarian nationalism?

The presentation will focus on one such alternative approach, Radical Ecological Democracy, or eco-*swaraj,* arising from experience in India but linking to similar approaches in the rest of world (buen vivir, sumac kawsay, ubuntu, kyosei, hurai, sentipensar, ecofeminism, degrowth, and others). Such approaches arise from ancient wisdom or new revolutionary movements, and from diverse grassroots initiatives springing up across the world. These include governance through direct or radical democracy, localized economies embedded in ecological and cultural landscapes and free of centralized monetary monopolies, notions of human well-being that relate to qualitative values like satisfaction and social security, democratic knowledge and technology generation, sustaining cultural diversity and exchange, and reviving a respectful and spiritual connection with nature and each other. It stresses that transformation needs to be multidimensional and intersectional, encompassing the political, economic, social, cultural, ecological. It notes that while there may be several common ethical values in these initiatives, there is no single universal model, but rather many paths within a pluriverse.

L

Comm-19.3

LIMA, JACOB CARLOS* (Federal University of São Carlos, Brazil)

The Challenges of Brazilian Sociology in the Context of Authoritarian Revival

Brazilian sociology has undergone an unprecedented expansion process in the last two decades, with the increase in undergraduate and postgraduate education, greater prospects in the labor market with the implementation of social policies to combat the poverty and the return of discipline to high school. It was a period of national consolidation of the discipline, marked by discussions of major national problems, strong growth of academic production and participation in major international forums.

This process was reversed from 2016 with the political crisis and the impeachment of the president. Followed by a rapid dismantling of social policies in a return to the neoliberal agenda of the 1990s, as well as the elimination of compulsory discipline in high school and a systematic attack on sociology seen as a knowledge without practical use. This situation was aggravated by the new government inaugurated in 2019 that resumed the Cold War speech and a conservative agenda in the customs, in which sociology is viewed with suspicion.

The purpose of this paper is to discuss the challenges posed to sociology as a science and profession in the context of systematic attacks on its existence as specialized knowledge. How to resist this process, considering that democratic freedoms constitute the substratum of its reflection and action?

Comm-16.2

LOVEMAN, MARA* (University of California at Berkeley, USA)

The Politics of Ethnoracial Population Data and the Future of the Census in Latin America

The last two decades witnessed a dramatic transformation of the datascape for the production of statistics about ethnic and racial inequalities in Latin America. This transformation is most strikingly evident in national censuses in the region. A few decades ago almost no Latin American countries included questions about race or ethnicity in their national census. In the 2020 census round, almost every country in the region will collect information about ethnic or racial identification. This paper briefly describes and explains the regional shift toward unprecedented statistical visibility of ethnoracially defined populations in Latin America. The paper then examines several *productive effects* of the production and existence of these new types of data, ranging from the advancement of intentional and instrumental goals, to the development of unintended and counterproductive consequences. Among the latter, in some contexts, opposition to ethnoracial classification in data collection is fueling the emergence of newly politicized majoritarian identities that support broader reactionary political movements. Such developments raise questions about the sustainability of ethnoracial data collection in censuses in the region, and provoke debate about possible alternatives to the national census as legitimate source of population data in the future.

M

Comm-20.6

MAC LORIN, CARMINDA* (University of Montreal, Canada)

The World Social Forum in a New Era of Global Challenges

In the last decades, humanity has suffered increasing austerity measures and inequalities, recently witnessing the rise of populist regimes. The permeability of political spheres to world finance is leading to an socio-ecological disaster.

The World Social Forum (WSF) has coexisted with other spaces of mobilisation (i.e. Occupy, Indignados, amongst others) in this context of deep global challenges - gathering a diversity of actors, causes and practices around the dream that "Another World is Possible". Nevertheless, articulating plurality on specific time and spaces implies conflicts and tensions, that can undermine the potential of these mobilizations. Therefore, the challenge remains for those who nourish the hope: how to face antagonisms that emerge, and to co-act effectively for socio-ecological transitions in a global context?

This presentation reads through some of the *paradoxes* of the WSF - which has emerged in the interstice between unity and plurality, ideals and practices, the urgency for concrete changes and the patience needed for generational shifts. I will share some reflections based on my recent Ph.D research, and my experience as an activist within the WSF 2016, Occupy and other initiatives of the post 2010 context - stating that a mobilizing resilience can arise from the acknowledgment of tensions within the WSF.

Comm-13.2

MARTIN, ELOISA* (United Arab Emirates University, United Arab Emirates)

Between Excellence and Diversity: Steps towards Challenging Inequality in Academia

Challenging inequality in academia is never an easy task, even for an institution as the ISA. For the last decades, the ISA has played a major role in both discussions surrounding the field of production of sociological knowledge and debates on its limits and challenges, drawing up strategies to overcome these limits and challenges. Meeting these goals has been puzzling at times because within the global academic community, the very production of knowledge entails inequalities derived from specific geopolitics inherent to the international division of academic work. Which is, at the same time, understood, cope with or tackled differently within the diverse national academia. Effective solutions are not necessarily in tune with the good will of ISA officials, but require working together with the underrepresented national academic communities. In this paper, I will analyses some of the main ISA policies developed over the past 10 years in an attempt to face the challenges of inequality in academia and carve out spaces of intelligibility.

Comm-15.4

MATOSE, FRANK* (University of Cape Town, South Africa)

Africa, Climate, Land Grabs and the Protection of the Commons

In this contribution we engage with the complex, benign and nuanced ways in which commons are being lost in Africa in the context of climate change and globalization. The engagement is informed by several cases across Africa. At the same time such engagement is historically situated in the continuities of the practice of colonialism when Europeans first set on the African continent and fundamentally changed the framing of local people's relations with nature. In as much colonialism was violent in its change and crafting of new relations between people and nature, in the climate change era, Africa has witnessed new realities of coloniality being invoked. New forms of extractivism, green grabbing, speculative capital, land grabs and globalization of state capture are witnessed in Africa in the new millenium that have adverse implications for people's relations with commons, particularly, seed, biodiversity, water, rangelands, forests, wildlife, oil and other mineral resources including gold and coal, and knowledge. Underlying these new relations is the fundamental shift in the way property is framed. Where property had many complex ways in which it was owned in largely collective or communal or group settings, with the settlement of European settlers on the African continent, property was privatized and commodified to allow for accumulation processes that were imposed thereafter. A lot of resources, including knowledge, were managed/governed/owned collectively with individual usufruct rights. Drawing from case studies of climate interventions in Africa we examine ways of asking what kinds of relations are being built in climate interventions, and whether these are capable of building a useful environmental politics. We argue that there is a missing dimension regarding extreme structural violence; the need for reclaiming and protecting the relationality of the commons as a politics for climate interventions.

Acción y discurso de los movimientos sociales: de la demanda al Estado hacia el cuestionamiento al poder

Los movimientos sociales, en particular indígena y de mujeres, aportan al debate sobre desigualdades, ecología y democracia con nuevos elementos que provienen de una interpelación general al modelo de desarrollo, sistema político y tipo de sociedad. En la práctica ponen en cuestión la separación formal entre lo político, lo económico y lo social puesto que enarbolan demandas y reivindican derechos que expresan un cuestionamiento general a las estructuras de poder que escinden las identidades sociales para reproducir las desigualdades de clase, género, étnicas y mantener las pautas de exclusión y dominación. El movimiento indígena pone en entredicho el modelo de Estado-nación y la ciudadanía liberal con la reivindicación de un modelo estatal plurinacional y derechos colectivos de los pueblos o nacionalidades. Sus logros políticos se limitan a los casos de Bolivia y Ecuador pero la interpelación indígena puso en evidencia la persistencia de formas de dominación colonial que niegan el supuesto de igualdad ciudadana. El movimiento de mujeres ha situado la reivindicación por la igualdad de género en la esfera pública, a nivel regional, combinando demandas por participación política y luchas por la despenalización del aborto con un discurso que cuestiona las estructuras patriarcales de dominación que atraviesan lo laboral, mercantil, estatal y familiar. Su accionar enfrentará nuevos desafíos debido a la ola conservadora, con tinte religioso, que se esparce por el continente y que son, en cierta medida, una reacción a las luchas y logros de mujeres e indígenas.

Struggling for Cognitive Justice: The Challenges to Decolonization in the Global South

Many of the 'global' references are based upon defined knowledge corpus, mostly produced in the North Atlantic region. This raises a series of epistemological and ontological questions in times when decolonization is a growing challenge. Following Boaventura de Sousa Santos, if the epistemological diversity of the world is to be accounted for, other epistemologies have to be taken into consideration, to account adequately for the realities of the global South. By conceiving cognitive justice as a constitutive dimension of social justice, the Epistemologies of the South, reflecting knowledges born in social struggles, amount to the occupation of conventional epistemologies. By showing the impossibility of real democracy as long as the abyssal line separates metropolitan sociability from colonial sociability they call for the need of post-abyssal politics, the call to recognize other ontologies and epistemologies.

Alternative Food Networks: The Vitality of Everyday Food in Latin America

Food, people's primary source of vitality (and its antipode), has taken front stage in policy debates and social activism, as the public increasingly becomes aware of its affects across administrative, bureaucratic and other organizational spaces. As a cosmopolitical force, food provides a space of high potential for social renewal and reconfiguration vis-Ã -vis our most pressing concerns, such as the proliferation of chronic disease, social inequity, and global warming. As experienced in localities across Latin America, Alternative Food Networks are capable of confronting powerful food interests, most importantly, they create new relations and potentialities for the present. Through becoming active in AFNs, people with otherwise limited political clout are able to free up energy and mobilize resources for agroecological production, direct and more solidarity markets as well as responsible food consumption options. Nevertheless, there are numerous challenges ahead, new and old inequalities need to be reworked so that the colonial way to introduce categories is not reproduced within movements, the relational and affective nature of taste has been widely exploited by corporations which is constantly pointed by food activists and requires more attention from sociologists. Through the analysis of more than twenty years of alternative food networks in Ecuador as well as first hand empirical studies on consumption, we will explore how promising counter-movements recurrently emerge and take social hold in ways that create new relations in, through and around food.

PATEL, SUJATA* (Savitribai Phule Pune University, India)

Production of Hierarchized Knowledge. a View from the Periphery.

India has more than 900 universities with about 37 million students wherein 79% are undergraduates. 36% of students are doing humanities and social sciences, 17% are in sciences and the rest in engineering and commerce. This system is a legacy of the colonial period and replicates the British system of affiliated colleges and has reproduced colonial forms of education.

India was and is a highly unequal society. The elite balanced democracy with political control by allowing social mobility through the processes of higher education. A policy of expansion of public supported higher education led to the reproduction the unequal structure into this system with caste, tribal, gender, ethnic and regional distinctions organising class distinctions in colleges and Universities. This pattern was reinforced due to the significance of English as a language of elite against 22 regional languages.

Two contradictory trends has defined the system between 1950s and 1990s. The first was an attempt to indegenise education by orienting global education to national priorities while maintaining these distinctions. There was thus an increase of print knowledge regarding local themes and national concerns. Secondly it was also recognised that education creates value and this led to privately sponsored education institutions at the expense of public education.

In this context, globalisation has allowed for diffusion of global north curricula through franchise and educational collaborations and simultaneously increasing hierarchies. Given a large number of English speaking professionals international publishing have outsourced publishing to India. Not only is there now a decline in production of Indian material but also production of these in Indian languages. These trends create further the geographies in knowledge production.

PELLIZZONI, LUIGI* (University of Pisa, Italy)

Green New Deal and Climate Justice: Innovation, Structural Imbalances and Prefigurative Mobilizations

The presentation will question the extent to which the burgeoning Green New Deal (GND) storyline and policy framework aims and is able to respond to growing demands for environmental justice from the global North and South. Namely, the question is whether and to what extent GND can distance itself from the 'ecological modernization' (EM) framework that dominated environmental politics in the last decades.

Using the expression 'New Deal' means making a case for a new, more just and equitable, social compact as essential to effectively addressing climate change. However, on one side different interpretations of the deal are already emerging (for some state intervention and social justice goals should take the lead; for others, private investments and market relations should keep primacy); on the

other, GND seems to share with EM the attribution of thaumaturgical virtues to technological innovation, and the dominant conception of its aims and effects is not brought into question.

Yet, the imbalances current innovation processes produce are demonstrably structural, rather than accidental. Indeed, ongoing transformations in the scientific-industrial complex are engendering new types of inequities and injustices. A GND focused on environmental justice, therefore, should point also, and arguably first of all, to rethinking the very notion of innovation, its goals and underlying assumptions.

I will argue that such rethinking has to tackle the issue of a post-work society – a proper one, not one where (a same type of) work is increasingly offloaded onto organisms, machines or cyborgs. In this regard, and in spite of excessive hype about them, 'prefigurative mobilizations' – that is, those committed to realize in the here and now the future aimed at, rather than protesting or struggling for gaining political power – deserve investigation, to the extent that they experiment 'alternative' ways of relating individuals, communities, places and things.

The Pandemic Is a Battlefield

The pandemic and lockdown measures put a halt to democratic movements in numerous countries. Far from disappearing, social movements have adapted to unexpected circumstances and been particularly active during this challenging period. The first section of the article provides an overview of grassroots movements initiatives to complete five roles. The second section focuses on the struggle over the meaning of the crisis. While progressive intellectuals and movements consider the COVID-19 pandemic opened opportunities to build a fairer world, they compete with reactionary, capitalist and state actors to shape the meaning of the crisis and the world that may come out of it. The intensity of social justice movements' initiatives during the lockdown may show the outlines of a global wave of movements, embodied in countless decentralized reactions to a global event that has shaken billions of human lives.

Building Climate and Disaster Resilience: Interrogating Environmental Inequalities and Gender Intersectionalities in Asia

Rapid urbanization, intensified capitalist development and consumption-driven lifestyles have heightened climate and disaster risks. These development patterns are driving the social-ecological transitions of cities, exacerbating the climate and disaster impacts to existing environmental inequalities and gender intersectionalities (race/ethnicity, class) in marginal, vulnerable communities. While these communities have the least contribution to climate change effects such as sea level rise, storm surges, flooding/coastal inundation, increasing urban heat indices, etc., they incur the most losses and damages to climate and disaster events but receive least public-private support. This paper interrogates the intersections of increasing climate and disaster risks, urban development and the widening of social-environmental inequalities alongside the multiple layering of gender intersectionalities in Asian cities.

Youth Struggles in State Schools in Brazil: A Politicization of Intergenerational Relationships?

In Brazilian state schools teacher-student relationships have been the object of deep concern as mounting problems, such as evasion, violence, apathy and failure to learn become commonplace. It is in this complex and challenging context that children's participation has become a focus of investigation since a growing antagonism between children and adults is foregrounded. Not only have children taken part of strikes against measures concerning reforms to downsize schools, change the curriculum and to introduce military aspects in the discipline, but also in the ordinary life of schools there is an increasing demand for reciprocity and justice. Making use of multiple and triangular data, this research aims at highlighting what is at stake from the students' points of view concerning state education; how they evaluate what the present adult society in Brazil deserves for less well-off children; what their educational demands are and what are the necessary social and political changes in order that children and youth can be regarded as part of the society where they live. This paper discusses whether, in such countries like Brazil facing the enormous challenges of an unfulfilled democracy, adult-child relationships are in the process of becoming politicized. This refers to how the educational process itself, and the taken for granted position of adults as the more experienced and the sole agents to decide upon these matters, is problematized and put into question concerning the conception and nature of the education for the young, its processes and ultimate goals.

Digital Inequalities As a Challenge for the Distribution of Power.

From the last decades of the twentieth century, what Manuel Castells describes as a new technological paradigm, driven by the revolution of information and communication technologies (ICT), begins to develop. From the creation and expansion of the Internet, ICTs begin to permeate the different changes of the Economy, Society, Culture and Politics. The concept of digital divide emerges as the social inequality linked to these transformations. Our research on the transformation of ICTs in the economy, in society and in education in particular, as well as in political and state action, allows us to analyze the relationship it has with other social inequalities. Also on the possibilities of policy implementation for its reduction. I will present in the panel some reflections and disjunctive questions about how these inequalities are influencing access to knowledge and decisions in contemporary societies, with focus on Latinamerica.

The End of the Black Girl Magic? An Examination of Black Women´s Interpersonal Relationships in the USA

After Beyonce´s groundbreaking 2015 visual album, "Formation", the term Black Girl Magic was used everywhere to describe the empowering imagery Beyonce employed to highlight the natural beauty of black women. The hashtag "blackgirlmagic" was used extensively through social media platforms like Instagram and twitter. However the data compiled by dating apps, showcase that on the contrary black women in the US are considered the least desirable demographic, even by black men. Further international pop stars like Chris Brown repeat colorist stereotypes under the pretence that these are just innocent romantic preferences in the women he chooses to date.

The purpose of this work, is to understand the unhealthy dynamics in which Black Women are placed in the context of their interpersonal relationships, in which colorism and self grained racism flourish. Additionally, these unhealthy dynamics in which Black women develop their romantic interpersonal relationships with black men, has served as a catalyst for dangerous cosmetic procedures to lighten their skin tone, or to manage their hair texture in order to appear more racially mixed or simply less "black". Thus creating a body dysmorphic environment for other young black women in social media platforms. As outlined above this phenomenon raises the question To what extent has the concept of colorist beauty ideals affect black women in their romantic pursuits and the way they see and understand their sense of worth.

SCHUSTER, FEDERICO* (Universidad de Buenos Aires, Argentina)

Epistemological Challenges in LATIN American Social Sciences

Social Sciences have shown great advances in Latin America in recent decades. The increase in academic production was exponential in the most recent quarter-century. Also, the increase in the number of researchers and the improvement of conditions for university and scientific activity. At the same time, all this growing capacity gave birth to a set of difficulties, but also valuable debates about scientific practice. To the limits established by the deficiencies of public policies and institutional weaknesses were added those derived from the unequal distribution of the international scientific system in all its dimensions of production and circulation of knowledge. Notwithstanding the relevance of such issues, other debates have also been put on the table. Thus, theoretical proposals such as those of the Epistemologies of the South, Decolonialism and others have raised the need to reconsider how we conceptualize the social world, from the perspective of the peripheral regions and postponed subjects of the planet. In this presentation, we intend to study the possible epistemological consequences that such proposals have for Latin American Social Sciences. The question of universalism and particularism, the historicity of knowledge, the idea of critical science, the relationship between theory and experience, the normative content of science and the practical dimensions of knowledge will be thought from the dimensions of experiences and the subjectivities of our region. The expected result is a contribution to the construction of a critical epistemology for Latin American Social Sciences.

Contradictory Class Locations: Erik Wright's Insights into Class at Work

In his early work, Erik Olin Wright offered a new way to think about class dynamics, and about labor struggles. Pointing out the contradictory dynamics of workplace relationships, he argued that class identities are shaped as much by autonomy and social status as by income – a point that has become so widely accepted today that it seems almost self-evident. Especially, perhaps, in new democracies like Brazil and South Africa, Wright's concept of 'contradictory class locations' raises important questions about how workers' grievances are framed, and how best to mobilize support for workers' demands.

The Politics of Real Utopias in South Korea

This paper addresses the role of political imagination in the social and political struggles for alternative visions of society in 21st century South Korea. Visions of a just and alternative social order have mobilized collective actors, both directly and indirectly. They defined binary oppositions: democracy vs. authoritarianism, fairness vs. unfairness, corruption vs. transparency, justice vs. injustice, efficiency vs. equality, unification vs. division, and good vs. evil. An imaginary social order has played an essential role in shaping the repertoire of struggle according to actors' perception of social change at the national and global level. To be effective, such discourses and practices for an alternative society, or "real utopias" to use Wright's term, when they are limited in scope. I shall address these issues with examples from South Korea.

Brightening Race and Ethnicity or Keeping Them in the Shade? Political and Methodological Debates about the (De)Racialization of Official Statistics in 2020

Officials statistics, and especially censuses, reflect legitimate representations of population in societies where they have been conceived and produced. Despite repeated efforts to standardized the content of censuses in guidelines promoted by the UN, some topics remain country specific. Among these data, ethnicity and race stand with religion as the most controversial categories in population censuses: countries can be divided between those collecting *colorblind* statistics and the others producing *ethno-racial* statistics. The strategies behind the choices to collect or not ethno-racial statistics can be related to philosophies of equality and framings of diversity which are grounded in histories, political traditions, legal prohibitions, and political mobilization. This paper aims at offering an overview of the debates and controversies about ethno-racial statistics in a comparison between national case studies in Europe, North America and Latin America. These debates involve different stakeholders (policy makers, statisticians, researchers, minority and antiracist organizations) and articulate both political and methodological arguments that will be summarized and discussed.

Comm-12.4

The Cooperative Market Economy: Wright's Search for Non-Capitalist Alternatives

Erik Wright changed his view about "cooperativism" after talking to researchers studying Mondragon cooperatives and, then, when he visited them in the Basque country. The ostensible social and economic effects of their democratic structure led him to include cooperatives as a real utopia in his pathways to social empowerment. An internal cooperative strategy led Mondragon to become the seventh largest industrial group in Spain, contributing to a region with one of the lowest Gini indexes in the world as well as surprisingly successful in maintaining jobs during the economic crisis. During his trip to the Basque Country Erik discussed with workers, their relatives, managers, and trade unionists, initiating a larger international network for the study of cooperatives as a viable alternative on a global scale.

Comm-15.3

SWARNAKAR, PRADIP* (Indian Institute of Information Technology and Management Gwalior, India)

The Role of Indian Civil Society Organization on Climate Change and Justice

Climate change is an unavoidable issue in India because a large number of Indians live in geographically vulnerable areas periodically affected by climate-related extreme weather events. In India, climate change-related activities are primarily managed by the government, but civil society organizations (CSO) are often engaged in policy formulation and implementation. This engagement varies from policy advocacy and scientific research to community-based adaptation and grassroots mobilization.

The purpose of this paper is to illustrate the activities of Indian CSOs that primarily focus on climate change. The essay is divided into four sections. The first section elucidates what CSOs can gain from discursive possibilities and openings created by the global climate change debate. Focusing on the politics of CSOs' overall climate change–related activities, the next section elaborates two distinct frameworks by which CSOs' engagement can be understood: (i) the 'climate sustainability frame', wherein CSOs' activities are more focused on issues which generally avoid confrontation with the national government or corporations; and (ii) the 'climate justice frame', wherein CSOs focus on human rights, highlighting the vulnerabilities of marginal communities, in direct or indirect conflict with the government and corporations. The third section discusses how the climate justice framework can carry two different connotations based on its geographical scale of focus. When CSOs address historical emissions and international justice, they legitimize the policy position of the national government. However, when other CSOs discuss domestic injustice and vulnerabilities of the poor as a result of national policy and corporate atrocities, they sometimes delegitimize the position of the federal government. The fourth and final section discusses international collaboration by Indian CSOs either as members of international coalitions or in joint deliberations in international climate meetings.

Politics of Representation and the Challenges with of the Pandemic

One reason for the initial enthusiasm but also of the political dead-ends of the WSF has been its lack of clarity on politics of representation. At the beginning, the idea of an open space where no-one could speak in representation of the whole forum was refreshing. It seemed like a welcome move away from traditional vanguardism of the left. It provided a frame for a space of social interaction and emergence of many useful articulations that still continue, mostly outside the WSF. Over time, this interpretation of an open space became a source of frustration. The International Council was stuck in debates over whether, and in representation of whom, it could issue declarations over issues like the crisis of democracy in Brazil or participate in campaigns about Palestine. These impasses and dilemmas became hard to solve because internal democracy of the WSF was not given sufficient attention. Is still possible to renew the process and make it more democratic and better equipped to play a role in future global struggles?

V

Comm-20.2

VARGAS, GINA* (Flora Tristan Centre, Peru)

The Great Transition of the Wsf: Where to? Reflections from Feminisms. La Gran Transición Del Fsm: ¿Hacia Dónde? Reflexiones Desde Los Feminismos.

The WSF in its origins was a fundamental impulse for the visibility of a global movement under construction, and for a conjunction of diversities that confronted unique thoughts and opened a hopeful horizon of transformation. However, a univocal view not only of the impacts of neoliberal capitalism but of the other dynamics of social change can exclude or belittle the struggles of meanings referred to other subversive ways in which change is fed, nationally, regionally, globally. So, the political culture of the Forum, despite significant modifications, continued to drag more traditional looks. The discussion on open space and political positioning continues to be an axis of dispute, which will undoubtedly continue to be addressed in this next WSF to be held in Mexico. It is true that the WSF is no longer what it was, because the contexts in which movements and forces of change are developed and articulated have been modified. However, it still has existence. And perhaps it is worth recovering what are the dynamics that the WSF has been able to promote, from the thematic and regional or sub regional Forums, which are the new coordinates that cross it, which are the presences that are not there. That is, it is not a blur and a new account, but to rescue that of the old that allows us to settle in the new. This is for me the legacy of the Forum that must be promoted, in this moment of crisis and confusion.

VIEIRA, PEDRO ANTONIO* (Universidade Federal de Santa Catarina, Brazil)

Receptivity to Immanuel Wallerstein's ideas and the World-System Perspective in Brazil

Through the publication of the translated works and the citations of the writings of Immanuel Wallerstein (IW) we intend to evaluate the reception of the ideas of IW and World-System Analysis (WSA) in Brazil. The main objective is to map and explain the dominant interests and areas of knowledge (Economics, Sociology, History, Political Science, etc.) in which Wallerstein has been studied. In addition, the institutionalization of the author and the WSA in undergraduate and graduate academic disciplines will also be researched. Since WSA is not restricted to Immanuel Wallerstein, other authors should be considered, such as Giovanni Arrighi, Christopher Chase-Dunn and Beverly Silver. The hypothesis that will guide the research is this: As the adoption of WSA implies the abandonment of the old epistemology by the researcher, this new perspective (WSA) probably is much less followed than other Wallerstein ideas and concepts which can be incorporated into pre-existing mental schemes.

Comm-14.2

VOMMARO, PABLO* (Consejo Latinoamericano de Ciencias Sociales, Argentina)

Mass Mobilization and Generational Expression of Politics in Latin America: Emergences, Persistencies and Conflicts

In the last few years, young people have been the protagonists of political processes and social mobilization in Latin America. In Argentina, this manifested singularly through a parabola of recomposition of party and institutional politics that focused on the State and public policies, which now coexists with forms of politicization that challenge those now revisited classical political modalities to propose alternative ways of participation. In Latin America, it manifested through the actions of student organizations fighting for the democratization and the improvement in the quality of a commodified and degraded education (Chile and Colombia), in the urban youths mobilized in Brazil, and through the young people producing different manners of resistance in Mexico and Central America. Therefore, we will posit in this paper that the generational dimension is a productive way of understanding contemporary political modalities, constituting what we call the generational expression of politics. Briefly, in this paper, we will approach the multiple, complex, and dynamic ways in which young people produce mobilizations and political practices in different situations and experiences in Latin America and the Caribbean. We will consider various experiences from different countries in the last few years in order to establish relations between them and to identify their singular and shared features. Our objective will be to advance in recognition of the organizational and political participation forms produced by young people in political and social collectives in today's Latin America and the

Caribbean. The paper will be based on empirical work carried out by the author in different research projects, as well as secondary bibliography regarding the experiences under study, analysis of documents produced by youth organizations, audiovisual material, and newspaper and magazine articles.

Vocational Teachers' Role in Coaching and Mentoring Disadvantaged Students

In many societies, individuals with higher education are in an advantaged position, as they have better positions in the labour market and readiness for lifelong learning. At least in school-based systems one of the fundamental selection of *inclusion* and *exclusion* takes place at the end of basic school. The disadvantaged or at-risk student tend to choose a vocational track. Most of them are frequently characterized by low social-economic background, inadequate mathematical or language proficiency. The students with this kind of profile affect vocational teachers' work. Moreover, they have to face in students with immaturity, lack of agency and general competencies. The logic guiding the behaviour of the ￼ideal' professional means that they extend their knowledge both for its intrinsic value and to enhance their ability to serve the needs of others (Woods 2014, 10). Additionally, the teaching of speciality, teachers' work is also coaching and mentoring to support the personality growth.

The aim of this paper is to enhance the understanding:

1) how vocational teachers empower students with the disadvantaged background;

2) how vocational teachers' professional learning facilitates their coaching and mentoring competencies.

The research is based on narrative life history interviews, conducted from 24 vocational teachers. During the analyses, the data were categorized according to the cultural-historical theory of activity (Engström, 2001), which offers a framework for examining vocational teachers activity, work system and interactions.

We suggest that the empowerment of students with the disadvantaged background is a challenge for vocational teachers, which demands personal characteristics, self-understanding, professional learning and collegiality.

Cadenas Globales De Costura: Violencia Estructural En Mujeres Bolivianas Del Centro De Sao Paulo.

El presente estudio se enmarca en una investigación mayor titulada "Profesionales de salud en la atención primaria: el cuidado de inmigrantes y refugiados". Dentro de la Atención Básica del Sistema Único de Salud brasileiro (SUS) se configura la Estrategia de Salud Familiar que cuenta con un dispositivo de vigilancia sanitaria conocido como el Programa de Agentes Comunitarios de Salud (PACS). Los agentes comunitarios de salud (ACS) tienen como objetivo catastrar personas con necesidades especiales (enfermos crónicos, adultos mayores, mujeres embarazadas) realizando visitas domiciliares dentro de barrios vulnerables de la ciudad, superando el paradigma hospitalocéntrico para fortalecer el vínculo entre las Unidades Básicas de Salud (UBS) y la comunidad.

Ante la llegada de nuevos grupos migrantes, con diversas especificidades y desafíos por sus modos de vida (focos de tuberculosis, infección urinaria, violencia intrafamiliar) la estrategia de territorialización sufrió una modificación importante. Frente a las dificultades de los migrantes para comprender sus derechos en el acceso a la salud, la desinformación y el miedo, los Equipos de Salud comenzaron a contratar ACS de origen migrante para resolver las diferencias culturales y acercar a las migrantes a los centros de atención básica del SUS.

Luego de una etnografía de ocho meses en la UBS Sé que atiende la mayor cantidad de población migrante de Sao Paulo, y junto al acompañamiento de ACS dentro de su espacio de inserción, es posible evidenciar el círculo de violencia al que se enfrentan mujeres bolivianas que son explotadas en los talleres de costura, generando focos de infección urinaria y que luego son violentadas en sus casas por concebir la dolencia como una enfermedad de transmisión sexual. En este contexto, se inserta el ACS-migrante quien debe lidiar sin mayores herramientas con las consecuencias de una violencia estructural que se presenta en el barrio, presentando manifestaciones de malestar evidentes.

ABARCA BROWN, GABRIEL* (King's College London, United Kingdom)

Becoming a (Neuro)Migrant: Haitian Migration and Mental Health in Chile.

Background: The recent arrival of Haitian migrants in Chile has challenged the day-to-day work of health services. They have introduced a cosmocentric view of health and illness through their knowledge and practices of Haitian-Creole medicine and, particularly, of Vodou. Besides being a religion that plays a central role in the Haitian everyday life, the Vodou is also a health system characterised by representations of health/illness, modalities of intervention, and classification of illness, among others. The Vodou has interrogated, particularly psychiatric and neurological knowledge and practices of practitioners in Chile, challenging them to include cultural perspectives in their approaches.

Aim: To analyse how a set of discourses, knowledge and practices around mental health and Haitian migration have emerged within healthcare services in Chile, as well as how this set has shaped the subjective experience of Haitians.

Method: This research draws upon from an ethnography conducted for 14 months in a low-income sector of Santiago, during 2018-19. The fieldwork also included 45 semi-structured interviews to health practitioners, patients, family members, as well as other social actors.

Discussion: Although healthcare services have made great efforts to adopt a cultural perspective, health practitioners have tended to ignore or reduce Vodou to a folkloric level. Health practitioners have tended to place the cause and solution of mental afflictions on the brain, neglecting sociocultural and material aspects. Whereas some Haitian patients seem to internalise new forms of representing themselves and their suffering, others instead legitime their health knowledge and practices. Thus, they have strengthened their relationships with their community, as well as with other institutions (e.g. churches), and actors (e.g. priests). I will argue that despite the emergence of new assemblies of government around the Haitians' suffering, Haitians have built up individual and collective forms of resistance, usually resorting to some aspects of Afro cultures.

Gender and Profession: A Case of India

Gender is a social construct of roles mostly in relation to sex which is otherwise biological. India being an advanced developing nation with neo-liberal political economy in place is going through the radical deconstruction and reconstruction of its gender roles. The supremacy of the Constitution giving the guarantee of the right to equality irrespective of sex and the Supreme Court taking it forward to create an egalitarian civil society have infused society with sufficient dynamics to aggravate the structuration process. In India, it's a very complex phenomenon since socio-economic transformations are taking place rapidly. The changing patterns of education and work and corresponding culture have geared up the process of neo-functionalism in which professions seem to be hardly gender specific, of course, baring a few exceptions. What is strikingly fascinating to sociologists, especially of India, is the interface between the caste based occupation and the class based profession. Indian society still holds both occupation and profession not in terms of dichotomy but accommodation as continuity with change being the process of social change. However, sociologists would be skeptical to even accommodation in view of the post-modern pluralism and role conflicts emerging out of different roles. The growing pace of feminism as a critical response to patriarchy and gender discrimination adds complexity to empirical and theoretical articulation. The recent judgments of the Supreme Court on decriminalizing homosexuality and same sex marriage have redefined family, family structure and functions. Moreover, the reflections of the virtual world of social media, though phenomenological, spell out a lot in deconstructing and reconstructing gender as one of the tasks of the 21st century. The paper captures this complexity with various sociological lenses.

The Right to Work for Refugees in Malaysia : A 'win-Win'for All

Malaysia is dependent on cheap labour comprising of both documented and undocumented migrants including refugees. Without official status and no right to work, refugees are often exploited and extorted which could lead to modern day slavery. This can undermine the rule of law and the country incurs losses from the

shadow economy. This paper explores the policy of granting work rights to UN-HCR-registered refugees in Malaysia based on historical and contemporary case studies involving Acehnese and Rohingya refugees. It particularly examines how the right to work for refugees granted in the past can be a basis for a similar Malaysian policy formulation in the present. Drawing on semi-structured interviews undertaken in Malaysia involving refugees, activists, experts and policymakers, this paper outlines the impacts of the right to work on refugee lived experience and political and socio-economic aspects of Malaysia. The right to work provides a 'win-win' situation which facilitates in achieving durable solutions by tapping the existing human resources of refugees for their better protection, livelihoods and dignity. Refugees can be absorbed into the labour migration scheme in sectors that need workforce especially 3Ds as well as occupations that match their skills and qualifications without affecting their refugee status. At the same time, Malaysia can reap the benefits of refugees' contribution to the economy and uphold the rule of law. This study is timely since the current Malaysian Government has pledged to ratify the refugee convention including providing refugees with labour rights en par with Malaysian citizens.

Studying Cultural Consumption in Latin America in Its Socio-Historical Context

The cultural consumption studies in the Latin American cannot ignore the social-historical determinants of the region. That means admitting the deep roots of the colonial structures in its everyday life (and cultural reproduction). Thus, the study of cultural consumption in the Global South has to address two distinct but interrelated processes: (1) the constitution of the colonial mode of production (and slavery); (2) the dependency and the overexploitation of labor as outcomes of its birthmark. For Caio Prado Jr., Latin America started officially existing as a part of the history of the European commercial route's expansion. Taking Brazil for instance, it means knowing that from 1532 to 1888 a number close to 12 million African slaves were forced to work as production machines for agricultural exportation. Actually, the end of the slavery system has not set them free, since they changed status from properties to misery. All actual statistics confirm the tragedy of the inertial salaried transition, since non-white are always behind in every human development level imagined. In the other hand colonialism creates dependency, or the idea that dependent countries are underdeveloped because the central countries are developed, as explained by Marini. Dependency creates a value flow towards Global North, obliging the capitalist in the Global South to compensate its losses overexploring labor, paying workers constantly below their necessities. So, to understand consumption in Latin America, as Vieira Pinto indicates, it is essential to reveal its contradictions with production, labor and social classes. Not everyone is a consumer (as a right) in a context of fighting for reproduction. Contextually, the lack of material resources is a structural restriction for the majority of the population, defying the well-established cultural consumption definition from the Global North, opening space for new consumption strategies.

The Values Associated with the Egyptian Public's Cultural Resilience Since the Start of the Millennium: An Analysis of the World Value Surveys of 2001 to 2018

The present study investigates the factors associated with cultural resilience among the Egyptian public while grappling with various acts of violence that confronted them since the Millennia. The study relied on a representative sample of 8774 adult population 18 years of age and older. We analyzed data in four World Value Surveys' waves conducted in Egypt during 2001, 2013, 2016, and 2018, respectively. The study utilized the descriptive analysis approach to describe the various variables followed by performing an inter-correlation analysis between a set of independent variables reflecting outbreaks of violence value orientations (such as the importance of family and religion, respect for traditional authority, values related to the socialization of the children, trust of individuals and social institutions, happiness and satisfaction, attitudes towards gender equality, attitudes towards democracy as a mode of governance, orientations towards materialistic and post-materialistic values, future directions) and the national identity pride as a dependent variable. Selected variables were put to the test to regression analysis to determine the causal relationships among the variables. The investigation revealed that the independent and the dependent variables showed statistically significant relationships reflecting a stable Egyptian cultural system, even during difficult times, and that religion appears as the moving force in the lives of the individuals who continue to conform to traditional values. There is

also a positive orientation towards democracy, technological development, encompassing their feelings of satisfaction and happiness, and self-control during difficulties—the Egyptians through their feelings of pride in their national identity.

Professors Vs Management in the Neoliberal University's Epoch

We are living in an era of the traditional University image crisis. A modern university is more a commercial enterprise than an educational institution, when the space of university democracy is constantly shrinking. The problem of reducing university democracy under the flag of "optimization" is typical for universities around the world [1]. Our study focuses on how professors react to ongoing transformations, how they propose changing the university management system, and how much more active university teachers involvement in this process is necessary. We made an attempt to describe the complex system of relations between university management and the teaching community, based on a study of a number of Russian regional universities. University management intentionally appears in the field of our vision, because in modern conditions it plays an increasingly important role in the life of any university, while being little studied.

Our hypothesis is as follows: 1) professors believe that the leadership system prevailing in many universities does not fully meet the needs of the time; 2) ordinary teachers are practically excluded from the process of understanding and publicly discussing the university's policy; 3) the professor has become an ordinary employee. In a number of leading universities, the most tangible dividends from obtaining such a status were received by bureaucratic structures, which less and less take into account the interests of teachers and students. The paper shows the possibility and ways of changing identified trends; it can be diversification of financing, which deprives university managers the monopoly on decision-making.

Confidence in State Organizations Among Egyptians before and after the 2011 Uprising: Conclusions from the World Values Survey

When Egyptian masses took it to streets of Cairo and other major cities on January 25th, 2011, they demanded a complete halt of the regime and the departure of President Hosni Mubarak. The demonstrators chanted and lifted slogans that showed lack of confidence in the state organizations, such as the presidency, the police apparatus, the judicial system, the political parties, and the parliament. This was an unprecedented event that represented a very significant turning point in the modern political history of the country. This paper draws on data from the World Values Survey to find out the changes in the level of confidence Egyptians had in their country's organizations before and after the January 2011 uprising. Egypt was included in the World Values Survey for the last three waves: Wave 4 (1999-2004), where the fieldwork was conducted in 2001, Wave 5 (2005-2009), where the fieldwork was conducted in 2008, and Wave 6 (2010-2014), where the fieldwork was conducted in 2012. It is interesting to note that questions about confidence in these organizations were not asked in Wave 5. Two hypotheses are being tested: (1) politics became more important for the life of Egyptian people after 2011, and (2) Egyptian people's confidence in the state organizations dropped significantly after the 2011 uprising. To this end, the paper analyzes the social, economic and political causes for such change. In other words, the paper investigates the question of what made people's confidence in their state organizations decline over time.

Cross-Country Variation and Key Domains of Happiness of Young People in the Arab World

Happiness and well-being have been exciting concepts for human's mind since the ancient times. Happiness can be generally defined as a mental or emotional

state of well-being characterized by positive or pleasant emotions ranging from contentment to intense joy. Nowadays happiness of the population, satisfaction of people with their life and assessments of individual's well-being have become important measures of social progress and one of the goals of public policy.

As the World Happiness Report for 2018 has proven, Middle East is a very diverse and dynamically developing region in terms of population happiness and wellbeing. With the United Arab Emirates leading in the region (20th place in the world hierarchy of happiness in 2018) and Syria and Yemen being at the very last positions in the world hierarchy and ranking of happiness (150th and 152nd places accordingly). Such diversity creates a unique opportunity for social scientists and policy researchers to analyse the main predictors of population happiness in different MENA and Gulf countries to study those good practices that lead to the increase of population happiness.

We seek to undertake a complex analysis to assess the state of happiness as well as the importance of different domains of life influencing the feeling of happiness and wellbeing of the populations of MENA and Gulf countries. Given the significant role of young people for the future development of all countries in the region, we focus our analysis on young people in the age between 18 and 29 years old. Countries included into the analysis are Morocco, Algeria, Libya, Tunisia, Egypt, Jordan, Iraq, Lebanon, Yemen, Kuwait, Saudi Arabia and the UAE. Sources of data that we use in our analysis include findings of the World Values Survey (2010-2019) and the World Happiness Report data (2012-2018).

Students As Learners and Teachers: Lessons from an Exercise in Active Learning

In spring 2019, the authors worked together in a semester-long independent study course on the topic of youth homelessness. Over the course of the semester, as a way to demonstrate their learning, the students developed an experiential learning exercise that was informed by insights generated through the students' independent study. The exercise is suitable for small and large undergraduate sociology courses and can be facilitated in a variety of substantive course, from Introduction to Sociology to classes focusing on social class, deviance, and youth. By way of developing the exercise, the students were not only positioned as learners, they also became teachers over the course of the semester. In this presentation, students and instructor will engage in a conversation that discusses, among other topics, the benefits of active learning, making the transition from learner to teacher, trust in the learning process, and becoming comfortable with the ambiguities involved in guided independent inquiry.

Suicides, Inequalities and the Search for Social Justice

Time and again the world has witnessed suicides that resonate beyond the personal and draw attention to larger issues of inequality and injustice. In the last two decades, there have been suicides in different parts of the world stemming from foreclosures, economic crisis, austerity measures, political repression, forced migration, and agrarian crises. While suicide needs to be addressed at the individual level, it is important to consider suicides in the context of the challenges of global inequalities, oppression, heightened economic hardships, and the displacement and dispossession of people. Drawing on a contextual global sociology, this paper focuses on suicides which highlight the historical, structural and relational dimensions of domination and oppression that underlie and contribute to current conditions of inequality. The causes and conditions that contribute to suicides and how these suicides have bolstered collective action for social justice are addressed. Linkages between suicides and inequalities and intersectionality based on gender, caste, class, citizenship, especially in relation to land is explored. The paper also addresses movements that highlight the issues of farmer suicides and the lack of protection and implementation of laws by the government. Special attention is paid to farmer suicides in India as well as women's struggles and their mobilization for the need to recognize their rights to land ownership, access to governmental protections, and fair and just compensation. The presentation concludes with a brief discussion of the public sociologists' critical role in deconstructing the dynamics of such suicides and their societal implications in helping in bringing about transformative change.

ABRAHAM, MARY* (Jawaharlal Nehru University, India)

Re-Imagining Evidence in Women's Prison Texts

Prison texts, written by women political prisoners, are an expression of the 'self' during incarceration, while also documenting the routines, deprivations and pains of the other women prisoners. These texts give voice to the patriarchal authority that prisons as institutions impose upon them, and how they treat women prisoners as a homogenised, passivised category, devoid of any agency or identity of their own. Through a reading of prison texts (autobiographical memoirs, diaries, notes and letters from prison) written by women political prisoners in India, this paper tries to show that women prisoners (within Indian prisons) are far from the passivised subjects that they are made out to be. Their ability to resist through negotiating power structures within the prison derives from their agency and identity formed at the intersections of caste, class, race and gender. It is a reading of this resistance against the power structures, against the homogenisation of the women inmates and the appreciation of difference that make evaluations of these prison diaries important from the framework of a feminist analysis.

Through a study of prison texts written by political prisoners such as Mary Tyler, Snehalata Reddy, Joya Mitra, Anjum Habib, Soni Sori, Urmila Shastri, I intend to bring out the dialectics of victimhood and resistance that exist within the women inmates, of how their bodies become the first sites for the inscription of law through surveillance, of the realities and pains of imprisonment and the hierarchies of power and control that they experience within the prison and their ability to resist (hunger strikes, social organisation) against these power structures that are situated within their identity and agency.

ABRAHÃO, MARIA HELENA* (Maria Helena Menna Barreto Abrahão, Brazil)

Visual and Audiovisual Sources in (auto) Biographical Research - Theoretical and Methodological Notes

The text to be presented intends to develop and approximate the concepts of given word, attentive listening and scenic understanding (MARINAS, 2007) to studium and punctum (BARTHES, 1984), which we consider constitutive dimensions in (auto)biographical research aiming at the comprehension of oral, written, imagetic and audiovisual sources. These are the epistemic and methodological theoretical dimensions with which we have been operating in the CNPq/UFPel research entitled "The singular-plural subject - narratives of teacher's life, identity, teaching and continuing education". This research is concerned with two aspects. Strand I, which has as its object the trajectories of leading educators, is methodologically worked through the construction of Life Stories. Strand II operates with Research-Training, through the construction of Formation Memorials. These strands are considered as generating practices of human development that originate reflective and metacognitive teachings from the teacher about his/her own formation, whether initial or continuing, and a reflective teaching practice. In both studies we operate with analysis through Scenic Understanding complemented by semiotics, which is more concerned with the analysis of imagetic and audiovisual sources. This analytical look is thus operationalized by the use of scenic comprehension analysis, as already referred, which combined given word and attentive listening, with the triangulation of the imagetic material that we had with the other narrative sources, bringing the different scenes that brought them closer together. They constitute by the perception of studium and punctum that they make sense of them from our perspective: the essence of the image according to the researcher. We believe that the entire text will enable us to have a fruitful discussion with peers about what we consider the interpretative power of scenic understanding, studium and punctum as possible operators in qualitative research, especially in (auto) biographical research that operates with oral, written and (audio)visuals sources.

ABRAMO, HELENA* (Prefeitura Municipal de São Paulo, Brazil)

Banderas De Colectivos Juveniles y El Tema Del Trabajo

Aquellos que son jóvenes en Brasil hoy tuvieron sus vidas impactadas positivamente por el avance de las políticas públicas, especialmente las de educación, lo que les abrió expectativas de una inserción laboral más digna y significativa, pero también, negativamente, por el aumento de la violencia asociada con las desigualdades estructurales que marcan la sociedad brasileña. Tales contradicciones y conflictos forman el terreno donde surgen una serie de grupos, colectivos y movimientos que, teniendo a los jóvenes de las periferias como protagonistas, buscan enfrentar las opresiones y agresiones a las que están sujetos.

La investigación realizada por un proyecto desarrollado por una red de organizaciones no gubernamentales con miembros de colectivos juveniles de las

periferias de 4 ciudades brasileñas importantes planteó sus percepciones sobre la escuela, el trabajo y la sociedad brasileña, buscando identificar sus principales problemas, sueños y motivos para la acción.

La crisis económica y el contexto político cambiante en el país han agregado nuevos obstáculos y contradicciones a la vida de estos jóvenes, dificultando la realización de sueños y planes, retirando derechos y aumentando las desigualdades, la discriminación y la violencia; sus posibilidades de inserción laboral y su perspectiva de "trabajo decente" también se ven afectadas por el desempleo y la retirada de los derechos laborales y de seguridad social, circunscribiendo sus alternativas en un horizonte precario.

La disposición de lucha de estos jóvenes activistas, sin embargo, permanece firme; hay una reafirmación y engrosamiento de sus principales estandartes (contra el genocidio de la juventud negra, contra el machismo y la violencia contra las mujeres, contra la homofobia, la libertad de expresión y el derecho a ser quien sea). Mediante el análisis del material generado por entrevistas en profundidad, buscase comprender porque el tema del trabajo no es parte de sus agendas de activismo y movilización política.

School and Work in Youth Transition Strategies in Brasil: Personal Effort and Public Policy

The transition to work for young people in Brasil is deeply remarked by structural inequality , given by class, gender, race and household situation. For young people with low incomes, this trajectory is long, full of difficulties and with many events of interruption or exposure of activities. Education policies, on the other hand, created conditions for the extension of schooling to high school (recently established as a compulsory stage of basic education) and expectations for further studies (third level), which appears as a more concrete possibility for working class yuth only in this generation.

A study developed by the ILO in Brazil between 2013 and 2015[1], had the goal to identify the most common transition patterns among young people in the country. Early employment (from the age of 16, legal age for employment), overlapping school, while advancing in higher education, is one of the recurring patterns. A qualitative study associated with this research sought to understand the strategies developed by young people from the outskirts of São Paulo to obtain a higher quality insertion in the job market.

The paper analyzes young people's perceptions of the factors that cause danger or support for the development of their trajectories and the pursuit of their dreams, looking in particular to the importance attached to different elements: public policy and the economic context; the support and demands of their families; self-effort and merit and personal difficulties.

[1] The research was part of an international project entitled "Work4Youth"; in Brazil, it was called "Transition from School to Work", and generated several developments involving a number of partners from the national government and academia.

Gender, Innovation and Sustainable Development: How to Create More Equitable Pathways

The past few decades have seen progress in the understanding of the gender dimensions of science and technology; women´s participation in higher education has increased and the development of solid indicators and robust data have allowed a better understanding of the issue and revealed the strengths and the challenges still remaining. One such challenge is the understanding of women´s role in science and innovation for development and how it can be supported by using science, technology and innovation. There is a consensus that this is an area where the conceptualization regarding gender is lacking, as are effective and relevant indicators. This paper will discuss these issues with a perspective of sustainable development and point out how to create more gender equitative pathways for women and girls.

Enablers and Barriers to Youth Participation in Protracted Crises: A Case Study of the Gaza Strip

International commitments to youth participation and the right to be consulted in decisions that affect young people's lives are increasingly recognized, but there is more limited understanding about how best to achieve this in practice in fragile and conflict-affected contexts. In light of the protracted nature of many conflicts, understanding how to support young people in the context of political volatility and violence is critical, including how to design age- and gender-responsive programs and services. This study contributes to knowledge gaps around the patterning, enablers and barriers to youth participation, drawing on mixed methods research in Gaza in 2016-2017 as part of the Gender and Adolescence: Global Evidence (GAGE) research program involving adolescents, parents and service providers.

Our findings suggest that youth participation in Gaza remains profoundly restricted, in large part because of the highly truncated opportunities young people have as a result of the de-development agenda since the Israeli blockade. This is in turn exacerbated by poverty, age hierarchies and strict gender norms. Girls are largely prohibited from visiting public spaces such as cafes, adolescent support groups and sport clubs because of concerns around the 'mixing of genders and family honor'. Due to their limited mobility, girls rely on television and the internet to break their isolation, despite parents' heavy policing and frequent power cuts. Whereas boys spend more time outdoors interacting with peers, girls spend most of their time at home studying or doing home chores.

Our findings confirm that girls who benefit from the limited services available to them reported being more able to negotiate change and to make some decisions within their households and at school. They also highlight the importance of working simultaneously with parents and community and religious leaders to shift social norms that hinder girls' and young women's greater participation in society.

ABUFHELE MILAD, VALENTINA PAZ* (Independent Scholar, Chile)

De Pobladores a Pobres Urbanos: Las Prácticas Políticas De Los Asentamientos Informales En Chile

Los asentamientos informales en Chile son una forma persistente de habitación y de acceso a la vivienda para los sectores populares al menos desde los años 40. A lo largo de los años, nuestras formas de describir y entender las prácticas de sus habitantes han estado moldeadas a partir de los marcos analíticos dominantes sobre la "cuestión urbana". En ciertos períodos históricos, los asentamientos son descritos como urbanizaciones espontáneas y las prácticas de sus residentes como acciones individuales, despolitizadas, basadas en la necesidad y la supervivencia. En estos períodos, los conceptos de "marginalidad" y "pobreza" son centrales para explicar la informalidad. En otros momentos, las prácticas de los habitantes de asentamientos son entendidas como acciones colectivas, articuladas políticamente y los repertorios de acción de los pobladores se evalúan en su potencial de transformación social. Durante los últimos 30 años, los asentamientos en Chile se han descrito como "concentraciones de pobreza", y sus residentes como sujetos pasivos y despolitizados, invisibilizando el carácter político de sus prácticas.

En esta presentación analizo cómo los marcos analíticos dicotómicos con las cuales hemos pensado la política de los sectores populares han dificultado el estudio de las prácticas políticas de los habitantes de asentamientos durante los últimos 30 años. A partir de las teorías sobre informalidad urbana (Bayat, 2000; 2004; Chatterjee, 2004; Weinstein, 2014), y con el fin de trascender las categorías dicotómicas, sugiero repensar los asentamientos informales en Chile como "transgresiones cotidianas" (Bayat, 1997, 2004) que, pese a estar motivadas por la necesidad, conllevan un carácter político. Acciones individuales y privadas de los sujetos—vivir en un asentamiento—adquieren una dimensión política al irrumpir como "concentraciones de pobreza" en el espacio público. A partir de esta literatura, muestro cómo ciertas prácticas que no se articulan como acciones políticas, pueden constituir una forma de poder político.

RC47-575.2

ACCORNERO, GUYA* (ISCTE-IUL, Portugal)

Media-Movement Relations in the Anti-Austerity and Post-Austerity Movement in Portugal and Their Consequences

Strongly based on new digital resources, the anti-austerity movement in Portugal had two major advantages with regard to communication of aims and images compared to many earlier social movements in Portugal.

1) Skilled activists: most groups of the anti-austerity movement had one or more activists with a formation in design, public communication, film-making or other professions related to external communication. Thus, most of the communication is highly professionalized.

2) Personal contacts to the mainstream media: As Portugal is a small country, individual contacts and personal overlapping between journalists and activists is more likely. Moreover, many journalists were affected by the crisis and open to the movements´ claims.

But are these advantages really that powerful? Recent studies show that highly professionalized information might backfire on social movements because they are expected to be less professional and more spontaneous and emotional. In this paper we analyse the interplay between web based movement communication and communication by the mass media with focus on if and how these apparent advantages in communication impacted mass media communication and social movement practices in the interaction with the mass media. Our paper is based on interviews and participant observation of activists groups between 2011 and 2013, on the analysis of web based communications and traditional mass media analysis (protest event and claims analysis of the years 2010 to 2015).

RC47-581.3

ACCORNERO, GUYA* (ISCTE-IUL, Portugal)

The Role of Law in the Struggle Against Eviction. the Case of NYC's Lower East Side.

This paper focuses on a successful mobilization carried out by tenants leaving in a rent-stabilized building in NYC's Lower East Side, in response to the continuous landlord's attempts of eviction. The main research question is: what are the reasons of the success of this action? In other words: what has tipped the balance in favor of the tenants in a conflict in which the landlord clearly had stronger economic, political and power resources?

I will argue that this success was highly based on the legal resources available to tenants. These legal resources are specially connected to the housing organizations present in the territory – such as the Good Old Lower East Side (GOLES) and the Cooper Square Committee and their legal support to tenants – and to a set of new rules and laws implemented in NYC, also thanks to the action of social movements themselves during the previous years. Among these new rules, there are new bills on harassment, some of which expanding its definition to include, for instance, repeated contact at unusual hours; and the "Certification of No Harassment". This requires covered building owners seeking to demolish or make significant alterations to their building to prove they have not engaged in harassment before they can get the permits they need from the NYC Department of Buildings (DOB).

Based on an original research developed with different sources – such as official documents, interviews, ethnography – and adopting an interactionist approach for the study of social movements, this paper aims to contribute to a deeper understanding of the role of legal resources for contentious actions, on the one hand, and of the role of contentious actors in improving and expanding these legal resources, on the other hand.

BARRAGAN CODINA, MANUEL (Universidad Autonoma de Nuevo Leon, Mexico)

Narco Violence and Sex Trafficking in Mexico

During the last decade, more than 160,000 people have been forcibly migrate internally due to *narco* violence in Mexico. These migrated families suffer social and economic vulnerabilities which, leaves them easy prey to traffickers for the purpose of exploitation. Young girls and women are extremely vulnerable. This paper analyzes the impact of forced migration on trafficking of women and girls for sexual exploitation caused by *narco* violence in Mexico. For this study, we gathered information from 16 forcibly migrated trafficking victims (FDTV) in Monterrey, Mexico. Findings elucidate that traffickers use different tricks and promises to trap displaced young girls and women, including force into sexual exploitation. Moreover, narco violence has generated a huge number of orphans and widows in the country. Traffickers use the economic vulnerable condition, and lack of family support structures, of these orphans girls and widows, and force them into sexual exploitation.

ACHARYA, ARUN KUMAR* (Sambalpur University, India)

Physical Abuses, Occupational Injuries and Disabilities Among Dadan Seasonal Migrants in India

Dadan seasonal migrants are the most vulnerable migrants in India, as they suffer extreme economic and physical exploitation mostly by the middlemen and employers. Every year, during the winter season, thousands of people from eastern India migrate internally in search of food and employment and work in brick kilns and construction sites in cities. Generally, after the paddy harvest there is no more work for people of this region and the *Nuakhai* festival (harvest festival) carries its own expenses for which loans are acquired and are difficult to repay; thus, most of these people end up as *bonded laborers* being paid minimal daily wages. Once they reach their destination, migrants are forced to work for long hours without any economic compensation, and if they do not complete assignments in time, they suffer multiple forms of physical abuse or harassment from the supervisor and middleman, which directly affects their occupational health. Therefore, the purpose of this study is to explore the incidence of physical abuses, occupational injuries and disabilities among dadan migrants in eastern India. Studying an unrepresentative group of 31 dadan migrants in 2018-19, we found that these migrants reported various types of physical abuse such as being slapped, kicked, beaten up, including sexual abuse, by the supervisor and middleman. We also learned that migrants suffer different types of injuries, including strains, wounds, cuts, fractures, and amputations, among others. We suggest an urgent need to create instruments to protect the rights and health of dadan migrants in India.

On Girls and Horses: Reclaiming Our 'natures'?

In the social sciences, arts and humanities, there is a now a significant corpus of work that documents and explores the historically and culturally changing 'woman-horse' relationship and its connection to female power/empowerment. From critical de/re-construction of a mythologized dyad to the ever -growing presence of veritable women/girls' equestrian subcultures within the context of modern sport and leisure societies, it becomes evident that there is something unique and significant in this story, perhaps related to what today's human-animal studies theorists increasingly emphasized as the force of 'humanimal' elements that modern Western societies have attempted to suppress. My reflections here focus on the potentially subversive elements of participation in equestrian cultures for young Brazilian rural and semi-rural women and girls, product of more than a decade of research and 'participant observation'. I also include comparisons based on work on I have participated in on the same theme, yet rooted in very different cultural contexts, such as France and India

When Other Humans Can't Help Us: The Paradoxical Position of Animals within Contemporary Therapeutic Cultures

Debates around the 'troubled modern self' and the therapeutic culture that has sprung up around are at the heart of contemporary sociology. In this paper, we develop the theoretical groundwork and consider some of our early empirical findings on the growing therapeutic use of a wide range of animals to assist humans in physical and/or psychological struggles - e.g. to overcome suffering and illness, find companionship, 'discover themselves', become 'happy and whole', less- stressed or able to find more pleasure and meaning in life, etc . Our approach is inspired by Eva Illouz' challenge to examine therapeutic discourse - whether coming from the medical professions or its popular (re) iterations - by looking at how it has come to be what it is (including how it becomes part of a profitable market), what it claims to do and 'what is actually does' for people who deploy it (e.g. as practitioners) or who engage with it (as 'users' or beneficiaries of different sorts). At the same time, we are intrigued by what appears to be a basic underlying paradox – that the very society that, in its genesis, has hammered away at 'human exceptionality' and in hegemonic discourses/practices, has emphasized human/non -human animal discontinuity (human superiority and rights over members of other species) is increasingly turning to the relationship with other (primarily domesticated) species to cure the psychic trauma, alienation and 'discontents of civilization' which among other things, are linked to its very premises and ramifications.

Social Inequality and Incidence of Diabetes in Ile-Ife, Osun State, Nigeria.

Presently, there is an event of epidemiological transition in most developing countries. Traditionally in Africa, communicable diseases, maternal, perinatal and nutritional factors accounted for greatest burden of morbidity and mortality but the burden is fast shifting towards chronic non- communicable diseases, and by extension cardiovascular diseases (CVDs). Diabetes is a public health problem not only in Nigeria but in the world at large. Studies have shown a relationship between social inequality and health outcome of individual in the society. The study utilized structured questionnaire administered on 294 randomly selected respondents. Majority (89.8%) has prior knowledge of diabetics through different means such as internet, media, and health talk and mainly (55.2%) family, friends and neighbour. The knowledge of the cause(s) of diabetes is quite low. 38.1% and 21.4% of the respondents believed that eating sugary food and evil spell respectively are the main cause of diabetes. About 53.7% of the respondents in their opinion said rich people are liable to diabetes than poor people. 48.9% of the respondents answered "yes" that gender has a role to play in the health outcome of diabetes patients. 34.7% of the respondents believe that women are liable to diabetes than men but men can survive diabetes than women. Statistically, according to Chi square test it was only income, education and religion that shown positive relationship to the health outcome of people with diabetes. The study recommends more enlightenment programs on causes and risk of diabetes. Adequate, accessible and affordable health care for all diabetic patients.

TREND and Determinant of Induced Abortion Among Female in School Youth in Federal University Oye-Ekiti, Ekiti State, Nigeria.

Social-cultural and religious believe in African society frowns at the practice of induced abortion, considering the act as a murder. Coupled with the fact that, abortion is illegal in Nigeria. Research shown that adolescents are highly exposed to different sexual practices and there is low levels of contraceptive usage, this is a conflict that results in a high proportion of students ending up with pregnancies. The study was carried out among female youth within the ages of 15-24 years. Data were collected through questionnaire and multistage cluster sampling technique was used in selecting participants. The findings revealed high level of sexually practices. Majority (86%) of respondents though heard of contraceptives never used any. 35% had practiced abortion at a time or the other. The study identified peer group influence, ignorant, fear of motherhood,fear of stigma, no access to contraceptives, poverty out of others has main determinant factors for induced abortion among adolescents. Provision of effective reproductive health programmes and services that include proper counselling targeted at adolescents to reduce sexual risk and abortion are recommended.

The Origins of World Alienation

The proliferation of political violence and deterioration of plurality in the national and international levels post 9/11 speak of a systemic crisis within the western political and sociocultural landscape. If in *The Origins of Totalitarianism*, *The Human Condition*, *On Revolution* and *Eichmann in Jerusalem* Hannah Arendt speaks of world alienation, in *The Promise of Politics* and *The Life of Mind* she offers us hope. Arendt's historical examination of the western political, philosophical and sociocultural settings not only leads us to see the historical prejudice against politics, but also how such prejudices have undermined the power of agency and democratic values, those of which can curb anti-pluralistic tendencies, intersectional inequalities and totalitarian violence. The aim of this paper through an interdisciplinary approach and a postmodern methodology is to shed light onto and examine the origins of world alienation.

How to Explain the Expansion of Organized Crime in Contemporary Brazil?

Brazil occupies an extensive territory with more than 8,500 million kilometers, where about 204 million people live, the largest part of which being a young population (15 or more) in productive age. According to the map of violence in Brazil the homicide rate per 100,000 inhabitants jumped from 11.7 in 1980 to 31.6 in 2017. Studies show that major part of these deaths is associated with the arrival of organized crime in Brazil in the late 1970s, especially around the illegal drug trade in metropolitan areas such as Rio de Janeiro and São Paulo. In most Brazilian cities, since Brazil has got involved in the fight against illegal drug trafficking, the "wars" among gangs and between them and the police intensified especially in the poor districts where low-income workers are concentrated. There are no cumulative studies able to write this history of crime and violence in Brazil, as there are in Anglo-Saxon countries and continental Europe. Regardless of sociological studies have pointed out some social conditions that facilitated changes in the traditional profile of crime among which: (a) economic globalization and its impacts on nation-states; (b) new patterns of urban development, the emergence of megacities and new forms of sociability; (c) crisis in the criminal justice system; and (d) life conditions in prisons. Taking into account the social context described above, the proposal is to evaluate how these four factors come together to explain the expansion of this modality of organized crime in the country as a whole over this decade.

AGARTAN, KAAN* (, USA)

Chasing the Spirit: The Rise and Fall of the Gezi Uprising

The excitement, optimism and anticipation among the activists in Istanbul had not subsided even after the police cracked down the occupation in Gezi Park in June of 2013. After all, this extraordinary uprising, which had dared to challenge the government and especially its leader Erdogan who was defiantly adamant in transforming the society along conservative religious lines, could continue its mission to build a new, pluralistic, and more democratic society in public parks and neighborhood forums. The yearning for a radical reorganization of the society around the motifs of commonality and diversity that would emerge from the spontaneous, horizontal and leaderless prefigurative politics in these parks and forums blinded everyone to the coming of the authoritarian backlash from the political establishment in the years that followed.

I aim to demonstrate that the failure of the Gezi uprising in delivering its promise of transforming political structures and social relations contributed to the constitution of a semi-dictatorial regime in Turkey. I claim that the very features of the Gezi episode had a contradictory, if not centrifugal, impact triggering several structural faultlines in the Turkish society. For instance, the need for constant political mobilization in many different urban sites simultaneously caused activists adopt and enact different political identities at once, the fluidity of which resulted in the loss of the common shared identity that formed the "Gezi spirit" in the early days of the episode. Similarly, the spatial fragmentation in the urban context eventually caused lack of trust, coordination and harmony between politics in different sites, forcing activists go even more local in their political practice, and embrace a narrower understanding of the common.

AGARWAL, SURUCHI* (National Institute of Financial Management, India)

Changing Face of Women

At a distance of 60 kms from high-tech Gurugram lies Mewat, the most backward district of Haryana, A saline water zone coupled with lack of water supply forces women to travel up to two to three hours to fetch drinking water. The average family size is eight in the district.

The mother involves the elder daughter in supporting the family. The elder daughter does not get time to go to school which reduces the literacy rate of women. Education is not considered as a important resource and thus, does not feature on the priority list of inhabitants

Large family sizes combined with low income leads to low nutrition for the women which results in poor health. Low medical facilities with the absence of nurses and doctors play havoc on their health.

Women work extensively on the farms but are not identified as farmers and land inheritance and ownership is patriarchal in nature. The women work up to 20 hours a day but continue to have low income.

The Haryana govt. at its end has made many efforts to improve the conditions of Mewat by opening hospitals, anganwadis, schools and colleges and developing infrastructure but have not been able to bring about an effective change

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

A more realistic way would be to identify public spending areas which give more advantage to women and girls. Then we would have to work towards improvising the financial policies to provide more funds in the identified areas which will provide advantage to women and girls.. Without increasing the budget of the district but by some changes in the policies can have far reaching effects.

Giving the policies a gender lens would have a greater impact in development in districts like Mewat.

How Does Class Matter in Politics? Drawing on 'Contradictory Class Locations' in the Contemporary Era

This paper draws on Erik Olin Wright's concept of "contradictory class positions" to analyze contemporary social movements among urban self-employed "entrepreneurial" workers within India and migrant "entrepreneurial" workers operating outside India. In analyzing dynamics of the state and poverty, South Asia scholars have curiously downplayed the role of class. Many scholars have justified their eclipsing of class analysis by pointing to the failure of working classes in themselves – determined by structural conditions—to transform into classes for themselves due to contradictory loyalties such as caste, community and locality that provide alternative vectors for mobilization. Such widespread inattention to class analysis needlessly sacrifices analytical power on why such failures in transformation are occurring. Wright showed us long ago that class is a relational concept, and class analysis thus requires a spotlight not just on waning class power at the bottom of society, but also the strengthening of class power at the top. To this end, this paper examines the messy terrain of those operating in "contradictory class positions" and how the identity of "entrepreneur" links workers with elites. This paper begins with the premise that class is relational (as important at the top of the social hierarchy as at the bottom); dynamic; and scale dependent. Class is an ever-present fact of life, but class structures and organizations are ever-changing and hard to observe, especially at the top. Moreover, class identities are mutually determinative, not mutually exclusive, with other ascriptive identities. Class actors operating in contradictory class locations are organizing *for* themselves, but in ways that differ from traditional labor movements. These findings have implications for our understanding of political mobilization today.

Inter-African Social-Scientific Cooperation in the Era of Decolonization: A Case of Science Diplomacy

Studies of trans-imperial cooperation in the scientific field have privileged the first decades of the 20thcentury when the movement was clearly pushed by private and non-governmental actors. There is also a rich literature on the history of the post-war international organizations, the United Nations (UN) and its specialized agencies, Food and Agriculture Organization (FAO), International Labour Organization (ILO), United Nations Education, Science and Culture Organization (UNESCO), among other. Still, the coordination of science with foreign policy in the era of decolonization is still largely unexplored. With respect to Africa South of the Sahara, the post Second World War opened a new cycle in the technical and scientific collaboration driven directly by the European colonial empires. This change in the nature, scope and scale of inter-African technical and scientific cooperation has to be understood as part of the post-war state policies for reinvigorating and re-legitimating colonialism trough developmental programs. It also must to be understood within the internationalization of development framework. This article intends to address the history of the Commission for Technical Cooperation in Africa South of the Sahara (CCTA) and its counselling body – the Scientific Council for Africa South of the Sahara (CSA) – from a three-fold perspective: the history of social sciences, the history of diplomacy and the history of late colonialism. Drawing on primary printed sources from the CCTA/CSA and the UNESCO and on archives from the Portuguese Ministry of Foreign Affairs and the Portuguese Overseas Research Board, it is our purpose to re-evaluate how the common aim of reinvigorating and re-legitimating empire in the era of decolonization forged a relation between (Africanist) social scientists and foreign policy officials and diplomats, and to provide new insights into ways social science influenced and was influenced by foreign policy in this specific context.

Experiencing Vocational Choices: A Case Study with Foreign Students in Lisbon's Multicultural Schools

The considerable number of foreign students completing their education in schools located in Lisbon's urban area justifies updating and widening the debate on how the educational system operates as an expert in school tracking, despite the rapid transformation of the economic, social and cultural environment. It is also demanding that the vocational choices resulting from impositions or limitations of the system are considered within the theory of modern reflexivity, alongside with certain variables implicated in the integration progress, such as host language learning, for a better understanding of the way agency is run by individuals when facing the structure. Our discussion arises from the confrontation between the future aspirations of foreign students attending culturally diverse secondary schools, and the expectations from significant others, particularly school institution as keynote advisor, when decisions have been made though not irreversibly, apparently favoring the idea of a changeable modern world but hiding, nevertheless, a damaging effect over time and human action. Our research focus on the way these students experience their vocational choices during their secondary studies, having defined it within the Portuguese track system, namely two schools whose profile meets the purposes of our field work. The current state of the art lays grounds for a case study aimed at displaying how the structure may overcome students' agency, especially if they belong to dominant ethnic and social minorities and how, in these cases, the aspirations may become frustrated, leading them to abandon their dreams and succumb to a social reproduction pattern. The qualitative methodology supported by interviews and biographic narratives collected from foreign students and school agents involved in the track process (head teachers, vocational advisors, tutors and language teachers) is expected to clarify whether there are inequalities from experts towards certain foreign minorities, notably African students, when class variable is controlled.

Transnational Corporations and Its Leaders: A Case Study about Brazil-Based Natura & Co

The research on global capitalism has emphasized the role of multinational companies (MNCs) and transnational companies (TNCs), which generally have their origins in the Global North, in the transformations brought about by globalization. Shareholders and executives are identified as active agents in this process, pressuring national states and supranational institutions in defense of structural adjustment policies, trade and financial openings that stimulate their global business. It is necessary to expand this investigation, incorporating the role of MNCs and TNCs from the Global South and the actions of their leaders in national and international forums.

This paper analyzes the transformation process of Natura & Co., formerly a Brazilian local company, into the fourth largest global cosmetics company - a TNC present in 100 countries, which has an annual income of over $10 billion, 40 thousand workers and 6.3 million sales representatives. The objective is to analyze the company's strategy of transnationalization through the restructuring of its Brazilian operations (2001), the opening of capital (2004) and the expansion of its international presence with the acquisition of the Australian company Aesop (2013), the British company The Body Shop (2017) and the iconic Avon (2019). Lastly, it is intended to analyze the political action of one of the founders of the company and leader of IEDI, the most important Brazilian business think tank. Our hypothesis is that, as Natura's international presence was expanded, such founder stopped vocalizing positions in defense of the interests of Brazilian "national companies" in favor of opening policies that benefit TNCs.

The investigation was based on ethnographic research in a Natura production unit (in Cajamar, in the industrial area of São Paulo), interviews with executives, shareholders, union leaders and workers, as well as the analysis of corporate documents, IEDI publications, statements and articles by the company's leaders in the press.

Talking about Sexual Health Concerns in Old Age: Implications for Post-Reproductive Sexual Health Promotion

This study interrogates the notions of sexual health concerns in old age by exploring how older adults(50+) conceive sexual health concerns and share such with their peers and those they felt could be of help or support to them. The findings in this paper are from 16 focus group discussions on sexual health communication in old age. A vignette that focuses on sexual health needs in old age was adopted in stimulating the discussion among the older adults drawn from selected urban spaces in southwest Nigeria. The analyses revealed a gendered disparity in the dispositions of older adults in what qualifies as a sexual health concern and associated measures. Female older adults expressed unwillingness to sharing their sexual concerns with their peers. Older males compare notes with peers and close associates on sexual performance and masculinities. Such conversation sometimes provides cues on medical and non-medical measures that can stimulate sexual desire and performance. In contrast, stigma and name callings dissuade older females from sharing their sexual concerns and on few occasions preferred talking about menopausal issues. For older males, conversation with peers was a critical source for suggesting traditional herbal remedies and self-care practices that can mitigate the loss of sexual performance. However, older females shared a sense that low sexual desire and sexual disengagement were signs of 'sexually ageing well'. There is a need for social campaigns around stigmatising and negative dispositions towards sexual health communication to mitigate the possible negative implications on sexual health promotion in old age.

Unmet Sexual Health Communication Need and Perceived Barriers to Open Communication between Older Adults and Healthcare Providers in Nigeria

Sexual health communication in old age rarely occurs in therapeutic interactions between biomedical practitioners (Physicians and Nurses) and their older adult(50+) clients. This study explores the notions of sexual health needs in old age and the communication around such needs within the biomedical system. Twelve individual(physicians and nurses) interviews and 16 focus group discussions with older adults (50+) were held in selected health facilities and urban communities in Southwest Nigeria. There were gendered variations in what emerged as sexual health needs in old age. For females, low sexual drive, menopause and dryness of the vaginal are core sexual health needs in old age. These needs contrast concerns around quick ejaculation, low libido and weak erection for older males. The desire to sustain performance and overcome weak erection was common conversation issues during hospital visits.—At such interactions, complaints around pains, an indirect reference to weak erection and quick ejaculation are brought up using verbal and non-verbal means. However, older females found it challenging to discuss, but appeared at dismissing their needs as part of the ageing process. Privacy and presence of significant others emerged as situational barriers to initiating open communication around these needs. Workload and the pressure to reduce client's waiting periods affect the readiness and quality of time physician/nurse could spend listening to clients that might be willing to share such concerns. Stigma and a sense to be socially acceptable as 'sexually ageing well' affect older females disposition towards sharing their sexual health concerns. There is an urgent need to address the barriers to promoting open sexual health communication during hospital visits and within communities and promote sexual health in old age in Nigeria.

The Collaborative Storytelling Method – a Way to Tell One's Own Story in the Name of Another?

The Islamic State in Iraq and Syria (ISIS) gained global prominence by conquering and controlling around 34.000 square miles in Iraq and Syria and proclaiming itself a caliphate. Amongst their gross human rights violations is the group's vast abuse of thousands of children in combats and combat-related support roles. These children are commonly referred to as child soldiers. ISIS followed a multifaced approach to recruit, indoctrinate and militarize children to provide itself with a transgenerational capability as well as to transcend territorial losses. It appears that ISIS recognized that for having a sustainable and loyal force required having access to as many children as possible hence the group of ISIS child soldiers is a very diverse one. We can speak of 3 different groups, based on different pathways and subsequent processes of ISIS socialization, tasks and experiences, corresponding frames of perceiving and feeling and making sense of the experiences within ISIS and afterwards in their different settings as well as group-specific ways of political, societal, and juridical dealing with:Arab Sunni children, Yezdi children, and children of foreign fighters. Since the liberation of ISIS held territories in Iraq the majority of former child soldiers have been under the surveillance and detention of the authorities in KRG and Iraq. Those who have been released are still in great fear of talking about their time as ISIS child soldiers. For understanding what these former child soldiers experienced we developed the method of collaborative storytelling that allows for expressing one's own story in the name of another by writing together as well as drawing, especially what cannot be expressed in words. This is crucial especially when it is risky and harmful for these children to tell their stories. In developing the story together with others however the own story can be integrated and told.

Engaging in Sociological Dialogues with the Roma Community: The Communicative Methodology of Research in the Creation of Knowledge with and for Society

How can sociological research contribute to better understand and tackle the most pressing challenges faced by current societies? Doing this requires from working with the different publics, taking into account their needs, while involving them throughout the entire process of knowledge creation. Drawing from the analysis of research funded by the European Commission (V and VI EU Programme of Research, and HORIZON2020), in this paper we reflect about how the Communicative Methodology of Research, a dialogic-oriented methodological approach, is being used in the sociological inquiry with the Roma community in the field of health, gender inequalities and education. We discuss the methodological strategies that it uses, engaging in an inter-subjective dialogue with the Roma subjects themselves, and thus not solely advancing in the creation of scientific knowledge, but also informing policy actions oriented to tackle the social exclusion they faced. The move from objectivist to constructivist, socio-critical and communicative conceptions has led to the development of this methodology that gathers key elements from prior research approaches, but goes beyond them in understanding that social reality has been constructed in communicative ways through social interaction. Traditional objectivist research saw the Roma as objects of the research, and taking distance from them, often reproduced exclusionary dimensions about them, something that has been outspokenly denounced among Roma and some non-Roma scholars as well as Roma communities. Subjective conceptions of research have included the voices of the subjects, but the Roma had often no say on how they ended up being portrayed so that stereotypes frequently aroused. The communicative approach breaks with these conceptions, by engaging with the Roma people in reflecting about the knowledge provided by the scientific community, and how this can serve to challenge social exclusion.

AKAHORI, SABURO* (Tokyo Woman's Christian University, Japan)

Desiring Desiring: On the Social Construction of Frustration and Emptiness

In recent years, the lack of desire especially in younger generation has been described as problematic behavior. For example, some new clichés to indicate the lack of desire have been created and become buzzwords in Japan. This presentation is not going to instigate such agitation; instead, by investigating this phenomenon, we try to shed light on the blind spot of modernity. In this meaning, it is an attempt of second-order observation on society. Then we ask: what is hidden behind these descriptions of the lack of desire as a kind of anomie?

To answer this question, we follow a sociocybernetic approach, especially "difference-theoretical approach" based on Niklas Luhmann's theory of social systems. Our attempt is summarized as follows. First, social system (communication system) is defined as a certain kind of observers (information-processing systems). Second, social systems observe by using distinctions, but those distinctions become invisible behind the system's observation (communication). Third, we apply this framework to the case of the observation on desire. When the lack of desire is observed socially, the distinction which constructs social desire is not weakened but strengthened.

In conclusion, behind the description of the lack of desire as a kind of deviance, the increasing need for desire is hidden. In the first place, the notion of desire is inseparably tied to modern capitalism and modern family. Therefore, the more the deadlock of those two becomes clear, the more desire is needed. In other words, desire is desired. However, as a result of "desiring desiring", at the negative side of the leading distinction between fulfilled desire and non-fulfilled desire, more and more frustration and emptiness will be produced and widely spread.

Dynamics of Celebration - Mapping Intersectional Identities in the City during Indian Festivals

Contemporary Indian society is a mixture of multiple lifestyles, religions, castes, languages and customs. This is also reflected in the dynamic identities of Indian towns and cities. The urban character transforms to take on different flavours during different festivals – the celebration of the Ganpati festival in Mumbai colours it in a vastly different light than the Durga Puja in Kolkata or the Kumbh Mela in Allahabad. The religious nature of the festivities and hence the character of the urban realm and the behavioural patterns of users are vastly different, ranging from the rigid to the fluid. Some festivals, like the Hindu festivals of Holi, are seen more as a celebration driven by the convergence of the locals and these festivals attract diverse participation – it would not be uncommon to see a

confluence of identities here. However, other festivals like the Kumbh Mela carry undertones of reverence and religiosity. The norms of participation are well-defined here – barring the odd tourist, such festivals are thronged by worshippers of specific religious identities who are expected to follow the established customs and traditions. The varied nature of these festivals may indeed be seen as an extension of the public realm of Indian cities. The urban discourse is driven by the pluralistic identities that inhabit the cities and consequently, the urban experience is different for different sections of the populace. This paper seeks to study the transforming nature of selected Indian cities during times of celebration to explore how it is negotiated by different communities with several, often intersecting identities to create vastly different, complex urban fabrics.

AKHMETIANOVA, RIMMA* (Institute for Strategic Studies of the Republic of Bashkortostan, Russia)

Mechanisms for Building Public Trust in the Municipal Self-Government Bodies in Russian Society: A Case Study of the Republic of Bashkortostan

This paper is devoted to the problem of public trust in the municipal self-government bodies, which directly affects the level of social activity and participation of citizens in solving the issues of local importance. To identify the factors affecting the public trust in the municipal authorities, we use the monitoring-based results on topical problems of the local self-government formation and development obtained in the Republic of Bashkortostan between 2011 and 2019.

The dynamics observed in the people's vision on key problems of economic, political and socio-cultural spheres shows considerably increased concerns over socio-economic challenges, decline in real income and the state of family budgets. The problems of financial survival have obviously shifted to the centre of everyday life for the majority of the population.

This is especially evident against the fact that the perception of the problems at the next relevant level, including the quality of life, healthcare, education, etc., remains almost unchanged over the recent years. At the same time the opinion starts to spread that authorities are insufficiently attentive to people and do not take adequate account for their needs.

Analysis of the monitoring data attests to the current decline in trusting local authorities, district and city leaders. The exceptions are the heads of rural settlements who enjoyed greater trust in 2016 to 2019. However, an increase in trusting the heads of rural settlements is observed against the background of declining trust in the heads of rural districts.

Thus, the process of the formation of social relations building trust in local authorities among the population is still characterized by the imbalance in the subjective relations between government and population. It is clear that the formation of people's trust in local self-government bodies lies in creating equal partnership and enabling the population to influence the decision making process.

AKIN, HAYDAR* (CNRS - Centre national de la recherche scientifique, France)

Pause Program: Welcoming Policies of Exiled Academics from Turkey

The aim of this project is to study the dynamics of migratory flows and the reception of scientists in danger. The PAUSE program established on January 16, 2017 in France to host scientists at risk, and supports their activities. Until the establishment of the Pause program, France previously had no mechanism in place to provide assistance to scientists under threat. A large part of academics in danger has been coming to France from Turkey with this program because of the systematic, large-scale attacks on academic freedom especially after the Peace Petition.

In 2016, the Turkish academic field is at the forefront of the sociopolitical upheavals in Turkey. Symbolized by the Peace Petition, Academics for Peace, the social movement led mainly by academics militates for the cessation of interventions by the Turkish army targeting the areas of eastern Anatolia populated mainly by the Kurdish people. The Peace Petition also aims to publicize the many human rights violations and international treaties signed by Turkey relating to torture and other forms of "unconventional" violence. The reaction from Turkish President was oppresive. The signatories were accused of using terrorist propaganda to undermine national security.

This Peace Petition is going to condition the two great trajectories chosen by the Turkish academics, choosing France or Germany as the main land of asylum, for those who able to leave the country.

Academic freedom has a long and multifaceted history (Hayes, 2009; Hofstadter, 1955) and there is no universally accepted definition of academic freedom (Hayes, 2009; Russell, 1993). My endeavour is to examine and analyse the theoretical side of academical freedoms by the example of exiled academics from

Turkey who welcomed in France. The methodology is based on interviews with exiled academics. Archives are also useful including archives dealing with scientists struggling with political power, totalitarian governments.

Living in Extreme Poverty: What Does It Mean for Older People?

Older people are growing majority among the extreme poor. Their experiences of extreme poverty are qualitatively different making them as a unique case in the poverty discourse. Without a detailed understanding of the lived context, their poverty will be impossible to address. Findings of the paper emerged from qualitative panel dataset, collected in a semi ethnographic manner, from 12 HHs followed annually over five years.

Results indicate many important interacting and overlapping dynamics related to ageing and extreme poverty. Respondents are found not only asset/income poor but also vulnerably relation poor which exacerbates their level of destitution, marginality and vulnerability. Fractured intergenerational relation/bargain and absence of state-led support force them to work beyond the ideal working age in labour intensive sectors with discriminated wage rate. Majority live either through begging or working as a domestic help but mostly paid in kind, another source of deprivation. Access to social protection depends on their political loyalty and strength of connections leaving most of them excluded. Survival and coping ability of the older people are often challenged by disasters, external shocks and stresses indicating to a lack of resilient infrastructure and support system. Majority of them are landless and reported severe housing problem. Living in own land has been frequently mentioned as an indicator to live with dignity.

The lived experiences of the older people in such precarious living conditions are tantamount to gross ignorance of rights and entitlements. This ignorance of the state, society and the family would be too costly for Bangladesh to afford in the long run. Need based state-led support, access to stable and modest safety-nets with proper insurance mechanism can ensure a decent ageing future. Simultaneously, ageing sensitive policies, long term plans and programmes, community based ageing interventions involving different generations can bring faster changes.

AL-HARDAN, ANAHEED* (American University of Beirut, Lebanon)

South-South Anti-Colonial Thought and Theory

The occlusion of the question of colonialism and empire in mainstream sociological theory is symptomatic of the discipline's European origins, history and resultant theory. In this paper, I argue that a shift in the discipline's theoretical and empirical geography of reason entails a reconsideration of the decolonization era as well as the south-south anti-colonial solidarities that it enabled as sites of social thought and theory. To this end, I consider a transnational moment in the Arab world that saw Egypt position itself as the successor of the Afro-Asian Bandung Conference (1955), which, in turn, enabled Arab anti-colonial activists and thinkers to look to, and be a part of, tricontinental movements and different forms of south-south political and cultural exchange. By analyzing the political literature of this era, particularly that which emerged around the Cairo-based Afro-Asian Peoples' Solidarity Conference (1957), I examine how various thinkers and activists attempted to theorize the idea of Afro-Asian anti-colonial solidarity. In conclusion, I address whether these south-south circulations can indeed form the basis of a Global South genealogy of anti-colonial theory and a possible decolonial social theory of resistance for today.

ALANEN, LEENA* (University of Jyväskylä, Finland, Finland)

For a Global Sociology of Childhood: Ambitions, Pitfalls and Possibilities

This paper starts with the conviction that a *global sociology of childhood* is possible to construct. Such an ambition is necessary if we wish sociological work on children and childhood to take seriously the challenges set by global processes and bring the field to join the worldwide struggle against inequalities affecting marginalized populations, especially children, on both a global scale and at the level of children's daily realities.

One crucial instrument for moving in this direction exists in the scientific literature on *post-coloniality*, produced by now by more than one generation of scholars and writers. Although this literature by no means speaks with one voice, it does effectively confirm the 'Westerness' or Eurocentrism of the sociological canon, down to its theories, concepts and categories. The implication for sociologists of childhood is to put to the test their own theories and concepts and to recognize their possibly limited, parochial validity. Another area in need of critical thinking

are the underlying philosophies some of which orient childhood research to directions which are not conducive to adequately sociological understandings (called 'decorative sociology', by Rojek and Turner (2000), also Vandenberghe (2018)).

The paper examines these and other impediments as well as prospects for generating a (re)constructive research programme for a global sociology of childhood.

Literacies or Numeracies As a Resource of Occupational Prestige?

Informational capitalism makes of literacies a central issue of the production processes, demanding new skills to its workers. Our objective is to analyze the paper of literacies in the development of the socioeconomic status in the late capitalism. Our results highlight that language(s) have become crucial in the current classification of labor market, in terms of wages, educational level, and in summary, occupational prestige.

The results highlight the centrality of literacies and language(s) in the development of occupational prestige, and locate numeracies and other new literacies (as communication, digital or professional and entrepreneurship literacies) or intellectual capacities in a secondary and/or restricted space.

This is the result of a multiple regression and a partial least squares regression (PLS) analysis of a socioeconomic index compared with abilities, skills and knowledge variables related with occupations. The analysis uses the 1.293 occupational equivalences coming from two big occupational data bases. The first one is the International Socio-Economic Index (ISEI) of occupational status, which estimates 436 occupations from the International Standard Classification of Occupations (ISCO) developed by the International Labour Organization (ILO). This is a database constructed with a wide range of international surveys. The second one comprises a wide range of the 240 abilities, skills and knowledge variables collected by the Occupational Information Network (O'Net) for the 967 occupations systematized by the Standard Occupational Classification (SOC) developed by the Bureau of Labor Statistics (USA).

Work and Language: Analyzing the Impact of Global Challenges in the Growing Linguistic Specialization of Occupations

This communication presents the main findings obtained from a cross-national empirical research aimed at analysing the role that traditional and new literacies play in nowadays employment relations in the more general context of a global and informational society. Our results highlight that literacy(ies) and language(s) are not a scarce resource, but have become crucial in the classification of occupations within the current labor market instead. In fact, data show how (traditional) literacy becomes the most central and clearest factor of classification of occupations in current informational capitalism (34% of variance). This is main conclusion obtained after conducting a factorial analysis with 967 occupations where it has been contrasted literacy, numeracy and new literacies such as digital, communication or entrepreneurship together with a wide range of other variables such 104 enduring abilities, 66 developed skills or 70 organized sets of knowledge . The data set used has been collected mainly from the Occupational Information Network (O*Net) database (U.S. Department of Labor) and mainly derive from the responses given on surveys by of large representative samples of employers and workers across USA territory. We have also considered variables from other data bases (ISCO-ILO, ISEI, SIOPS, PIAAC). Conclusions emphasises the potential impact of literacies in employability and managerial productivity.

Meta-Organizations As Challengers and the Translation of the Access-Paradigm: Driving Forces in the Field of Refugees' Labor Market Integration in Berlin

Refugee policy in Germany is marked by a paradigm shift guided by labor market policy considerations. A highly restrictive access to the labor market for asylum seekers is partly replaced by an integration policy that facilitates access. In this paper we show that this general shift is translated in Berlin with reference to the structures of an existing organizational field of refugees' labor market integration.

Combining different field concepts (DiMaggio/Powell 1983, Hoffman 1999, Fligstein/McAdam 2012) with translation theory (Czarniawska 1996; Wæraas & Nielsen 2016) within a practice-based framework, we show how (meta-)organizations have addressed the issue of labor market integration and how they relate to established actors. The web of inter-organizational relations is crucial to understand the way how actual labor market policy is enacted in Berlin. These processes of translation have become even more important in recent years, because responsibilities shifted from the federal to the local level.

We analyze the field-level as an arena for social struggles. Especially organizations challenging the current status have chances to participate here. We show how various topics in the field have emerged and changed since 2015 driven at least partly by meta-organizations. We focus on the promotion of work-related language and show that not only political actors, local administration, language schools, employers but also a meta-organization of large companies is involved in regulating the field. We highlight that this involvement (to a certain degree) has unintended consequences for the organizations that actually founded the meta-organization.

New Youth Societies: Ethnography in Online and Offline Space

In recent years there has been a greater insertion of digital technologies in the daily life of "postmodern" society, creating increasingly heterogeneous and multifaceted cultural and social spaces. In this context, routine experiences through the publication of photos, videos and comments on the Internet, as well as experiences in the school environment, can highlight what it is to be a "young student" in contemporary times, becoming a significant research field for work ethnographic. The main objective of this study is to analyze how young people using Technologies Digital Information and Communication (TDICs) behave and live specific patterns of online sociability and how this "new" lifestyle is directly related to sociability in space school. This is an ethnographic survey conducted on Instagram and in a public high school in 2018 and 2019, with 73 students between 14 and 18 years old users of this platform for sharing photos and videos. The results show that, in general, young women access this digital platform to self-expose in order to gain more followers, while young men use it to view publications and make non-intimate posts. The data analysis reveals that these virtual interactions generate a series of individual dispositions to view, publish, comment and enjoy, for several hours, the various contents in this relationship site, within a complex system of exchanges (friendships/status) and construction of virtual capital. Finally, we conclude that there is a close relationship between the sociability practiced in the online and offline spaces, evidenced in the vacation and recess months, when the web interaction flows decreased compared to other periods of the year.

Activist Proofs: Three Big Challenges for Building Transnational Solidarity Today

This paper proposes analytical tools and an original theoretical lens to understand contemporary transformations of dynamics of solidarity by bringing theories of societal individuation processes into conversation with social movements studies.

From the notion of "activist proofs", it identifies the challenges faced by activists to establish solidarity relations in the post-2008 context. Since then a new pattern of global contestation has become visible, which connects to a wider process of digitization of the daily lives.

The theoretical perspective is applied by empirically examining on-site the solidarity relations between activists in Barcelona and Mexico. Following the "Zapatista solidarity" (1994) to the context of "indignant solidarity" in the early 2010s, the ongoing transformations of solidarity are analyzed. How have the shorter waves of indignation – e.g. Movimiento por la Paz y la Dignidad (2011), # YoSoy132 (2012) and Ayotzinapa (2014) – been performed by transnational actors.

Three major challenges are identified: the disconnect between struggles, the urgency of solidarity and "satellite participation". In the first case, the context of proliferation of different causes and collectives appears to activists as a fragmented world that needs to be sewn. It is necessary to connect territories, symbols, worldviews, individuals, struggles, history, territories, and temporalities. The second proof that is needed is the urgency of the conjuncture itself. Internationalists feel that critical events happen every day and a quick response is needed. Finally, guided by a normative ideal of participation, activists feel uncomfortable with the "satellite participation", which is possible in their contexts and which consists of being in several struggles at the same time, but inconstantly in each one of them. In addition to presenting the challenges and their relationship to structural changes in society, the paper focuses on how activists face these daily trials.

ALDAMA ANGUITA, LISSETTE* (Universidad Iberoamericana, Mexico)

Políticas De Cuidados De Adultos Mayores. El Papel Del Estado, El Mercado y La Familia En La Desafamiliarización Del Cuidado.

La investigación analiza las políticas de cuidados de los adultos mayores desde los regímenes de bienestar en Cuba y México, buscando identificar su grado de familiarización, tiene en cuenta una perspectiva de género al considerar el hecho de que las mujeres son las que generalmente se dedican al cuidado de los adultos mayores.

Se analiza la teoría de los regímenes de bienestar planteados por Esping-Andersen, las críticas hechas por las feministas a su primera versión de estos y los retos que se plantean los estados del bienestar. La influencia del cambio de la estructura de las familias en el papel de estas en la generación de bienestar, sobre todo la influencia de la incorporación de la mujer al mercado de trabajo. Se incorpora la clasificación de los regímenes de bienestar para América Latina hecha por Martínez-Franzoni, la cual adapta a la región los términos utilizados por Esping-Andersen.

Se compara el desarrollo de la política social en Cuba y México, utilizando como casos de estudio la Ciudad de México y La Habana, específicamente las relacionadas con las políticas de cuidados para los adultos mayores; así como el papel del estado, el mercado y la familia en el funcionamiento de estas políticas.

Hasta ahora no se han obtenido resultados definitivos. No obstante con la información que se tiene hasta el momento la discusión está en torno a la siguiente pregunta: ¿hasta qué punto las políticas no logran un mayor nivel de desfamiliarización del cuidado de los adultos mayores porque las familias siente que es su responsabilidad el cuidado de estos?

El tema de los cuidados es muy polémico, una de las causas son las diferentes perspectivas al respecto de todos los implicados de una forma u otra, tanto los funcionarios, como los cuidadores o los beneficiarios.

Redes Transnacionales y Academia En El Surgimiento De La Sociología En Colombia. Entre Los Organismos Multilaterales y Las Organizaciones Católicas (1959-1972)

La enseñanza de la sociología en Colombia, como disciplina profesional, data de mediados del siglo XX. El proceso resultó similar a lo acaecido en otros países de la región, en términos de la consolidación de los espacios académicos, la conformación de un equipo docente idóneo y la búsqueda de oportunidades de investigación para la incidencia en instancias de decisión en el ámbito público y privado.

El impulso dado por las directivas en distintas instituciones universitarias fue central. También lo fue el rol desempeñado por organismos multilaterales como la Unesco (1946), Flacso (1957), Cepal (1948), ISSC (1952), entre otros. La preocupación por el "desarrollo" económico, político y social de la región, en el marco de la guerra fría, hizo que organizaciones "filantrópicas" de la Ford y la Rockefeller financiaran proyectos bajo la sombrilla de la política de buena vecindad de programas como La alianza para el progreso. Se registra además el papel de las redes católicas en la fundación de los tres primeros programas de formación profesional en Colombia (el de Nacional, la PUJ y la PUB), con expertos egresados de universidades católicas europeas. La preocupación sobre la cuestión social hizo de Latinoamérica un espacio privilegiado para la cooperación católica a través del humanismo cristiano.

En la ponencia, se profundiza en las tensiones tempranas que se generaron en gracia a estos antecedentes, y los procesos de autonomización de la sociología que llevaron a un cuestionamiento crítico sobre la influencia de "fuerzas externas" en el desarrollo de la disciplina. Este cuestionamiento derivó, en algunos casos, en el cierre de los programas o en su transformación hacia nuevas corrientes interpretativas frente a la realidad social latinoamericana.

Educational and work aspirations: transitioning from upper-secondary vocational education to adulthood in Chile

The interest in educational and professional aspirations of working-class vocational students in transition to post-secondary education life trajectories has gained prominence across disciplines in different academic debates as well as in policy agendas (Garth et al., 2019; Powell, 2012; Spohrer, Stahl and Bowers-Brown, 2018; UNESCO, 2018). Yet, little is known about the meaning that disadvantaged young people attribute to their aspirations in their transition to adulthood. This paper addresses this research gap by bringing young people's perspectives on what they value in life (the normative meaning of aspirations) to the forefront of the discussion while retaining the role of structural barriers and opportunities in shaping aspirations. Through an inductive analysis of the interplay between structural and agential factors, the paper provides a complex understanding of post-compulsory education aspirations and, possibly, choices. Chile constitutes an insightful case study to investigate this topic because of its radical neoliberalist ideology which permeates public policy and culture. The access to social rights and basic opportunities is regulated by the market which exacerbates the social inequalities of an already highly stratified society (Bellei et al., 2018; Valiente, Zancajo and Jacovkis, 2019). Yet, there is a strong cultural belief in neoliberal meritocracy as legitimate mechanism of social mobility which permeates young people's narratives. Drawing on the first of the two rounds of interviews to 30 upper-secondary vocational students from the same public school this paper presents a typological analysis of aspirations based on the participants' perception of the highest opportunities available for them after compulsory education. By exploring the meaning that young people attributes to these perceived opportunities, the evidence sheds a light on the limits of traditional rational choice and reproductions theories often applied to understand choices and life projects.

ALENCAR, BRENO RODRIGO* (INSTITUTO FEDERAL DO PARÁ, Brazil)

"Fazendo Tudo Certinho": Socialization, Performance and Identity in the Brazilian Engagement

Although it is socially accepted that a couple start their married life living together, having children without being officially married, in Brazil it is common to listen to a person who inhabits the metropolitan regions and is thinking about the subject that one must "take a step". Describe and reflect on how and in what direction the Brazilian bride and groom walk in order for this "step" to lead them to marriage is the main objective of this work that combines the proposal to understand the place that engagement has in the process of socialization for married life, as well as the symbolic efficacy of the rites that characterize it in Brazilian society. As a result of the comparison between the data obtained through ethnographic recording and interviews conducted in the cities of Belém, Teresina and Brasília, we can show that in Brazil, engagement is a type of socially valued relationship because its plasticity allows to articulate traditional symbolism and rites essentially experimental, whose meanings vary according to the constructs around the identity of spouse. Their persistence in these societies stems from their own status formed by a highly prescriptive set of behaviors that can be identified in the motivation to engage, the performance of the request for marriage, the choice of dates and places of the party and the ceremony that officializes the union, the composition of the guest lists, the decision on the place of residence and its consequent organization.

Revolution without Revolutionaries, Revolutionaries without Revolution: Ideas and Outcomes in Egypt and South Africa

The paper takes its cue from Asef Bayet's book *Revolution without Revolutionaries* (2017),which highlights the limitations of the 2011 Egyptian Revolution by contrasting it with the 1979 Iranian Revolution. In Iran, democratic councils controlled factories and there was a battle of visions about the world, but in Egypt there was 'revolution without an ideology or a project' (Krastev 2014). Bayat concludes: 'the outbreak of a revolution has little to do with any idea ... but having or

not having ideas about revolution does have critical consequences for the outcome.' Echoing classical Marxism, this opens valuable comparative and conceptual debate. For instance, does the era of neo-liberalism, which followed 1979, mean that comprehensive re-thinking and re-organising are required before 'another world' becomes possibile?

But what kinds of ideas do we need? This is pursued by twisting Bayat's title and thinking about 'revolutionaries without revolution'. Here I move to South Africa, where the 'revolutionary' identity nospans ministers in a neo-liberal government, the left-populist Economic Freedom Fighters, the Socialist Revolutionary Workers' Party launched by the largest union in Africa, and others beyond. These organisations and their ideas exist alongside high levels of fractured resistance (three distinct rebellions are discernable – among the poor, workers and students). Contrasting South Africa with Egypt, discussion of the relationship of ideas to action is expanded to consider the extent to which ideas may inhibit the outbreak of revolution.

The present context gives urgency to matters raised. A new industrial revolution eliminates jobs, climate change destroys our environment, and right-wing politicians threaten war. But there is also working-class resistance, a rise of youth-led climate justice movements, and a revival of socialist politics. All these open space for engagements about the meaning of 'revolutionary', an issue at the heart of the paper.

Local Sustainable Development, Social Inclusion and Green Growth for Islands at the European Level: The Case of Tilos, Dodecanese, Greece

Tilos is a small island in the Dodecanese, Prefecture, Greece, with a local population of about 800 islanders- and around 13,000 visitors per year. Tilos as a community has revealed a quite dynamic profile as a sustainable community. Tilos is being set as the first island in the Mediterranean to run entirely its energy needs into wind and solar power. The Tilos community under the "captainship" of its Mayor has already achieved the goals of a total energy autarchy. A European research project engaging 13 participating enterprises and institutes from 7 European countries (DE, FR, EL, UK, SE, IT, ES) in cooperation with a receptive and knowledgeable mayor started the process and ended up with complete success. The Island until recently covered its electricity needs through a poor interconnection to the island of Kos. The successful completion of this cooperative effort is expected to inaugurate a new era of sustainable energy for the Aegean Archipelagos and the Mediterranean region as a whole. In the Tilos community case all three pillars (environmental, social and economic) for sustainable development were taken into account. For instance, the enhancement of social capital and cohesion included an open invitation to refugee families to settle on the island, working with the NGO Solidarity Now and the UNHCR to establish sheltered accommodation, language classes and mentoring schemes to help asylum-seekers to set up organic farming businesses in partnership with the locals. In the context of our research on the assessment tool for Community Capacity Building (CCB) for Local Sustainable Development on the Dodecanese, the present paper involves the examination of the factors which drove this unique local developmental path of Tilos.

Construcción y Reproducción De Privilegios: Una Aproximación a Apoderados De Colegios De Elite En Chile

En la presente investigación se aborda el proceso de construcción y reproducción de privilegios en Chile desde la mirada de apoderados de colegios privados de elite en Santiago. La literatura en los últimos años ha dado cuenta de una serie de mecanismos que permiten la mantención de la riqueza en una elite cada vez más identificada con un ideal meritocrático, y la aparición de nuevos discursos legitimadores de ventajas sociales en este grupo. Analizando este fenómeno desde su dimensión moral y su transmisión intergeneracional, se busca llenar un vacío desde el punto de vista empírico: la falta de la perspectiva de los apoderados al momento de estudiar las dimensiones morales del privilegio. A partir de 24 entrevistas semi-estructuradas a apoderados de 5 colegios de elite, se muestra que la noción de privilegio para los apoderados se construye desde la referencia al logro económico de sus propios antepasados (abuelos o padres), buscando actualizar permanentemente el componente meritocrático en la crianza de sus hijos. Es por esta razón que la elección de colegio tiene un componente valórico más que académico, enseñando las herramientas propias de un currículum de contenidos gerenciales que les permita a sus hijos "navegar" en un mar de oportunidades y legitimar su privilegio mirando la riqueza con distancia. Además, sostenemos que los apoderados buscan transmitir los valores morales del privilegio a partir de la continuidad entre crianza y educación formal. De este modo, los apoderados se identifican con un colegio desde la perspectiva de su formación valórica, tanto religiosa como en la relación con la riqueza, pudiendo distinguir de este modo diferentes maneras de legitimación del privilegio dentro del grupo de colegios privados más prestigiosos del país.

ALI, ZAHRA* (Rutgers University, USA)

Protest Movements in Post-Invasion Iraq: From Recognition to Redistribution?

This presentation explores the waves of protest that Iraq is experiencing since 2015. Based on fieldwork among protestors in Baghdad, Najaf-Kufa, Karbala, Nasriya and Basra, it draws on theorization on contemporary civil society and social movements. I argue that the protests allow Iraqi youth and women's rights activists to find spaces of organizing that challenge the NGOization of civil society activism. The young protestors that initiated these movements associate recognition politics to the Iraqi regime and its political elite and put forward politics of redistribution as central in their demands for radical change. Moreover, I argue that the trauma of sectarian and political violence experienced in 2006-2007 and during the 2014 Islamic State invasion makes the demands for individual freedom as crucial as economic equality and access to state services. The presentation first situates the protests within the country's social, political and economic contexts and engages with notions of recognition and redistribution. Then, drawing on theorization of NGOization, civil society and social movements, it explores women's involvement within the protests. The presentation then turns to Bayat's notions of 'refolutions' and nonmovement and shows the importance to consider the traumatic experience of sectarian and political violence to understand Iraqi youth organizing and demands.

Financial Crisis and Family or Crisis of the Family in Greece?

The economic downturn, the economic crisis is a constantly evolving situation, affecting many levels of society, shaping and imposing new conditions on social and economic situations with often adverse effects on citizens well-being making family group more fragile and more unstable.

On the other hand, the discussion on family crisis has dominated in recent decades, both in the scientific discourse and in the public opinion, while the observed weakening of commitment creates failures on many levels.

In the context of the present paper we will address the crucial issue of current trends and developments of the family in Greece. First, we will give a brief overview of the changes observed in family behaviors and family models. Then

we will try to answer whether these modifications are related to the economic crisis during last decade or are the result of the changes, as generally observed in developed countries.

ALKATIRI, WARDAH* (Universitas Nahdlatul Ulama Surabaya, Indonesia)

'Anti-Fish' Campaign: Looking into Food safety and Ethical Issues of eating Fish from Indonesia

Water pollution in Indonesia has reached an alarming level. In 2018, the country was recorded to have contributed the second largest unmanaged plastic waste to the world's oceans after China. The plastic waste problem is far larger than the trash we can see. Tiny pieces of degraded micro-plastic potentially harm human health. The micro-plastics can be present in fish, mussels, and other species. Researchers have found signs that ingested micro-plastics can leach hazardous chemicals added to polymers during production, as well as the environmental pollutants like pesticides that are attracted to the surface of plastic, leading to health effects. Alongside micro-plastics contamination, heavy metals' presence in Indonesian fishes and mussels has been widely reported. Heavy metals contamination increases proportionately with the industrialization and development of Indonesia. These metals are highly toxic to human and aquatic organism. Therefore, the public needs to be made aware of the harms associated with seafood contamination from the environment. Yet, in spite of information from popular health websites and individual doctors' advices, public health campaign to make this issue known has never been attempted this far. On the contrary, people are encouraged to consume more fish and seafood as part of the 'eat-fish movement' ('gerakan makan ikan') by the Ministry of Maritime Affairs and Fisheries. Despite abundant scientific findings, Indonesian government is very unlikely to expose health risks associated with seafood consumption. As an archipelagic state, 'anti-fish' campaign is saddled with ethical consideration for it potentially undermines the livelihood of poor fishermen communities. The food safety issues associated with environmental degradation in Indonesia reveals uncoordinated goals between health improvement and poverty eradication on Sustainable Development Goals (SDG) in the Global South context.

ALLASTE, AIRI-ALINA* (Tallinn University, Estonia)

Mobility As Capital: Spatial Movement and Movement of Ideas

This paper examines the interrelations between mobility and capitals as well as mobility as capital in itself. The theoretical outline relays on new mobility paradigm, which focuses on mobility as a socially and culturally produced motion, instead of analysing places, social processes and movement separately and ignoring their inter-relatedness. On the one hand, spatial movement increases social and symbolic capital, which is deposited in social relationships. On the other hand, youth mobility is not only about physical movement, but also about the movement of ideas and mobility comes capital in itself. Mobility capital relays on interpersonal contacts as well as shared information and ideas, which allow access to different resources.The empirical part of the paper is based on a longitudinal study of young people from Estonia who had attended youth exchange projects in different parts of Europe. Semi-structured, in-depth interviews were conducted with the participants before their mobility experience, one year after and three years after the experience. Analyses focus on how the movement of ideas is practiced and negotiated with other changes in their life during their late teens and how an increase in mobility capital influences life choices and opportunities.

Sharing City and Collaborative Governance: The Case of Collective Civic Imagination Process Implemented in the City of Bologna

Sharing and collaboration have come to prominence in the public and political discourse in the last decade. Cities themselves are increasingly described as "sharing and collaborative" cities. "Collaboration" is also a key dimension of participatory practices carried out by citizens in micro urban areas, to take care of "urban commons". Practices which are often an "hybrid" since citizens take the lead while collaborating with public authorities. Moreover, a new phase of democratic experimentalism can be observed characterized by an increasing interest of public institutions to go beyond the implementation of "time limited" deliberative arenas- widespread from the '90 in different cultural and geographic contexts- in an attempt to promote new forms of relationship between institutions and citizens to be practiced over time, to foster a process of co-production of policies and a collaborative urban governance in the perspective of a "shared administration". Starting from the framework of analysis described above in this contribution I will present the case of the city of Bologna in Italy and in particular the process

of democratic innovation promoted by the Municipality along the last 5 years, mainly with the adoption in 2014 of a "Regulation on collaboration between citizens and the city for the care and regeneration of urban commons" implemented trough the instrument of the "pact of collaboration" and in 2017 with the implementation of a new public function named "civic imagination" fostered trough the implementation of Neighborhood Laboratories every year in each neighborhood of the city and the complementary participatory budgeting, shaping what the administration itself defines as a "collaborative ecosystem". I will then critically discuss the participatory and collaborative practices and dynamics emerging in the context of this institutional innovation, particularly through the lens of the generation of a public dimension, meant as a collective and collaborative process of democratic imagination.

After 68: Rethinking the Memories and Its Contemporary Interpretations

This paper aims to analyze the meanings of the projection of the memory of 1968 in the present, considering the balances of memory and the contemporary interpretations that emerged in the last 50 years of the event. The main objective is to compose a sociological framework of the memory, which was produced in the last ten years about these global events, where can be found new meanings of interpretation of that event. The analysis begins from the historiography, the social theory and the memoirs of participants (intellectuals or militants), though bibliographical and documentary analysis, to elucidate the dynamics of memory and its meanings. Our hypothesis is the assumption of changes in the senses, interpretations, and analyze the events of 1968, especially since the celebrations of the last decades. It is identified that these transformations relate to the sense that the "celebrations" about 1968, that is, the academic, individual and collective memories and journalistic revisions of those events have been presented every ten years. For this reason, the guiding question of this investigation relates to interpreting the dispute for the meaning of 1968, and what are the meanings that have been and are currently in dispute after the 50 years of these events. It is expected to understand the reason that in the present context conservative and neoliberal dominance 1968 excels as are known experiences recognized, developed and examined. The article presents a theoretical character, starting with a bibliographical survey and dialogue with the methodologies of Historical Sociology and the History of Present Time, to obtain from the immediate past some keys of interpretation of the actuality of the interpretations and meanings of those events.

Cooperation Development and International Social Work: A Systemic Model Proposal.

The methodologies that have been used over the years in which international cooperation has established itself as a field of action and study are varied. Scholars and professionals of development cooperation have made use of a wide range of strategies and methodologies in projects whose aim is to achieve social changes efficiently in the intervened places, many of them, landing in the institutional structure of social services of developing countries.

The results in some of these projects have shown limited proposals that in the end, make not possible to arrive from the initial intentions to the final results. Often this is because they are based on a poor identification of the needs of those who are considered the beneficiary population; or on a simplistic perspective of what is considered a problem. Sometimes they are designed and executed by actors outside the context of the project itself, or do not have an integration strategy with existing institutional structures leaving in mere anecdotes, important efforts to improve the living conditions of disadvantaged groups in the host country.

We propose to analyse the above as a complex problem. Following the proposal of Rolando García (2000, 2006), we propose a model based on Sociocybernetic principles to address in the first place, a diagnostic phase oriented to the identification from an interdisciplinary perspective and an a prospective phase to address the possible emerging relationships and anticipate systemic reactions, thus enhancing the adaptive capacity both, of the project and stakeholders engaged in the process.

Social Innovation Labs and Citizen Science: A Sociocybernetics Review

This paper explore the concept and methodology of social innovation labs within the scope of citizen science, and within a sociocybernetics perspective. Citizen science is sometimes referred as public participation in scientific research, participatory monitoring, and participatory action research, although there is no general academic agreement on the notion, its characteristics, formats and processes.

As research methodology, social innovation laboratory is a space for exchange, study and experimentation that is based on participatory action research strategies. That means that the participants define the guidelines and objectives of the research process and its purpose. In addition to its participatory action research base, other aspects are added to enhance the innovation side particularly, the technological component, where information technologies predominate.

These methodologies propose a flexible format that is being used in different parts of the world to bring heterogeneous actors willing to reflect, design and collaborate on proposals to change their social or productive contexts. Unlike other forums, the social innovation laboratory seeks to identify needs together but also propose new forms of solutions. That implies, thinking beyond the stakeholder position and betting on a creative, purposeful work that values the diversity of the participating agents.

We will argue that many sociocybernetics concepts can be applied to this processes to reach a robust methodology: second order observation, positive and negative feedback, reflexivity, self-organisation among others. Applied cases in the context of Spain will be presented addressing social inclusion, community empowerment, rural development and sustainable development goals implementation. Difficulties and opportunities when including the social actors in the generation of knowledge using this approach will be debated including power relations among participants, knowledge gap, diversity in referential aspects, intergenerational perspectives, among others.

ALMEIDA, EDUARDO* (, Mexico)

Social Triage in a Franchised State

We live in a world of brands, citizens, refugees and zombies. Something that was already clear for some decades, but that the Covid-19 pandemic highlighted is that most societies are experiencing a severe lack of resources to maintain a dignified living standard for the whole of their populations. Another unsurprising realization during the pandemic was that the State has delegated much of its responsibilities in non-state actors, while at the same time it regained centrality, but not necessarily its capacity to respond.

As a result of four decades of neoliberalism, the State's trend leads to it being diminished into a symbolic and juridical framework, a brand of sorts, and a skeleton managerial apparatus. In the process of globalization the State, increasingly mistrusted, structurally weakened and fragmented, turned to a franchise model, where many of the institutional gaps have been filled by other actors that are accountable in some degree to the State itself but not directly to the citizens.

As resources become insufficient, State management and governance turns to an extreme forms of social triage. There is a shrinking percentage of people who are not only formally entitled with rights but with the conditions to be able to exercise and demand them. Then we have a large percentage of the population that live precariously subjected to humanitarian aid or police persecution. Lastly there is a growing percentage of the population that are deemed expendable.

This study focuses on one fragment of this phenomena in Mexico, one that relates to the development and infrastructure projects in indigenous territories, human rights and public financing of NGO's.

Complementary and Alternative Medicine As an Invisible Healthcare Support Workforce

In ageing Western societies where chronic conditions have become more prevalent, complementary and alternative medicine (CAM) practices and practitioners have performed an important role in areas such as health promotion, rehabilitation, and compassionate, preventative and palliative care (WHO, 2013).

Yet collaborative partnership between CAM practitioners, other professionally qualified healthcare workers, and the state, has rarely materialised. By using a neo-Weberian social closure theory of the professions, this paper explores the extent to which CAM practitioners have come to form part of a precarious and underestimated healthcare support workforce, focusing on the interlinked societies of Brazil and Portugal. It will be suggested that CAM practitioners have resembled healthcare support workers, especially in their statutorily unregulated status and/or subordinated role to the medical profession. In Brazil, CAM practices, but not CAM practitioners, are statutorily regulated; in Portugal, CAM practitioners, despite being statutorily regulated, remain marginalised. We suggest that, in the same way as support workers, CAM practitioners have been an invisible support workforce, despite increasing public sympathy for their services and legitimation by the WHO.

Complexity and the Significance of Collaboration. Interviews with Swedish Young People and Professionals in Social Services and Psychiatric Care

Enhanced collaboration between welfare state actors has been a buzzword for quite some time in the public discourse and legislation in Sweden. This paper concerns how young people as well as professionals working with them experience collaboration or the lack of it, and the consequences thereof. The study presents findings from two interview studies in two Swedish municipalities between 2017 and 2018; one with 24 professionals working with young people (13 from social services and 11 from psychiatric care), and one with 14 young people, aged 15–22 years. The young people have in the recent past been subjected to multiple and sometimes long-term interventions from both psychiatric care and the social services and are labelled by professionals as having 'complex needs'. Findings show that young people experience fragmentation in support as well as discontinuity in the relations between young people and professionals, as well as in placements. The paper highlights ambivalence in the professionals' use of the label complex needs. Professionals sometimes confine complex needs as an individual attribute. It also refers to young people's life situations. Another finding is that a consequence of organizational complexity in care and support makes a holistic perspective difficult. Implications are that when collaboration is merely based on organizational rationality rather than the young people's needs, this may have a negative impact on their situational complexity. Increased collaboration may reduce the young people's sense of complexity if they are involved in the decision-making concerning interventions for them.

ALONSO, VIRGINIA* (ITP-UNCuyo, Argentina)

La Configuración De La Desigualdad En El Cruce Entre El Género, La Heterogeneidad Estructural y Segmentación Del Mercado De Trabajo En Argentina.

América Latina se ha caracterizado y continúa caracterizándose por las marcadas desigualdades que se producen y reproducen al interior de sus países. A la reflexión sobre las profundas diferencias asociadas a los estilos de desarrollo de la región (heterogeneidades entre sectores económicos, entre zonas integradas y zonas excluidas, entre personas ocupadas en sectores formales e informales, por mencionar algunos ejemplos) se han sumado los trabajos que han buscado visibilizar la interseccionalidad de las desigualdades de género en el ámbito laboral en su conexión con las modalidades de desarrollo de los estados latinoamericanos.

En el marco de estos esfuerzos, esta investigación toma los aportes de los estudios de género y de la economía feminista para ponerlos en diálogo con el enfoque de la heterogeneidad estructural y con los estudios de la segmentación laboral. De esta manera, se construye un enfoque heterodoxo desde el cual se plantean los siguientes interrogantes: ¿Qué configuración adopta la desigualdad de género en el ámbito del trabajo productivo en relación a los rasgos del estilo de desarrollo vigente durante la postconvertibilidad en Argentina? ¿En qué medida la inserción en las distintas posiciones de los estratos de productividad y los segmentos laborales mitigan o exacerban la igualdad / desigualdad de género?

Para dar respuesta a estas preguntas se ha confeccionado una estrategia metodológica de tipo cuantitativa que ha utilizado datos provenientes de la Encuesta Permanente de Hogares, de registros administrativos del Sistema Integrado Previsional Argentino y de la Dirección Nacional de Cuentas Nacionales. Como resultado, la ponencia presenta hallazgos empíricos que permiten conocer tanto la vinculación entre el uso de la fuerza de trabajo según género y el modo de desarrollo argentino como las diferencias que existen entre las mujeres que se ubican en distintas posiciones sociales.

RC09-112.4

ALONSO, VIRGINIA* (ITP-UNCuyo, Argentina)

Obstáculos Para El Desarrollo Con Equidad En La Argentina Del Siglo XXI. Una Mirada Al Mercado Laboral Afectado Por La Heterogeneidad Estructural Durante 2003-2013.

Desde la emergencia del campo temático del desarrollo/subdesarrollo, diversos enfoques se han abocado a la identificación y examen de las dificultades para el logro del aumento de la riqueza social junto con el mejoramiento del bienestar de la población. El presente trabajo se ubica dentro de estos esfuerzos y toma un periodo de particular relevancia en la reciente historia argentina.

Más específicamente, se aborda la década de crecimiento económico posterior a la crisis de 2001. Esta década resulta de especial interés ya que luego del estancamiento económico y bajo crecimiento durante las últimas décadas del siglo XX -culminadas en el colapso de principios del siglo XXI-, Argentina experimentó un elevado ritmo de aumento del PBI y marcadas mejoras de los indicadores sociales y de ingresos. Sin embargo, este desenvolvimiento encontró obstáculos para el avance hacia un proceso de desarrollo con equidad sostenido en el tiempo.

Rescatando las contribuciones del estructuralismo latinoamericano relativas a la heterogeneidad estructural, la ponencia busca precisar esos escollos mediante el análisis de los efectos del comportamiento de los estratos de la estructura productiva heterogénea sobre el mercado laboral. Para ello, se ha formulado una estrategia metodológica que ha utilizado datos provenientes de diferentes fuentes oficiales (fundamentalmente información provista por la Dirección Nacional de Cuentas Nacionales y la Encuesta Permanente de Hogares). Como resultado, se ha encontrado que la persistencia de la heterogeneidad estructural se asocia con problemas para la generación de empleo, mejora de las condiciones laborales y reducción de las desigualdades en los ingresos durante el periodo de estudio.

Socionatural Disaster Risk Management in the Brazilian Federative System

The institutional framework of each country greatly influences the formulation and implementation of public policies within its territory. Federative systems are based on the compatibility between autonomy and interdependence of governmental entities and the sharing of power and duties. Therefore, successful policies depend significantly on the coordination and control among the related parties (Abrucio, Franzese 2007). Brazilian federalism consists in a particular case of three federative autonomous entities—federal, states, and municipalities. In the case of socionatural disaster risk management, the National Center for Natural Disaster Monitoring and Alerts (CEMADEN) is the federal agency responsible for monitoring and issuing risk warnings. But some municipalities—usually the largest—also have their own warning systems. CEMADEN is linked to the Science and Technology Ministry and the Regional Development Ministry is responsible for the policy formulation. The implementation responsibility is municipal, as established by Federal Law 12.608/2012.

This paper discusses the institutional arrangement of disaster risk management policy in the Brazilian federative framework and its main characteristics. In terms of methodology, we selected four municipalities of São Paulo from three main criteria: population size, level of economic development and distance from the capital. We've conducted 16 semi-structured interviews in the main municipal protection and civil defense agencies, as well as other public institutions that could dialogue with risk management, such as urban planning, public works and other related areas. The main challenges observed were grouped: vision about the disaster risk management and the role of civil defense; governance; technical questions; and administrative questions. Similar to other public policies in Brazil, we conclude that responsibility is mostly in municipalities, where capacities are limited, and regional heterogeneity are very significant within the country. Fur-

thermore, since disaster risk extends beyond municipal boundaries and involves different sectoral policy areas, regional cooperation and intersectoral coordination emerge as additional institutional challenges.

Feminist Responses Against Embedding Gender Power Relations

Hackerspaces are workshops organized with an open community model where people with technological interests can socialize, collaborate, share and expand their knowledge (Berrebi, Bureau and Lallement, 2018).

These organizations are presenting gender equity problems corresponding particularly to the under-representation of women: this situation recreates another form of symbolic domination relationship between dominant (those who master, male) and dominated (those who are in demand of knowledge and recognition, women).

Despite important contributions of women, development of digital technologies is an area of male dominance (Rossiter, 2010). Therefore, feminist hackerspaces emerged in Europe, modeled in contradiction to traditional hackerspaces.

These issues lead to questioning how much of the new technologies being developed are gender-biased and tend to perpetuate the prejudice towards women still present in society.

This study concentrates on the phenomenon of feminist strategies, based in empirical analysis, from hackerpaces observed in France and European hack-meeting (Italy, Germany) from April 2015 to December 2017.

However, can digital technologies also be used to transform gender stereotypes and to renegotiate the sexual division of labor? Is gender equality, a key element for the debate on how to construct more democratic and gender equal societies? Feminists hackerspaces attempt to "hack" dominant *heteropatriarcal* patterns by reshaping the mainstream meaning of hacking, in order to gain (or regain) feminist emancipation by education and democracy.

Our aim with this presentation is to point out an inventory of feminist initiatives on local levels, and to discuss how feminist hackers address the diverse contemporary forms of resistance to hetero-patriarchal constraints.

Remedying the gender deficit is seen as a problem that can be overcome by a combination of different socialization and collective processes: The problem was not only men's monopoly of technology, but also the way gender is embedded in technology itself.

ALTINDAL, HATICE* (Bergische Universität Wuppertal, Germany)

A Detour into Adulthood. Back to School with Additional Breadwinning

Second-chance education in Germany offers an opportunity to achieve "Abitur" (highest general school degree that qualifies for tertiary education). It is a chance to correct the possible wrong decision due to an early stratifying general school system, which brings along the problem of inequality in participation in education.

There are state funded student grants; however, not every student receives this kind of support or can afford to attend school without working (part-time) jobs, i.e. they have to pay their apartment or even to provide for their families. Thus, most of the students decide to or are subjected to live under precarious conditions: Some of them have completed vocational training before, others have worked in full time jobs, but now they want to complete their education to obtain the university entrance exam (Abitur), they renounce their (well-paid) jobs and work in jobs that offer flexible working-times, even if these are precarious – in order to improve their situation with the aspired degree. There are other students whose precariousness had existed before. They have broken biographies, were unemployed and aim to get out of this with this education.

Now the question arises, why these students want to be students again, even though they might have to drop out of their jobs for this wish, have stressful phases and have to live or to continue to live in precarious conditions. In this regard, my research questions are: what are the biographies and future prospects of students who complete their secondary education? How high is agency anchored among these students? What about their amount of social capital?

My work will be a qualitative longitudinal analysis. Biographical interviews will be collected and repeated three times a year with the same students. The first wave of surveys has been completed. 27 interviews were conducted

Marginalizing Localization: Reception of US-Sociology in Ecuador

Sociology in Ecuador developed in constant relationship to sociological traditions outside of this country. Especially relevant is the relationship between Ecuadorian and US-sociology. This relationship can be divided into three moments: the early influences in the 1910s and 20s, characterized by a mixing of the most diverse traditions, the supposed hegemony of US-sociology in the 1960s, marked, for instance, by the cooperation between Universidad Central and University of Pittsburgh, and the later rejection of a largely imagined US-sociology by -also, largely imaginary- Marxist sociologists.

RC08-90.2

ALTMANN, PHILIPP* (Universidad Central del Ecuador, Ecuador)

New Classics for the New Science – Re-Reading the Basis of Sociology in Ecuador until the 1950s

Professional sociology in Ecuador started with the first chair in sociology in 1915. This led to a series of foundational texts during the 1920s and 30s that sought to define what sociology is while applying it to core aspects of Ecuadorian society. While this time was -in the Global North- marked by a growing centralization on the theories of Durkheim and Weber, the Ecuadorian sociologists preferred other thinkers in order to understand society. The result was a mixture of different theories that not always were clearly articulated but however did sustain the first relatively coherent sociological readings of Ecuadorian society.

This presentation will shed light on the way how the first professional sociology in Ecuador used the classics of sociology in a particular way in order to build a local sociology. The focus will be on the four most relevant sociological thinkers of the first half of the 20th century, Alfredo Espinosa Tamayo, Agustín Cueva Sáenz, Ángel Modesto Paredes, and Luis Bossano. They worked with Tarde, Worms, Durkheim, some German, US-American, and Latin American authors. The creation of the first School for Sociology in the 1960s meant a break with this tradition that has not been reflected adequately until today.

TG04-751.2

ALTSHULER, ALEX* (University of Haifa, Israel)

Towards a New Conceptual and Empirical Model for Predicting the Perceived Security in the Face of Large-Scale Emergencies

The main research question that the study posed was: *What components may constitute integrated assessment of human perceptions of emergencies, and how may this assessment contribute to the effectiveness of emergency preparedness?* The research developed conceptually and initially examined empirically a novel concept called "perceived secureness," which was defined and constructed as a mathematical proportion of perceived preparedness and risk perception. The concept of perceived secureness is designed to help better understand and incorporate human perceptions of emergencies into effective emergency management and evidence-based public policy. The current empirical examination viewed in parallel the national, local and household settings, focusing on perceptions regarding war and earthquake in the Israeli context. The data were collected through the telephone interviews with the respondents. The data collection process was based on phone numbers of the Israeli residents randomly picked up from the national landline phone directory.

The research results reflect, among others, the theoretical, conceptual and empirical "added value" of the concept of perceived secureness. Thus, while both perceived preparedness and risk perception were found significantly higher in all settings (national, local and household) in the case of war than in the case of earthquake, their proportion (i.e. perceived secureness) was found higher for earthquake than for war. The novelty and the added value of the research results indicate that it should be fruitful to continue with the theoretical and conceptual development of the model and to move forward with larger samples and a wider variety of types of large-scale emergencies and geographic locations.

ALVARADO MENDOZA, ARTURO* (El Colegio de Mexico, Mexico)

Youth Violence and Criminality in Latin America. a Revision of the Sociological Literature Produced in the Region.

This paper provides an overview of the wide range of juvenile violence and crime studies in Latin America. Makes a systematic revision of the literature and on the models—theoretical paradigms as well as the different methodological strategies followed by empirical researchers in the subcontinent. It also accounts for the must important findings; some of them are concurrent with the literature in the US and in Europe, while some others are different.

Violence is one of the major challenges Latin American countries are facing, and young people are central to this problem. The majority of offenders and victims of crime is young people. Studies published both within and outside the region emphasize the fact that juvenile offenders cannot be considered without analyzing the psychological and social processes. Additionally, in Latin America, those explanations must incorporate the structural factors that affect these processes surrounding youth. One must have to consider the deep and cyclical economic crises, the inherited disadvantages, the structural inequalities, and the lack of fundamental rights that impact what it means to be/become youth and, specifically, a youth offender in the different territorial urban and social contexts of the region.

In the Latin American region, youths are affected by lethal armed violence, defined as *youthicide* and *feminicide*, and as well as other crimes that have specific regional traits, like disappearances related to organized crime or military interventions; or abductions and harassment by the gangs in Central America or by other mayor criminal groups from Brazil, Colombia, and Mexico. They are the must likely victims or personal for forced recruitment. Young women are even more affected and are systematic victims of sexual, educational, racial and political harassment and also are the victims of daunting *feminicides*.

The author takes into consideration the juvenile judicial reforms that have created a hybrid system.

Democracy, Authoritarianism and Human Rights: Reflexions on the Notion of Socially Implanted Authoritarianism

The last five years have witnessed the resumption of questions about the fate of democracy on a global scale. The pessimism that marks most of the current analysis contrasts with the optimism of the 1980s and 1990s, when the end of the Cold War led countless theorists to diagnose the inevitability of democracy worldwide. However, in parallel, Brazil observed the exponential growth of its statistics related to violence, raising public and specialized debates about the causes of this phenomenon. At this moment, through the notion of Socially Implanted Authoritarianism, Paulo Sergio Pinheiro inscribed the USP's Center for the Study of Violence in a perspective that sought to rescue in history the long trajectory of forms of oppression undertaken in the practices of Brazilian society. Beyond institutional transformations, the challenge of disputes that resulted in the updating of certain authoritarian, elitist, and hierarchical structures had to be considered. This paper, starting from the experience of the Brazilian democratic transition, aims to look for the possible approaches and tensions between the debates around authoritarianism and its persistence and the sociology of violence, as formed in Brazil from the 1970s. Therefore, the paper will be structured in two parts: (I) the discussion about the relationship between authoritarianism and violence, from the notion of Socially Implanted Authoritarianism and (II) the mapping of the more specific bibliography about the causes of violence (especially urban) in Brazil. From the dialogue between two keys of analysis on the causes of violence, it will be possible to better understand contemporary issues, such as the obstacles that challenge the realization of Human Rights and the way the discourse of public insecurity is politically explored today.

ALVAREZ-BENAVIDES, ANTONIO* (CADIS Internacional - GRESCO Universidad Complutense de Madrid, Spain)

Ethnonationalism and Identitarianism in Spain. Changes and Continuities in the Spanish Far-Right Wing

Spanish far-right has been always connected with the regimen of Franco. Their claims, styles, symbols, ideology reclaim the glorious past of the dictatorship.

But in the last years, we can see an important change with the born of new far-right groups, some classics political parties as Vox, that they do not define themselves as extreme right, but they combine all the characteristics of the European far-right parties, and others absolutely new, the so-called alter-right or the alter-activism of the extreme right, as Hogar Social.

The basis of its ideology is Spaniardness. They reject diversity as a whole. The ethnic and linguistic diversity of Spain, sexual diversity, ideological diversity and, of course, feminism, all of them put the Spaniard identity and the unity of Spain at risk. The independence process of Catalonia is a clear example, for them, of the consequence of losing classical values. The nationalist exaltation is articulated into an identitarian and an ethnopluralist discourse but no longer makes direct reference to the Franco regime, to Catholicism or these traditional elements. In this context many people who support these groups consider neither them nor themselves to be extreme right, but just real Spaniards.

That is another important characteristic of the nowadays Spanish identitarianism, many of the ideas normally associated with the extreme right, such as the defense of national unity or the primacy of Spaniards' rights over that of immigrants, are being naturalized and normalized by Spanish society, passing the ideology on and to the platform of more moderate parties and supported by a public that does not identify itself as extremist, extreme-right supporters or fascist.

In this text, we will analyze the different fields, scenarios and ways in which the identitarian ideas are being developed in Spain.

Persistencias y Cambios En Las Formas Del Activismo Juvenil En Movimientos Sociales: Analizando Activismos Juveniles En El Estado Español

El 15M de 2011 significó un momento de implosión de movilizaciones, protestas y movimientos sociales y, a su vez,de explosión de nuevas formas, articulaciones y movimientos sociales. Urde sus raíces en un buen número de acontecimientos sociales y de transformaciones en el ámbito de los movimientos sociales. Los jóvenes habían adquirido un renovado protagonismo poco visto en lustros anteriores, nuevas cohortes de activistas cuestionan el orden establecido a través de prácticas subjetivas, usando de manera masiva las herramientas virtuales sin dejar de lado las redes físicas de sociabilidad más amplias (que sirven como canales de transmisión de ideas), con unos estilos innovadores de *reclamarlas calles*y ocupar el espacio público para visibilizar mediáticamente sus demandas, y poniendo en el centro del debate público temas centrales que marcan la agenda. Es, a su vez,el resultado y el germen de movimientos de gran impacto, como el activismo por una vivienda digna con la aparición estable de la Plataforma de Afectados por las Hipoteca (PAH) y sus múltiples asambleas barriales de vivienda o, más recientemente,la renovación del movimiento feminista que se manifiestaen la alta presencia juvenil en las huelgas feministas del 8 de Marzo (8M).

El propósito de nuestra comunicación es analizar cuatro tipos de activismos (JSF, 15M, PAH y activismos feministas juveniles en el 8M), caracterizados por diferentes procesos de innovación estratégica y su difusión interna. Son formas de contagio político impulsadas por los jóvenes, y que emergen de iniciativas de participación juvenil, en un hilo temporal que va de 2009 a 2019, a partir de fuentes primarias y secundarias de investigaciones propias que hemos desarrollado estos años anteriores. Además de estas investigaciones cualitativas previas, también analizamos datos cuantitativos de contexto a partir de la Encuesta de Juventud 2016.

Virtual Activism in Chile through COVID-19

In 2019, Chile experienced massive social unrest that continued into the global coronavirus pandemic of 2020. After the metro fares were increased in the nation's capital, Santiago, students began a fare-dodging movement as a response. This resistance led to further movements addressing income inequality, inadequate health care systems, and other institutional social problems. Addressing the pandemic, the government mandated curfews, "stay-at-home" orders, and quarantines, deterring protesting in public spaces. The rising question is, how have Chileans adapted to limited physical freedoms, and how have they used social media and the internet to continue resistance. This work aims to understand the changes in approach to activism in Chile, from physically oriented speech to virtual communication through social media networks. By analyzing and comparing online posts on Instagram, we can compare the manners in which activist-oriented pages and governmental institutions address national reform and promote consensus on how to manage social problems.

Sociotechnical Controversies Involving the National Biodiesel Utilization and Production Program

Climate change and energy security are increasingly present in technical and scientific issues in public policy and in the public debate surrounding national development. Biodiesel as an alternative energy source was included in the Brazilian energy matrix in 2005 through the National Program for the Production and Use of Biodiesel (PNPB) and, since then, has produced a series of socio-technical controversies. The main controversies found in our research are economic (relation between oil supply and demand; inflationary risk); social (family farming and soybean and palm oil monoculture; social fuel seal); technoscientific / environmental (scientifically stabilized and "wild" raw materials, level of greenhouse gas emissions in production). This paper aims to present an overview of these controversies over the 14 years of the policy's existence, focusing especially on the changes in its objectives. The methodology used in this research consisted of interviews with researchers who produce knowledge in the area of biofuels, news mapping in the media, and analysis of policy documents. The main hypothesis is that the changes in policy, which promoted the use of certain raw materials over others, and the flexibility of the perspective of social inclusion, intensified the techno-scientific / environmental and social controversies.

How Much I Walked to Get Here! Analysis of Young Adults' Life Courses Attending VET Provisions

This paper focuses on the analysis of life and education pathways of young adults attending VET courses, based on life course theory (Heinz et al. 2009; Walther, 2002, 2006). The adoption of this theoretical perspective allows emphasizing the agency and the role of the individual in the construction of his/her biography in interaction with the social context and the existing institutional arrangements. This discussion is supported by an empirical corpus built on in-depth interviews with 18- to 29-year-olds attending VET courses. Data analysis reveals biographies marked by geographical mobility and events that constitute true turning points in their life courses: divorces, deaths or early pregnancy. Their academic trajectories are characterized by failures, dropouts and a general feeling of disaffiliation towards regular education. Attendance of VET courses occurs for most young adults after having experienced precarious or seasonal, low-paid work. To get an upper secondary education diploma is the main motivation to which is added the learning of a profession that in some cases corresponds to the fulfilment of a vocation, but in others, it is only a non-choice. In the first case, the choice of the course is intentional and is at the service of a project where personal and professional development takes a prominent place. The strategies young adults develop are imbued with strategic rationality and reveal the ability to take advantage of the existing opportunity structure. In the second case, the profession for which they are being trained was the only one they had access to or the least bad, given their academic qualifications. The mismatch between the VET course provided and the desired one gives young adults a sense of frustration about the present and uncertainty about the future. However, in both situations, the life courses of these young adults are marked by de-standardization and non-linearity.

The Uses of Internet and the Social Media By the Teachers' Unions in the Context of the Protest Against the Devaluation of the Profession

Employment relations in the Portuguese public administration have changed profoundly in recent years, firstly under the "New Public Management" ideology and later with the austerity policies. This hit hard the education sector, particularly teachers' wages and careers.

Much of this transformation was led by the previous right-wing government. With the change of the political situation after 2015, teachers thought that the process of devaluation of the profession will stop. Despite the replacement of the cuts in the wages, the actual government of the Socialist Party continues to refuse the full recovery of the length of service frozen (9 years, 4 months and 2 days) only accepting to recover slightly over two years. This situation led to a deep protest, which takes place both in the real and digital worlds.

In this paper we intend to analyze how the teachers' unions are using the Internet and the social media in the context of this protest. Our findings show that they are being used intensively, but with different purposes. Some unions used them mainly for mobilizing; others used them basically for information. However, there is a convergence in the fact that the use that it is made do not allow us to assert that unions have fundamentally changed the way they act in the Internet, namely in what concerns the enhancement of participation. A relative exception is STOP, a newly founded union. In this case, it takes advantage of the potential of the new media through the promotion of participation, for instance, by answering the questions or comments in Facebook.

ALVES, PAULO* (ISCTE-University Institute of Lisbon, Portugal)

Workers' Participation in OSH in Portugal: A Missed Opportunity?

The available statistical information shows that accidents at work continue to have a strong incidence in Portugal, which makes this country one of the European states with one of the highest incidence rates in this field. This happens despite the progress achieved in recent years, especially in relation to fatal accidents, which have been showing a downward trend although the fluctuations observed, and that the data remains identical to that recorded at the beginning of the 1990s.

Therefore, and notwithstanding the fact that matters related to OSH are legally regulated in detail, working continues to be an activity that involves numerous risks in Portugal (Areosa, 2011), which has been accentuated in the current context of a deep devaluation of work and of a growth in labour market deregulation.

This situation calls for the need to deepen the joint action of the social partners, implying the indispensable participation of workers, which is legally foreseen, and which arises as a central issue of prevention strategies, as stated by Menéndez et al. (2008: 5)

Participation can take place in two ways. The first is by the collective bargaining, through which working conditions are regulated. The second is the election of workers' representatives to OSH and their participation in specialised OSH committees.

With this paper we intend to make a review of the election of workers' representatives since 2004, as well as to assess the regulation of OHS in collective bargaining in the last three years. We will highlight the scarce number of elections held, and that in the collective bargaining the contents negotiated are in general quite generic and follow strictly the legislation, although some provisions stand out. We conclude by stating that the Portuguese unions have not been able to obtain new rights in this field beyond those enshrined in the legislation.

Body Practices: Symbolic and Cultural Measures in Quilombo Are Joseph of People in Curralinho-PA

The research about body practices in the Remaining Quilombo Community called São José da Povoação, in the city of Curralinho-PA/Brazil, intend to analyze body management, meanings and investments in body practices through body expressions and movements, identifying the cultural aspects of the black population and the relationship with education. It is based in the "Roots of Quilombo" Dance Group that performs typical dancing habits like Carimbó, Lundu and Maculelê, teaching the main movements for a group of teenagers in local schools. The members of the group are themselves responsible for making the costumes, choreography and songwriting for the presentations that are held at the town's parties, by understanding the reality of the body expressions of the quilombola community, one can approach the sociology of the body with emphasis on black body culture.

Women's Bodies As Representations of the Perceived Space in Emirati Higher Education

This presentation is concerned with Emirati women students' bodies and associations with their bodies, as representations of the perceived space and as a way of offering a glimpse into women learners' forces of inclusion, exclusion and inequality associated with their bodies. The focus will be on the perceived space represented through the physical presence of the female body, and its pure material representation, as the medium that allows for our physical existence in space and time. To explore women's bodies in space, an ethnographic qualitative inquiry was conducted at a federal university campus in the UAE, applying several levels of data gathering and analysis, including mobile and static interviews, observations and class audits. The work here is backed up by theoretical framework of Lefebvre's spatial triad, specifically his interpretation of the perceived space, and his rhythmanalysis that fits the nature of body-space analysis. The women's perceived space, as it emerged from the field work, is inclusive of, and represents women students' bodies with their associations (clothes, accessories and smells), physical movements and unique rhythms in the sensory world. The findings emphasize these women's lack of space and exclusion, and their agency in utilizing their bodies as a place of their own. The emerging types of bodily, academic, religious, institutional, socio-cultural and mobility related rhythms, reveal interesting aspects of these women's spatial reality, social forces, habits, and unique daily practices. Such bodily rhythms and representations are culturally and socially driven while being closely intertwined with their unique identity as Emirati women.

Offline and Online Intertwined. an Ethnographic Approach to the Use and Impact of Digital Media in the 2016 High School Occupation Movement in Rio De Janeiro.

The 2015-2016 high school occupation movement in Brazil is characterized by the relative novelty of its modes of action - preventing classes from being held while organizing daily activities and transforming the school into a place to live - but also by the intensive use it makes of social-digital networks (mainly through the use of smartphones). Without replacing the more traditional modes of action and communication such as meetings, assemblies or demonstrations, these digital tools are however much more than a mere accessory. As many recent studies point out (Gerbaudo, 2012; Lim, 2014), it is essential to consider the use of new technologies in social movements from the perspective of the very strong intertwining between physical spaces and digital media, between "keyboard" participation (one would rather say : "touch-screen") and the forms of participation that involve the body in its materiality. From March to June 2016, I participated in the daily life of a high school occupation in Rio de Janeiro, as part of my PhD field research. Thanks to this immersive participant observation, combined with my presence on the socio-numerical networks used by the high school students, I was able to draw a detailed ethnography of the multiple relationships between the online and offline dimensions of mobilization. This allowed me to bring to light the "hybrid media ecology" (Tréré, 2018) in which the high school occupation was embedded, essentially combining an internal interface through the whatsapp group (which served as a space for continuous discussion, emergency decision-making, collective coordination and casual chatting and joking) and an external interface through the facebook page, which served as an official communication channel, allowed the students to collectively stage their image and to broadcast on a large scale the announcement of the various organized actions and activities.

« Protagonisme » Et Autonomie : Les Défis De L'auto-Organisation Dans Le Mouvement Des Occupations Lycéennes De 2016 à Rio De Janeiro

Le mouvement des occupations lycéennes à Rio de Janeiro se caractérise par un mode d'action largement inédit au Brésil : il s'agit non seulement d'empêcher la tenue des cours, mais aussi d'organiser régulièrement diverses activités ouvertes au public (cours alternatifs, ateliers, concerts) et de transformer le lycée en un véritable lieu de vie. Les lycéens sont alors confrontés à la gestion quotidienne du vivre-ensemble (résolution des conflits, répartition des tâches quotidiennes, etc), qui devient une dimension à part entière de la mobilisation. Pour ce faire, les lycéens ont recours à des modes de décision et d'organisation qui privilégient l'horizontalité : réunions, assemblées, commissions à participation libre. Ces

méthodes font l'objet d'un véritable apprentissage, et parfois, d'une transmission d'expériences assurée par des militants plus âgés ou des enseignants en grève intégrant le « comité de soutien » de l'occupation. Par ailleurs, une grande majorité des lycéens mobilisés tend à s'inscrire dans un refus des organisations traditionnelles (« entidades ») et à revendiquer une indépendance par rapport à toute influence extérieure : les lycéens doivent ainsi décider à la fois collectivement et par eux-mêmes tout ce qui a trait à la mobilisation, s'affirmant comme les « protagonistes » à part entière de leur mouvement. À partir d'un enquête de terrain en immersion d'avril à juin 2016 au sein d'une occupation lycéenne à Rio de Janeiro, je tente ici de décrire dans sa complexité le défi que pose au quotidien l'apprentissage de l'auto-organisation et des méthodes de prise de décision horizontale, tout en tentant d'éclairer la construction récente d'un imaginaire de l'autonomie qui puise largement dans les traditions anarchiste et alter-mondialiste.

Gender and Migration: Transnational and Intersectional Prospects By Anna Amelina and Helma Lutz (Routledge, 2019)

From its late beginnings in the 1970s and 1980s, interest in the topic of gender relations and migration has grown. Gender and Migration is a textbook that seeks to introduce and connect the most relevant sociological theories of gender relations and of migration studies; it considers ongoing transnationalization processes at the beginning of the third millennium a driving force of current migration movements. Using an intersectional lens key issues of migration are explored as fundamentally gendered processes. Intersectional theory, queer studies, social inequality theory, and the theory of transnational migration and citizenship are brought together and illustrated by means of various empirical examples.

AMETOWOBLA, DZIFA* (Technische Universität Berlin, Germany)

Digitalization: Competing for Control of Societal Innovation through Software

Digitalized societal innovation is fundamentally dependent on software. I propose to use the software used in digitalized social processes as entry point to analyze how, by whom and for which purposes digitalization shapes social processes and is shaped by them. To this end, I put forward a sociological perspective on software that reconstructs the complex interconnections of social systems that shape software development and use.

Practices of software use result from users' interactions with the software and the rules and dynamics of the societal relations in which users are embedded (Orlikowski 2000). Both software and rules can be regarded as attempts to control user behavior and thus contingencies of the social (Mormann 2010). Organizations and communities of developers produce software because they want to utilize users' desire for new forms of communication and interaction to achieve their own purposes. Software is not only contingent upon developers' purposes, but also on the social systems that influence its production. Since usage information feeds back into software evolution, a sociological perspective on software can trace back these influences to the systems that use, develop, finance, regulate or standardize software (Pollock et al. 2007).

By reconstructing how control shifts between social systems that compete in influencing software usage, we can analyze how the objectives of software users, producers, investors, regulators, bodies of standardization and others shape societal innovation.

AMETOWOBLA, DZIFA* (Technische Universität Berlin, Germany)

The Social Complexity of Software: Tracing Back Processes in the Software Life Cycle to Surmount the Plurality of Perspectives in Sociological ICT Research

Research about the uses of ICTs in social and political life comprises a plurality of subjects, theories, and methods. One common denominator is that the object of research is always fundamentally dependent on software. I put forward a sociological perspective on software, which traces back the interconnections of social processes that try to influence social life through ICTs. The perspective fits a variety of subjects, theories, and methods and thus provides common ground for discourses in Digital Sociology. Practices of software use result from users' interactions with the software and the rules and dynamics of the social contexts in which users are embedded (Orlikowski 2000). Both software and rules can be regarded as attempts to shape social life by controlling user behavior. Organizations and communities of developers produce software because they want to utilize users' desire for new forms of communication and interaction to achieve their own purposes. Software is not only contingent upon developers' purposes, but also on the social contexts that influence its production. Since usage information feeds back into software evolution (Pollock et al. 2007), a sociological perspective on software can trace back these influences to the contexts that use, develop, finance, regulate or standardize software.

My perspective systematically traces back the "involutions of agency" (MacKenzie 2006) that characterize ICT development and use. By locating their research objects in the web of processes created during the software life cycle, researchers can relate their work to other investigations about ICT-related social change.

AMORIM, CAMILA GABRIEL* (Pontifícia Universidade Católica de Minas Gerais, Brazil)

Theory of Life History and Theory of Life Course: Convergences and Contributions to the Study of Infrational Trajectories of Boys and Girls

The proposal in question, sought to analyze to what extent the theory of life history can converge with the theory of life course, and thus analyzed, how the dialogue between the two theories constitutes as an important analysis on infringement trajectories in the scope of criminology . The proposed study had as main objective to raise a debate about the perception constituted among criminologist sociologists of the theory of development and of the life course, that the research used to analyze the trajectories of infraction of adolescents, theoretically anchored in the theory of the life course, they must prioritize the use of quantitative studies, with a predominance of statistical analysis, to the detriment of qualitative studies, with the use of life history to deepen the questions about social trajectories. This argument was built from the distrust of sociologists about the use of life history, specifically when it comes to studies that use only the self-reports of the research subjects, who, according to them, may present distorted data by the interviewee. Given this, this study proposed to deepen the study on the theory of the course of life, from the origin, main North American, European and Latin American exponents, until its main modifications. As well as presenting the study on the theory of life history, its origin, its main exponents in the French and German context and its use in sociological studies. And to analyze the main convergences between the theories of the course of life and the history of life and the importance of this junction in the studies on infringement trajectories.

AMOROSI, LUCIA* (University of Milan, Italy)

The Italian Care Regime: Persistent Informality and the Role of Mesolevel Organizations.

The theme of migrant domestic work plays a crucial role in our everyday life and our societies. In Italy, the increase in female participation to the workforce since the '70s has provoked a real care shortage, due also to the familistic welfare system that characterizes Mediterranean Europe. Care regime, in fact, seems to be still strictly linked to gender regime according to which domestic and care work

denotes a presenting author. Abstracts are organized by first presenting author's last name.

are still conceived as women's burden. On the other hand, the recent transition that Italy has faced, starting as an emigration country to become an immigration country, has generated a strong presence of labour supply, shaped also by the peculiar migration regime in terms of migration laws, rules on residency and cultural norms. The historical and structural invisibility of care and domestic work linked to the sexual division of labour intersects with the juridical invisibility that affects migrant workers'life. This invisible dimension is relevant even more when it is translated into heavy working conditions and exploitation within the strongly informal italian labour market. Focusing on the italian case, I detect the different realities of northern and southern Italy (Milan and Naples), characterized by very different rates of labour informality and I analyze also the recent impact of employment agency operating at the mesolevel, in order to grasp how this kind of care organization interacts with the widespread labour informality. This reality, in fact, has recently developed also in Italy, although networks and communities still play the major role at the mesolevel of care regime.

AMOROSO GALBIATI, LÍGIA* (, Brazil)

Women's Role in the Climate Change Debate

In a global context, some groups benefit from environmental exploitation while others suffer from the negative consequences of environmental degradation. Thereby, addressing environmental issues through the perspective of power relations and social inequalities is essential to find appropriate and effective solutions. This perception opens a new field for investigation, in which gender is an important category to assess the dynamics between the human being and the environment.

With regard to climate change, the discussion of gender issues generally takes place at two levels: (1) about women's specific vulnerabilities to negative effects and (2) about the potentials for broadening their political participation. The historical construction of this theoretical field occurred intimately to activism in the area. This has outlined how international documents and policies address this theme: crystallizing essentialist views on the category of women. Thus, women play two ambivalent roles within the debate: more vulnerable and more virtuous, that is, victims of climate change and saviors of humanity.

There are several criticisms and discussions of how these essentialist and universalist attributions have negative implications for the environmental debate, limiting theoretical development and leading to ineffective political programs.

Currently, some discussions establish a dialogue with intersectional theories. From this perspective, the way women relate to the environment is also a result of their economic, racial, ethnic, age, political, cultural contexts, which may result in different perceptions of environmental issues. More than just broadening women's political participation in the climate-related political agenda, we must consider the contexts of these women. This way, it is possible to understand its own specificities and in its potential contributions (or not) to mitigation and adaptation proposals.

We then point to the need for empirical studies that elucidate women's participation in policy discussions on climate change issues, considering different contexts on a local scale.

The Rise of an "Indocile Middle Class" in Cameroon

New economic and consumption patterns and open forms of political participation are widely considered as key features of the rising middle-class in Africa. This article focuses on another, subterranean, feature of the rise of a middle-class: processes of subjectivation, understood as the construction of oneself as an actor of one's own life, against the hold of political, cultural or economic domination. Cameroun offers a particularly interesting case study, as the authoritarian regime impedes the rise of middle-class political citizenship while maintaining the hold on politics, economy and society by a wide patronize system. In this adverse context, our series of life-course interviews show the emergence of new subjectivities in citizens from the generation marked by the repressed 1990 democratization protests. The subjectivation processes they experienced led them to become entrepreneurs in economic, media, cultural or social projects, developing initiatives that are not political in a strict sense but contribute to transform their society and entail criticisms toward the hold of the society by the authoritarian regime.

AMOZURRUTIA, JOSE ANTONIO* (UNAM, Mexico)

The Adaptive System for Social Analysis, Sias

The socio-cybernetic analysis can be performed from different social theories. In this paper I present an operating system that starts from the concepts of Walter Buckley's social adaptability and principles of general systems theory. The system take into account the cybernetics of Wiener and the second reflexivity of Heinz von Foerster. The system is built by the genetic epistemology of Jean Piaget and considers the operational principles of Rolando García. The operation of the system has been done in practical social problems by various authors. We present the general philosophy and various applications of practical national problems.

The general philosophy is based on the configuration of Socio-Cybernetics, proposed by Felix Gayer, Bern Honung, Bernard Scott and Garcia. The methodological strategy is heuristic and is presented with a systemic scheme with several ways to address the problem. The system has a basic social model "Analysis of epistemic / social / cultural components for social problems". In this model, the process for the approach of the cognitive complex of social actors corresponds to Piaget's epistemological theory.

The operative process starts from the observation of the *empirical unit* and basic theories proposals for the *theoretical unit*, to raise *problems and research questions*. With these components, variables and categories are configured that are assuming to evaluative values for information in information techniques.

The system is presented at several sociocybernetic meetings at the beginning of the 21st century and since then we have presented the different advances and relevant techniques in the social sciences. In these times it has been used in different presentations by authors from Mexico and other countries of which I will refer to their results. I indicate some applications and how the sistema is used for a set of problems related to Urban Design in cities of Mexico.

AMWE, RUTH* (Princeton Theological Seminary, USA)

African Spirituality and Popular Culture Betwixt Africa and the African Diaspora

Ama McKinley's blog article 'Beyoncé Serves African Spirituality in Lemonade' in *The Huffington Post* (2016) depicts Beyoncé Knowles Carter as "an artist of the Earth, using her stage and global influence to teach about the human condition, using symbology and language that is sacred and pronounced beyond a few approved circles." This view partly epitomizes the resilience of African Spirituality in the diaspora, where she in 'Lemonade' invokes so much of the Yoruba tradition, grounded in African tradition, by offering a musical and visual journey through the African diaspora. African spiritualities touch on and imbue every facet of life and thus cannot be separated from quotidian, mundane thought. This paper explores African spirituality as a spirituality of the marketplace that is mostly concerned with the pursuit of cosmic balance and human flourishing through a matrix of worldviews, belief systems and ritual praxis. Using concrete case studies in exploring the intersectionality of African spirituality and popular culture in Africa and the African diaspora, we demonstrate how and to what extent the religious, moral, sociocultural and popular imaginaries linked to indigenous worldviews in Africa and the African diaspora are continually contested and negotiated.

Under the Conditions of Removal: Green Dispossession, White Gentrification, and Black Elimination

Mobilizing Ananya Roy's (2017) iteration of racial banishment, this paper seeks to examine various mechanisms of removal that operate within and across Black geographies in Canada. Removal, a form of violence that is chronically operationalized –not only ruptures connections between people and place but is a process of racial violence that is situated in histories of racial exclusion and colonial domination. This paper pays particular attention to the relationship between green dispossession, white gentrification, and Black elimination as key contemporary sites through which techniques of removal are practiced, enacted and narrated to structure geographic domination. As McKittrick (2006) contends, traditional geographies organize the world from a stable White patriarchal Eurocentric heterosexual classed vantage point that assumes that we can view, assess, and ethnically organize the world from positivist and imperialist lens that is deeply negotiated through geographic landscapes upheld by legacies of exploitation, surveillance, and conquest. Accordingly, I will be drawing on Postcolonial theories alongside Critical Race Studies to shed light on racial-colonial-state-instituted structures that function to propel processes of removal, while being cognizant of the particular ways that mechanisms of removal operate differently on Black geographies. Put forth by Roy (2017), I contend that the material and discursive work of (re)presenting 'empty' landscapes through varying processes of removal is not merely a practice of capital accumulation or burial, but also that of racial banishment which brings into focus systems of power relations, resistance(s), and histories.

"for My Health and for My Friends": Exploring Motivation, Sharing, Environmentalism, Resilience and Class Structure of Food Self-Provisioning

This presentation aims to supplement the growing understanding od the specificities od the food-self provisioning (FSP) practice in Eastern Europe with a deeper understanding of the class structure and the broader environmentalist motivations of the self reported practitioners. FSP and sharing of "garden pro-duce" is a long-term socioeconomic phenomenon in Croatia but so far there has been no research on the whole population in regard to FSP. We explore how wide-spread FSP in Croatia is, based on a survey of a nationally representative sample (N=1000), within a broader social stratification project. We further explore the class structure of FSP practitioners and compare it to their reported motivations for engaging with the practice, and their pro-environmental behaviour, resilience and personal flourishing. Previous research in CEE has shown that FSP is charac-teristic of between 35% and 60% of national populations (Smith & Jehlička, 2013) thus indicating "quiet sustainability" practices, whereas our findings show that a little over 50% of respondents claim that they have a garden, field or orchard, they use to produce food for themselves and part of their social network. As a practice it is more situated in smaller settlements and rural areas, but it is not a principally rural phenomenon. Slim majority of people involved in FSP in Croatia are identified as working class, however FSP is not a coping strategy focused on the poor and low-income households in Croatia and food self-provisioners report higher level of personal wellbeing, more pro-environmental behaviour and higher level of self-perceived resilience.

Through Technologies of Communication and New Media Practices: [Un]Aesthetics, [Un]Mensch

Through technologies of communication and new media practices, such as speculative media interfaces and façade projections, our posthuman society com-bat a globalized "technosphere" causing the planet and its inhabitants to undergo a profound crisis. Such new media practices, in their technique and epistemolog-ical aspects, stand as the provocative potential of the dialectics of nature and cul-ture and its role in critically exploring the implications of emerging technologies in the communication processes in urban space. The hypothesis is that speculative media interfaces and façade projections can be used to explore the co-existence of human vs. non-human futures under the environmental crisis today. How in-terface's 'non-human eye' as a communication device can be related to Bernard Stiegler's (1952-2020) endavours to understand technical evolution by provoking a revision of the whole of a non-human agency in history? What 'otherness', such as Benjamin's 'angel of history' ('unmensch'), may have revolutionary forces that indicate a way out of our Anthropocentric perspectives?

Bilinguism and Procedures of Portuguese Text Comprehension in Refuged Children Enrolled in the Municipal Public Education Network of Rio De Janeiro

This project proposes the investigation of the processes that take place in BI-LINGUISM, having as special reference the comprehension of words and texts of the Portuguese language of Brazil and French of Africa, in children, specially children of refugees enrolled in the schools of the Municipal Public School, in Rio de Janeiro city. The phenomenon of migration has occurred in this third millen-nium as one of the most intriguing psychological and sociological situations of this time. Most of the research focuses on the environmental, social and cultural factors to which refugees are exposed. We have base Dr. Marcia Mota's studies on morphological awareness (2012) which can be defined as the ability to reflect on the morphological structure of words. There are also researches carried out in different orthography that show a relationship between morphological aware-ness and reading. Thus, we want to research which cognitive processes involved in the comprehension of Brazilian Portuguese texts in children of refugee families with mastery of the French language and in compulsory bilingualism. Theoretical investigations will be based on Child Development Studies and Cognition Studies, for the exploration of bilingual perception, as well as, in relation to social and cultural studies, we will based on the authors of Cultural Studies. The method-ology to be applied will be participatory research, in which we will make a selec-tion with refugee children attending the Municipal Public Education Network of Rio de Janeiro through operational groups to verify the understanding of texts in Portuguese. We will continue the data collection with interviews conducted with the parents of these children assessing the degree of adaptability to the official language of Brazil. The results will be published so that we can understand which cognitive processes and cultural partners interfere in the understanding of words when children are exposed to mandatory bilingualism.

The Representation of Ugliness and Beauty in the Soap Opera "La Fea Más Bella"

The Colombian soap opera "Yo soy Betty la fea" is still the most watched ever, even though she has a low budget, few characters, the story of the ugly girl who fell in love with her new boss conquered the world, being displayed in various countries in Latin America, Asia, Europe. In this sense, what we seek to under-stand is how the representation of the ugliness that has been made in the Latin American soap operas, thinking mainly of the Mexican version of the soap opera, called "La fea más Bella", that also became a great phenomenon in that country. It is noteworthy that the representation of female ugliness in the Mexican version was carried out in a caricatured manner, which generated strong criticism from the Colombian public, especially Fernando Gaitán, writer of the original version. To identify the way the social representation of ugliness in the Mexican version will be compiled chapters in which the protagonist deals with her appearance, as well as the way she is treated when presenting as Leticia (ugly) and when present-ing as Aurora. This is because after the transformation the protagonist can not show differently to society and is afraid to present herself as a beautiful wom-an. Finally, the analysis will be done through the discourse analysis of the two versions of the character, to understand the changes of approach between the representation of an ugly woman and a seductive one.

Sourcing Wild Gold for Whose Benefit? Challenges and Prospects of Value-Oriented Sourcing Strategies in the Shea Nut Sector of Ghana.

There is an increasing demand for shea nuts from West Africa in the inter-national cosmetic and confectionary industry, but its supply is dwindling. In re-sponse to this, international cosmetic and food processing companies promote organized groups as solution to ensure steady and reliable supplies. This sourc-ing strategy disguised in discourses about fair trade and quality enhancement that draw on values such altruism, environmental protection as well as health. But in concrete implementation, it is not clear who actually benefits from new

***denotes a presenting author.* Abstracts are organized by first presenting author's last name.

sourcing approach and the development of social and quality standards. Looking at power relations and the nature of Shea nut sourcing it can be observed that different standardized and non-standardized sourcing channels offered different benefits, experiences and challenges. Producers selling through standardized contract arrangement received slightly higher market prices, access to loans, and bonus schemes while those selling through largely unregulated market channels reported to be disadvantaged. However, though producers under standardized contract arrangements received better prices and some additional benefits, their risk of production, such as widely fluctuating yields and health hazards, remained largely unaddressed. Social and quality standards as well as corporatization and training exercises rather helped reducing the risk of international buyers, largely increasing highly valued sourcing security in a competitive market environment through contract arrangements - and as as marketing tools vis-à-vis value-oriented consumers in in the North. Local value such as secure and sufficient livelihoods remained largely unaddressed.

Competition between Vocational and Higher Education? Determinants of Educational Choices and Their Return on Investment in the German Labour Market

The presented results derive from a project which focuses on the alleged competition between vocational and higher education. We contribute to the debate on the relevance of vocational qualifications in the labour market, driven by an increasing academisation in multiple occupational fields.

Our approach evaluates qualification and skill utilisation of potentially competitive educational programmes regarding the returns on educational investment. The mixed methods research concept contains curricula and vacancies analyses, case studies in selected sectors and a quantitative survey. The theoretical background is formed by rational choice theory (Arrow 1989; Esser 1990) as well as the signaling (Spence 1973) and screening (Stiglitz 1975) approach. This contribution analyses data from the German BIBB/BAuA employment survey of 2018 and 2012. We assess employees' educational decisions based on their returns on educational investment. From an individual perspective, the disparate labour market outcomes of employees with equivalent qualifications (based on the German Qualification Framework) are compared.

Our empirical approach utilises multilevel models. First results indicate that the aspirations regarding employability and income have a positive effect on individuals' returns on educational investments, confirming their educational decisions to be rational. In further models we test the impact of the following aspects as criteria for the educational choices employees make on a micro level: aspirations regarding employability and income, personal strengths and interests as well as individual socio-economic factors including their parents' socio-economic status (SES). On a macro level, the analyses take into account the sector, the company size and the counselling impact. Our data allows for the comparison of selected micro and macro level factors of 2012 and 2018.

Relations between International Mobility and Intersectionality: What Factors Influence the Labour Market Success of Internationally Trained Employees in Canada and Germany?

Deterioration of labour market performance and economic marginalisation of qualified migrants are a global problem of inequality. The aim of the presented mixed methods project is to gain insights into how well immigrants can use their foreign qualifications and skills in the Canadian and German labour market, and how skills, qualifications and work experience affect their labour market outcomes. The analyses explain skill under-utilization and pay inequity. Besides, they contribute knowledge regarding the subjective perceptions of immigrants and employers in the recruiting process.

This presentation triangulates the results of quantitative analyses using PIAAC data, with the results of twelve qualitative case studies conducted in Canadian and German enterprises in the information and communication technology and health sectors, which vary in their degree of regulation, requirements for labour market access and their occupational requirements. Overall, 26 internationally trained employees and 24 recruiters were interviewed to provide a multi-perspective analysis.

The Mincer wage regression (1974) is used to analyse impact factors of individual wages, focusing on migration status. The signalling (Spence 1973) and screening (Stiglitz 1975) concepts are used as theoretical reference points for the analysis of the case studies.

The findings confirm the discrimination of immigrants regarding their current income as well as a greater problem of qualification and skill mismatch for this group. The results also clearly indicate that the signalling effect of foreign qualifications is lower than the one of domestic qualifications, while skill mismatch varies less between immigrants and natives. The case studies provide a more detailed explanation for the quantitative results including sector specific and subjective rationales. They provide an empirical explanation regarding the relevance of information in the recognition of foreign qualifications and competences. Quantitative and qualitative data indicate the lower usability of foreign qualifications due to the lack of host country specific human capital.

Half Widows in Kashmir: The Unheard Voices of Conflict

The breakdown of the rule of law and militarization of society have a major impact on women's lives and on their sense of security and well-being, creating feelings of constant fear, alienation, and despair.

Since past thirty years Kashmir has experienced Militarization, Conflict and violence. The turmoil has given rise to an army of widows who have lost their husbands and scores of "Half-Widows", whose husbands are missing; there is uncertainty whether they are dead or alive. These women, described as half widows, are most pathetic, running from pillar to post to discover the whereabouts of their missing husbands. The situation is far worse for the half widows', whose husbands are missing or have disappeared.

Half-Widows are unable to either close on old chapter in her life or to start a new one by remarrying. The loss of a principle bread earner from family can be devastating. The prolonged often-permanent absence of male family members is particularly detrimental for women from weaker social –economics background, where the absence of male kin has severe economic implications. The chance of half-widows remarrying is slim- since their husbands have not been declared dead officially, half widows are not entitled to ex-gratia payments by the state. The loss of a husband is compounded by fears regarding custody of children and/or desertion by in laws. More corrosive still is the psychological price paid by broken families-constant agony and trans-generational trauma that over time can develop into mental disorders. The paper is based on empirical study, highlighting the trajectories and anxieties of the lives half-widows, The plight of Kashmir's widows and half-widows is not a 'women's issue. It is inextricably linked to the enforced disappearance /detention and/ or unlawful killing of men by the state.

The Intersectionality of Caste and Gender: Feminization of Manual Scavenging

Census 2011 reported 12.76 lakh in sanitary latrines and 5.9 lakh dry latrines were cleaned manually in rural areas. Socio-economic caste census reports further found 1,82,505 persons are engaged in manual scavenging. An average of 20 sewer workers die every month due to suffocation or exposure to toxic gases and accidents in Mumbai (Partha, 2014). It is estimated that more than 100 sewer workers die in India every year (Limaye, 2016). About 90 to 95% of the scavengers engaged in removing human excreta from household latrines are women, which is lowest among the low status jobs, as manual scavenging is not a homogeneous category. There is a disdainful hierarchy among the various jobs that come under manual scavenging. Women are forced into cleaning excreta, while men do the sweeping- considered as the lesser evil. The intersectionality of gender, caste and social positioning is thus an important aspect of manual scavenging in India. Coupled with a 'narrative of disdain' it has made inequalities sharper and stigmatized women manual scavengers physically, emotionally and culturally. Persistent health issues such as skin diseases, sexually transmitted diseases, chest pain, viral and bacterial infections, add to their miseries. Men suffer from acute alcoholism and women bear the brunt of it. The wives of these workers are forced into the occupation, not just domestically but structurally through the 'preference' given to the kin of the manual scavengers in employment. This paper seeks to understand the dynamics of gender, caste and class in the perpetuation of manual scavenging in India and enforcing gender oppression among the lowest castes.

The Triple Helix of Social Hierarchy: Bourdieu's Three Forms of Capital

Demographers are critically aware of the role of social hierarchy in describing population structure and in explaining demographic processes. However, hierarchy itself has been poorly conceptualised, and measured in many different ways. Research programmes have focussed on income, education, labour force

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

characteristics and many other measures of hierarchy, sometimes separately, sometimes combined in a composite scale. Besides these are measures of race and ethnicity, forming a social hierarchy, but whose relation to other elements of hierarchy is unclear. In the present paper we suggest that Pierre Bourdieu's tripartite concept of Capital can help us understand the composition of social hierarchy and the way it varies from one society to another. Bourdieu (1986) defines Capital as cumulated work which has taken on a substantive form and which enables whoever controls it to expropriate social energy, human work, either their own or that of someone else. Bourdieu identified three types of capital:

1) *Economic capital*: anything which can be directly translated into money;
2) *Cultural capital*: Education, educational credentials, and other forms of socially valuable knowledge;
3) *Social capital*: The sum of social resources accessible through network relations

Together, access to these three types of capital create a *habitus*, or social environment which generates socially conditioned patterns of action and gives a certain degree of control over the life-space. This control is never absolute but limited by the amount and types of capital at individuals' disposal.

In this paper we discuss the meaning of these three types of capital, the relations between them, how they may be measured, and how they may help us understand demographic phenomena, mortality in particular.

La Ficción Televisiva Como Espacio De Tensiones Globales y Locales

La ficción televisiva seriada ha estado presente en la parrilla televisiva local prácticamente desde sus orígenes. Tanto telenovelas como series han logrado adaptarse a las transformaciones y cambios de las sociedades a las que se dirigen. Esto pues son producciones situadas en un espacio- tiempo determinado y responden a necesidades de sus seguidores, pero también refuerzan y alimentan la construcción de comunidades imaginadas.

La multiplicidad de plataformas existentes hoy en día junto con el creciente número de producciones y posibilidades de acceso a estas, han ido modificando las temáticas, estética, y lógicas de producción enfatizando la utilización de marcas locales que puedan ser reconocibles y distintivas en el contexto global.

Las nuevas tecnologías han ido difuminando las fronteras espaciales alterando las categorías de lo propio y lo ajeno unificando mercados y consumos. En este sentido y a partir de la revisión de las transformaciones en la producción ficcional televisiva en Chile del 2000 en adelante desde las nociones de Espacialidad crítica y enfatizando las distinciones existentes entre los aspectos globales y locales presentes en ellas, nos preguntamos por las múltiples y complejas conexiones que se manifiestan en estas narrativas.

Complexity and Truth Regarding Security: A Sociocybernetics Approach.

The present paper presents a short state of the sociology of security as the scientific study of the mutual relationships between community and security as a socially construct. The main issue addressed in a sociocybernetics approach is referring at multiple understandings of security concept provided by the society through its agencies (the military, the police, the judiciary, and secret intelligence agencies).

The meaning of security concept is particularly influenced by a wide variety of human perceptions. More than this, the concept of security implies a wide variety of dimensions of analysis, from the values and beliefs of people to the fundamental rights.

Furthermore, this paper attempts to identify and explain the relation between epistemology and truth of security as a socially construct, and to notice the evolving and dynamics of security based on complexity of a liquid and hybrid society. Since the cyberspace is an extremely complex and large-scale social system, we can consider Sociocybernetics, besides the other cybernetics paradigms, to be a proper method of study related to security.

Brazilian Think Tanks: Roles and Dynamics in the Field of Power

The rise and expansion of Think Tanks in Brazil, as well as their role in the contemporary scenario, have been a subject of little investigation in the field of Sociology. The debate concerning these organizations has been held nationally in the areas of Political Science, International Relations and even Administration, neither of them succeeding at offering a more compreennsive understanding of the dynamics of such institutions whithin the changing field of power. This may be stated, firstly, due to the limitations current theories present at justifying the expansion of think tanks in Brazil in the first two decades of the XXI century, which opposes to an international trend of decrease or stabilization in the number of existing think tanks. Secondly, by the inneficiency of the importation of the American models to the Brazilian context, as both the participation of these organizations in the political field and the kinds of interactions they establish with other political actors differ significantly from nation to nation.

This investigation aims at understanding the Brazilian think tanks' role in the field of power, not only by considering their willingness to foster and direct policy-making, but above all by their ability to influence the value of resources that intervene in the political game, such as money, social connections with influential actors, and political know-how. It is whithin this perspective that the relation with the State stands out, specially in what concerns the conjuncture of its symbolic re-signification. Through the recruitment of certain profiles, these Think Tanks embody specific forms of thinking the State and of applying categories of thought geared to a belief in the (in)capacity of the State to ensure the organization of social life.

Chasing Rainbows: Digital Labour and African Youth's Transition to Work

In the contemporary era, the opportunities for work have changed tremendously. New digital work has provided non-traditional avenues to work for youth entering the labour markets through work platforms such as Upwork, *Fiverr.com*, Uber or Deliveroo. In the African continent context, these are considered as silver bullet for solving the unemployment problem both among the national policy and international development discourse. Yet, these platforms and their work activities come with their own challenges despite the much-lauded aspects of flexible working conditions and freedom to achieve well-being, often noted in the mainstream literature. To complicate the matters, much of these activities already operate unregulated and unprotected. Therefore, new entrants to the labour markets, especially youth in the developing countries contexts can face long transition period to meaningful and sustainable livelihood opportunities.

Drawing on author's in-depth interviews with African youth from South Africa, Kenya, Nigeria, Ghana, and Uganda, this paper provides an empirical account of the challenges of transition to work among workers doing a variety of digital labour tasks on the continent. The paper focusses on three broad digital work types. These are *remote gig work, place-based work,* and *call-centre work*. The paper points to key structural factors constraining African youth's transitions such as economic inequality, which further influences the levels of education, skills, and digital tools, all necessary to earn a living in the digital work of work. It concludes with some policy-level implications and suggestions required to support African youth's transition to digital work in a way that provides sustainable livelihoods and reduces the risks that many digital jobs carry.

RC30-372.6

ANWAR, MOHAMMAD AMIR* (University of Edinburgh, United Kingdom)

Toiling on the Internet: Digital Labour and Informality in the Local Labour Markets in Africa.

The growth of digital economy has changed the way work is being organised with implications on livelihoods and local labour markets in Africa. An estimated 4.8 million workers have performed a variety of digital labour through 277 digital work platforms in just seven countries on the continent. Ride-hailing services have grown tremendously. Of all the cities Uber operates around the world, Johannesburg experienced the fastest growth within the first 12 months of the launch. Platforms such as Upwork and Fiverr.com provide much need livelihoods to a large workforce in Africa. On just one platform, there are an estimated 130,000 registered workers seeking jobs from Africa. While the existing research on digital labour suggests that these activities present both the opportunities and challenges for workers, these are also unregulated. In other words, digital labour

can be generating new forms of informalisation in the local labour markets on the continent. With high rates on informality across the continent, we need to understand the political economy of labour market transformation in Africa, in the context of digital labour.

Markets do not exist in a vacuum but are shaped by institutions, regulations, civil society, behavioural norms and cultural values. Through the crucial works on segmentation theories (see Peck, 1996), this paper attempts to examine the dynamics and processes of labour market segmentation in digital work (labour flexibility, workplace restructuring, [de]regulation), and the emerging forms and shapes local labour markets take. Empirically, the paper is grounded in the author's previous work on digital labour in Africa (2015-2019 and a year-long fieldwork with over 200 interviews (2016-2017). The objective of the paper is to highlight how segmentation in digital work generates informality in the labour markets and to explain the geographies of segmentation across the four case study countries, i.e. South Africa, Nigeria, Ghana and Kenya.

APITZSCH, URSULA* (Goethe University, Germany)

Generational Experiences and Biographical Differences Among European Migrant Workers and Their Offsprings.

Generational experiences and biographical differences among European migrant workers and their offsprings.

This paper tries to analyze the family histories of several generations of former guest workers in Europe as collective and inter-dependent historical processes that can be reconstructed through biographical research. Firstly, it aims at identifying the different experiences of the first and the second historical generations of contract workers and their families from Southern to Northern and Western Europe. Secondly, it tries to explain how the two different generations were coping in their biographies with the difficulties and the new chances of the trans- national space that was developing in Europe. In this historical process, questions of Gender and Family Relations became more and more relevant.

In the third part of this paper there will be explained how the offsprings of former guest – workers –despite their precarious position in the receiving societies- could take advantage of the chances of the new trans – national space. Finally, in its last part, the paper refers to the social and cultural diversities of different generations of migrants nowadays. I want to show that the concept of the so-called post - migrant society –influencing also Sociology- is productive and reductive at the same time. It is productive in so far it takes into account that nowadays in Europe there is no place where social relations are not affected and often constituted by migration processes regardless whether the involved persons are migrants or not. The concept of the post migrant society, however, is also reductive in so far it tends to overlook that also after generations individual and collective migration experiences as processes of suffering and as resources still matter.

In synthesis, generational experiences in migration will be conceptualized as the outcomes of biographical processes of negotiations of belonging.

Being, Presence, and Stillness: Towards a Sociology of Mindfulness

Mindfulness meditation has emerged as one of the most popular and accessible interventions for tackling the growing challenges of mental health and wellbeing in western societies. The vast majority of research in this nascent field however remains targeted exclusively on the clinical efficacy of mindfulness interventions over and above the people, places and practices that constitute this ubiquitous field in the first place. This paper draws on the recently completed 'Mapping Mindfulness in the UK' project (Leverhulme Trust, with S. Stanley, P. Hemming, E. Hailwood, and R. King), the first nationwide sociological study of the contemporary mindfulness milieu to date. Over the last three years, this project has produced a survey of 800 qualified mindfulness teachers, 80 in-depth interviews with leading practitioners, 4 focus groups with key advocacy groups and stakeholder organisations, as well as extensive ethnographies of the delivery of mindfulness programmes across hospitals, schools, workplaces, and the UK parliament. Based on these findings, this paper will provide original insights into (1) the professionalisation and institutionalisation of one of the oldest religious ritual practices known to humanity; (2) the role of secular platforms for religious work in western societies; and (3) the growing currency of highly abstract yet deeply embodied notions such as being, presence, and stillness in modern life.

SGD, Agenda and Climate Changes: A Study in Context of a Brazilian Metropolitan Region

The dynamics of urban development generate high impacts on the environment and society, and with the urbanization, at this point, cities have begun to awaken to the need to find sustainable solutions to social and environmental problems, making them a common agenda for discussion, whether in public management, in science or business. Amid the popularization of the United Nations (UN) Sustainable Development Goals (SDGs) and their Agendas and the encouragement of Climate Change fighting actions, there is a need for public policies to adopt a climate agenda to reduce social and environmental issues. In underdeveloped countries with a reality as unequal as Brazil's, the challenges for implementing a climate agenda are enormous. Having as empirical object the Natal Metropolitan Region (MR), in Rio Grande do Norte, Brazil, focusing on the city of Natal, this paper aims to discuss the process of formation and incorporation of the climate agenda in Brazilian public policies. Using a qualitative, time-bound methodology from 2017 to 2019, we will use documentary research, content analysis, and the KINGDON multi-stream approach model to analyze the processes surrounding agenda-setting on climate change issues. We are going to study environmental, urban and social policies of the Natal MR, as representation of the regional, socioeconomic and political importance of Brazilian MRs and their great social and environmental impact printed on territory. The discussion and analysis of the results are expected to be useful about the internalization of the SDG and UN Agendas guidelines of a climate agenda, analyzing how this agenda has been constructed and internalized in the design of a more sustainable government agenda to fight against Climate Changes on MRs.

The "Non-Labor" of Women: An Analysis of Housework and Care Activities in 21st Century Brazil

This article intends to analyze the housework and care activities in Brazil in the 21st century from the perspective of gender and race. The study tries to demonstrate in what form of socio-economic organization these activities are performed, *where* they are performed and, especially, *who* performs them and for *whom*, are among the central aspects of the organization of social life. It starts from a discussion about the use of time in different activities, and then examines what is considered labour/work in our society, historically and contemporaneously. We intend to discuss the reasons why housework and care activities were relegated to a condition of "non-labour", having as an important influence the development of capitalism and the separation between domestic space and the space of production, that even conformed traditional models of family, with the provider man and the housewife woman. However, in the last five decades women's living conditions and, as a result, family organization have been transformed under the impulse of the feminist and youth movements. Although the increasing insertion of women in the labor market did not mean their departure from domestic work, so they were subjected to a double shift, by continuing to spend many hours on housework. Therefore, this article examines the role of the state in attributing responsibility for household chores and care activities to women, by not providing enough public facilities, such as child care centers, hospitals, collective restaurants and laundries, and by formulating public policies that end up reinforcing this responsibility. This will be done by analyzing the evolution of these activities in Brazil through the microdata of PNAD and PNAD Continua, from IBGE. The different categories of housework and care activities will be analyzed in relation to gender, race, age, income and working hours.

ARAUJO, EMILIA* (University of Minho, Portugal)

The Changing Nature of Time to (for) Work

This communication debates the apparent conflicts between the experience and the understanding of time by young people and the experience of time and temporality by firms and labor markets. For quite long-time firms and employers in general have dictated the time regimes of persons. They were the only time owners. Therefore, individual times have become in its dependence. That meant that working time regimes were designed and planned according to em-

ployer's needs. It is still fact that employers continue to have a great discretionary power over individual times, affecting deeply daily life and interfering largely on biographical expectancies. At its core, economical neoliberalism is feed by an intense manipulation and exploration of individual times. However, for small countries such as Portugal and other places whose greatest part of industrial tissue is still directly productive and lacks greatly design and I&D industries new time cultures with which young people is becoming more and more socialized (working in precarity, at different places, and in different, alternate and variant time models) are threatening strongly industrial time regimes because young people do not feel no more they need to work for a specific time period, follow a schedule, or manage their life prospects according to a specific job. This paper analyses data qualitative data gathered through semi-structured interviews with human resources managers and owners of 15 firms from the northern region of Portugal in which firms are strongly suggestive of the emergence of new time orders that regarded as perverse effects, signal great transformations on the way people perceive and value their time and the need for employers to radically reshape the traditional modes of operating with time regimes.

Los Efectos Políticos De La Institucionalización De La Agenda Global De Resiliencia Urbana En Porto Alegre.

El trabajo tiene como objetivo discutir los efectos políticos locales de la agenda global de resiliencia urbana. Desde 2005, en particular, con el huracán Katrina que devastó la ciudad de Nueva Orleans, las agencias de cooperación internacional han promovido un conjunto de informes, acuerdos y programas que describen una agenda de políticas de resiliencia global. Esta noción ha sido promovida como una guía (deseable) para la gestión y planificación urbana mundial frente a los desafíos del siglo XXI, caracterizados por la globalización, la urbanización acelerada y el cambio climático. Si bien el termino rápidamente se volvió de amplio uso, todavía existe poca precisión sobre sus significados reales para las ciudades. En esta dirección, problematizamos la agenda de resiliencia global a partir del estudio de su aplicación concreta en Porto Alegre, a partir de la participación de esta ciudad en el Programa "100 ciudades resilientes". Esta es una iniciativa de la Fundación Rockefeller, una organización filantrópica internacional de EUA que, de 2013 a 2019, financió a 100 ciudades de todo el mundo para desarrollar un plan estratégico de resiliencia para la formulación e implementación de políticas urbanas. Porto Alegre se unió a la red de ciudades resilientes en 2013, finalizando su plan estratégico en 2016, y comenzando la implementación de las acciones definidas. Sobre la base de este proceso empírico, nos enfocamos en comprender los efectos políticos de institucionalizar la noción de resiliencia en la gestión de la política urbana. El análisis se basa en una perspectiva crítica que cuestiona la naturalización de la resiliencia como un paradigma contemporáneo para la gestión y planificación de la ciudad, en este sentido, tiene como objetivo comprender los significados políticos e institucionales de esta agenda para las ciudades. En otras palabras, el artículo busca responder sobre modificaciones materializadas y desafíos a nivel local.

ARAUJO, KATHYA* (Universidad de Santiago de Chile, Chile)

Historical Trajectories and Problematizations of Individualism in South America.

Based on a research which comprises five countries (Colombia, Peru, Argentina, Chile, Brazil), this paper aims to present and discuss the historical trajectories of individualism in South America. We will start by arguing that in these societies there is a strong reluctance to interpret themselves from the framework of individualism despite the importance attached to the figure of the individual both in the legal framework and the importance of individualistic manifestations (caudillos, characters, etc.). This reluctance is expressed in very different but consistent ways throughout the nineteenth century and until the last part of the twentieth century. Secondly, we will discuss the reasons for this paradox by underlining five major problematizations, that is, following Foucault, orders of facts, domains of interpretation and sets of institutional responses, whose historical articulation is subject to controversies since they raise problems: 1) the relationship between political individualism and an ungovernable individual model (through the case of the transgressive subject); 2) liberal individualism as a solvent of the collectivities (through the threat to organic and hierarchical social visions); 3) the collective subject as an antagonistic ideal to political individualism (discussing the case of the national-popular subject); 4) the neoliberal project and criticism of the State (focusing on the figure of personal entrepreneurship); and 5) political individualism as a citizen horizon (through the case of human rights).

ARAUJO, KATHYA* (Universidad de Santiago de Chile, Chile)

Revisiting the Notion of Authority

As indicated by the current debate in the social sciences, we are witnessing today the advance of a set of transformative currents (individualization, technological development, pluralism, the fragmentation of social frames, de-traditionalization processes, etc.) that bring to the fore questions about the forms taken by the management of power asymmetries and hierarchies, and consequently the question of authority. The questioning of power asymmetries and hierarchies spread significantly at the same time as new forms of power management and of the exercise of authority began to emerge with relevant impact in different social and political spheres. Among them, the questioning of representative democracy; the spread of authoritarian political leaderships; non-pyramidal forms of organization of collective action, to mention just a few. Drawing on the results of theoretical and empirical research, I propose in this paper that this evidence underscores the importance of revisiting the notion of authority, a concept for which political sociology and sociological theory have shown relatively little interest in the past decades. I will argue that a response to the challenges of the current historical juncture requires not only a sharper focus on the study of this phenomenon, but also its conceptual re-examination. With this aim, I will propose a critical review relating to three dimensions of this notion: the relationship between authority and the notions of power and domination; the conception of hierarchy that has tended to underlie the former; and the compact and homogenous character attributed to it, that is, its compactness.

Street Vending As a Profitable Urban Problem: Governance and the Business of Shopping Populares

This presentation aims to discuss the governance strategy towards informal street vending practices in Belo Horizonte (Brazil), whereas is seen as an "urban problem" to be managed. The research findings indicate the production of consensus around both the definition of target groups and the definition of the "solution" methods that simultaneously outline public policies and create or canalize markets. The current strategy implemented in Belo Horizonte is a result of public-private partnerships that represents the contemporary neoliberal interventionism in Brazil. In Belo Horizonte it is deployed by two main interdependent fronts: (1) the increase of surveillance and militarized repression against street vendors, reinforcing a process of criminalization and moral stigmatization of the more resistant street vendors; and (2) the pressure for formalization of street vendors activities by shifting them to regulated indoor comercial centers called shoppings populares, which are managed by private specialized companies. While informal street vending is seen as an obstacle for the city modernization (or a typical trace of latin american economic underdevelopment), it represents a convenient input for certain businesses consistent growth, such as the profitable shoppings populares branch, among others. Such mechanism of governmentality tends to persist and expand since it allies both labor force disciplinarization and space ordering, by reshaping the sense of public actions by market validation. This social process empirically observed indicates new forms of social insertion by promoting a sense of "innovative" local development through "social entrepreneurship"; and, also, new perspectives on marginalization in the 21th century neoliberalism.

Trapped in a Lie: Physical Truth and Temporal Migration in Asylum Cases

Abstract
In this paper I explore the protected characteristics developed to supposedly aid asylum seekers who would be the most vulnerable in conflict. Specifically I focus on the LGBTQIA and childhood identities. These protected characteristics end up exhibiting three main state narratives: (1) the imagining of the national LGBTQIA/child, (2) the heavy reliance on "unbiased" medicalised knowledge to prove them and (3) the imagining of the other through the dichotomy between developed and undeveloped.
In this national imagining the occidental nation-state imagines the child as an innocent dependee, a creation that Postman (1995) suggested was due to the increased rate of literacy that had swept Europe, creating a timeframe of liminality in which learning certain aspects of society marked the division between child and adult. This construction of ignorant innocence often becomes incompatible with children who have fled war zones and crossed vast, dangerous territories by themselves. Something that ends up creating solid timelines that exist parallel to each other and that the asylum seeker needs to choose from. In order to be giv-

en asylum in court they must choose the more developed, saviour west, proving that they have broken free from their past oppressive timeline. Children then, must remain innocent and ignorant, their existence in between these timelines completely disregarded.

When the Dubs Agreement in 2016 agreed to take in unaccompanied children to the UK from different shelters in Europe there was public scrutiny over how to prove that these young people were indeed children. Scans of wrists and molars revealed that while the margin of error within Europe was relatively small, 2-7,3%, it was considerable in other parts of the world, Brazil had a margin of error of 22.6%. This begs the question: whose childhood are we using as a measure?

Developing and Testing a Coupled Human & Natural Systems (CHANS) Social Movement Theory

Early social movement theories were largely based around understanding the internal motivations of participants in social movements. Later theories examines the structural opportunities which allow individuals to take action. Much of this later work took a contentious politics approach, highlighting the collective claims made by oppressed, or marginalized, groups against the state or formal institutions. However this suite of theories have not yet fully incorporated the role of external, environmental stimuli, which prompt social action. In this paper we develop and test a coupled human and natural systems theory of social movements. The mechanism which we propose underlies the relationship between climate change and social unrest is the stress on social institutions which were developed for a social system created in a different climate.

We utilize data from the Social, Political and Economic Event Database Project (SPEED), a technology-intensive effort to extract event data from a global archive of news reports covering the Post WWII era (1946-2005). These data are joined with country specific, observed mean surface temperature changes with respect to a baseline period (1951-1980) and World Development Indicators. We fit a mixed linear model estimating how changes in surface temperature affected 52,033 social unrest events that occurred globally from 1961 to 2005. The number and severity of social unrest events will be the dependent variables in the county-level models, with fixed effects for year and country, and a covariate for population density. Estimates will be obtained for the change in land temperature for each county and year. Covariates related to a country's reliance on natural resources' and social safety nets will be included at the country level. We also included a random effect for country nested within one of the four income brackets designated by the World Bank (Low income, lower-middle, upper-middle, and high-income).

Trajectories of Concern: The Role of Race, Religion and Politics in Support for Environmental Policies over Time across the US

Since the late 1960s the relationship between environmental concern and religion has been increasingly studied. Much of this work has been in response to Lynn White's (1967) provocative argument that Christian teachings are fundamentally opposed to protecting the environment. In the years following, there has been a great deal of research investigating the role of religiosity in environmental concern. However this work has not sufficiently disentangled the role race plays in these relationships. We hypothesize that the trajectory of White fundamentalists will become increasingly less concerned about environmental protection over time as a function of increased political polarization on these issues. Whereas the trajectory of African American fundamentalists will become increasingly more concerned about environmental protection, as a function of increased vulnerability to environmental hazards, as measured by vulnerability to flooding and hurricanes and exposure to air pollution. In addition, we expect to see denominational differences in trajectories. We argue that religious communities have framed their changing environmental positions as being morally and religiously aligned with their denomination's positions on the environment. We test these hypotheses with a mixed-methods approach, joining data on environmental hazards, race, fundamentalism, denomination, and political preference to support for environmental policy spending using annual data from the General Social Survey from 1972 through 2018. Using content analysis of denomination's stance on environmental issues, we explore if and how religious groups have framed environmental issues as a moral one to determine if their congregants environmental concerns line up with the religious leaderships positions.

Adaptive Dynamics of Health Occupations in the Age of Liberalization of Labor Markets: The Cases of Medicine and Nursing in Mexico.

Two occupational groups are key in the operation of health systems over the world: medicine and nursing. Across a long historical process starting from mid XIX century, medicine and nursing in Mexico moved across professionalization processes which derived in two distinctive labor markets. By the beginning of the XX century, the Mexican state had priviledged the development of medicine and early granted it the status of profession. Nursing did not received this priviledged treat but in the last 20 years, the state supported the upgrading of technical nurses to university-trained nurses and declared its profesional status. However, is with the liberalization of commercial and labor market relations by the end of the XX century, when the state partially withdrew its protection from both groups leaving them to confront market forces and competition. The effects of this withdrawal have been clearly detetereous for both groups but each one of them have confronted different consequences. Physicians were attracted by the exploding demand of pharmacies that were not able to sell antibiotics without a medical prescription after 2010, while nurses have confronted an increasing precarization in the demand of labor positions from private and public institutions as well. In this context, the role of unions have been neutralized and doctors and nurses have been able to coincide in common public manifestations, as civil society groups, against the loss of employment positions, areas of practice and training in pubic institutions. Joint civil manifestations have achieved meager progress to change labor market conditions but they represent an innovative strategy of the manifestation of common intereses that until recently was not considered. Civil groups, including doctors and nurses may become a potent political force in the years to come if they further agree in their organization and strategic decisions.

Le Street Art à Casablanca : la perception des Habitants

Depuis ces dernières années plusieurs fresques s'imposent dans l'espace urbain de la ville de Casablanca participant à améliorer son image esthétique. Ces initiatives artistiques sont le plus souvent soit le produit des associations culturelles telles que « L'Boulvard » ou « CasaMouja » qui organisent des festivals annuels du street art à Casablanca soit elles proviennent d'une action de volontariat de certains street-artistes marocains qui s'autofinancent pour produire des œuvres murales sur de grandes façades.

En effet, ce type d'initiative a créé un débat autour de cette forme d'expression artistique et culturelle qui trouve son origine dans le mouvement culturel du graffiti connu historiquement comme moyen de contestation sociale et politique. Cependant, les mass médias à l'image de la télévision ont participé à construire une image positive sur cette forme d'expression dans le sens où elle permet à des jeunes artistes de contribuer à la vie citoyenne de la ville. Toutefois, nous constatons que certaines fresques à Casablanca ont subi de la violence à travers des actes de vandalisme.

Ainsi, en partant d'un travail empirique (observation directe, collecte des données et des entretiens semi directif), nous nous inscrivons dans une approche socio-anthropologue pour proposer une réflexion sur le degré d'acceptation et d'interprétation de ces productions artistiques au sein de la société marocaine et plus particulièrement dans la ville de Casablanca. L'idée est de voir quelle place occupe le street art dans les médias et dans les représentations des habitants casablancais.

Políticas De Protección a La Maternidad y Paternidad En Chile: Una Interpretación Del Ejercicio Del Derecho Al Cuidado

En las últimas décadas la relación entre trabajo y vida ha sido uno de los principales focos de debate sociológico, convirtiéndose en una vertiente fecunda de la clásica relación capital y trabajo. Una respuesta estatal a este conflicto ha sido la elaboración de políticas de protección a la maternidad y paternidad, centradas en el ejercicio de los derechos al cuidado infantil de padres y madres trabajadoras.

Esta ponencia presenta los resultados de una investigación cualitativa en base a 29 entrevistas en parejas heterosexuales de padres trabajadores de diferentes orígenes sociales y 8 grupos de discusión de trabajadores de distintos sectores de la economía que viven en Santiago de Chile. Su objetivo es comprender los

denotes a presenting author. Abstracts are organized by first presenting author's last name.

significados otorgados a las políticas de protección a la maternidad y paternidad, las experiencias en el ejercicio del derecho al cuidado y su ubicación simbólica dentro del marco de protección social destinadas a las familias.

Los resultados muestran que los padres y madres trabajadoras tienen un desconocimiento relativo acerca del contenido y acceso a las políticas de protección a la maternidad y paternidad vigentes en Chile, mientras que el ejercicio del cuidado está concentrado en las madres trabajadoras. Los entrevistados tiene una creencia generalizada que tras este desconocimiento se produce una situación de injusticia que jerarquiza a los individuos en términos de acceso y titularidad de derechos al cuidado, sin que puedan decidir libremente sobre los ámbitos trabajo y familia, como padres y madres trabajadoras. También ellos afirman no se trata de acceder a prestaciones o servicios limitados en términos temporales o espaciales como los provistos por las actuales políticas mencionadas, marcados por la participación en el mercado laboral, sino de proveer un conjunto de prestaciones integrado y universal que minimice los riesgos que viven las familias ante el cuidado de los hijos.

Beyond Erving Goffman and Conversation Analysis?

In studies of public behavior, it has been discovered that gazes between non-acquainted persons form a two-peak distribution. Most gazes are liminal, less than 100 msecs, and the second, a bit lower peak, is around gazes of less than 500 msecs. Only rarely gazes among unacquainted are longer than 500 msecs. The empirical finding both supports and qualifies Erving Goffman's notion of civil inattention, in which "one gives to another enough visual notice to demonstrate that one appreciates that the other is present, ...while at the next moment withdrawing one's attention from him so as to express that he does not constitute a target of special curiosity or design". For Goffman, civil inattention as the most frequent interpersonal ritual is the foundation for interaction order enabling a distinction between focused and unfocused interactions. The gaze length measurements comply civil inattention with the gazes of less than 500 msecs, as neurophysiology has demonstrated that the response delay is about 200 msecs. In that way, we may presume that these gazes are potentially reciprocal, and evidence for centrality of civil inattention in human encounters. Nevertheless, liminal gazes escape reciprocity: they are subconscious foundation for interaction that escapes the recipients' eye and conscious social orientation. Conversation analysis encounters also other structures of interaction in which parties rely on irrecoverably unsaid as a basis for interaction, e.g., "confirming allusion", even in principle inexplicable tie between conversationalists. We will claim that the principled imprecision underneath social action will leave us three options. 1) We can start to analyze neurophysiology below society. 2) We may rely on artistic license and try to catch the lived sense of social action without its measurement as Goffman. 3) We may follow the methodological canon of conversation analysis, and focus on actors' orientation for achieving social action.

The Contemporary Alternative Biomedicalization of Pain during Childbirth

In this paper, we analyze the development of an alternative biomedicalization of pain during childbirth (Clarke and als, 2003) according to a sociological comparative research focusing on the restructuration in health care work and organizations of the perinatal care system in France and in Quebec, Canada. The paper specifically focuses on the diversification of places of birth (from public hospital to public and private birth centers) without recourse to anesthetic pain management. We analyze the intersections of, on the one hand, the transformation of the standardization of epidural anesthesia as a public health problem (80% of childbirth in France, 70% in Quebec) (Akrich and Pasveer, 2004) and, on the other hand the increase of an obstetric market focusing on "alternative" pain relief through the techno-scientific controversies about the development of birth centers in Quebec and their legalization in France in 2013 (Daston, 1992; Murphy, 2012). Based on the analysis of written sources, as well as, seventy-five semi-directed interviews and non-participant observations with health professionals, in this paper, it is argued that the analysis of the management of pain outlines how the boundaries between health and illness, pain and suffering, are transformed through the appropriation of heterodox obstetrical knowledge and practices transformations, their movement from users and professional practices and the development of midwifery as a practice fit together in the development of a stratified alternative biomedicalization of pain during childbirth, which highlights tensions between multiple forms of knowledge (Collins, 1985; Epstein, 1996) which then oscillate between "objectivity" and "subjectivity" and "certainty" and "uncertainty". This process opens new spaces of negotiation and consumption of health and pain, but lacks the possibility of comparing expertise between these heterogeneous and multiple forms of knowledge, and the interconnections both at the level of practices and at the level of political and health institutions.

Where Standards Do Not Play a Role: Food Waste Valuation

While it is accepted that standards organize the production and exchange of food, this article sheds light on an area of the world of food that is not pervaded by standards: the valuation of food waste.

Since food waste has gained in visibility, private and public actors are concerned about its organization. The EU has developed a powerful policy which ranks the desirability of different forms of waste organization according to their environmental impact. Prevention is best-ranked, and scientists call for strong prevention that generates a desire for food waste (Mourad, 2016). Yet, strong prevention is rare, and we lack an understanding (practical and theoretical) of the ways in which food waste is turned into edible consumer goods.

Against this background, I ask: how is ostensibly worthless food waste valued so that it becomes desired by consumers to eat, and what are the newly ascribed values? Theoretically, I mobilize insights from valuation studies (Beckert and Aspers, 2011; Bessy and Chateauraynaud, 2014) and Thompson's rubbish theory (2017) to develop a framework for analyzing value infusion. Empirically, I examine four purposefully sampled organizations that engage in strong prevention by producing and exchanging food waste goods (jams, bread and bakeries, catering goods, bouillon) in Swiss marketplaces.

The findings show that the practices of saving and price-setting, the mobilization of senses, and the creation of local networks allow for an upward valuation process. This means that standards do not play an important role, but sensory experiences, which are to be considered as standards' counter-element, are pivotal for food waste valuation. As all cases prevent food waste, they are of value; but I also discuss them critically, pointing out their shortcomings, such as the emphasis on economic and environmental values that risks undermining social values.

The Contours and Trajectory of the Dalit Movement in Bijnor: Congruities and Incongruities

The Dalit movement, before independence, under the leadership of Dr. B. R. Ambedkar struggled for recognition, space and identity. However, as the period of freedom of the country approached, the movement was eclipsed by the Indian Freedom movement and the issues of nationalist concern over the dalit issues. Though Ambedkar and his party AISCF tried hard for pushing these issues to the forefront, but could not succeed. His party performed badly in the General as well as Assembly elections held after the independence. The dalit issues and movement took a backseat after the demise of Ambedkar due to the lack of any strong leadership.

The dalit movement continued to be in crisis in the northern region, until Kanshi Ram appeared on the political forefront. He provided the much needed catalytic momentum to the movement. He launched BSP in 1984 for intruding into the political arenas. in 1989, it made successful entry into the Loksabha and the Legislative Assembly of Uttar Pradseh.

Bijnor, a district in the western UP, became the launchpad of Mayawati by making her win the Loksabha election 1989, which until then was ruled by Indian National Congress party. The Assembly seats from this area also were won by the BSP. However, the journey has been a chequered one.

The present paper attempts to explore the trajectory of the dalit movement and politics with the entry of the Bahujan Samaj Party in this district and Uttar Pradesh region. It seeks to analyse the contours and the various phases of the Dalit movement in Bijnor as well as at the State level.

For the purpose, the data have been collected empirically through in-depth interviews conducted with the leaders of BSP and other politically active in the studied area. The secondary data has also been collected from various written records.

Gandhigiri in Save the River Teesta Movement of Himalayan Sikkim, India

In June 2007, I discovered Mahatma Gandhi inspiring the political practice of a social movement opposing the construction of numerous hydropower projects in the Himalayan state of Sikkim, India. Save the River Teesta movmement is the name I give to a loose coalition of non-state actors who organized public opposition to hegemonic state-directed cascacde development of River Teesta in Sikkim and North Bengal in India. This paper is not about organization of these protests, but explains the ideology that informed the leaders and their praxis. I demonstrate how the eco-warriors and *satyagrahi* of Save the River Teesta (SRT) movement creatively combines the teaching of Lord Buddha with Mahatma Gandhi and evoke them in their narrative and negotiations with the Indian state. The indigenist nationalism of these struggling Lepcha and Bhutia tribals neither challenges their political citizenship nor undermines their nationalist affiliation to India. The ACT (Affected Citizens of the Teesta) leaders have dedicated themselves to the pursuit of truth, questioned the truth of professed participatory development in Sikkim, and exposed the rhetorical claims of the elected government's democratic practice.Their narrative of protest has challenged the existing power structures that serve expansion of capitalist interests and marginalize them in the name of national development. Their critical voices have deepened the 'green' roots within the discourse and practices of local and state-level democracy in manifold ways. This article is based on prolonged fieldwork and extended engagement with the Save the River Teesta movement of Himalayan Sikkim.

Renewable Extractivism, Rivers, and Hydropower Projects in Manipur, India

Neo-extractivism bears the indelible stamp of the capitalist state prioritizing national development and economic growth over envionmental rights and human rights of the indigenous people. Conflicts over ecological conditions of livelihood and production (water) are increasingly being transformed into political conflicts between state, market, and society, and the impoverished peasants and tribals are emerging as 'ecowarriors' guarding these contested waterscapes against rapacious capitalism.North-eastern India is being transformed into the vital ingredient of India's energy sovereignty and its sustainable development agenda.Taking two case studies of the Tipaimukh Dam and the Maphou Dam located in Manipur (North-east India), I highlight the renewable extractivism embedded in neoliberal India's mega hydropower development policy and plans. I document the mounting and intensified contestations between a hegemonic hydro-state development vision that is being opposed by the hydro-social territorial attachment of many tribal and rural communities in Manipur. The affected communities (primarily indigenous groups) are unwilling to be displaced form locales of their ancestral identity, but state is forcibly transforming them into environmental refugees. Dams are getting inter-linked with violent repression and heavy militarization of these hydroelectric project areas is apparent. The human rights of indigenous communities are being violated, and their impoverishment and social trauma is directly a result of hydropower development. The repressive conditions and violation of all democratic norms evident at these project sites and condition of displaced villagers underscores the ecological racism inherent in these India metropolitan-centric renewable extractivist projects that are alienating locals from their hydro-social territories, and transforming Manipur into an enclave of mainland India.

Access to Justice in Young Land Occupations: From Water Rights to Legal Representation

In the Global South, young land occupations are a main driver of peri-urban growth through the consolidation of informal housing in areas of environmental protection and geological risk. In their early years, slums are subjected to legal challenges that evoke the narrative of environmental degradation and unsustainable practices to force eviction or deny urban services to impoverished land occupiers. Thus, land occupiers in particular lack consistent access to drinkable water for the first few years of a land occupation. Meanwhile, they live under unhealthy conditions such as precarious or open sewage and drainage and inadequate waste management. Instead of addressing these problems as human rights violations caused by environmental injustices, legal actors frame land occupations that involve deforestation as an environmental crime, resulting in the criminalization of informal dwellers. By the time municipalities assess that it is legally sound to upgrade a land occupation, it is often too late to guide their informal settlement patterns towards healthy and ecologically sensitive development (Pimentel Walker & Arquero de Alarcón, 2018). Moreover, land occupiers lack tenure security and are more likely to be victims of forced evictions. Since 2016, we have been partnering with young land occupations in the periphery of São Paulo in Participatory Action Research, which aims to mitigate pollution and improve environmental health. We co-produce land development strategies that promote healthy environments and place land occupiers as protagonists and stewards of their environment. We believe access to clean water is an environmental and human right. Likewise, we (Arquero de Alarcón and Pimentel Walker) work with the Center Gaspar Garcia for Human Rights, the Piabiru architecture NGO, and colleagues from LabJuta, Brazil's Federal University of ABC, to increase dwellers' access to justice, including timely notification of complaints, which may result in eviction, and proper legal representation in court.

Outsourcing US Based Immigrant Detention?

In 2017, 46 US states received reimbursements through the State Criminal Alien Assistance Program (SCAAP) for incarcerating immigrants with at least one felony or two misdemeanor convictions for violations of state or local law and incarcerated for at least 4 consecutive days during the reporting period. Although unsurprising given the devolution of US immigration enforcement, recipients also included Puerto Rico, Guam, the Commonwealth of the Northern Mariana Islands, and American Samoa. According to the U.S. Department of Homeland Security, some of these financial relationships date back to 1997—the first year of SCAAP reporting (Puerto Rico received $407,718 and the Virgin Islands received $541,016). But how is this possible? And how might this broaden our understanding of migration patterns to the United States? And are the incentives to participate similar across non-state jurisdictions? This research seeks to bridge the recent focus on extraterritorial detention (Mountz & Loyd 2018; Macias-Rojas 2016; Lindskoog 2018) and the devolution of US immigration enforcement (Farris & Holman 2017; Jaegar 2016; Menjivar 2014).

ARRIBAS LOZANO, ALBERTO* (Maynooth University, Ireland)

Cosmopolítica Andina y Futuros Pluriversales

Esta comunicación explora la cosmopolítica andina y su contribución para imaginar y tejer otros horizontes de futuro. A partir del trabajo de campo realizado entre junio de 2018 y mayo de 2020 con el Proyecto Andino de Tecnologías Campesinas (PRATEC) y los Núcleos de Afirmación Cultural Andino-Amazónica en Perú, mi propuesta invita a pensar el futuro / los futuros (y su construcción) desde la perspectiva de la ontología política.

En la concepción eurocéntrica del tiempo lineal, los futuros *deseables* implican a menudo la superación del pasado que pervive en el presente. Este *ethos* es compartido por la axiomática capitalista, que hace que 'todo lo sólido se desvanezca en el aire'; por la epistemología moderna/colonial, que enmarca los saberes-haceres subalternos como primitivos, atrasados, subdesarrollados; y por los grandes relatos progresistas, que ven en la ruptura revolucionaria su horizonte de deseo, su ideal de realización de una política emancipadora. Por su parte, en la cosmovivencia andina, con una concepción no-lineal del tiempo, el futuro / los futuros *deseables* (cuya construcción no depende solo de la acción humana, sino también de la acción de otras comunidades no-humanas) pasan por la recreación/regeneración del pasado en el presente. No su imposible reproducción literal sino su *repetición como diferencia*. Recrear el pasado bajo las condiciones cambiantes del presente alienta hoy en el área andina múltiples prácticas de *afirmación cultural*,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

autonomía y descolonización que operan sobre las más diversas dimensiones: regeneración de las tramas comunitarias, formas de distribución de autoridad, salud y educación propia, tecnologías de producción, ritualidad, lengua, etc.

En este contexto, para las comunidades andino-amazónicas la posibilidad de tener futuros propios, singulares, auto-determinados, y en diálogo pluriversal con otros proyectos de futuro solo puede existir entretejida/imbricada íntimamente con el pasado que se armoniza en el presente.

Humiliation. Social Anatomy of a Dark Emotion

Humiliation is one of the most intense among the so called "dark emotions" (e.g. envy, jealousy, Schadenfreude, etc.). An increasing attention has been payed to this emotional complex by recent psychological research. This paper, however, takes Georg Simmel's contributions to the sociology of emotions, specially his thoughts on shame, as an important theoretical basis for analyzing humiliation. Taking both historical and literary examples into account the paper looks for the distinctive features of humiliation in relation to other closely related phenomena, like that of offense. Firstly, it is highlighted its relational character, because humiliation requires the interaction of at least two persons or social units. This minimal social core is completed when a "third" comes into play, when a spectator watches the action considered "humiliating", intensifying in this manner the whole negative charge of it. Secondly, some reflections are devoted to the "excessive" nature of humiliation, because more than mere asymmetrical interaction and instrumental rationality is needed for it to emerge. Humiliation requires a plus; it doesn't just finish when the other is defeated but it seeks for his degradation even if there's no more resistance from his part. This leads us, thirdly, to discuss the relations between moral notions of the self and human dignity. Such notions are directly affected by the situation or action considered humiliating. That's why the paper concludes with some final remarks on the topic of social "recognition" and some important consequences of its negation: resentment and desire for revenge.

ARZA, CAMILA* (National Scientific and Technical Research Council and Centro Interdisciplinario para el Estudio de Políticas Públicas, Argentina)

Changing Families, Social Policy and Inequality in Latin America

In Latin America, social policies specifically oriented to support families with young children have been weak and countries have mainly relied on parents (or the extended family) to provide material security and care to their offspring. Despite recent social policy expansion and the growing attention to child and gender equality issues, family policies remain limited: childbirth leave offers only partial coverage (formal sector workers), the supply of full-time childcare services for children under school age is weak, and cash benefits for children have expanded but tend to be low, conditioned and income-tested, rather than universally provided to all children.

At the same time, the socio-demographic context on which social policies are applied is transforming. Families are shifting from the traditional nuclear family model and populations are ageing. Fertility patterns and female labour force participation have changed over the past half century, but remain stratified by income group. In a context of limited state support, families' alternatives to combine paid work and care also vary considerably across social strata. And all this risks reproducing and reinforcing existing socioeconomic inequalities.

This article explores these issues looking at changes in family structures and female labour force participation by socioeconomic strata, as well as at the ways in which social policies work for diverse family and care arrangements. It aims to identify the specific contribution and remaining gaps of social policies to support families with young children, in a context of changing and unequal families. It focuses on two Latin American countries (Argentina and Chile) and relies on both household data on family structures, paid work and care arrangements, as well as on administrative data on the reach and generosity of family policies.

Healthcare Policies and Health Outcomes in Sub-Saharan Africa

In sub-Saharan Africa (SSA) health sector reform has witnessed significant evolution and in the process governments have experimented with various health programs guided by neo-liberal policy towards improving health equity and accessibility. However, fiscal constraints, starting from the early 1980s, which necessitated a partnership with the Bretton Woods Institutions, and leading to varying structural adjustment programs, have significant effects on healthcare delivery in all countries of the sub region with lessons to be drawn towards achieving the United Nations sustainable development goals. This paper describes health reforms embarked upon by sub-Saharan governments and chronicles public healthcare development from the 1980s with reference to key features of actors, processes, designs and contexts. A comprehensive review of the literature and relevant documents forms the basis for analysis and discussion within the broad context of socio-political exigencies and the neglect of indigenous health knowledge systems that explain the seemingly intractable health problem in SSA. To achieve universal healthcare coverage, the paper highlights sub-regional responsibilities in taking ownership of health policies by designing health programs that are both endogenously crafted and sensitive to local conditions and contexts.

Responsible Tourism and Economic Inclusion in South Africa

Tourism contributes significantly to the social and economic value of a country especially those countries in the global South that are categorized as prime destinations. South Africa is one of such countries with its natural wonders and unique scenery. Tourism is a major source of job creation to thousands of South Africans, thus, improving the lives of citizens. Tourism is also an important source of revenue for the country. Current statistics suggest that tourism contributed about 8.6% to the country's gross domestic product grossing about $30 billion in 2017. Consequently, in this paper, we examine the South African tourism model and discuss the lessons other African countries with similar potentials but with less success may learn from that country's tourism industry. The paper also examines how the country promotes the practice of responsible tourism towards citizens and foreign visitors as well as the environment within the context of the United Nations sustainable development goals. Finally, we consider how xenophobic attacks in recent times may hinder further development of tourism in the country with significant ripple effects on citizens and the country at large.

An Analysis of the National Health Insurance Scheme of Nigeria's Website and the Efficacy of Its Health Communication Messages

The National Health Insurance (NHI) scheme in Nigeria was established through Decree 35 of 1999 but did not become operational until 2005. The aim of the NHI was to ensure that Nigerians have access to healthcare services at a subsidized cost without directly paying for it. To have access to this, participants pay a monthly fee to a licensed Health Maintenance Organization (HMO). The HMO serve as the financial body that ensures that the financial pool needed by the health care providers are available to provide the needed health care service. Unfortunately, many researchers do not see the scheme as successful and due to various factors ranging from lack of trust by the Nigerian people of their government, the urban focus of the scheme, the philosophy of paying for health, the limitation of the scheme to the nuclear family (thus excluding the external family). Other more pertinent challenges noted by scholars are the participant's complaints of lack of drugs and health facilities by the health care providers, distance of the centers for those seeking health care or to register with the scheme. In a bid to get the cooperation of the Nigerian people, various governments of the day embarked on awareness campaigns and one of such strategies was the setting up of a website managed by the NHI Scheme in Nigeria (*https://nhis.gov.ng/home/*). This paper interrogates the quality and quantity of the information provided through this website in addressing the identified challenges noted in the literature. Using the content analysis method, the paper aims to find out if the website tries to fill the gaps by providing public inspired information as against government assumed and misleading information. This will be significant in understanding how the NHI can be better designed to meet the actual needs of their people.

An Analysis of the Osun Osogbo Festival As a Cultural Tourism Attraction and Its Possible Effects on the Ecosystem of Osun State Nigeria

Tourism is considered a major contributor to the growth of middle and low income countries due to its ability to draw in much needed foreign exchange. In Africa, countries like Kenya, Cote d'Ivoire and Ghana are countries in Sub-Saharan Africa which have witnessed high tourism performance while Morocco has been identified as Africa's leading tourist attraction. In a country like Zimbabwe, foreign visitors to Victoria Falls contributed up to 11% of the GDP, employing 7.3% of the total work force. On the flip side though, tourism has resulted in an increase in GHG emission caused by transportation, accommodation and other activities that

come with it. Such activities environmentalists have warned trigger climate changes such as flooding, droughts and wildfires; and this in turn affects the tourism industry because natural scenery is the major attraction. This interdependence of tourism and climate change will be considered in relation to the Nigerian tourism and cultural attraction of the Osun Oshogbo festival which takes place in the month of August. Though the festival is a cultural one, many side events such as the production of the traditional *Adire* greatly increases resulting in the increase of residual dyes in the soil; and because the festival involves sacrifices to the Osun River, so does the pollution of the water body. This research thus considers these factors and the possible long term as well as short impacts the yearly cultural festival may have on the ecosystem of Osun State, Nigeria.

Influence of Social Capital in Multiple Contexts on Mental Health and Academic Achievement Among Japanese Junior High School Students.

Recently, researchers are interested in the influence of **multiple domains of social capital** on adolescent health (Novak D & Kawachi I, 2015). For adolescent such as junior high school students, social capital embedded in multiple social contexts or domains, including **neighborhood**, **family**, and **school**. The previous study suggested family social capital and school social capital interplayed and such interaction related to adolescent academic achievement (Crosnoe R, 2004). Therefore, we examined the influence of three social environments of social capital -in neighborhood, in family, and at school- on students' mental health and academic achievement. We used the data obtained from 2,002 eighth-grade students from 20 public junior high schools located in four cities located in urban, suburban, satellite, and rural areas in 2007. In the first step, to measure family social capital and school social capital, we specified sub-constructs of family social capital and school social capital by a series of exploratory factor analysis and following confirmatory factor analysis. We found four sub-constructs of family social capital and six sub-constructs of school social capital. Using generalized linear model (GLM), the influence of three social environments of social capital -in neighborhood, in family, and at school- on students' mental health and academic achievement were examined. Controlling basic characteristics including gender, family background, and residential area, we found that higher level of depressive symptoms associated with sub-scale scores of neighborhood social capital (availability and quality of services (-), cohesive neighborhood relations (+), insecurity and danger of accidents (-)), and sub-scale scores of family social capital (parents' concern and understanding about study and school (-), mutual interest among family and gap of feeling with parents (+), cooperation and solidarity of family (-)), school social capital (cooperation among students (-), Cleanliness / order / safety (-), Violence / Confrontation / Danger (+)).

The Role of the International Sociological Association for Boosting Academic Career and Building Global Networks

International societies/associations are playing an important role in the processes of professionalization and the development of disciplines. In 1958 *Robert K. Merton* in his paper *"The Functions of the Professional Associations"* defined a professional association as "an organization of practitioners who judge one another as professionally competent and who have banded together to perform social functions which they cannot perform in their separate capacity as individuals". He felt certain that professional associations are important for the regulation of the structural influence on professionals. The associations can help to overcome the problems of ambivalence in a professional society, the possible selfish behavior of professionals. Later on, *Jennifer Platt* wrote about sociological associations (Journal of the International Sociological Association, June 2002; 17 (2)): *"They are playing an important role in the processes of professionalization and the development of disciplines".* Alan Johnson in his brochure *"Charting a course for a successful research career. A Guide for Early Career Researchers"* (April, 2011) recommended young researchers to participate in all activities of professional associations. Professional associations, especially international certainly boost an academic career. A. Johnson summarized: *"International societies are very important and obviously work at a much more global level than National societies. The award of prizes from these societies and other activities such as invitations to present keynote papers at the International Society meeting are indicators of the high level of your research activity and will certainly benefit your research career".* RC23 presents the study of the ISA modern role for boosting an academic career in sociology area, how its activity helps individuals and collective members to cooperate and build academic networks. The project is collecting data to develop a broader picture of the status of ISA across the world and ideas from the members for future ISA development.

From Globalization to Post-Globalization: Shifting Paradigm in Modeling the Future of the Nation State and Global

This paper is intended to discuss the prospects and the ways of constructing a new model of nation and global development in a situation of factual and theoretical uncertainty indicated in social and political science by the concept of post-globalization. It aims at analyzing the critical and theoretical potential of the concept of post-globalization for understanding the direction of shifting the paradigms of conceptualization of the future of nation state and its potential effect on political agendas and social policies of international and national administrations.

My research is based on contextualization, theoretical analysis, and conceptualization of the post-globalization critique of the results and further prospects of globalization.

I proceed to the study of the emergence and the content of the post-globalization concept. The concept of post-globalization radicalizes the critique of globalization by the act of heuristic disruption. Delimiting globalization temporally and spatially by drawing the line separating the actual from the "post-" and thus demarcating the contours of globalization as it happened, the concept of post-globalization actualizes understanding of the "fault lines" of neoliberal model, makes them more "visible". My research results in determining the heuristic and constructive value/potential of the post-globalization concept for configuring the foundations of the modeling present-day concept of nation state, global policies of international institutions, national administrations, and the principles of their coordination.

Between Strangers and Citizens: Mediating and Making Claims for Migrants in South Korea

This paper examines the role of faith-based organisation in the claims-making process for migrant inclusion and citizenship in an emerging 'multicultural' society like South Korea. Following Peter Berger and John Neuhaus' (1977; 1996) notion of mediating structure, I contextualize faith-based organisation (in particular the Catholic Church) as a *migrant-serving mediating structure* which bridges migrants as 'strangers' and the wider publics in the receiving society. Within the context of migration, mediation as an organisational process and strategy is employed by faith-based organisation to make claims on behalf of migrants whose limited access and resources at the structural level encumber direct transmission of demands and claims to the state, bureaucracy, receiving society and even the market. Based on a multi-sited ethnography of Catholic-based migrant organisations in South Korea, this paper introduces three strategies of mediation between migrants and the wider publics. I first focus on *care mediation* by which the Korean Catholic Church engage social service provision and delivery as a (de)politicized blueprint of welcoming and incorporating migrants especially vis-à-vis welfare and migration regimes. I then present *symbolic and spatial mediation* by which the Catholic Church provides the physical and symbolic infrastructures for migrant community formation especially among Filipino migrants. Through a mediated community-building, the presence and visibility of migrant communities becomes both an object of legitimacy and scrutiny in public sphere. Finally, I present *empowerment mediation* as a paradoxical strategy of providing spaces and resources which migrants employ in the production and maintenance of a "sense of self" and self-worth amidst social exclusion, discrimination, and marginalization. By focusing on these three strategies, the paper offers a portrayal of mediational state-civil society relations that is played out in the context of migration and religion and the need for intermediating institutions in the claims-making for citizenship among migrants.

The Fintechs and the Great Brazilian Banks - Disputes, Partnerships and the Reconfiguration of the National Financial Field

Fintechs' breakthrough in the country has allowed a broader and more specific range of financial services. These startup companies become increasingly competitive with traditional services for both their ability to handle highly unstable but flexible scenarios and the ability to focus on the specific needs of particular customer groups and the arsenal of data it can interpret and use for the configuration of its next steps of action in the offer of services. However, what could be just a competition front to the traditional system has become a potential tool for a new performance of the big banks and lenders. We have then configured at least three possible situations to be debated: the one in which Fintechs compete directly with banks in attracting customers and offering innovative and increasingly

44

simple and useful services - making use of its large analysis differential data and algorithms, another one in which they claim investments and compete with each other (obviously this scenario is much more complex, also counting on cooperation for power lines to be established in certain segments), and one in which the banks themselves become propellants of these new players (such as the incubation structures of startups in which such banks become investors).In this sense, it is considered interesting this effort that starts from this new technological trend and that are able to reconfigure the structures, values and lines of strength of a scenario dominated by large and traditional players. From these transformations we operate the naturalizations of the financial way of executing, from the technological base and the customer-focused customization, which redirects the look to large banks and creditors and makes us question the future movements for the preservation of the force of actors already consolidated and the tricks to be used by the entrants to reconfigure this scenario.

ASSIS, THAÍS* (Universidade de São Paulo, Brazil)

Between Religious and Secular: The Dynamics of Spirituality

Over the last four decades, Brazilian religious dynamics has changed significantly, notably the diversification of practices and beliefs. The majority of the population is Christian and the Evangelical and Pentecostal denominations are growing in influence. In parallel, a number of practices and beliefs commonly identified as mystic-esoteric or New Age spiritualities have become more prominent, especially among urban middle classes. Based on a sociological perspective, this communication addresses the issue of contemporary forms of religious expression at the fringes of or outside religious institutions, through religiosities and spiritualities that defy the boundaries and the opposition between the religious and the secular. To describe such practices and conceptions has been a challenge for researchers; moreover, in the sociological and anthropological literature, there are multiple terminologies trying to account for the complexity of the social world. Strictly speaking, there is no consensus on the issue and the definitions that some researchers elaborate – concerning both religion and spirituality – seem to be different from the concepts of social actors. Indeed, according to current world trends, individuals involved with spiritualized or mystical practices tend to identify themselves as "nones" or "spiritual, but not religious". These individuals consider their activities as philosophy, faith, explanation, self-knowledge or lifestyle, but not as religion. In addition, they generally present themselves as articulators of a universal knowledge that transcends cultural and religious boundaries. Many sociological analyzes show that such phenomenon neither indicates that there are fewer religious people in Brazil, nor that the secularization theory is valid. Evidence suggests that categories of irreligion encompass expressions of individuals who have some kind of religiousness, but do not consider themselves religious for some reasons. The present work attempts to outline the particularities of these expressions and discourses based on an empirical and theoretical analysis of Brazilian cases.

ASSIS, THAÍS* (Universidade de São Paulo, Brazil)

Between Spirituality and Health: Holistic Therapies Beyond the New Age

Based on a sociological perspective, this communication addresses the issue of complementary and alternative medicines (CAMs), officially recognized as integrative and complementary practices (PICs) in Brazilian public health. By analyzing the interfaces between spirituality and health, the study intends to examine how non-biomedical practices originally associated to New Age esoteric spiritualities have achieved a therapeutic status in the Unified Health System (SUS). Over the last four decades, Brazilian religious dynamics has changed significantly, notably the diversification of practices and beliefs. The majority of the population is Christian and the Evangelical and Pentecostal denominations are growing in influence. In parallel, a number of practices and beliefs commonly identified as mystic-esoteric or New Age spiritualities have become more prominent, especially among urban middle classes. This presentation starts from the historical background of alternative and holistic therapies at global and national levels in order to map the social movements that contributed to popularize, legitimate and institutionalize these practices. The theoretical discussion intends to examine how discourses, practices, therapeutic routines and public policies institute and legitimate holistic therapies as instruments for disease prevention, health promotion, well-being, and quality of life. Public disputes, tensions and debates around the professional recognition of therapists are also analyzed. Hence, the work proposes to advance the sociological understanding of the asymmetries of power between the different health care modalities and also of the indicators of autonomy and authority of non-hegemonic therapeutic practices.

ASSUMPÇÃO, CAROLINA* (Universidade Estadual de Campinas, Brazil)

Women As Mediators of National Identities in the Globalization

Identities are built dynamically and they are result of association and differentiation processes among individuals in social environment. They arise as an element of belonging mutual recognition between its members. The main interest of this research is to comprehend the mediation of South Korean national identity made by migrant women in cultural centers in São Paulo. The emphasis is on mediation - understood as a process of transmission, meaning allocation and ritualization - of national traditions regarding to cultural roles undertook by the mobilization of national symbols. The cultural mediation marked by female gender enables us to get in contact with national narratives and imaginary, in which women's perspective about their life trajectory and social experiences provide a comprehensive enlargement of national identities development in the context of globalization. The selection of these immigrant groups is based on the recent institutional organization of cultural centers around original nations, as they are Korean Cultural Center in Brazil and Hallyu Cultural Center. These cultural centers, displaced spaces of ritualization and significance of national identities, are not randomly headquartered: they are based on central neighborhoods in the global city of São Paulo, which is permeated by intense flows of social, economical, political and cultural relations immersed in a global scenario.

ATOBE, CHISATO* (Rikkyo university, Japan)

Who Supported the Career Development of Japanese Highly Educated Women? : Focus on Social Division of Women between Elementary School Teachers and House Wives in Tokyo between the 1970s and 1980s.

Japan has the third highest GDP but is only ranked 110th for gender equality. This is because the employment rate of women did not rise as much as other developed countries, despite demographic changes. In other words, we can say that it follows a civilization process different from other countries. In recent years, the Japanese government has a policy to promote the participation of women in the labor market. In this paper, I will consider the problems that women continue to work after giving birth in a society with large gender inequality, in the historical case in Japan. I focus on female teachers in elementary schools who managed to continue working after getting married and giving birth in a time when married women being housewives was a growing trend in Japan. I presented at the ISA 2018 Toronto, where I spoke about maternity leave substitute system for highly educated women resulted in a new job for women with low income and unstable employment, in a society based on gender disparity. This time, I will discuss about domestic workers, which were also needed when highly educated female workers continued to work after giving birth. So, I conducted interviews with female elementary school teachers who moved from local cities to Tokyo in the 1960s, and housewives who helped female teachers' house work and childcare. At that time, many female teachers entered urban areas, which also caused the "feminization of teachers" in Japan. I investigated the trajectories of female teachers, when they had no relatives in the neighborhood. As a result, I believe it is necessary to understand the workers of the reproductive field and the informal sector, who identify themselves as housewives, when we consider about the career formation of women in the countries where the gender division are strong.

ATTENCOURT, BORIS* (Ecole des hautes études en sciences sociales (EHESS), France)

The Fabric of Profane Intellectual Taste : The Case of Conferences of Scientific Culture

Notre communication se propose d'analyser la fabrique du goût intellectuel profane à partir d'une ethnographie multisite menée dans les années 2000 en France parmi les lieux de conférences de culture savante (la BnF, Beaubourg, l'Université de tous les savoirs, le Collège international de philosophie, etc.). De telles instances et l'audience qu'elles rencontrent auprès d'un large public s'inscrivent dans le développement depuis la fin des années 1970 de tout un ensemble de circuits de célébration qui mêlent référence à la culture légitime, accessibilité et action : institutions culturelles, presse de qualité, revues intellectuelles, émissions de radio et de télévision, maisons d'édition, laboratoires d'idées, etc. Or, ces nouveaux circuits se sont imposés au milieu des années 1980 comme l'espace où se jouent désormais la valeur publique des idées et de leurs porteurs et, partant, les classements et systèmes de classement intellectuels du grand public. Sur la base des approches mixtes (observations, questionnaire et entretiens) engagées durant notre enquête auprès des auditeurs, nous avons cherché à saisir

la consommation des conférences savantes sous l'angle de ses déterminants, modalités et usages. Il ressort du traitement de ce matériau empirique qu'une telle pratique renvoie avant tout à des trajectoires émaillées de décalages scolaires et professionnels qui portent les individus à entretenir un rapport ambivalent à l'école et ses hiérarchies et, par conséquent, à trouver des formes de salut dans les styles et discours anti-école que leur procurent des producteurs d'idées à la fibre extra-universitaire. Caractérisé de la sorte, le goût intellectuel profane peut donc être rapporté à la diffusion par une élite de l'esprit de biens culturels de luxe situés au-delà des classements scolaires, pour des dominés qui tendent à se les approprier de manière plus ou moins légitime selon les différents facteurs de domination de l'espace social (genre, race, classe sociale, etc.).

Navigating Transnational Higher Education Options

This presentation answers the following questions: How do parents navigate the transnational field of higher education? How does this affect where they send their children to complete their K-12 schooling? What challenges do parents of transnationally mobile youth face when getting their children admitted to college? What are the experiences of transnationally mobile youth in college? I examine these questions by focusing on the specific case of Indian American return migrants and their children. In doing so, I describe how the transnational struggle for social status shapes parents' local educational decisions and how, as a result of living a life characterized by mobility, transnational Indian American youth carve out a cultural and social niche for themselves on US college campuses. As such, using the transnational field of higher education as its backdrop, this presentation discusses how parents make educational choices for their children and transnational youths' experiences in US institutions of higher education.

ATTERBERRY, ADRIENNE* (Syracuse University, USA)

Transnational Concerted Cultivation: Parenting Practices Among Indian American Return Migrants

Social inequality is produced and reinforced by how parents choose to educate their children. Through analyzing interviews with 39 affluent, professional Indian American return migrant families, this presentation discusses their enactment of a transnational form of concerted cultivation. According to Annette Lareau (2011) concerted cultivation is a middle-class childrearing technique that involves discussions between parents and children and children's participation in organized activities. As a result of these experiences, children develop a sense of entitlement that benefits them in institutional settings whereby they learn to make demands on adults. This provides middle class children with important institutional advantages that may be valuable when they enter the labor market. Annette Lareau (2011) originally defined concerted cultivation in relation to Black and White, middle class US families. Expanding upon the original concept, Pawan Dhingra (2018) defines concerted cultivation for Indian American migrant families living within the USA. He describes them as enacting a form of concerted cultivation that emphasizes education and (academic) extracurricular involvement. In his conceptualization, parents' racial and immigrant backgrounds inform how they navigate opportunities and constraints within an intensely competitive environment. In this presentation I extend Lareau's and Dhingra's conceptualizations of concerted cultivation as I discuss how Indian American return migrant parents practice transnational concerted cultivation. I argue that they use four tools in this process: exposing their children to India, educating them in good K-12 schools, nurturing their interests, and encouraging them to travel abroad. I argue that parents use these tools with the goal of facilitating their children's cultivation of advantageous cultural capital that will enable them to be successful, transnationally mobile professionals in the future. In doing so, I discuss how transnational migration enables the emergence of new forms of economic and social inequality.

ATZMUELLER, ROLAND* (Institute of Sociology, Austria)

Critical Crisis Theories?

The paper assesses so-called political crisis theories (O'Connor 1987) which were developed by people Claus Offe (1973) and Jürgen Habermas (1972) (and from a different theoretical strand, Nicos Poulantzas) in the crisis of late capitalism/Fordism, for a deeper understanding of finance dominated accumulation. These approaches tried to understand the role of the in the crisis of (fordist) capitalism not only because the interventionist state of late capitalism/Fordism tried to manage the crisis but even more so because these approaches could show that the crisis prone developments in late capitalism/Fordism, which threatened its reproduction, did not simply emerge logics of capital accumulation. Rather they showed how in particular (welfare-state) activities which were developed to manage the destructive effects of capitalist accumulation created crisis tendencies of

its own (eg crisis of legitimacy/loyality, rationality etc). Habermas and Offe did not envisage the transformative capacity of the CMP and the emergence of neoliberal reform projects this at this time.

However, the theoretical core of their argument is still helpful to understand the contradictory developments concerning the reproduction of the CMP in and through crisis in finance capitalism. In this context the attack on welfare system but also the transformation of labour processes in particular in the global north is crucial. This shifts the burden of coping with crisis onto individuals (and their family household), their ability and willingness to constantly adapt their labour-power under a human capital oriented mode of regulation, and to develop their subjective abilities in a post-Taylorist form to secure reproduction through change and to reify their labour power. Thus, the permanent re-composition of their "Arbeitsvermögen" constitutes a crucial mechanism of the reproduction of the relations of production. Thereby, the latter is transformed into a pedagogical relation through which the hegemony of capital over the former is secured.

RC12-150.2

AUCHMUTY, ROSEMARY* (University of Reading,, United Kingdom)

Is Divorce Ever a Feminist Issue?

In a society where marriage is women's main career and livelihood, as was the case in Britain up to the 1970s, and where property is separately held, feminists recognise that divorce law reform will leave many ex-wives destitute unless proper arrangements are put in place for their maintenance. The men who pushed for divorce reform in Britain in the nineteenth and twentieth centuries resisted feminist calls to incorporate such arrangements in each new divorce law (the classic 'after the revolution' argument) and in 1969 (the year of the last Divorce Reform Act) tricked the feminists into abandoning their community-of-property-style bill in favour of the less far-reaching provisions that form the basis of the current law. The 1969/70 legislation is a classic example of how feminists may achieve successful (and much-needed) interventions in law but not in the form, or to the extent, that they wanted; and how men's self-interest almost always prevails.

AULAKH, SUNDEEP* (LUBS, United Kingdom)
EDWARDS, LEE (London School of Economics, United Kingdom)

Top Dogs Drink from the Same Bowl! Corporate Professions, Elite Actors and Linked Professionalization Projects.

A central construct within institutional theory (Scott, 2014), several ground-breaking papers have greatly advanced our understanding of organisational fields in recent years (e.g. Hinings et al., 2017; Zietsma et al, 2017), including identifying new pathways engendering field-level change (e.g. Faulconbridge and Muzio, 2019; Furnari, 2016). Yet, with notable exceptions (Furnari, 2016), few studies explore ways in which the interaction between fields produce and reproduce cultural and material practices. Responding to Wooten and Hoffman's (2017) call to adopt a relational approach to organizational fields, this paper explores how the interaction between elite actors of two corporate professions (executive search and public relations) that are unable/unwilling to adopt a traditional professionalization strategy (Muzio et al., 2011), maintain economic privilege and social prestige through exclusionary practices in the name of the client.

Drawing on a qualitative research strategy, including interviews with recruitment professionals serving the public relations industry, we show how narratives such as client service, 'matchmaking', talent and 'fit' are treated as forms of competence by executive search professionals. Deployed in the context of recruiters' self-ascribed roles as 'guides' for the practitioners they are seeking to place in corporate and other elite organizations, such narratives have the effect of reinforcing the 'othering' of BAME practitioners in the recruitment process. The translation of subjective criteria into 'objective' forms of competence results in the prioritisation of client relationships and professional legitimacy in both fields despite their (field-level) aspirations to improve diversity.

This study demonstrates that exclusionary practices occur not only as standalone dynamics within fields, but emerge through field-level interaction of elite actors whose mutual interests are reinforced and where patterns of engagement strengthen normative power of exclusionary practices, thereby simultaneously perpetuating stratification and inequality characteristic of most professional occupations.

DECIEUX, FABIENNE (University of Vienna, Austria)

Social Investment, Child- and Elderly Care – a Polanyian Analysis of the Austrian Care Regime in Times of Marketization and Social Inequalities

The welfare states' paradigm of social investment goes along with politics and policies discovering children and women as human capital and the 'best agers' as productive resource of the society while the multi-morbid elderly people are considered to be cost factors. Combined with the adult worker model it touches and changes the role of the family, the market and the state in the Austrian care regime. Drawing on two projects which investigate child- and live-in care the paper compares the social policies and arrangements. In the first part of the talk we reflect on the social investment paradigm and social policies referring on Karl Polanyi's work and show how the neoliberal governance strengthens but also regulates the marketization and quasi-marketization of care and care work. The second part discusses the case of public and non-profit childcare as an example for quasi-marketization of care drawing on the investigation of stakeholder policies and education in kindergartens. These policies are strongly connected with the adult worker model, the concept of education instead of or besides care and the idea to produce human capital in the case of children and to make women available for the labor market. The third part draws on empirical research on the promises of brokers of live-in care, the policies of stakeholders, and the embeddedness of this care market in the welfare state. It shows how elderly care is organized in the line with the adult worker model privileging the middle classes at cost of the mainly female migrant care workers. The conclusion argues why childcare has to be seen as a case of social investment in line with marketization and elderly care has to be seen as a case of marketization instead of social investment.

Camino Académico Y Profesional De Doctores EN Geografía De UNA Universidad Pública DEL Sur De Brasil

La inserción profesional de los graduados ha sido objeto de investigación desde la perspectiva de verificar el desempeño de los alumnos de los cursos más diversos en el mercado laboral. Sin embargo, existe un desajuste notable entre la producción intelectual académica de los graduados y las políticas de democratización y expansión del acceso a la educación superior observadas en las últimas décadas. Los estudios de posgrado, en este plan, han adquirido una importancia central, dado que el aumento en la matrícula ha resultado en un mayor grado de profesionales calificados que juegan un papel fundamental en la producción de conocimiento y el desarrollo de nuevas tecnologías. El Programa de Posgrado en Geografía (Posgea) del Instituto de Geociencias (IGEO) de la Universidad Federal de Rio Grande do Sul (UFRGS) se encuentra entre los mejores del país según la evaluación de la Coordinación para la Mejora del Personal de Educación Superior. (CAPES) Teniendo en cuenta que Posgea tiene como objetivo la formación de profesionales académicos altamente calificados, ¿la inversión personal en la carrera durante la trayectoria educativa favorece la inclusión de los doctorados en puestos académicos y de investigación? La población analizada consistió en 80 graduados de doctorado de 2008/1 a 2016/1. La recopilación de datos se realizó a través de cuestionarios en línea, disponibles a través de la plataforma Google Docs. Los datos se analizaron estadísticamente con la ayuda del software SPSS y NVivo. Los resultados muestran que la inserción previa al curso de doctorado en el mercado laboral y la participación en eventos durante todo el curso de posgrado favorecen la entrada de docentes en instituciones federales de educación superior.

Leisure Time Activities of Working Women in India

Leisure time is a product of modern society. Though some roots of leisure activities are found in ancient period .In modern era concept of work and leisure are redefined according to class, caste, region and religion.

In Indian society concept of work and leisure was defined according to religion, region and gender too. A general assumption is that working women who also fulfill domestic responsibilities are starved of time for themselves. In India concept of work has been changing after industrialisation in general and after accepting new economic policy in particular.

After accepting new economic policy participation of women in labour force is decreasing constantly though Government is implementing several policies and programs for women's empowerment. Women experience inequalities in gaining access to work and it also reflect in gaining access to leisure 'space' and activities.

This study aims to search the relation among leisure and work and also leisure and gender in India.

AYALA, CONSTANZA* (Doctor(c) in Sociology UC Chile, Chile)

Teachers' Bias and the Academic Achievement of Foreign-Born Students: Testing the Compounding Effect Hypothesis

Sociology has paid little attention to teachers and focused on the relevance of schools in the reproduction of social stratification. Moreover, the use of different empirical strategies has shown mixed results. In this paper, I try to address some of these issues. This paper analyzes the bias of primary school teachers on foreign-born and national students, relying on the compounding effect hypothesis. I apply a double-blinding design using a difference-in-difference analysis on administrative data from Chile. Data availability allows me to measure academic performance with standardized (blind) and teachers' (non-blind) scores in mathematics and language. Results show that teachers present a positive bias towards Latin American students compared to their Chilean and other foreign-born counterparts in mathematics. However, in language, the gap is negative. This difference is higher when the cultural capital of students is included. A possible explanation comes from the social reproduction theory, which suggests that students with higher material and immaterial resources experience a more significant benefit from teachers' effectiveness. Moreover, as teachers are part of the social structure, they rely on stereotypes in their perceptions and attitudes towards their underprivileged students. This explicative mechanism can be related to ethnic discrimination in the grading process. Although these findings are not conclusive, there is a hint that teachers could rely on negative or positive stereotypes reproducing social inequalities in the educational system. These results help to discuss teacher effectiveness and educational attainment of disadvantaged students from a sociological approach and contribute to public policymakers.

How to Transfer Artistic Knowledge? the Case of Turkish Musicians in Germany

The concept of *cultural capital* coined by Bourdieu is understood to be contextual. This contextuality is shaped by inclusion and exclusion practices of a certain society that turns into either recognition or devaluation of certain abilities and skills. Although the concept has been used widely in the research of the highly-skilled migrants, these studies tend to exclude the field of arts. This article addresses a very specific sub-group of migrants in Germany: Turkish Classical music artists. This sub-group is uninvestigated although this migration path is continuous since the 1930's. It carries importance since cultural capital is not equal among migrant groups and theirs is different than the majority of guest-worker generation Turks in Germany. The musicians were educated in highly eurocentric institutions and they are experts in a genre that does not originate from Turkey but has strong historical roots in Germany. This paper questions the experiences of highly-skilled Turkish musicians in Germany in terms of knowledge transfer of an occupation that is hegemonic and has its own language. The purpose of the paper is to understand how social negotiation is carried out in the field of arts in Germany and to explore the role of dynamics regarding institutional settings in this field. This study shows that there is a strong relationship between Turkey and Germany regarding Classical music owing to the artistic knowledge and expert exchange that took place in the 1930's. This relation, the reception of this genre in Germany and the fact that music is a language itself eliminates the problematics of entering the foreign labor market. Ultimately, this article argues that in the context of Germany, the cultural capital of the Turkish musicians is recognized which eases the process of knowledge transfer, unlike being experienced by other profession groups.

Digital Work Platforms: A Challenge to Professions and Organisations

Granovetter's notion of "Strength of the weak ties" is a challenge for Professions and Organisations in a time when digital work platforms (DWP) are spreading all over the world.

Drawing on case studies, this communication examines the conditions for organizing and managing the employment relationship on DWPs. We show that these conditions are largely due to the disruptive nature of the process of digitizing the employee/employer relationship. Digitalisation replaces the employment contract of the standard employment relationship with a triangular "worker - platform - customer" relationship. The boundaries become opaque and uncertain: subordination disappears, labour law gives way to commercial law, the figures of the employer and the employee lose institutional visibility. We seek to clarify the contours of this "in-between" model and propose to use the notion of "grey zone". The notion of "employment grey zone" (EGZ) makes it possible to shift the researcher's perspective by focusing attention on practices and "intermediate spaces of regulation", relatively autonomous and endowed with their own dynamics. This broadens the perspective and helps to better understand the impact on the employment relationship of new forms of governance in a context of digital turn.

We argue on the foundations and interest of mobilising this geopolitical notion in the field of industrial relations. The links between digital platforms and grey zone are then examined. In particular, we show that digital governance is based on a confusion of powers between coordination and leadership. The reflection continues in a third phase with an examination of digital management practices in two areas: the control of the activity of connected workers and the production and management of externalities induced by the operation of platforms. We conclude with a discussion on the heuristic value of the notion of grey zone of employment and its meaning for professions and organisations.

The Interplay between Life Courses and the Welfare State: Women's Mental Health Later in Life in Comparative Perspective

How can exposure to different welfare contexts throughout the life course moderate the way individual characteristics affect people's health? More specifically, how can generosity of child care, maternity leave, and unemployment policies moderate the effects of childhood SES, mid-life labor-force and family-formation trajectories, and social mobility over women's mental health later in life? Using SHARELIFE data, a retrospective survey representative of the population aged 50+ in 13 European countries, I employ sequence and multi-level regression analyzes in order to better understand mental health inequalities by bringing the welfare state as a dynamic time-varying entity, and labor-force and family-formation patterns as non-static throughout time. Mental health has rarely being used to study the association between life courses and health, but some long-term effects of life course circumstances over mental health have been documented. However, research has not looked at life course stages simultaneously and contextually. Looking at women's mental health is a particularly important considering traditional gender roles and the incorporation of women into the labor market among the cohort observed in this study (1943 - 1958), which created several sources of stress that might translate into mental health issues later in life. Results show that women who experienced a disadvantaged childhood, who were downwardly mobile, and who followed non-traditional labor-force and family-formation trajectories, show worst mental health later in life. However, by showing that these effects are weaker in contexts with more generous welfare states in different policy domains, this paper advances the intersection between political sociology and social epidemiology in two ways: by moving forward from static definitions of the welfare state, understanding it as an institutional entity that changes over time, and conceptualizing it as an institution that can be analytically fragmentized into different policy domains in order to understand how it affects health inequalities.

BAMBS, CLAUDIA (Pontificia Universidad Católica de Chile, Chile)

To What Extent Can Lifelong Employment and Wellbeing-Habits Trajectories Moderate the Negative Effects of Disadvantaged Early-Life Conditions on Chronic Diseases?

During the last two decades, sociological and epidemiological research has stressed that people who confront material and social disadvantages in early-life periods (i.e., pregnancy, childhood and youth) have a higher risk in old age for non-communicable chronic conditions such as cancer, hypertension, diabetes and others. This research has also highlighted that adulthood conditions (notably, occupational status and health behaviors) can moderate the negative health effect of adverse childhood experiences. Nevertheless, when it comes to adulthood measures, most of these studies consider static indicators from only one point in adulthood, thus neglecting the effect of long-term trajectories in domains such as employment, health and wellbeing. Based on a life-course approach and using longitudinal statistical tools (sequence analysis and regression models) this study examines to what extent the association between early-life conditions and non-communicable chronic diseases in old age is moderated by lifelong and simultaneous employment and wellbeing-habits trajectories. The research is

focused in Chile, a relatively high-income (but strongly unequal) Latin-American country, that has achieved universal health coverage (99.9%) in 2013, and where non-communicable diseases account for 85% of all deaths among adults. To perform this study, we used data from the survey '*Life course and vulnerability among older people in Santiago, Chile*', which provides information about key experiences and transitions across the entire life of 802 individuals aged 65 to 75 years old. Among other preliminary results, we observe that long-term trajectories indicating weak labor market attachment (i.e. career interruptions, informal and part-time jobs) and simultaneously inadequate wellbeing habits (i.e., low physical activity, high tobacco and alcohol consumption, and permanent stress) increase the odds of chronic diseases among individuals with disadvantaged origins. The results of this study will have academic and policy salience for countries aiming at promoting healthy lives among older people based on a life-course perspective.

Mental Illness and Its Milieu: Socio-Spatial Issues on Housing Support for Mentally Distressed People in France

In France, the reform of psychiatric assistance and the emergence of the "médico-social" sector in the 1970s led to an important reconfiguration of mental health policy, care practices and trajectories of people with severe mental disorders. This policy aims, somehow, to avoid wellknow spatial patterns: imprisonment, homelessness, long-term hospitalizations, wandering, social isolation at home etc., and, to do so, improve housing and home-based care.

Taking these elements into account, my doctoral research focuses on home-based care for people with mental distress in France and aims to analyse its spatial issues. My reflections are grounded in a fieldwork (involving interviews and observations) realised on three different Parisian home-based services: (1) a psychiatric team responsible for the home visits of psychiatric patients living in social housing estates ; (2) a social support team composed of social workers caring for around eighty people and (3) a medical-social support service composed of a multidisciplinary team in charge of the case management of around seventy users.

Assuming that social practices are inherently spatial practices, I argue that these three different services (re)shape the living space-time of mental health users : these teams build and organise territories of life by constraining actions, mediating interactions and regulating social practices of everyday life through spatial arrangements focused on home and dwelling. Home visits corresponds to the main tool of intervention in this field and places workers and users into ambiguous situations and spaces and promotes reflections on professional jurisdiction and deviants uses of living spaces. Home visits can also be considered as a way to reframe peolple's senses of dwelling.

The elements presented here ask us about the spatial (and therefore social) inscription of these people in the city within an ecology of services, practices and experiences which aims to render the city habitable for this population.

The Mobilization of the Religious Leaders of the Metropolitan Community Church (MCC) Under the Perspective of an Inclusive Religion

This study aims to understand the meanings and practices that the religious leaders of the Metropolitan Community Church (MCC), located in Rio de Janeiro city, mobilize about the relationship between Christianity and sexual diversity in the Brazilian religious context. At the theological and doctrinal level, this evangelical stream called Pentecostal, pay different kind of attention as usual about religious and sexual diversity, mainly in the debate based on the inclusion of "social minorities". In its version of the biblical texts, the MCC produces the rereading guided by scientific work yielding an inclusive Christian doctrine. With the participant observation method inside cults and activities of this institution, it is noticed the appreciation of a theological formation for the leaders as a mechanism of widening the meanings and practices of gender and sexuality in the religious scenario. "Including theology" is based on the political participation of different social actors. It presents as religious mission the idea of "social justice" and because of it, is common that the institution be present in protests, realize marriages between LGBT people, promove prevention campaigns about IST, and another actions that put on its agenda the human rights. As consequence, religious leaders articulate inclusive theology in the resignification of discourses promoted by Christian streams that do not promote the inclusion of non-heterosexual people. Inclusive theology presents itself as an alternative to people who had their religious trajectory in institutions who denied their gender identity and their sexual identity.

Incarceration and Penal Alternatives in Brazil and Canada - Comparative Study of the Scope and Impact of Criminal Alternatives in the Two Countries

The Brazilian prison population grows uninterruptedly throughout the post-Constitution period of 1988. Considering the fact that in this period the possibilities of alternative punishment and measures were expanded, as well as alternatives to provisional imprisonment, It is assumed that the relationship between prison and the alternatives proposed in its place is not necessarily of rupture, but also of coexistence, continuity and reciprocal functioning. On the other hand, Canada has maintained an incarceration rate close to 100 inmates per 100,000 inhabitants over the past 30 years, not adopting the policy of mass incarceration of the American neighbors and expanding the possibilities of alternative mediation and punishment, as well as prioritizing the application of the prison sentence for short periods. Thus, if it is relevant to question what criminal alternatives "did", what is the impact of their implementation in reducing incarceration, and to question "what was done" with criminal alternatives, how the actors involved in its production and implementation, as well as in other areas of the judicial field, sought to lead, implement or oppose them. In this sense, it is intended, with the present research, to establish criteria of comparison on the imprisonment and the penal alternatives in two countries whose data point to the existence of a contrasting situation, and that will allow to advance in the comprehension of the elements that can somehow influence the greater or lesser ability of criminal alternatives to effectively constitute a mechanism for reducing incarceration.

Punitive Populism, Penal Reforms, and Response to Crime in Brazil - the Bolsonarian Discourse for Public Security and Its Impact on Crime Control Institutions

Jair Bolsonaro's victory in Brazil's presidential election in 2018 usheres in a new moment in criminal policy. The lack of more effective measures to contain violence, the reform of police institutions and the assurance of public security by governments following the redemocratization process since the 1988 Constitution have opened the way for the rise of criminal populism, providing answers. reactive and regressive to the problem, but with increasing social support. With about 60,000 homicides per year, and a rate of 30 homicides per 100,000 inhabitants, the growing sense of insecurity and fear of crime was one of the factors driving Bolsonaro's bid. Once in government, the discourse of punitive populism gave rise to a set of initiatives, both legal reforms and the empowerment of police institutions and questioning the defense of fundamental rights and guarantees. The present work seeks to map the main elements of the pocket speech for crime control, the measures implemented by the current government and their impact on justice and security institutions.

Narrativas De Una Crisis Socioecológica: El Caso Del Megaincendio De 2017 En La Comuna De San Antonio, Chile

Las crisis socioecológicas dan cuenta de la estrecha vinculación entre sistemas sociales y ecológicos, develando diferentes efectos que sinérgicamente tiene uno sobre otro. Los sistemas y sus organizaciones son capaces de aprender de las crisis socioecológicas y adaptarse a los nuevos escenarios que estas generan. Comunidades e instituciones involucradas en la producción e intervención de este tipo de crisis pueden renovar sus conocimientos y recursos para enfrentar futuros eventos similares, aumentado con ello su capacidad de adaptación. El supuesto de esta investigación es que las crisis socioecológicas se constituyen en una dinámica de comunicaciones diversas que se intersectan e influencian positiva y negativamente y que se potencia a partir de las contradicciones internas sobre sus atribuciones causales, consecuencias y proyecciones de reestructuración. Lo que se comunica como crisis socioecológica es una conjunción de narrativas en las que se enfrentan versiones contradictorias y complementarias que dan cuenta de su carácter controversial. Esta investigación aborda el estudio del mega incendio producido en Chile el año 2017, analizando como caso particular la comuna de San Antonio. Esta comuna presenta uno de los índices más altos de ocurrencia de incendios forestales en el país. Fue una de las comunas con mayor daño social y de infraestructura urbana como consecuencia del megaincendio de 2017. A partir de análisis de prensa y entrevistas cualitativas a actores clave (técnicos, políticos, fuerzas armadas y comunitarios) se presentarán resultados que describen y caracterizan las diferentes narrativas sobre las causas del megaincendio de 2017 y de su propagación, junto con describir los mecanismo de restructuración de este sistema socioecológico. Se identifican los aprendizajes que dan cuenta de un incremento en su capacidad adaptativa, a la vez que el déficit de coordinación entre instituciones y las medidas de mitigación adoptadas luego de la ocurrencia del megaincendio el año 2017.

Teacher-Styled Chasing Perfection: Research on the Education Field of Chinese Primary and Secondary School Teachers' Children from the Perspective of Cultural Capital

As teachers' status in society continues to increase, the family life of teachers has gradually entered the public's field of vision. Teachers educate their children, but they are not as smooth as people think. In this research, using depth interviews and grounded theory as research approachings, 15 children of primary and secondary school teachers were involved in qualitative research. Pierre Bourdieu's cultural capital theory was used as a theoretical perspective to study the educational experience of teachers' children in both school and family education fields.

The study shows that, due to the professional characteristics of teachers, there is an overlapping and fuzzy intersection between the school and family education fields. The opposing cooperation between the two is the focus of shaping the unique educational experience of teachers and children. Meanwhile, the differences in cultural capital used by different teachers' children's families are the keys to achieving different social benefits and influences of cultural capital. This study believes that there are strategical differences in the use of superior resources given by teachers in different teachers' families, especially when assigning family power relations. The application of different strategies is the key to different educational outcomes.

In terms of research results, this study proposes that teacher families have the initiative in cultural capital reproduction, mainly because parent-child presents gamification strategies in the interaction of dual education fields. At the same time, it proposes ways to improve the dilemma of teachers' children's family education, that is, to carry out cooperative educational games in the form of "family-child collusion".

The Commoditization of Nature and People. The Struggle Against Neoliberal Extractivism

The UN Declaration Human Rights on Indigenous Peoples, finally in place thanks to the joined efforts of Rodolfo Stavenhagen (UN Rapporteur at the time) and Victoria Tauli-Corpuz (President at the time of the UN International Platform for Human Rights of Indigenous Peoples), provides an international legal platform of human rights, from where Indigenous Peoples' Movements are enabled to safeguard and counteract to some extent the continuing murder and intimidation of environmental activists. The policies to criminalize environmental activism and protest of indigenous movements are associated with countries with authoritarian regimes and neo-liberal policies, closely allied to the interests of powerful mining, construction, oil and gas international corporations. These key players in the global economy tend to deny climate change and regard nature and people as commodities. In the end, the entailed conflict is not just about a wasteful economy and environmental devastation. It is primarily a cultural war between competing visions of the world and nature. The future of our planet and Humanity depends not only in averting a climate catastrophe. It also depends on the outcome of this cultural war, where the human rights of indigenous peoples holds a decisive role.

Citizen Science for Strengthening Disaster Risk Governance with Children and Adolescents in Chile

Greater inclusion of children in disaster risk governance as part of a children's rights paradigm has been the subject of collaborative research in several countries. These contributions underline that children's participation could improve the effectiveness and legitimacy of disaster policies and interventions, incorporating their unique knowledge about disasters and recognizing them as right-bearing citizens. In Chile, we are developing DRR modules that are integrated into the regular educational curriculum, working directly with students and teachers. Educational research projects with children and adolescents, however, carry inherent risks of misrepresentation, tokenism and exploitation, as demonstrated by an extensive literature on the topic in geography and other branches of the social sciences. In spite of these challenges, little research so far has worked on the development of appropriate methodologies to engage children and youth in disaster management. We are experimenting with photo mapping as a way of engaging students in a coastal territory. The study takes a first step in that direction by exploring the value of participatory photo mapping (PPM) in this context. The few existing experiences with PPM suggests that this technique could provide a use-friendly way to involve young people, facilitating critical reflections and communication hard to achieve through purely textual methods. Two local schools are involved, organizing weekly class activities over a period of three months consisting of photo surveys followed by discussions in class. Participants take an active role in defining the mapping focus advancing a participatory citizen science iis an instrument for children to learning science practice to engage with community members and experts in reflecting upon DRR strategies and knowledge locally. We hope to contribute to a small but growing body of critical literature on children-led disaster management, laying the basis for developing a model of disaster management that is more inclusive of young people.

Mapping Actors in São Paulo's Urban Development Policies: Interests at Stake in the Challenge to Sustainability

In the context of global climate change, extreme weather events are increasingly intense and frequent, challenging the adaptability of urban space. In this sense, the literature points out that urban planning is a relevant instrument to address several sectoral policies capable of linking the urban agenda to the reduction of socio-environmental risks. Our findings indicate that the São Paulo's Master Plan (2014) presents innovations capable of promoting urban sustainability transition, including: i) promotion of population and construction density in the mass transportation axes (compact city); ii) socio vulnerabilities reduction based on housing policy, including regular source of funds for social housing, land reservation in consolidated urban areas and urban resettlement of people in risk areas; iii) and promotion of green infrastructure implementation strategies related to the creation of a green belt, public parks and water basin's protection. However, its long-term implementation involves distributive conflicts and may change in different political, economic and social contexts over time. Thus, the central objective of this work is to identify the dynamics of conflicts between the main actors that seek to influence urban development policy taking into account their views, interests and demands on urban regulatory structures and how their views converge or not with the assumptions of sustainable urban transition. In particular, we highlight the performance of three urban actors who played an important role in the municipality's recent urban development policy: the real estate market, upper-middle-class neighborhood associations and housing movements. To support our analysis, we conduct semi-structured interviews and we survey the discourses of these different social groups expressed in documents produced during public consultations to review the city's urban laws. This approach seeks to fill a gap in the international literature on the causes that support or limit the implementation of policies aimed at sustainable urban transition.

DI GIULIO, GABRIELA (University of São Paulo, Brazil)

Sao Paulo Urban Development Policy: Distributive Conflicts and Adaptive Capacity

In the context of global climate change, extreme weather events are increasingly intense and frequent, challenging the ability to adapt in urban space. Thus, urban planning is a relevant tool to address, in a systemic way, several sectoral policies capable of linking the urban agenda with the reduction of socio-environmental risks. The São Paulo's master plan, 2014, presents innovations capable of promoting the transition to sustainability in the urban space, with a view to its regulatory instruments related to the promotion of *population and constructicve density*, the *redistribution of resources and risk management in housing policy* (sources of regular resources; urban resettlement; reserve of land to social housing), and promotion of *environmental sustainability* (financing instruments and reserve of green areas for the creation of parks). However, its long-term implementation involves distributive conflicts and can undergo changes in different political, economic and social contexts over time. Thus, the main objective of this paper is to identify the dynamics of conflicts of interest between social groups in the implementation of São Paulo's urban development policy, particularly in relation to recent attempts at a (re) interpretation of the Master Plan guidelines, in view of the proposals for revision of the urban zoning law, aiming to make it more flexible to capture urban surplus value. This movement tends to prioritize the interests of the real estate market to the detriment of the interests of housing social movements, neighborhood associations and environmentalist movements, weakening the mechanisms of redistribution of resources to social housing and expansion of green areas in the city. To support our analysis, we survey the discourses of the

different social groups expressed in documents and interviews, as well as we perform a historical series of the commitment of resources focused on social housing and environmental preservation, in City of São Paulo.

El Sistema Unificado De Asistencia Social (SUAS) y La Protección Social Brasileña: Correlación Entre Los Niveles De Gestión Del Sistema y La Reducción De La Pobreza Extrema

Históricamente vista como caridad y benevolencia, la Asistencia Social fue reconocida en Brasil como una política pública bajo la Constitución Federal de 1988, incorporándose como una de las bases del trípode de la Seguridad Social. A pesar de la relevancia legal, el desarrollo institucional de esta política se retrasó, e incluso con la promulgación de la Ley Orgánica de Asistencia Social, cinco años después, en 1993, faltaba la construcción de instrumentos de coordinación que permitieran la operación compartida entre las entidades federativas. Esta situación comienza a cambiar en 2004, 10 años después, a partir de la movilización popular en la IV Conferencia Nacional de Asistencia Social, que señala la necesidad de una Política Nacional de Asistencia Social con la consolidación del Sistema Unificado de Asistencia Social. . Hay una inflexión en la trayectoria de la política de Asistencia Social con SUAS, en aproximadamente 10 años después de su publicación, casi todos los 5570 municipios brasileños se unieron al Sistema. Pero, ¿la amplia adhesión de los municipios al SUAS significa un cambio en los estándares de protección social, especialmente dirigido a las personas en situación de pobreza? Para verificar la existencia de una correlación entre la gestión de SUAS y sus impactos en las tasas de pobreza extrema en municipios medianos de São Paulo (entre 10 y 50 mil habitantes), este estudio compara los porcentajes y la pobreza extrema antes y después de SUAS Censo y 200 y 2010 y correlacionarlos con los datos de gestión SUAS disponibles en la base de datos SAGI / MDS

Gender, Law, and Symbolic Politics: U.S. Republicans and the Ban on Female Genital Mutilation

In 2018, a federal judge ruled that the U.S. Female Genital Mutilation (FGM) ban — untested since its implementation in 1996 — was unconstitutional. His ruling ended the first federal prosecution of FGM in the U.S. involving two doctors from an Indian-Muslim community in Michigan. This case and the subsequent judge's ruling gathered public outrage. In response, over twenty anti-FGM state laws have been introduced, and white Republican lawmakers sponsored two third of them. This paper examines the U.S. Republicans' commitment to end FGM and shows how their rescue narratives of Black and brown immigrant girls from FGM is an illuminating demonstration of femonationalism in the United States. Following Sara Farris (2017), femonationalism describes the discourses that suggest the inferiority of the immigrant Others regarding women's rights and gender equality, thus lauding the host nation's moral virtue. This concept uncovers the intertwinement between feminist claims and xenophobic ideas within public discourse, which stigmatizes non-Western immigrants in the name of women's rights. I will argue that Republican lawmakers' claim to "protect little girls from FGM" is merely symbolic politics aiming to pursue both the anti-immigration and nationalist agenda of the Republican party.

BADILLA RAJEVIC, MANUELA* (Universidad de Valparaíso, Chile)

Carnivals and Barricades of Memory: Political Repertoires of Mobilization of Peripheral Neighborhoods in Post-Dictatorship Chile

Transitions from authoritarian dictatorships to democracy in Latin American countries strengthened a discourse that deeply connects recognition and memory of the victims of these regimes with an ideal of reconciliation and consolidation of democracy. However, during the last years, new generations from peripheral neighborhoods of Santiago are mobilizing an alternative memory that challenges the idea of reconciliation and the repertories of remembering. Young people are remembering the resistance movement against the 1973-1990 military dictatorship that played a key role in these areas, as well as the process of urban segregation and stigmatization that the constant police harassment and violent repression triggered in these territories.

According to the first Chilean Truth Commission the repressive military apparatus targeted many peripheral areas of Santiago were actions of solidarity and resistance were part of the everyday experiences. Many of these areas, have remained in the margins, not only of the economic growth -becoming hubs for *drug*

traffic; but also, disappearing from the public memory of the dictatorial time. Yet, today, young neighbors who did not experienced first-hand that repression are bringing back the memory of urban segregation, solidarity and urban struggles against the military apparatus through creative and many times violent demonstrations, such as Carnivals of memory, barricades or actual confrontations against the police.

Throughout the analysis of 50 in-depth interviews with young people from these areas, archive analysis, and fieldwork ethnography, I suggest that silenced and bottom-up expressions of public memory of the dictatorship inspire and activate new generations and mobilize contemporary social demands that have the capacity of questioning the current state of democracy. Remembering has become a key political repertoire in these marginalized territories that strengthens civic engagement of young people who today find within the past an effective way to be part of the political community.

Rising Against the Radical Rigth: New Feminist Wave in Central-Eastern Europe

Since 2016, East Central Europe has witnessed a significant increase of women's protests and feminist mobilizations. Particularly in Poland, attacks on reproductive rights have mobilized various segments of society and brought thousands of people into the streets. Around these protests, a very important and effective activist platform called Black Protest has formed, countering the far-right and ultra-conservative government. Similar mobilizations have occurred in other parts of the region, such as the #IamNotAfraidTo Speak in Russia and Ukraine, and pro-choice protests in Slovakia, Croatia, Czech Republic, and elsewhere. These mobilizations are part of recent women's and feminist wave of protests that have occured all over the globe, such as the #IamNotAfraidTo Speak in Russia, Ukraine, and Kazachstan, the global #metoo movement, Ni Una Menos in Argentina, Peru, Bolivia, the Women's Strike in the US, and many more. Using my ethnographic data, in this paper I explore the transnationality of feminist movements in East Central Europe, and their connections to the international feminist mobilizations, the 'traveling feminism' or 'migrant tactics' of transnational feminist movement. Furthermore, being both a researcher and an activist, in this paper, I explore the question of what is the role of a resercher working with feminist movements, the challenges of activist-research synthesis, and possible consolidations.

Ending up in Brazil – Leaving Situations of Collective Violence As a Long-Term Process

In this paper I will discuss the situation of refugees and migrants who have left sociohistorical situations of collective violence and lived in Brazil for several years.

Based on my empirical findings from the research project "Biographies of migrants from Syria and West Africa in Brazil and in Germany", funded by the German Research Foundation, I will discuss how leaving a context of collective violence is oftentimes a long-term process. In the cases I will present in this paper, Brazil was not the intended destination, nor was it perceived as the final point of a process that had already lasted for many years. Rather, the respective migration processes were influenced by historical coincidences and were interrelated with transnational networks, (changing) constructions of belonging, and figurations with other individuals, institutions and groupings in which the migrants were embedded.

Biographical research enables us to accompany and analyze these processes and figurations. Biographical interviews and historical context research allow us to reflect upon the background constellations that result in particular migration "decisions". Follow-up interviews direct our focus to the processuality of migration and (possibly temporary) arrival.

As the corona pandemic has deeply affected the conducting of fieldwork, I will discuss possible ways of keeping in touch with interviewees, and consider how this enables us to analyze the processuality of flight and migration processes even (or especially) in situations of profound crisis.

Women in the Informal Sector of the Russian Economy: Do the Regional Features Matter?

Informal employment of women, its scale, structure and special features are one of the least examined issues not only in Russia and in the world as well. There are many reasons for that: objective - the lack of accurate data; the lack of special regular studies, representative at the subnational level (regions of Russia) and enabling the analysis of the situation by age, sex, residence, education and other factors; methodological - inaccuracies related to the distinction between the concepts of informal employment and employment in the informal sector of the economy, disputes about the criteria for classifying households workers as employed people etc.; subjective – some respondents participating in the surveys are not aware of the presence or absence of formal employment or refuse to answer the relevant questions, etc. Meanwhile, the well-known problems of gender discrimination and informal employment are closely related to the phenomenon of segmentation of the labor market. According to the concept of labor market segmentation, the secondary (periphery) group consists of employed under short-term contracts and without contracts, working part-time, without guarantees of workplace preservation in times of economic recession, subcontractors, borrowed workers, self-employed. The relevance of the problem is due to the consequences and social risks that accompany women's employment in the informal sector (lack of development opportunities, education and career growth; social insecurity, low self-esteem and confidence in the future, etc.). The purpose of this work is to reveal specific features of women's employment in the informal sector of the economy in different regions of Russia depending on the level of their socio-economic development, structure and type of economy. The empirical base of the research is made up of National Labour Force Surveys, the results of Comprehensive Monitoring of Living Conditions, macroeconomic indicators on national and regional development.

Love, Technology and Melancholy in Her

Through the sociological analysis of the film *Her* (2013) – a North American audiovisual production directed by Spike Jonze -, love, technology and melancholy are discussed in this paper. It is part of a research which aims to understand the last decades technological development impact on contemporary ways of life. More specifically, this research seeks to understand how the technological innovations observed in recent years impact on love. To this end, the film is comprehended as a singular language, a construction from which several aspects of the social life can be reached. *Her* is analysed in its entirety, taking into account its aesthetic aspects, dialogues, silences and soundtrack. Throughout the paper, the proposals of Walter Benjamin (*The origin of German tragic drama*) and Elisabeth Beck-Gernsheim and Ulrich Beck (*Individualization* and *The normal chaos of love*) are discussed, among others.

Business and Employment Cooperatives in France: When the Cause of Solo Self-Employed Testifies to Workers' Creativity and Renewal of Mobilizations

Since cooperatives first appeared in the 19th century, history has shown the diversity of this movement. This contribution highlights the role of Business and Employment Cooperatives (BEC) i.e. a peculiar kind of cooperative of self-employed workers. The way the latter organize themselves in a context of growing incentives to self-employment and decline of trade unions challenges the classical debate of continuity/renewal of workers' collective action.

Unlike the classical model of cooperatives, in which all workers produce a common good/service, BECs gather different entrepreneurial activities (services, intellectual and professional services, building trades...). Actually, not only do BECS create solidarity among workers, but they also aim at providing them an indefinite employment contract - and its social protection; to some extent, making them 'salaried-entrepreneurs' is way of 'hijacking' the wage-labor contract. Besides, BEC are considered to be new actors at the crossroads of policy making, industrial relations and academic world: they are *employers* of these freelance workers, but also *interest groups* (e.g.: their attempts along with European trade unions to play their part regarding the status of 'uberised' workers), and *think tanks* (e.g: SMart in Belgium and their research activities). In parallel, some BECs endorse the rules and shape of the Social Sector, but actually work as traditional companies: they include a CEO, profit goals, and very few workers' participation is observed. These BECs deviate from the 'cooperativist spirit' and resemble 'umbrella companies' used to support individuals' entrepreneurial projects.

Despite such diversity, BECs appear as the testimony of the inventiveness of actors to adapt the existing rules of the cooperation movement to current political issues, whether they emerge from local and informal initiatives, or highly institutionalized dynamics. This communication aims at showing empirical and theoretical elements to think through these new forms of cooperation, which nowadays shape the cause(s) of self-employed workers.

BAJUSZ, ORSOLYA* (Corvinus University of Budapest, Hungary)

Cuteness As a Tool of Depoliticization: Two Hungarian Case Studies.

The "Squirrels" and "Mauves" are two activist groups, both dedicated to good causes (helping the homeless, preventing cancer, social justice and preventive healthcare) but mostly they talk about themselves, and in fact, the most important element of their discourse is creating and narrating their own distinction. Meanwhile, they create a fictitious world based on "common sense" rules and alternative facts that justify their own privileged status. Behind the "good cause" most of their activities relate to their own world views, revolve around their own (fictive) identities, and reflect their own desires. I use narrative analysis and visual rhetorics analysis to investigate the mechanism of such depoliticisation and I conclude that most of it is done on the visual and affective register.

I investigate how and when they communicate "rational", "common sense" statements, and what is the material reality behind them. The "Squirrels" and the "Mauves" seem to move in very different environments, thematising causes that seem far apart, yet the two groups have striking similarities: through the strategic application of cuteness they obscure the complexity of "good" causes and the political struggles surrounding them. The personal investment of the participants also prevents the breaking of the "common human value", "common sense" consensus. Meanwhile, their activity is connected to transnational networks invested in political work, so it clearly has political stakes. These groups do the local footwork of transnational political actors (meaning making, distributing cultural scripts such as identity panels and moral axioms), and they legitimise geo- and biopolitical relations of the East-West axis by staking out moral hierarchies.

Digital Media and the Lived Experience of Activism

Taking theoretical guidance from sociological phenomenology and theories of practice and mediatization, this paper discusses participation in progressive social movements at the level of lived experience. Individual citizens' enrollment and sustained participation is critical to movements' growth and political efficacy. Yet little is known about how movement-related activities mesh with everyday life. Activism is typically discussed as a type of subject position and performance with

denotes a presenting author. Abstracts are organized by first presenting author's last name.

reference to a public context without tracing the links to the ways in which activist self-understanding and practice is embedded in private lives. Taking the use of digital media by movement participants as our entry point, we investigate the complex intertwinement of the personal and the political that leads individuals to align themselves with collective identities and causes and to invest time and effort in collective action and the pursuit of movement goals.

Our analysis draws on two projects conducted in two different political and cultural settings – Canada and Bulgaria. In the course of these projects, we collected a total of 65 in-depth interviews with people variously involved in collective mobilizations around issues related to environmental protection, support of refugees, defense of public education, challenging sexual harassment, racial and sexual exclusion. The analysis presented in this paper focuses on the role of digital media in the construction and performance of activist identities in the course of everyday life. We discuss how these media affect the structures of the experienced social world and the emergence of political sociality; under what circumstances they enable people to transcend "networked individualism" (Rainie & Wellman, 2012) and see themselves as members of movement collectives; and what challenges and pressures the maintenance of private and public presence in digital media spaces creates for activists.

Negotiation and Collaboration in the Canadian Refugees Welcome Movement

The impending federal elections and the refugee crisis unfolding on the world stage in 2015 created both a political and a discursive opportunity structure for the rise of the Refugees Welcome movement in Canada. This movement represents an instructive case because it comprised a wide variety of stakeholders and creatively combined social-media facilitated communication and embodied collective action in its repertoire. It attracted intense public attention and left an enduring political and symbolic legacy.

This paper reports the results of a multi-method case study that aimed to capture the dynamics and practices of this broad-based (and relatively short-term) movement in which formal civil society organizations and grassroots citizens on the one hand, and communities driven by different moral principles on the other, collaborated to influence official refugee policy. The goal of our analysis is to identify the factors that led to their success. We draw from several data sets comprising (1) in-depth interviews with organizers (2) qualitative content analysis of Facebook group discussions (3) quantitative and qualitative analysis of Twitter posts (4) thematic analysis of mass media content. Theoretically, we build on ideas from Benford and Snow (2000) on collective action framing and Jasper (1997) on moral protest.

Our conclusions highlight several key achievements that paved the way for the high public resonance and political impact of the movement: (1) The use of social media facilitated a participatory discursive process that allowed diverse views to be negotiated (2) Affective symbols were successfully mobilized in collective action frame alignment between different moral communities (3) CSO activists acted as skilled mediators and symbolic resource providers.

BAKKER, JOHANNES* (University of Guelph, Canada)

Patriarchy and Alienation: Patrimonialism, Capitalism, and Comparative Historical Transitions

Patriarchy has an elective affinity with Alienation regardless of the Mode of Production. Slave, Patrimonial-prebendal ("Asiatic"), Feudal and Capitalist societies are all Patriarchal and every human being in those societies is alienated from themselves due to the rigid ways in which patriarchal values become normative. Max Weber's discussion of Patriarchy, Patrimonial-prebendal and Patrimonial-feudal societies makes that clear in a way that Marx's discussion of alienation does not. Marxian sociological theorists who are not also Feminists have tended to ignore the alienation that is part and parcel of almost all societies; but, many Feminists have ignored the role of "authoritarian states" in helping to evolve beyond the most rigid forms of patriarchical norms. Those interested in alienation have often viewed it as a phenomenon primarily associated with the Capitalist Mode of Production and neglected the Comparative Historical Sociology (CHS) use of a Weberian approach. The idea of Matriarchy is a fiction (although often a useful fiction). Marx was Eurocentric in his discussion of the so-called Asiatic Mode of Production since "Oriental Despotism" was something that existed universally and thus is a concept that suffers from Eurocentric "Orientalism" (Said). Nevertheless, the progressive aspects of pre-modern "authoritarian" forms of

"legitimate authority" should be taken into account. What has particularly been ignored is the progerssive asepct of the transition from prebendal state system (empires e.g. Ancient China and India and Rome) to "feudal" forms of Patrimonial patriarchy involving the invention of norms of legitimate authority involving monogamy and the repercussions that eventually had for world history (e.g. King Henry VIII and inheritance of monarchy). Alienation has existed in many types of societies and is not just an attribute of the Capitalist Mode of Production. Victorian patriarchal norms have already decreased significantly and further reduction of patriarchal values will also reduce alienation.

Gendered Effect of Marriage and Social Network Structure on Cardiovascular Health of the Korean Older Community-Dwelling Adults

Objectives. Marriage and relationships between spouses protect against cardiovascular diseases and inflammation in older adults, but these associations differ across gender. We estimate the longitudinal associations of marriage, marital quality, and distress and spousal involvement into one's social network and examine how these associations differ for males and females across a 5-year nospan among community-dwelling Korean older adults.

Methods. We examined how marital status, positive & negative marital quality, and spousal involvement in one's social network are associated with risks of cardiovascular dysfunction and elevated inflammation, accessed by six markers (CRP, IL-6, Troponin, BNP, NT-proBNP, Cystatin) in a longitudinal study of 612 older adults from the Korean Social, Health and Aging Study (2011-2016). Biomarkers were grouped into two factors – cardiovascular risk factor and inflammation risk factor as a result of exploratory factor analysis. Effect modification by gender was tested with interaction terms and stratification by gender.

Results. Results from panel random-effects multivariate regression analysis show that (1) effect of marital dimensions is contingent on gender; (2) men are more likely to benefit from marital status itself and marital quality, while women's health was more sensitive to positive and negative marital quality. The effect of the spouse involved in the social network was contingent on the gender of the respondent and gender of the third party: women benefited from the presence of other women, while men benefited from the presence of the other men.

Discussion. The findings highlight the importance of a gendered approach to the analysis of pathways from the social environment to health.

Wall of Mirrors: Political Narcissism on Digital Platforms

The new socio-technical configuration - marked by the centrality of social networks and user-generated content - calls into question the *material base* versus *ideological form* dualism, when the production and consumption of digital content are guided by the imperative of monetization of the new data economy. Such a configuration questions utopian visions that prevailed among influential analysts regarding the potential for information democratization and political participation contained in digital media, thus disregarding the role of programming in accessing and directing *online* content, according to interests in intensifying and segmenting digital consumption. We hypothesized that digital platforms, far from stimulating the flourishing of a "democratic culture", should be taken as the algorithmic materialization of imaginary, binary, fragmented, narcissistic "wild thinking", which is also revealed in the different ideological poles and all "bubbles" of political opinion. A scenario of political narcissism is unveiled in which social transformation through dialogical struggle loses space for the tightening of apparently insurmountable ideological and identity boundaries. A certain appropriation of poststructuralism, combined with Critical Theory, allowed us to underline the processes of fixing binarisms, the hypostasis of concepts and the substantialization of identities present in the political debate conditioned by digital media. The close correspondence, already noted by Walter Benjamin, "between the world of modern technique and the archaic symbolic world of mythology" encourages us to grasp the phenomena of the present in their topicality, uniqueness, and universality. Our research is empirically based on the analysis of the proliferation and consolidation of various Brazilian political channels on YouTube, left- and right-wing-aligned, characterized by the repeated affirmation, on the narrative level, of political identities defined by contrast and opposition to others, in order to erect true walls of mirrors that furrow the political field, throwing to the "other side" everything that is not its faithful reflection.

BALLESTÉ ISERN, EDUARD* (University Pompeu Fablra, Spain)

Looking for a Place. Youth Activists in Post-2011 Spanish Social Movements: Normalization and 'Good Practices'

In this paper we will highlight the ways in which post-15M young people participate in today's Spanish social movements. For this, through the ethnographic work carried out in a middle Spanish city (from 2014 to 2017), the forms of action, organization and relationship acquired by the movements after 2011 in Spain will be defined to understand in which spaces young people participate or not. Furthermore, the construction of the idea of the 'good activist', through processes of internal normalization of social movements, will also help us to understand the means that politicized young people experience in the political field and the social space. With this, through the idea of the "good activist", understood as a process of normalization within the social movements themselves, we will observe those practices and those speeches that are not recognized as valid in the post-15M and that mark limits of the possible in activism. These limits usually come into dispute with the political positions that young activists have and that are inherited from participation in youth political groups (such as anarchist, communist or anti-capitalist collectives).

Finally, the forms of protest lived in the 15M squares built a certain hegemony of the forms of struggle that were transferred to subsequent social movements. This hegemony, which revolves around a citizen-based form of protest, is the centre of pivot on which to understand the participation processes of the young people studied here and understand the clashes that take place between them and the post-15M social movements. Clashes that focus on the search by young people that their political practices are not criminalized, excluded or not recognized.

BALLESTÉ ISERN, EDUARD* (University Pompeu Fablra, Spain)

The Evolution of Latin Gangs in Barcelona: The Construction of the Gang Field and Space As a Methodological Tool

The different social, political and cultural positions that Latin gangs have occupied in Barcelona over the past three decades can be understood through the construction of the gang field as a methodological tool. Through prolonged fieldwork with these groups and the current ethnography developed through the TRANSGANG project, the political, social and cultural position that gangs have occupied at any given time can be reconstructed. These different positions are related to the interrelation that these youth groups have had with the institutions, with civil society or with other similar groups. Depending on the ways in which these groups are treated (hard hand versus mediation), their position occupied in each space varies. The idea of the gang space/field allows us to see which agents influence that field. Through this influence we can understand what position gangs occupy in our society and also how they are treated by other agents: media, politicians or police.

This vision also allow us to determine the ways in which the State, the media and, as a consequence, the society itself approaches this phenomenon. As an example, when the band's field is determined by a criminalizing and repressive vision of the phenomenon, this field is integrated into a peripheral space of the rest of the fields, causing an exclusion process for gang members. When these groups are articulated as valid agents in the interlocution with the State or other institutions, the band's field is integrated within the other fields, generating spaces for interaction, the public appearance of the phenomenon and the recognition of Gangs as groups that fulfill a social and cultural function. The case of Barcelona, where there have been different approaches (from mediation processes (2006), to more recent repression processes), allows us to build this field/space and observe how it evolves throughout the years.

BALOURDOS, DIONYSSIS* (National Center for Social Research, Greece)

PETRAKI, MARIA* (University of Athens, Greece)

Family Demographic Processes, Child Poverty and the Working Poor: A European Diverse Landscape

During the last decade the rise in atypical and precarious work patterns and a growing segmentation in the labour market between low or unskilled work and high-skilled work have created new poverty risks among the employed population. In 2017, the "working poor" represent 9.4% of the EU population at work. However, the number of specific policies that are designed to protect or improve the situation of the working poor is restricted.

Although many factors may influence in-work poverty, we focus on household size and its composition. We find, for example, that among poor children, those in families headed by a single woman were less likely than those in married-couple families to have a family member who worked. Cuts to government spending on benefits and weak economic growth, especially for the South European countries, could result in record levels of child poverty. We recommend that policy responses to address in-work and child poverty should be connected and multidimensional. Working poor families with dependent children need greater support to reconcile their family responsibilities and paid employment, through the greater provision of free and affordable childcare.

Targeted policies should be addressed to single- parent families and families with many children without neglecting other types of families with children. In this perspective, some measures may have indirect positive effects as they may boost the fertility rate at higher levels.

Material Well-Being and Subjective Well-Being of Children. the Case of Romania

Recent studies show that, unlike the case of adults, for children the correlation between the material well-being and subjective well-being is not strong. The second wave of Children's Worlds Study (www.isciweb.org) in 15 countries unexpectedly fails to find a correlation at national level between GDP and subjective well-being of children. We test this link at individual level for the case of Romania, a European Post-communist country with high levels of child poverty. The data was collected within the third wave of Children's Worlds Study (2017-2019), financed in Romania by Botnar Foundation, Switzerland and co-financed by Jacobs Foundation (both from Switzerland) and University of Oradea. The main sample (n=3.296) is representative for school children around age of 8, 10 and 12 years and a separate sample of 380 disabled children was collected. Subjective well-being was measured by Overall Subjective Well-Being (OLS with 1 item), Children's Worlds Subjective Well-Being Scale (CW-SWBS with 6 items) and Children's Worlds Domain Based Subjective Well-Being Scale (CW-DBSWBS with 5 items). Material well-being is measured by a family possessions scale (6 items) and personal possessions scale (8 items), as well as a single item satisfaction with possessions. Results shows that while there is a low correlation between material well-being and subjective well-being, possession of certain items correlate much higher for subjective well-being items. Starting with these findings, we discuss how the theory and the measurement should be adapted in order to grasp better the link between material well-being and subjective well-being of children.

Methodological Challenges for Risk Perception Studies Using GIS Technologies

Visual methodologies are powerful, but yet, underused tool in risk perception studies. GIS data is usually used for the mapping of objective risk data, however, there is a lack of studies that take into account the spatial factors as determinants of risk perception, for example, proximity to risky objects (e.g. Mudu and Beck, 2012; Douglas et al., 2019); public perception of spatial boundaries of objective risks (e.g. Sun et al., 2009); or relations between distance and vulnerabilities (e.g. Glatron and Beck, 2008).

The gap between objective risks and subjective risk perception is one of the classical questions in the sociological research of risk and uncertainty. Advanced technologies, using GIS, such as for example, developed by ESRI (with the moto "*the science of where*") are providing tools to investigate spatial aspects of this gap adding multiple layers of data into one model. However, there are important methodological challenges that should be considered while using GIS technologies in survey research, for example, sampling strategies for best representation of spatial aggregation, data protection and technological problems identifying GIS location of the respondents and else.

This presentation aims at systematizing existing literature on spatial dimension of risk perception and discuss methodological issues related to using GIS technologies in risk perception survey research. Presentation will draw upon examples of risk mapping in general and using ESRI software ArcGis in particular.

This presentation is based on the project "Mapping of Risk Perception on in Lithuania: Spatial and Socio-psychological Dimensions" (P-MIP-19-365), funded by Research council of Lithuania.

BAMBERG, INGRID* (University of KwaZulu-Natal, South Africa)

Revisiting Social Engagement and Decoloniality at University in South Africa

In 2015, South African students opposed a post-apartheid State that failed to keep its promises of transformation and equal access to higher education for all. The students' mobilization that spread all over the country via the slogan #FeesMustFall adopted the motto of abolishing university fees and decolonizing the curriculum. Students obtained a wider access to a National Student Financial Aid Scheme (NSFAS) while most faculties integrated the decolonization of teaching and learning contents into their mission statements. Four years later, what is left of this mobilization that prompted the youth from historically disadvantaged backgrounds to raise their voice? What do the effects of the Covid-19 lockdown on higher education say about the decolonial and transformative agenda of tertiary institutions?

To answer these questions, the study uses the notions of decoloniality, community engagement and intersectionality to revisit student and academic identities, and perspectives of cohesion in a context of exacerbated inequalities. Looking at the pedagogical situations lived by students and lecturers in KwaZulu-Natal, one the poorest provinces, the study explores the effects of the institutional mindset and functioning on students' and academics' sense of belonging. Finally, the study interrogates the decolonial agenda and revisits the notion of engagement in higher education in the light of the teaching and learning inequalities experienced in times of high uncertainty.

RC34-443.5

BAMBERG, INGRID* (University of KwaZulu-Natal, South Africa)

The Future of Youth and Higher Education in South Africa

In 2015, South African students opposed a post-apartheid State that failed to keep its promises of transformation and equal access to higher education for all. The students' mobilization that spread all over the country via the slogan #FeesMustFall adopted the motto of abolishing university fees and decolonizing the curriculum. Students obtained a wider access to a National Student Financial Aid Scheme (NSFAS) while most faculties integrated the decolonization of teaching and learning contents into their mission statements. Four years later, what is left of this mobilization that prompted the youth from historically disadvantaged backgrounds to raise their voice?

This article explores this question by looking at the turmoil experienced in South African higher education in 2020: the student protests at the beginning of the year and the unequal teaching and learning conditions, exacerbated during the Covid-19 related lockdown. This study uses the notions of social capital and intersectionality to analyse how the plural identities of students and lecturers crisscross, respond to or oppose each other.

The research is based on the experiences of students and lecturers in the province of KwaZulu-Natal, one of the poorest of the country. It reveals the discrepancy between the students' aspirations, the pedagogical expectations and practices which struggle to consider the sociological background and often chaotic journey of students, and the institutional injunctions lecturers are required to conform to, without adequate time to reflect on their collective practices and a cohesive approach.

Although teaching and learning are difficult under such circumstances, the article underlines how the societal engagement at the heart of the university's mission can still be effective, in unconventional forms, thanks to the agency of the various actors and their resistance capacity.

BANDELLI, DANIELA* (LUMSA University, Italy)

Women's Movements and Gestational Surrogacy: Frames and Strategies of Mobilization in the Global North and South.

A new controversial issue of debate and mobilization is arising among women's movements internationally: surrogate motherhood or gestational surrogacy, which in the last decade has increasingly spread as a form of family formation for couples in the Global North and as a form of reproductive labor for women in the Global South. Some women's groups oppose the spread of this reproductive transnational market insofar it implies the exploitation of women and commodification of children, whilst other women's groups push for national and supranational regulation of surrogacy to provide better protection for surrogates and to affirm women's autonomy to work with their bodies and embrace opportunities to empower their economic and social status.

Surrogacy is a topic that links with some of the core feminist principles such as: women's right to choose and consent, body ownership, reproductive autonomy and freedom from patriarchal exploitation and violence. These are competing principles that are applied by women's groups to frame the issue of surrogacy and different policy demands. Despite of the high relevance that the spread of surrogacy has for women's life, it has not (yet) developed in a common cause for feminism, women's health movement or women's sexual and reproductive rights groups: rather, surrogacy is a divisive issue which only few groups specialize and engage on.

Data collected within the Marie Curie research project WoMoGeS (www.womoges.wordpress.com) in USA, Mexico, India and Italy will be presented to show how women's movements in the Global North and South are organizing around this emerging social issue, by employing context-specific frames (e.g. female poverty) combined with global macro discourses (e.g. commodification), and by applying strategies that are influenced by existing alliances and fractures within the movements (e.g. radical versus neoliberal feminism).

THOMAS, CARIETA (University of Calgary, Canada)

"Our Purpose As Women and Nurses Is to be Selfless Healer": Discourse of Gendered Carework and Self-Making As Healers Among Indian Immigrant Nurses in the U.S.

In this paper, we investigate how Indian immigrant nurses in the U.S. navigate their status as the primary migrant, family breadwinner with the incessant feminizing discourse of immigrant nurses as selfless healers. The paper is based on in-depth interviews with 45 Indian migrant nurses and their husbands, 3-years of ethnography in nursing conferences that Indian nurses in the U.S. attended, and in the homes and churches of the nurses. What is distinctive about immigrant nurses in the U.S. is that they hold skilled-worker visas, and their spouses hold dependent spousal visas that prevent them from legally working in the US. This makes the nurses the primary migrant and the breadwinner. However, at work the immigrant nurses experience more exploitative circumstances than native-born nurses. The situation is further complicated when the U.S. employer applies for permanent residency (PR) for the nurses. The PR application binds the workers to their employers for years during which time they often endure prolonged gendered and racialized exploitation. Parallelly, the nurses are continuously subjected to the discourse of nursing work as healing work in formal and non-formal environments such as, by recruitment agencies, at nursing conferences, by superiors and peers at work, in their churches and at home. This makes them constant careworkers and caregivers in every aspect in their lives. Their internalization of the notion of immigrant nurses as healers often prevents the nurses from processing and verbalizing their gendered and racialized experiences at work, double shifts at home and caring for community members. Nursing work as healing work becomes their path toward self-making in the new country. As such, we argue that immigrant nurses operate in what we call a "migrant carework regime" which is bolstered by the intersections of migration policies and a feminized and racialized discourse of migrant nursing work.

The Socially Excluded Urban Elderly in India

Population aging has become an inevitable trend in the demographic transition happening across the world most recently. The population of India is also growing old faster than ever. Several issues are not being yet addressed for creating a better place for the greying population. One of the serious problems with which the older adults are dealing today is elderly isolation among different sections of society. As children grow up and moves out of the native place in search of better quality of life leaving behind the parents and thus creating a vacuum in their lives. Earlier Old age was never considered a problem in Indian society as long as traditional joint families dominantly existed. The elderly was the head of the family and had active participation in the decision-making processes ranging from family decisions to financial decisions. However, due to the increase in nuclear families, urbanization, and migration of the younger generation, the elderly role and status have changed notably. In the contemporary time, elderly people in India may have reasonable access to family care, they are inadequately covered by economic and health security. Older people are largely excluded and left on their own intentionally or unintentionally. The study will also analyze the ways the elderly people adopt to get rid of negligence and exploitation in various sectors of the society. Today, the elderly demand that society should not only ensure independence and participation but also provide care, fulfillment, and dignity. These factors will only ensure the concept of Active aging among the population. After all, this stage of life holds as much potential for growth and development as earlier stages.

Intersectional Methodologies: Engaging the Perspectives of Adolescents with Disabilities in Jordan

The paper contributes to better understanding of how an intersectional framework can contribute to more inclusive methodological approaches, focusing on research for the Gender and Adolescence: Global Evidence (GAGE) programme with adolescents with disabilities in Jordan. There is currently limited research that explores the experiences of adolescents with disabilities in the Middle East - and rarely does research engage with the ways that disability intersects with gender, age and displacement, to produce particular forms of marginalization and exclusion. Due to cultural norms, adolescents with disabilities in Jordan, particularly girls, face marginalization within their households, are isolated from their peers and communities, are at a higher risk of violence, and have limited access to opportunities for education, work, and agency. These outcomes are worse for the poorest adolescent girls and those who are displaced.

However, adolescents with disabilities are often excluded from research due to challenges in including their perspectives. Even when research seeks to be inclusive, the interview context itself can reinforce negative self-esteem by 'labelling' adolescents with disabilities in ways they may not identify with, and caregivers may seek to speak for disabled adolescents or be present in interviews. This paper draws on qualitative and participatory research with adolescents with disabilities in Jordan, including Palestinian and Syrian refugees, and marginalized Jordanians. It reflects on the challenges of undertaking research in this context with young people with disabilities in ways which both affirm their agency and are adaptable and attuned to adolescents' specific vulnerabilities. An intersectional approach recognizes the ways that these vulnerabilities may vary across space and time as well as reinforce each other to produce particular experiences. The paper shows the empowering effects of participatory techniques used in the GAGE Jordan research which respond to and reflect the diverse challenges and strengths of adolescents with disabilities.

Meeting the Housing Need and Quality of Life of Sub-Urban Residents in Nigeria: An Empirical Study in Ibadan, Nigeria

Like most African countries, available statistics show that Nigeria ranks low on Human Development Index. With regards to housing, one of human basic needs, the target of meeting this need by the vast majority of the Nigerian people constitutes a major challenge in recent decades. This is exacerbated by the failure of government in meeting the infrastructural needs of the citizens and continuous impoverishment of the people arising from global economic crisis. Observations show that housing provisioning at the grassroots comes with mixed bag. This study interrogates such questions as: how do the Nigerian people achieve their housing need? How does this enhance or erode the quality of life of sub-urban residents? What are the measures in place or being put in place by the various stakeholders to lift people out of poverty situation?

Using both quantitative and qualitative data, this empirical study was conducted in Ibadan, the largest traditional city in sub-Saharan Africa. The study adopted functional theory and actor-network theory as the theoretical framework. The paper drew a nexus between housing and quality of life of the Nigerian people. It describes the value grassroots people place on housing, their efforts at housing provisioning, the individualistic and communal-oriented neighbourhood development agenda, and the assertiveness or not of governments and other stakeholders at improving the lots of the people. The results fundamentally show the absence of positive role of government and its agencies in meeting the infrastructural needs of its people. In conclusion, action-based and re-distributive policy measures are recommended.

Using Non-Technical Skills for the Remaking of Audit Professionals in the 21st Century

Ideally professionals should be honored servants of public need. Through time, conceptions of professions evolved. Professions were distinguished by traits or the functional relationship with society, viewed as a form of occupational control with questionable trust and seen as being hybrid. Notwithstanding the evolving conceptions of professions, knowledge and expertise remained central. However, sceptics believe that traditional professional work will in future be replaced by capable systems on practical experience and technical knowledge, and as asymmetry of expert knowledge diminishes, professions will steadily be dismantled. This incremental change requires remaking professionals such as auditors. As 21st century citizens, auditors have to function in an inter-connected, borderless and multi-cultural world driven by knowledge- and information-based economies. Different ways of working, different ways of thinking and different ways of living are needed. These ways will have a pronounced social orientation, become more collaborative and be driven by an information- and technology. Similarly the professional competence of auditors is being challenged with increased demand for digital, organisational and professional (non-technical) skills. This study investigates how non-technical skillsets of future auditors should change for the 21st century environment. Following a qualitative research approach the study uses data from two southern African countries (South Africa and Zimbabwe) collected through focus group discussions and interviews. The results of the study reveal that remaking future auditors needs a re-orientation towards citizenship and digitalisation. The contribution of the study lies in adding to the debate on conceptions of professions, arguing for a remaking of professionals with an increased social orientation and digital acumen. Insights from the study broaden the understanding of non-technical skills needs of future auditors by adding a social citizenship dimension and highlighting challenges in digital acumen. Accounting educators, practitioners and professional bodies could use the findings to refine their development programmes and offerings.

SANTIAGO, JOSE (,)

Rooted Lives, Vulnerabilities and Care. an Approach to Roots As Socio-Existential Supports and Their Transformations in a Context of Globalization.

The enthronement of the so-called "spatial turn" (Urry, 2007) in social theory has resulted in multiple theorizations of the global or glocal reconfiguration of social life, or, more recently, in formulations such as the "new paradigm of mobilities "(Urry, 2007; Sheller, Urry, 2018).

The thesis supported in this paper is that in these approaches the recognition of roots has been, in many cases, relegated. Faced with this denial or forgetfulness, it should be remembered that many other approaches, such as those from various feminist contributions or with a gender perspective (McDowell, 1991; Hyden, 1996, Ahmed et al, 1994), or referring to the sense of "home "and belonging (Blunt & Dowling, 2006), have been drawing attention to its centrality. Many other perspectives have also theorized the transformations of these roots in a global context (Massey, 1994, 2007; Cresswell, 2004). In this direction, for example, the translocal or transnational roots of the present have been conceptualized, or the contemporary rearticulations of neighborhoods and distances, including, in addition, both physical and virtual space.

This paper aims to highlight the prominence of roots, as well as their invisibility, considering, by way of example, their centrality in the satisfaction of care, and, more broadly, in the sustainability of life, in urban contexts of the South of Europe, and, above all, in vulnerable neighborhoods of some of its big cities. These roots are understood as "socio-existential supports" (Castel, 2010), doubly important in an "era of uncertainties" (Castel, 2010) and in contexts in which the networks of reciprocity and support exhibit a notable roots in the territory. . The work is supported by two ongoing funded competitive research projects, one directed by Margarita Barañano, COMURES, by José Santiago, VOLSOCU, which theoretically and empirically address this issue.

Rooting, Social Networks, Vulnerabilities, Local Well-Being and Care. the Case of Madrid from a Comparative Approach.

This paper focuses its attention on the importance of territorial anchors and local roots in an urban environment such as Madrid, notably in the case of its

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

vulnerable spaces, and in relation to the processes linked to daily arrangements, therefore It does to the care, above all, of the elderly. The analysis ranges from the household scale to neighborhood, community, social and political networks.

The form and meaning that these spatial anchors acquire in said metropolitan region, in comparison with others, is exposed, above all, regarding the convergences and divergences regarding this "local" dimension and the role of the roots in the social welfare regime in these vulnerable neighborhoods. Likewise, the aim is to highlight the importance of proximity in this type of well-being.

Another common thread of the paper is how, at present, physical proximity is combined with other modalities of proximity based on digital connection, which opens up new opportunities, and also possible new vulnerabilities.

All this would also have expanded in the context of the post-crisis, as of 2015, and that have resulted in a growing expulsion of residents from their urban areas of reference, especially in the central parts of the city, but also in other many spaces. This may have had a more negative impact on access to well-being and care for these people, especially dependent people, due to the prominence of roots and rooted social networks in these types of cities. Likewise, the impact of the health crisis linked to COVID 2019 is considered, more specifically, in relation to domestic work and care. The paper is supported by a research project funded by the Community of Madrid and the European Social Fund, COMURES (program H2019 / HUM-5738), in which all the authors collaborate.

Prevalence of Overweight and Obesity in Brazil: A Historical Analysis By Age Groups, Gender and Regions

Considered a problem for public health, obesity is a global pandemic, in a scenario of nutritional transition of populations being defined as one of the faces of food insecurity. In this context, the present work aims to analyze the prevalence of obesity and overweight in Brazil, to understand the nutritional transition that is taking place and its relationships with food and human development.The data mobilized in the research are from the Food and Nutritional Surveillance System (FNSS), of the Ministry of Health. It is a study with a quantitative approach from the FNSS web secondary data survey, through reports of the nutritional status in different phases of life (child, adolescent, adult and elderly), by sex, macro-regions of the country (South, Southeast, Midwest, Northeast and North) and with a 12-year historical series (2008 to 2019).In the adult life phase, the South Region of Brazil, presents the highest national percentages of overweight and obesity in relation to the people followed in FNSS, 69% in women and 68% in men, in 2019. The lowest prevalence of overweight and obesity is in the age groups: children from 0 to ◻ 2 years, from 2 to ◻ 5 years and from 5 to ◻ 10 years, in the North and Center-West macro-regions, where the highest percentages of eutrophy are found. Overweight and obesity have an increasing linear trend in the time series, in the phases of adolescent, adult and elderly life in all macro-regions.In Brazil, as in other countries, overweight and obesity are increasing, which suggests that public FNS policies should be more assertive in the planning and management of programs and actions, in order to reduce the percentages of this disease, with a diet based on sustainable systems and healthy diets, promoting full human development with freedom.

Challenges for Welfare States: European Comparative Research in the Light of Survey Data

The question of the institutions of the welfare state and its future in the era of the dominant views of the neoclassical version of the economic science, fetishizing the alleged advantages of free market economic solutions for overall social welfare, but in reality contributing to the instability of the financial system, growing socio-economic inequalities and the reduction of common goods, is of particular importance. In order to determine the functionality of the given models of welfare states, based on the data from the European Social Survey Round 8, we decided to examine whether there are more than three classic welfare regimes (Esping-Andersen 1990, 1996, 2015) in the context of welfare state attitudes. We have developed a proprietary conceptual model, based on an extended classification of welfare states, that combines these regimes with attitudes that have been operative on the basis of seven dimensions (see diagram below).

On this basis, we put forward research hypotheses (H1, H2, H3, H4), which were tested using GLM ANCOVA analysis (eg. H1: In the European context, welfare state attitudes in the Mediterranean and post-communist regimes differ fundamentally from those of the three classical types: liberal, conservative and social democratic). The obtained results constitute a significant contribution to the discourse on models of attitudes of welfare states (undermining Esping-Andersen's thesis on the existence of three regimes of welfare states), and also allow to compare the influence of particular variables on the support or lack of support for the above mentioned institutions.

Methodological Implications of Intersectionality

In my talk I want to explore the methodological consequences of arguing for an intersectional approach in critical social research. I want to reflect on the epistemological consequences of the plurality of meaning and the necessity of performing an intersectional analysis of multiple, cross-cutting vectors of relations of power. As a corollary to that, I wish to demonstrate the politics of knowledge production through the reconfiguration of said/unsaid statements in a critical project. The actual discourses for analysis will be the Hungarian feminist debates about 'neoliberalism' in the face of the anti-gender mobilization that has been on the rise globally as a key element of right-wing populist political discourses.

Netnography and Online Health Community Studies: A Review of the Literature

Online health communities (OHC) have become a popular realm for patients, due to their ample availability of health information and the possibility of connecting with others going through the same health problem. In the past decade, academic research about OHCs has increased, and netnography has been used as a research method to investigate the social dynamics and values produced in these communities.

This paper aims to analyze the use of netnography in OHC studies. A review of the literature about OHCs was conducted in three databases: PubMed, Scopus and Web of Science. Only articles published in scientific journals were considered for analysis. Our final sample consisted in 492 documents. The title, abstract and keywords sections were examined for a specific mention of the words 'netnography' or 'netnographic'. 9 netnographic studies were found. A subsequent thematic analysis was carried out.

5 netnographic studies were conducted in OHCs defined by a specific chronic disease or health condition. A common theme was the impact of OHCs in different aspects of the life of a patient, such as patient-doctor relationship, empowerment and self-management. A less common theme was the value creation in OHCs. Overall, the immersion process of netnography allowed researchers to examine how a singular type of digital sociability can impact patients, especially those with a chronic health condition.

Netnography is not a method largely applied to analyze the social impacts of OHC participation in healthcare. However, the studies found show that it can be a strategic method to examine these digital spaces, since its observational approach allows researchers to identify how social interactions in OHCs can affect patients and their life outside the digital community. Further research can investigate why netnography is not a common research method in OHC studies or discuss the ethical implications of a netnographic study in OHCs.

The "Home" of Home Care for the Elderly: Place of Freedom, Industry's Next Frontier or a Heterotopia?

Extolled by experts as a cheaper alternative to the gloomy nursing homes of yore, sought after by care agencies as the "next frontier" for technology, growth and profit, widely understood as the preference of seniors who want to "age in place" but still employing a highly underpaid work force that is in short supply, home care for the elderly has increasingly become a topic of policy and public debates. Based on participant observation of long-term care professionals' association meetings and of webinars that teach care agencies' managers the new trends and innovations for labor retention, audit survival and quality control, this paper demonstrates how the home -- often understood as a domain of respite and freedom from social institutions – has become a contested place. Examining the discursive struggles to fix the meaning of the "home" of home care in particular ways, we explore how different instrumental rationalities espoused by home care industry actors can reinforce or resist the institutionalization of the home.

Learning & Practicing Law: How University Can Build Educational and Law Systems for the Next Society

We observe the educational system, focused on law institutions, to answer how the university can contribute to the law system of the next society (BAECKER).

Ordinarily, each law educational system performs techniques that represent its legal tradition. In countries that embrace the tradition of civil law as legal system – mostly nations from Western Europe and Latin America, which base their systems on general codes and written laws – schools primarily use the study of these codes as the foundation of their classes. In its turn, the Common Law tradition base his legal function and education in the analysis of precedents – rules established by courts in previous cases.

Considering the systemic centrality of courts in the law of modern society (LUHMANN, 2016), the civil law tradition and his education faces two particular problems in modernity. First, the gap between legal education and systemic law operation, since studying codes it's not the same as applying codes. Second, the massive insertion of computer-mediated communications into the law system, especially computer-generated communications, with the dawn of artificial intelligence, for instance, in operation of computational systems to assist legal decisions. These computer-generated operations lead us beyond Luhmann's description: we are facing the law of next society.

The answer can be placed at Baecker's proposal for the so-called next university, an education for the unknown. Higher education, therefore, operates crossing sides of the form know/unknown: the next society often asks questions whose answers have not been yet formulated, and is expected the aptitude to deal with this condition. "Knowing" is different from "being sure".

Following its function so far, the education system shares its results with other social systems, and, combining Luhmann and Baecker proposals, the construction of the next law system cannot be possible without thinking about the educational system modifying himself too.

BARBOSA FERREIRA LUCIANO, JOHN HEINZ RUMMENIGG* (Universidade Regional do Cariri, Brazil)

Socio-Legal Possibilities of Artificial Intelligence As Legal Decision-Making in Brazilian Law System

In the past few years, Brazil has constituted a horizon for Internet regulation and data protection, especially with the Brazilian Civil Rights Framework for the Internet (Marco Civil da Internet) and the General Data Protection Law (Lei Geral de Proteção de Dados). Associated with other acts, we can stablish an authentic and organized set of digital law.

At the dawn of machine learning operations in Brazilian legal system – such as the Supreme Court System *Victor* – we can analyze how, in this legal context, artificial intelligence can be use as legal decision-making, its possibilities and limits.

By observing another national-legal systems, we establish a comparative scenario for this enterprise and lay down another possible social and ethical boundaries.

Methodologically, we apply Niklas Luhmann's systems theory to measure the value of the computer-mediated communication into the law system, and to analyze stabilized operations in other national-legal systems.

Loneliness Among Older Australians – Meanings, Experiences, and Perspectives

Loneliness in later life is becoming a pressing issue in industrialized countries, as research shows the negative social and health consequences of feeling lonely. Lonely older people are more often sick, in cognitive and physical decline, and disconnected from their communities. As a result, they are more likely to be socially excluded, civically disengaged, hospitalized, and in need of continuous care. For example, loneliness in later life increases the risk of dementia by over 40%. These effects impact their quality of life, independence, and sense of worth, and reduce their social contributions, such as caring for families and sharing knowledge with younger generations. In particular, oldest old people seem to be more vulnerable to loneliness when living in aged care facilities and experiencing frailty. Yet, we still lack a comprehensive understanding of the meanings and consequences that oldest old people living in care homes ascribe to loneliness and how they live through it.

To help bridge this gap, I studied experiences of loneliness among frail older people living in aged-care institutions. Drawing on an interactionist approach to the topic (based on Erving Goffman and Arlie Hochschild), I conducted participant observation in two Australian care homes and interviewed 22 residents. Findings show that loneliness is seen as relational (associated with social relationships) and related to 'oldering' (getting older and frail), but also private, subjective, and stigmatizing. Participants employed diverse strategies to manage their loneliness; however those strategies were constrained by their social contexts and the stigma attributed to loneliness. We also discussed interventions and participants offered their perspectives on the value of different initiatives to tackle loneliness among oldest old people.

Women`s Nutrition and Family Sustainability

Healthy women is an asset to the family. In the patriarchal family pattern, the same is never looked up seriously. In the traditional families, women`s nutritional need is considered as a secondary issue ,as a result the family peace is also hampered .In traditional families in India, much importance is entailed on man`s nutrition. This results in the poor health condition of women in the families, discrimination in food supply for a girl child is prevalently observed in the economically backward families. The aim of the paper is to discuss the impact of nutritional deficiency of the students enrolled in University studies and their significant behavioral expressions observed as an expression low nutritional condition.

The research methodology adopted for the purpose of the study is based on primary data like empirical and analytical part. Since the historical and evaluative methodology needs to be taken care of for the discussion part of the study ,All these methodologies have been adopted in practice .

The research Funding of the study indicate that, unhealthy women are always the cause of anxiety to the families .Also they cannot contribute much for the smooth of the family . Their ill health effect to the families too, because her nutritional deficiency causes ill health to the children too. Looking to the generational effect of nutritional deficiency of women, the present research aims to look to the nutritional issue as an important source of societal awareness ,the present research aims to look to the development of social research on women nutrition in West Bengal ,India to indirectly extend inputs to the Third World Nations,about the adverse effect of low nutrition on women.

BARDIA, AMAN* (New School for Social Research, USA)

Politicizing the Unorganized in Southern China: Challenges for Political Workers Unions in an Informal Economy

Since major market-oriented reforms of 1978, the transformation in the Chinese political economy could be argued to have a different foundation than the legacies of Maoist-era mass movements. Recent relocations of the factories from southern China to the interior has brought about widespread hardships among the workers in the former region. One province that stands out among these is Guangdong. Guangdong is interesting in this respect as it had been the forefront of privatization since the reforms of 1978. This is in the context of a massive crackdown on NGOs providing services for workers on the one hand, and of an increasingly politicizing workforce on the other. Guangdong has also seen by far the highest number of labor strikes in the past fifteen years. My background research is aimed to survey the depth of state control, surveillance and social support that 'politico-legal' organizations provide against a background of increasing precarity in the informalized workforce. This investigational paper would center on decentralized planning structures that coordinate the needs of the workers with the centralized allocation of state and federal level resources, within the context of 'market socialism'. It is my hope that investigating the planning and resource allocation infrastructure in a differently organized form of 'market socialism' as practiced in Guangdong would lead to unique comparative insights between the period before Deng's reforms and the present. I hope it would shed important analytical light on government-led programs to address labor-capital tensions from the perspective of workers and institutions in a major global manufacturing hub. At the same time, I will consider the possibilities of the labor movements that have arose in this region that point to an emerging political force that may or may not find an innovative way to incorporate the geographically and organizationally distributed workers of the informal-contract economy.

Implication Et Lien Dans La Recherche-Action Avec Des Groupes Socio-Éducatifs

Le but de cet article est de reflechir sur la cohérence épistémologique de différentes méthodologies de recherche et interventions utilisées dans le travail accomplit avec de petits groupes socio-éducatifs dans une perspective socio-clinique. Les groupes ont été accueillis à Brasília entre 2007 et 2017, jeunes adultes entre 18 et 65 ans envoyés par la justice, pour la possession ou l'utilisation de substance ilégale. Dans ce sens il est important dans la participation. de mentionner que les jeunes viennent aux reunions contraints comme qui reçois une

punition. Nous avons décidé de changer la punition pour une idée de socialization. Pour eux la participation dans le groupe éducatif signifiait seulement remplir une obligation avec la sphère de la justice et ensuite être libre. Cependant en cherchant à rendre possible l'implication des jeunes comme sujet à partir de leur scéne sociale, nous avons pu observer leur apprentissage. Leurs histoires de vie partagées ont eu dans le langage théatral du socio-drame une possibilité descriptive, intimiste et interprétative du vécu. Cette ouverture, la participation a signifié l'affirmation de liens dans des activités avec les chercheurs. Seulement a partir de ce lien que l'intervention sociale a revelé tout son sens, valorisant les contextes, les perspectives de chaque acteur social. Liens et implications ont permis aux sujets de tester leurs verités dans le groupe, les comparant et pouvant changer d'opinions. L'ensemble de nos efforts était de promouvoir l'implication et l'analyse collective des actions et du contexte social qui les produit. En favorisant leur possibilité de s'exprimer, Il a été possible à chacun de se rendre compte de ses limites et certitudes. Dans cette intervention socio-clinique nous cherchons à affirmer la nécessité du sujet de se reconnaitre dans le processus de connaissance sur soi même afin de comprendre le rôle de la subjectivité dans l'interprétation du social.

Sociologie Clinique Et Théatre: Contradictions Et Retombées De La Piéce De Théatre Macunaïma.

Le champ constitué entre la pedagogie du théatre dans une communauté de la periphérie urbaine et la sociologie clinique, delimite le contexte de l'analyse de l'expérience que nous décrivons ici. Le spectacle Macunaïma, adapté de l'oeuvre de Mario de Andrade a été réalisé en 2018 avec des éléves de l'enseignement secondaire et des participants d'une communauté de Gama, petite ville près de Brasilia Dès les premiéres répétitions jusqu'aux premiéres représentations dans la communauté et à l'Université de Brasilia, la stratégie était de rendre possible un espace ouvert de discussion et de création de scènes sur la question identitaire du peuple brésilien. Chaque participant était conduit à se percevoir comme sujet du processus social dans lequel il est inscrit en étant attentif aux déterminismes sociaux, économiques, psychologiques qui le constitue. Les discussions durant le montage et aprés les représentations, avec le public ont offert des conditions suffisantes pour une reflexion critique sur l'identité personnelle et collective. Deux catégories de discussions ont surgi durant le processus. La première se réfere à la constatation et l'acceptation que la société est multiculturelle et composée par différentes références ethniques, religieuses , affectives et socio-économiques. La seconde montre la nécessité d'affirmation de la culture noire laquelle même dans des interprétations multiculturalistes, historiquement est marginalisée, devient périférique des grands centres urbains, négligée ou étouffée par les médias, dissimulant ainsi son existence. L'impératif de la seconde discussion est devenu, représentation après représentation, débat après débat, le spectacle teatral en « intervention sociale » rendant possible des effets dans les groupes et dans le public présent. Les effets les plus notoires sont la continuité des discussions sur l'identité du peuple brésilien dans les écoles et à l'Université dans une perspective de sociologie clinique, à partir du Sociodrame, du Théatre de l'Opprimé et du Théatre Forum.

Indian Agriculture and Women Labour: Reflections on Their Participation and Emancipation

Indian agriculture has undergone tremendous transformation and modernization with the introduction of Green Revolution during the last four decades. Immense contributions of women labour in production process of agriculture have made the country self sufficient in food grain requirements and their contributions neither can be ignored nor can be undervalued. As per the recent data the country has produced 281.37 million metric tons of food grains. The women labourer engage themselves in various agricultural operations like preparation of fields, ploughing, planting, transplanting, weeding, watering, harvesting and storing the food grains besides carrying out household activities like cooking, child care and taking care of elderly parents in the family. These women labour force comprise around 27.11 per cent of population of the country and they all belonged to under privileged and weaker sections of the society. They belong to castes of lowest rung in the caste hierarchy. These women labour force are being exploited in various ways like payment of less wage, adverse working conditions, lengthy hours of work, fulfilling sexual gratification of the landlords and many other forms. The women labour force is completely unorganised and they do not have any formal organisation to ventilate their grievances. No doubt there are registered farmers organizations are working for safe guarding and protecting the interest of farming communities but these organizations have shown little concern for safe guarding and protecting the interest of women labour force working

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

in agriculture and let alone their emancipation. This paper based on secondary data and narratives intends to reflect on the prevailing precarious environment in which the women labour force work in agriculture and contribute immensely for sustainable growth of agriculture and development of the country.

Casting Caste through Sectarian Institutions: The Case of Socio-Religious Intersectionality in Hinduism

Caste has historically been the most significant identity marker of Indian society. Caste indeed is a phenomenon that shapes and guides the web of social interactions in the Indian social milieu. The recent developments in sociology in the field of caste have advocated for a study which recognizes the existence and practice of caste with different regional intricacies and convolutions. Focusing on the praxeological dimension of caste, this paper will investigate the relationship between caste and sect in the Vaishnava sectarian scenario of Hinduism in India. The development of the reformist Vaishnava sects in India since fifth century AD has been founded on establishing an egalitarian religious space and further bringing in principles of equality bereft of hierarchy and divisions in the wider society. Thereby, at the onset, sects appear to be an anti-thesis of caste. However, historically speaking, in case of many Hindu sects it is witnessed that caste has penetrated into their process of institutionalization, albeit in different degree and configurations. Sects as institutions have developed on the basis of caste affiliations; and in certain contexts some sects have developed into a caste like structural principle. Contextualizing this intersectionality on a Vaishnava sect situated in the North-Eastern part of India that is in the state of Assam; this paper wishes to delineate the process of co-optation of sect into localized structure of caste system. Using primary data collected from the field, this paper attempts to analyse how do sects lose their radical-ness when placed in a particular social and regional contexts reproducing the already existing contours of social relations. It will also look at how power, authority and hegemony are reproduced and maintained in such institutionalized sectarian landscape which ideologically calls for a democratic religious platform.

Digital Technology and Youth Justice: Practitioner Perspectives on Shaping and Being Shaped By Social Technology in the Public Sector

This paper draws on original empirical research that focused on the use of an experimental mobile application developed by the authors, and used in the domain of youth justice in England, to explore the processes of shaping and being shaped by technology in the public sector. Against a backdrop of the theory of the paradox of technology with ideas of the networked self, child rights, and governmentality, the paper explores youth justice practitioners' perspectives about the use of social technology with vulnerable / marginalised young people. Given the dearth in knowledge and understanding, in this area of social technology and practitioner narratives, the paper focuses on an important, original and fast-developing issue in contemporary youth justice. Using a co-design methodological approach, the paper explores the qualitative experiences and views of practitioners (n=14) to promote a better understanding of the opportunities and challenges in the adoption of digital technology, and social responsibility in working with marginalized young people in the public sector. The study sheds important insights on risks and benefits, values, and innovative practice. Study findings indicate that digital opportunities and challenges are embedded in organizational and cultural structures and values and practices. The paper discusses implications for youth justice, and ultimately for young people in conflict with the law who are caught up in the system. The paper raises important issues about the likely increasing use of technology as a tool in rehabilitation and desistance, and possible surveillance and loss in privacy, and its key messages will be of considerable interest to practitioners, managers and policy-makers who will have little option, as time goes on, to enter this controversial field.

This Is a Man's World?: Understanding the Experiences of Senior Women Police Officers in Punjab, India

Although women police officers were deployed in small numbers in some parts of pre-independent India, their presence was only considered important following the partition of India in 1947, primarily to help deal with large scale offences including abductions, kidnappings, and rape (Ghose, 1979). This paper addresses the entry of women police officers within the police service, in contemporary Punjab. Through a methodological empirical approach that entailed qualitative interviews with 30 senior and middle ranking women police officers, we explore the profession of policing and its inherent image of hypermasculinity. In particular, we utilise Joan Acker's theory of gendered organisations, together with the notions of space and place to understand occupational segregation, and in particular how a gendered context, and hegemonic masculinity are reproduced and maintained (Acker, 1990). Three key themes are examined – namely legitimization of hegemonic masculinity, control and segregation, and doing gender and gendered personas. Within this framework, we pay attention to structural effects in relation to gender segregation, family-work-life balance, coping mechanisms, sexual harassment and access barriers (Natarajan, 2016; Brown, 2017; Jackson 2017). To help advance policy discussions, the state of Punjab is also compared to other Indian states such as Tamil Nadu and Maharashtra to argue for stronger initiatives to address the gender disparities that exist in the Punjab Police Service.

Addressing the Efficiency of the Integrated Water Resources Management (IWRM) Model in the Context of Climate Change. Lessons Learned from Two Contrasted Regions in Burkina Faso (Africa)

The Integrated Water Resources Management (IWRM) model promotes a new way to ensure resources preservation in a context of water scarcity. IWRM is an illustration of standardized « travelling models » circulating at the international level since the 1970s and adopting international recommendations (Dublin 1992). According to these principles, water is recognized as an economic good, the participation of all stakeholders is called for, and the watershed is the water management scale. Since 2000, the Global Water Partnership has globally disseminated these principles (Petit, Baron, 2009). We will question the impact of Sustainable Development Goals (2015) on IWRM model.

Many scholars have shown the limits of IWRM pointing out the gap between theory and practical applications (Molle, 2008). If its efficiency to guarantee water resource preservation is put forth in the discourses, the application of its principles in African countries has been met with adaptations, circumventions and resistance.

Burkina Faso is often cited as a «success story» for IWRM in Africa, and is the first African country to have adopted it (2001) with support of donors (DANIDA). However, if Burkina Faso is considered as an example for the translation of IWRM principles in institutional mechanisms (water laws, regulations, etc.), their implementation has encountered much resistance, partly due to a lack of social acceptability by the populations.

We will discuss this gap through the comparison of two contrasted regions of Burkina Faso in the operationalization of IWRM principles, illustrating the « unexpected effects of the contexts ». The Nakanbé watershed has been an IWRM implementation pilot project while the Mouhoun watershed lies in an endogenous innovative water resource protection system, well before the IWRM.

We will highlight the findings from an interdisciplinary approach combining a socio-anthropological approach and an institutional analysis, in the context of Burkina Faso.

Social Stratification's Measurements. Comparative Perspectives between Europe and Latin America

This presentation has a twofold aim: first it compares the social structure of five Latin American countries (Argentina, Brazil, Chile, Mexico and Uruguay); and five European countries (France, Great Britain, Finland, Italy and Spain). We present descriptive differences between both continents regarding their social structure, using the EGP scheme based on a previous work of homologation in Europe

and Latin America. Regarding Latin American countries, we use national social stratification and mobility surveys applied between 2009 and 2014 by our academic teams. As for Europe we use different data sources such as the European Social Survey, the European Working Conditions Survey and the European Quality of Life Survey. Secondly, we assess these differences among nations, in relation to its regional and national recent history. The research outlines the differences between Latin America and Europe, including specific variables that allow us to characterize social classes in each country associated with welfare states dimensions: employment, health, education and family and personal income. Attention will be paid to disparities between Europe and Latin America by considering the literature related to the timing of industrialization and varieties of capitalism, productive and reproductive models, to understand the specific configurations and comparison conditions. As ethnic data is not available in each survey, we cannot at this time provide specific information on that topic, though gender will be one of the main dimensions of our analysis. The present study thus, validates the internal consistency of social classes in a comparative perspective.

This paper is part of the INCASI project ("Global trends in social inequalities in Europe and Latin America and exploring innovative ways to reduce them through life, occupational and educational trajectories research to face uncertainty" (INCASI), H2020-MSCA-RISE-2015 Funding scheme: Marie Skłodowska-Curie Research and Innovation Staff Exchange (RISE), (*http://incasi.uab.cat/*)) to be published in 2020.

Experiences of University Professors: Paradoxes about Employment in Conflict Settings

The paper analyzes the employment of university professors based on their experiences in conflict settings. In their experiences, teachers develop complex teaching and research processes within employment conditions that involve work, obligations and remuneration. The text has a qualitative orientation, participant observation was conducted and 10 in-depth interviews with professors of Social Sciences and Economic Sciences in 3 private universities in Bogota, Colombia, they were selected for having temporary contracts. The teacher, by participating in the training and, in some cases, research processes, generating a significant symbolic load in the contexts where he develops. In its work, on a recurring basis, its activity is reduced to the performance of processes, standardized activities and an increase in the number of students. In private universities, hiring is characterized by employment instability, they have fixed-term contracts; The teacher does not know if the contract will be renewed the next period, they must go through its liquidation and be alerted to be called. The above, derived from the practices that come from private companies, is evidenced in the relationships between professors and managers, where the business model is established as a guide for the operation of the university. Finding the paradox, on the one hand, teachers develop training and research processes that involve a long duration, effort, work, resources, high level training, participation in national and international academic spaces and communities; on the other, they have employments with uncertain contractual conditions, where it is established that their relationship with the university is temporary and can be canceled.

Narco Violence, Forced Migration and Sex Trafficking: A Qualitative Study in Mexico

During the last decade, more than 160,000 people have been forcibly migrate internally due to *narco* violence in Mexico. These migrated families suffer social and economic vulnerabilities which, leaves them easy prey to traffickers for the purpose of exploitation. Young girls and women are extremely vulnerable. This paper analyzes the impact of forced migration on trafficking of women and girls for sexual exploitation caused by *narco* violence in Mexico. For this study, we gathered information from 16 forcibly migrated trafficking victims (FDTV) in Monterrey, Mexico. Findings elucidate that traffickers use different tricks and promises to trap displaced young girls and women, including force into sexual exploitation. Moreover, narco violence has generated a huge number of orphans and widows in the country. Traffickers use the economic vulnerable condition, and lack of family support structures, of these orphans girls and widows, and force them into sexual exploitation.

Transformative Social Protection in Latin America? Poverty and Dignity Narratives in Policy Design

Governments in Latin America have increasingly committed themselves to addressing extreme poverty and social inequality through the implementation of social protection programmes and a global sustainable development agenda (SDGs).

In order to take stock of the social policy outcomes and assess how transformative the applied measures have really been in addressing poverty and social inclusion, I propose to take a critical look at the policies from a rights-based perspective that puts dignity at the core of the analysis. Within the context of a rights approach and the SDG agenda, there is a clear push not only to achieve wider coverage for the poor and vulnerable but also to work towards national social protection systems for all, thus advancing towards universal social services.

How do Latin American countries fare in this respect? I propose to examine the role of the state in ensuring social citizenship and rights, vis-à-vis some of the most emblematic social policy schemes the region has seen: conditioned and poverty-targeted social protection programs. How have some of the narratives around poverty and the "deserving vs undeserving poor", the "takers", "laziness" or "dependency" informed social policy design and implementation in the region? Have non-contributory social programs targeting the poor been transformative enough?

An inclusive social protection system requires Governments to base their policy design and programme implementation on principles of human rights and dignity. If Governments fail to do so, and base their social protection provision on the negative narratives surrounding the concept of poverty and the "deserving", they are fragmenting service delivery based on different audiences. This is bound to create cracks in the system, making it well-nigh impossible to "leave no one behind". Individuals of all ages are vulnerable to shocks, thus the need to embed social protection policies in a lifecycle approach.

BARRATT, SUE ANN* (The University of the West Indies, Trinidad and Tobago)

Beyond the Misogyny Frame: Caribbean Media Coverage of Violence Against Women

Caribbean media have often been complicit in the reproduction, if not promotion, of gender based violence, particularly violence against women. This paper maps and evaluates both online and offline newspaper coverage of cases of gender based violence against women in particular. It samples coverage from seven Caribbean countries - Jamaica, the Bahamas, Dominica, Antigua and Barbuda, Guyana, Barbados and Trinidad and Tobago - which saw the growth of the Life-In-Leggings movement from the online to the offline. The feminist movement, which emerged in 2017, started with a hashtag and later organised marches throughout the region to challenge myths that blame women for their experience of gender based violence, especially street harassment and other forms of sexual violence. From this point of departure, I examine, through content analysis, how media coverage reflects a new consciousness of the nuanced experience that is gender based violence as it occurs in the Caribbean. My purpose is to pinpoint cases where media coverage speaks beyond the misogyny frame and to use these cases to inform media training exercises designed to assist journalists in their use of language that is not only non-sexist, but does not reproduce linguistic mechanisms of misogyny, e.g. blaming the victim, diverting attention away from the perpetrator, diminishing cases of violence or reproducing violence against women as normative.

Affects and Social Bonds in a Dualized Society: Contributions of Sociology and Psychoanalysis

Politics brings to the scene the passions of being, that Lacan spoke of: love and hate with unequal and immeasurable intensities. The starting point of this text is to reflect on the dualized forms of expression of affects that we experience today in Brazilian society, especially in the field of politics.

Hate does not begin in politics, but it is in the polis that passions are normatively addressed to institutions, signaling quilting points [*point de capiton*] for "excesses". The ritualized moment of radical disputes, including elections, not only signals a chronological calendar. As a legitimate device for tolerance and explicit options in the choosing of representatives, electoral processes are regulators of affect. The dualities recompose themselves 'when the time of politics is over'.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Freud's reflections open important doorways for thinking about how affections are actualized in the specific ways of organizing everyday life relations in the polis. Thus affections do not appear in social life as substantive expressions but rather as historical ones. This question is resumed by Pierre Ansart (1983) when he analyzes political passions throughout history. From a methodological standpoint, this text will refer to concrete situations from which the theme of duality is present, exemplified in street manifestations, online social networks and daily life. Such opposition is not exclusive to the right versus left nominations, thus encompassing emblematic modes of subjectivation of the contemporary Brazilian situation. Among the possibilities of developing an analytical tool, Luc Boltanski (1990) opens an interesting doorway to think about how collective actions acquire a status of legitimacy through the agency of affections in which notions of love, justice and competence come to have meaning. Affects and their languages, the places of appearance and the discussions in Brazilian society raise enriching analytical bridges, creating possibilities of intercession between psychoanalysis and the social sciences.

BARREIROS, BRUNO* (Federal University of Bahia, Brazil)

Business Schools, UN and the Institutionalization of "Corporate Sustainability"

The paper relies on an ongoing research focused on the institutionalization of "corporate sustainability". This research is a work in progress started in 2015 that based the researcher's PhD thesis in political sociology. The context of analysis is the advance observed since the beginning of the 2000s of institutional alliances between the UN, large private companies and business schools around the PRME (Principles for Responsible Management Education) network, whose declared goal is to promote the models of "sustainable development" and "corporate sustainability". This arrangement of forces has marked the social construction of an *international market of executive education towards sustainability*. In order to understand and explain this phenomenon and its implications for contemporary societies, this proposal relies on the theoretical contributions of Bourdieu's praxeology, the sociological institutionalism of Berger and Luckmann as well as the amount of knowledge accumulated by economic and elite sociologists. The general objective is to understand and explain the social construction of an *international market of executive education towards sustainability*. In terms of operationalization, four fronts compose the ongoing research: 1) the history of the phenomenon, using documentary research and specialized literature; 2) the social cartography based on multiple correspondence analysis (MCA) of the international space of business schools, focusing on the PRME's signatories; 3) the sociogenesis of courses from highly reputable business schools in this space – the so called PRME Champions; 4) the analysis of the graduates' social properties based on an international survey. For the presentation of this paper on the IV ISA FORUM and considering the research schedule, the first three fronts will be contemplated. The exception is made for the survey, which will be on the participants' recruitment stage by the middle of 2020.

Research with Children: Methodological Issues and Innovative Techniques on Physical Education Classes

Considering the 21st century challenges, thinking about children as protagonists and subjects of rights is an important way to develop researches on physical education classes. For this purpose, we intend to analyze innovative research techniques with children in the field of physical education in Brazil. We highlight, at first, a growth of investigations conducted with children, which consider the social and cultural experiences among their peers, adults and school environment in daily life. These studies reinforced the perception of children who participate, produce and decide about subjects of their interest, revealing their own culture. Researches with children demonstrate children as subjects and co-participants in the process of knowledge construction. Thus, it is essential to consider space and time and a culturally situated context to increase the incentive to these researches. Analyzing the results of our investigation, we present two examples of ethnographic investigations with children realized in different schools in Brazil who respectively intended to: understand daily life of children from children's culture established in specific spaces and times of school and to understand how the plays and the education of the body were experienced by the children at school. The innovative techniques found was construction of toys, creating draws and photographies with children. In the researches analyzed, the techniques go along by non-official conversations with children. Therefore, methodological issues discussed in this paper offered a different comprehension about children's perspec-

tive in physical education classes. We conclude that it is an important discussion about the relations between research objectives and methodologies, looking for children's contribution in researches and not only adults' perspectives.

Analysis of the Visibility of Images of Bedouin Children in Photographs in Palestine

This paper will analyze photographs of Bedouin children in Palestine from the end of the 19th century. The era was characterized by an increase in Western colonialist activity in the region, nurtured by Orientalism. Imperialistic and religious claims over the land encouraged gentlemen travelers, missionaries, scientists, artists, and explorers to document the Holy Land and its indigenous/ local populations.

The Arabs and Bedouins were photographed in their natural surroundings. Bedouin children were rarely the focus of photographs, appearing in photographs as part of a family unit or a tribe rather than standing on their own. Few images of Bedouin children from the period are to be found in archives and publications, and there has been little research in this specific area. Young Bedouin children accompanied their mothers when doing chores, or when older, tended the flocks of goats and sheep. Western photographers sometimes came across women at work, with their infants or toddlers. There was no visual distinction between boys and girls. Bedouin children often appear as filthy and ragged, often barefoot, with disheveled hair. This stood in contrast with styles of portraiture of children common in western societies, in which children were dressed for the occasion and photographed in studios. The attire of Bedouin children gave no indication of their family's social standing within their tribes.

Furthermore, photography was not common among Bedouins at the time, so that awareness of their appearance or of Western viewers' gaze was insignificant. This study will explore how these presentations of Bedouin children by Western photographers served as a form of instrumentalization in religious/Biblical and anthropological interest on the one hand and with colonial struggles in the region on the other, while exploiting the vulnerability of children to empower Western viewers in their imperialistic aspirations of entitlement in the Middle East.

Exploring Multi-Stakeholder Meta-Organizations As Vehicles of Political Influence for Private-Sector Actors

Given their increasing role in modern society, meta-organizations – understood as organizations that have other organizations as their members – have gained significant scholarly attention in the past decade. Some meta-organizations have demonstrated their efficiency in tackling societal issues, especially when they are composed of public, private or civil society organisations in what can be called "multi-stakeholder meta-organizations". In such organizational configurations, actors from diverse backgrounds can initiate dialogue and coordinate collective actions in a consensual way. However, despite promoting interactions between private and public actors, the effects of multi-stakeholder meta-organizations on the political activities of private actors largely unexplored. Thus, the present study seeks to investigate the features of multi-stakeholder meta-organisations that make them a relevant vehicle for political influence.

From an empirical perspective, our research draws on an in-depth, single case study of a multi-stakeholder meta-organization created to reduce traffic congestion around an industrial zone and airport in a major French city. We use secondary data sources and interview data to explore how private actors use the meta-organisation to influence public authorities within and beyond the scope of the meta-organisation.

To date, the key findings of on-going analysis suggest that, within the meta-organization, the influence work of private-sector members involves broadening the original objectives of the meta-organization. We also find that private-sector actors use the meta-organization as the basis for exchanging information with policy actors on topics beyond the scope of the meta-organization. For some private-sector actors, the meta-organization also serves to build legitimacy with decision-makers in the public sector.

This study contributes to meta-organization scholarship by elucidating an unexplored, more discrete impact of such organisations on society. It also speaks to the corporate political activity (CPA) literature by identifying a new vehicle that firms can use to wield political influence.

DE MATTOS PIMENTA, MELISSA (Universidade Federal do Rio Grande do Sul, Brazil)

The Field of Studies on Youth and Violence in Brazil: The Construction of Paradigms and Pathways to Challenge

Research on the phenomenon of young people as authors of violence has expanded considerably in the 1990's upon the consolidation of drug trafficking in Brazilian urban peripheries. In this paper we recover the formation of the field of studies on "youth and violence" in Brazil, recovering the consensus already produced and pointing out the gaps that still need to be filled by the researchers. In the 1990's the association between poor, urban, young men and violence began to be studied by social scientists, leading to the consolidation of an "ethnographic crime theory", which inspired researches that aimed to understand the dynamics of illegal markets through methodologies that gave voice to the protagonists in such realities. In this research field, important insights from sociology of youth have been incorporated and led to the supposition that becoming a drug dealer can be a milestone for some young men, as much as regular work and becoming a parent. In addition, social categories such as gender and race have gained importance in the understanding of relationship between youth and violence, becoming central dimensions in the recent studies. Therefore, also based on data from focus groups and narrative interviews conducted with adolescents confined at a house arrest, we argue that drug trafficking can be understood as a structure of social interactions that, ruled by traditional values like the use of physical force and the idea of the man as an economic provider, responds to hegemonic heteronormative masculinities in contemporary capitalism. We also suggest that in order to incorporate biographic changes in the life course, studies in youth and violence must produce transversal approaches to young people's lives, that relate criminal trajectories to other life dimensions such as family, work, gender roles and racial identity, instead of approaches that isolate them in a criminal sphere.

Dom José Rodrigues's Leadership in the "Caminhar Juntos" and Popular Statement

In the 1970s, the cities of Remanso, Sento Sé, Casa Nova and Pilão Arcado underwent social transformations resulting from the construction of the Sobradinho dam in the state of Bahia, Brazil which promoted the displacement of 72,000 people. Given the importance of this context, this article analyzes the political action of the religious leader Dom José Rodrigues to denounce the action of the State and the economic agents that caused social, environmental and socio-cultural impacts for the populations that had to abandon their cultural spaces of experiences in the territory. On the banks of the São Francisco River. To reflect the leadership role, we use the theoretical framework of the empirical field approach thought by Paul Lazarsfeld, the perspective of mediations observed by anthropologist Jesús Martín-Barbero and studies of a sociological nature. Starting from Max Weber's theoretical basis, for which the press shapes configurations about modern man, introducing displacements and causing changes in the reading and interpretation habits of the world, documentary research was conducted based on the content analysis of the *"Caminhar Juntos"* newspaper editions, from 1976 to 1979. Our analysis revealed that Dom José Rodrigues used the newspaper as a mediation tool to legitimize popular experiences, acting as an opinion leader to mobilize the riverside populations affected by the construction of the Sobradinho dam, encouraging the emergence of pastoral activities, and collective actions. The double leadership exercised by the bishop as a religious leader and as a communicative agent is also contacted.

Political change, trends and impacts on the Latin Americanist knowledge production and circulation in Social Sciences and Sociology in Brasil

The present paper aims to contribute to the debate on the current trends and impacts that involve science in Brazil, with special focus on Social Sciences and Sociology, arising from the new political configuration that has prevailed in the country since the 2016 coup and the election of Jair Bolsonaro in 2018.

We have identified threats of various kinds, such as the curtail on academic freedom, the greater imposition of the logic of productivism, putting knowledge at the service of the market, and the worsening of public spending cuts, which undermine the survival of various universities and institutes of higher education in Brazil, starting with courses in the area of Humanities, such as Social Sciences and Sociology.

These are processes with a great disruptive potential, which threaten the present and future of science in general and Social Sciences and Sociology in particular, and their roles and contributions to public policy for development, democracy, civil rights and social justice in Brazil. Given Brazil's strategic and historical importance in Latin America and, at the same time, in view of the new foreign policy guidelines, the risk of the consequences of such national processes overflowing to a regional and international scale are accentuated.

We highlight such trends and impacts in the field of Social Sciences and Sociology, while pointing out, more specifically, to the production of knowledge in Latin America in these areas. Based on a research about the Brazilian institutional initiatives that produce knowledge on Latin America, we demonstrate that the current tendencies and their consequences, regarding Higher Education, Science and Technology, have a clear deleterious effect on the consolidation of Latin-americanist perspectives in the country, with a great potential harm to critical thinking and alternative approaches to social problems pertinent to the region.

BARROS, LUIS* (Universidade Federal do Ceara, Brazil)

Accounting for Crime: An Extension of Piketty's Macrosocial Model

In this paper a method is proposed to account for the "fiscal" aspects of the criminal sector of the economy. Based on an extension of Piketty's (2014) macro-social model it is possible to show that "destruction" plays an important role in the dynamics of capital, connecting the dimension of violence to that of inequality. Beyond this theoretical expansion of the theory, a practical implication arises: the value of all capital produced and circulated in the economy will be underestimated if the criminal sector is unaccounted for in the national accounts of developing and emergent economies. I will show that Piketty's model applies to a very special case, that of the developed countries, since it only accounts for inequality of wealth and income of the formal sector. Despite arithmetic simplicity, the modifications to the original model have significant implications for future research.

Labor Laws Reform and Access to Justice in Brazil

This study examines the extent to which the brazilian labor laws reform ruling since 2017 has influenced the access to justice. It's argued that labor rights and access to justice are fundamental social rights protected by the Brazilian Constitution of 1988. Using empirical evidences published by the National Council of Justice - CNJ, and interviews realized with social actor involved in the question, the study aimed to identify potential factors that might have influenced the negative tendency in the access to justice since the implementation of the brazilian labor reform. As was pointed out by CNJ, labor disputes were drastically reduced in 2018. Interviews have showed that the costs involved in the dispute such as the fees imposed to the defeated party and the requirements for the waiver of fees have caused an inhibition effect on the access to justice. Fundamental rights and access to justice are conquests of civil society in the democratic state of law. Nevertheless, in our days, we assist in Brazil a continued decline of these conquests with the political purpose of produce changes in the the social order.

Personas Mayores Viviendo Solas En España: Entre El "Aging in Place" y La Exclusión Social.

Las proyecciones del Instituto Nacional de Estadística español (INE, 2018) para dentro de tres lustros en España sugieren que, por un lado, uno de cada cuatro habitantes tendrá 65 o más años (25,2%) y, por otro, tres de cada diez hogares serán unipersonales (28,9%). Ante este escenario de mayor vejez y soledad, se hace imprescindible conocer en profundidad la realidad social de aquellas personas mayores que viven solas. Uno de los aspectos a los que debe prestarse especial atención es el entorno en el que viven estas personas, de cara a detectar posibles situaciones de exclusión social. La mayoría de personas mayores que viven solas manifiesta un deseo de continuar viviendo en su hogar y en su barrio, a pesar de las posibles dificultades que conlleva tal decisión: convertirse en un perfil vulnerable y en riesgo de exclusión.

En este sentido, la propuesta pretende acercarse a la realidad social de estas personas y que apuestan (o no) por lo que se ha denominado como *aging in place*. Tratamos cuestiones en torno a la vivienda y el hogar (accesibilidad, habitabilidad), la presión residencial (aumento del precio del alquiler, *mobbing* inmobiliario) o su entorno vecinal (redes sociales, vida cotidiana, aislamiento social), entre otras. El material analizado, obtenido a partir de la realización de entrevistas en profundidad, permite conocer de primera mano la percepción que sobre estos temas tienen los propios mayores. Asimismo la apuesta metodológica se ha articulado en dos ámbitos distintos, Barcelona (gran ciudad) y Jaén (pequeña-mediana ciudad), permitiendo de este modo aplicarse un análisis comparativo.

Justifying Physical Activity (Dis-) Engagements: Fitness Centres and the Latent Expectations of (Former) Members

Diverse actors construct public health as being at risk and individual physical activities as a possible remedy. Scientifically, insufficient physical activity is especially related to non-communicable diseases. State actors design programmes for physically activating vulnerable target groups. Commercial providers of sport facilities and fitness products advertise their goods and services with the positive health effects of their consumption. Hence, seemingly heterogeneous discourses appear to converge on creating a rather general moral obligation for individuals to engage in body work and self-care. Fitness centres seem to be an ideal socio-material setting for practicing such body work in an effective and efficient way and are furthermore a quantitatively significant urban infrastructure. The aim of this article is to investigate how individuals subjectively reflect upon their own engagement in or disengagement from physical activities in fitness centres.

Our assumption is that the alleged moral obligation to physical activities is mediated by the socio-material settings which individuals choose. More specifically, we assume that commodified providers such as fitness centres, which promise to deliver healthy and attractive bodies, often disappoint their customers because the production of this good requires the continuous engagement of the customers themselves. The fluctuation rates of fitness centres (21,4 %) indicate that routine engagement of the members is often not achieved especially by fitness centre chains (25,6%). We claim that while fitness centres provide an efficient facility for body work, however they often fail to nurture sustainable motivation among their customers because they disappoint customer's latent expectations that are directed towards secondary qualities of the socio-material setting. These contradictions evolve only by experiencing these socio-material settings and the resulting emotions of estrangement. Our results from qualitative interviews lead us to reflect upon the theoretical place for justifications of self-care in the "orders of worth".

BARTL, WALTER* (Martin Luther University Halle-Wittenberg, Germany)

Organizing Federal Responsibility Sharing in Asylum Policy: Collective Action Problems and Their Resolution in Germany

Growing refugee flows raise the question of protection for individuals but also questions of responsibility sharing among political territories, both, on the international as well as on a subnational level. On the international level, responsibility sharing faces severe problems of collective action because of free-riding. On a subnational level one could assume that collective action problems might be less significant due to the "shadow of hierarchy". However, in federal states, as in meta-organisations, unitary decision making is often not possible because of the relative autonomy of the constituent territories. How do federal states overcome problems of collective action?

The proposed paper will investigate this question based on a historical case study of the organization of the German asylum system using the heuristic of partial organization.

Overall, the heuristic of partial organization proves to be useful for getting a fine-grained picture of the process analysed. First, it shows that the requirement to re-organize the German asylum system originated historically in the 1970s after global rule setting (Convention and Protocol Relating to the Status of Refugees) and the subsequently rising numbers of asylum applications. In the 1970s the federal conflict over territorial responsibility sharing escalated and was appeased only in the 1980s, setting the rules of territorial responsibility sharing that are still in place today (dispersal of asylum seekers according to a formula). Second, the heuristic highlights that (cooperative) federal states use some elements of organization when they try to overcome problems of collective action (membership, rules, monitoring, procedural rules for decision making) but others not (sanctions). Third, the distinction between emerged and decided premises of collective decisions allows analysing their interplay. In the German case, an indicator of „fair shares" institutionalised in other policy fields, decided forms of negotiation and experimenting with new, decentralised organizational designs facilitated cooperation.

Age and Life Satisfaction: Getting Control Variables Under Control

Researchers investigating the relationship between age and life satisfaction have produced conflicting answers, with the conflict rooted in disputes over whether to include individual-level control variables in regression models. Most well-being/happiness scholars believe there is a 'U-shaped' relationship, with life satisfaction falling towards middle age and subsequently rising. This position emerges mainly in research that uses control variables for e.g. income and marital status.

This approach is incorrect: variables such as these would intervene in the relationship between age and life-satisfaction and should therefore not be controlled. Regression models should control only for 'confounding' variables, i.e., variables that are causally prior to the dependent variable and the core independent variable of interest. Other individual-level variables cannot determine one's age; they are not confounders and should not be controlled. The only potential confounders in this context are cohort, period, and country (for a multi-country study).

This paper applies these points to an analysis of data from the World Values Survey covering a range of 69 countries. The key finding is that there is no substantial post-middle-age rise in life satisfaction – and the important implication is that there cannot then be a U-shaped relationship between age and life satisfaction. Taken separately, there is a U-shape pattern only for three of the 69 countries; for all the rest there is no U-shape.

BARTRAM, DAVID* (University of Leicester, United Kingdom)

Sexual Orientation and Life Satisfaction

The recent addition of sexual orientation questions to high-quality datasets (e.g. 'Understanding Society' in the UK) has facilitated research on a wide range of topics pertaining to the experiences of sexual minorities. But some methodological issues need attention especially for quantitative research. Existing research on the relationship between sexual orientation and life satisfaction offers insufficient clarity on what variables must be included as controls to give a correct estimate. Controls are typically selected on the basis that they are 'other determinants' of the dependent variable (life satisfaction). This approach neglects an important distinction: between confounders and intervening variables. Estimating a causal effect requires controlling only for confounders (i.e., variables that are antecedents of not only the outcome but the main independent variable as well). Controlling for any variables that intervene in the path from the main independent variable to the outcome will introduce bias.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

The key implication here is that no controls are necessary to evaluate the consequences of sexual orientation on life satisfaction: none of the usual 'other determinants' of life satisfaction are also determinants of sexual orientation. An analysis constructed from this perspective reveals that gay men in the UK have lower life satisfaction than straight men – but lesbians are not less satisfied with their lives than straight women. Bisexuals and those reporting an 'other' orientation are less satisfied regardless of sex/gender, and the gap is larger than the deficit evident for gay men.

Inequalities, Discrimination and Inclusion: Expectations and Variations in Social Pedagogical Work with Unaccompanied Young Refugees in Institutional Care in Sweden

The study purpose was to provide new understanding about: 1) institution personnel narratives about the day-to-day work of taking care of young people who experienced a war, fled to Sweden and were cared for and placed in institutions; and 2) interactive patterns contributing to constructing the category 'social pedagogue'. The material was gathered through interviews with personnel who work with these young people at residential or care homes. The social pedagogic perspective in social sciences stresses including the individual in the community, which gives the individual confirmation of an identity through community participation. Successful interaction between individuals is fundamental for achieving community integration of unaccompanied children and young people in Sweden. Analysis of the study's empirical material reveals major variations in what is expected of a social pedagogue working in institutional care in Sweden with unaccompanied young refugees who have experiences of war. A common denominator is that the mission of and context in which the social pedagogue operates appear flexible enough to enable an individual to play the role in a variety of ways. Only when the individual social pedagogue adopts an active, assertive, independent, personal and relatively strong posture will there be a chance of being important to other professional categories and for the client. From a Swedish perspective, it is easy to imagine that the war's consequences are taking place 'over there', in a different country or another part of the world, at another time in place. It therefore becomes especially important to allow people with war experiences who are in Sweden to share and relate how the experiences are significant here and now. By allowing this sharing, knowledge is also created about how preconceptions, inequalities and discrimination can be faced and discouraged.

War Violence, Conflict of Values, and Populism. Socio-Cultural Analysis of Bosnian–Herzegovinian Post-Genocide Society

The purpose of this article is to analyse institutionalised paralogisms, social and economic inequalities, and frustrating consequences arising from decades of symbolic and real war and post-war violence against the population of Bosnia and Herzegovina. The historic background of this paper is the war in Bosnia and Herzegovina (1992–1995), as presented in the reports of the United Nations and documents produced during international and national trials concerning war crimes. The analytical basis is a literature review of various studies from the domains of social epistemology, war sociology, and sociology of knowledge. Immanent antinomies, contradictions, and political, legal, and criminal perpetually institutionalise and reproduce the identitary references to war vocabulary. For this reason, creation of publicly responsible programs is necessary to evaluate the prescriptive impact of the domination of cultural and identity differences between peoples in Bosnia and Herzegovina. The genocide of Bosnian Bosniaks in the war against the Bosnian–Herzegovinian multicultural society urges the creation of a completely different description, prescription, logic of naming, and explanation strategy to achieve transitional change. The article criticized globalisation as a form of new colonisation and natural-science quantative emphasis. In the spirit of the analysed scientific literature, future scientific analyses should focus on the criminal, social, economic, ecological, anti-educational, sociopathological, and anomic consequences of the (catastrophic) impact of decades of symbolic and real war and post-war violence against the population of Bosnia and Herzegovina.

How Does Asian-American Voting Behavior Differ from Other Ethnic Groups and between Native-Born and Naturalized Asian Americans?

This research aims to present a profile of Asian American voting using the most recent data available from the 2016 Presidential election, first defining who votes across 11 Asian-American subgroups, compared to non-Asian Americans. While this is a large and diverse ethnic group in the US, little research has focused on differences among ethnic sub-groups or other racial-ethnic groups. The National Asian American Survey (NAAS) 2016 Post-Election Survey recently became available and provides a nationally representative sample of Asian Americans across its sub-groups. We use the NAAS to profile Asian American voting behavior, considering 11 Asian-American sub-groups compared to other ethnic groups, controlling for social-economic and demographic factors. We find several Asian-American subgroups, including Cambodians, Chinese, Filipinos, Hmong, Indians, Koreans, Pakistanis, and Vietnamese, are less likely to vote than Non-Asian-Americans, net of other effects. The propensity to vote increases with each additional year of age, education, high income, and the propensity to vote is 25% less likely among the ever married, compared to married individuals. Moreover, we find that Asian Americans as a group report that they voted as a lower rate overall, compared with non-Asian Americans. Further, native-born Asians have a higher propensity to vote compared with foreign-born Asians. Across the groups, native-born non-Asians, foreign-born non-Asians, native-born Asians, and foreign-born Asians, the foreign-born Asian group is the least likely to vote net of other related social and demographic factors. The authors find that Asian Americans are distinctive in their voting behavior compared to non-Asians, because Asian-Americans are less likely to report that they voted in the 2016 Presidential election. Among Asian-American subgroups, this lower propensity of voting is not felt evenly.

Health and Emotional Well Being of Muslim Adults in South Florida: A Mixed Methods Study

Muslim Americans are a rapidly growing, diverse group that remains understudied. The literature is sparse on the health status of US Muslims. Presently, there are limited identifiable sociodemographic and health data on Muslim Americans in the U.S. Hence, the absence of health statistics for Muslims in South Florida, despite their recent growth, is not surprising. This research explored and identified high impact health conditions and behaviors among South Florida Muslims. A mixed methods design facilitated data collection in eight largest mosques in South Florida. Cluster sampling yielded 507 participants who were asked to fill out a short questionnaire. Focus groups and in-depth interviews followed, mainly to investigate low scores on the SF036 Quality of Life scale, especially on mental and emotional health. Major factors predicting poor mental health were Muslim related stigma and stereotype, birth in the US and younger age, under 34 years old. Focus groups and in-depth interviews asked participants to expand on their constructions of stereotype and stigma. Focus group data revealed that women were more likely to feel stereotyped than men, especially because they felt easily identified by their Muslim clothing In depth interviews with 30 participants, under 34 years old and primarily US born young Muslims followed above two research strategies. These focused on social constructions of Islamophobia, awareness that such existed, views on feelings stereotyped and the immediacy of Islamophobia in the United States. Probes were extended when participants expressed ambivalence on about being stereotyped and when recognizing special visual predictors of Islamophobia, particularly as it may be practiced with looks and glances, words and other subtle mechanisms for expressing stereotypical notions. Muslim apparel in women was also discussed with concomitant observations of its meaning, religious and otherwise, in a multiethnic society.

Intersectionality of Age, Food Insecurity and Ethnicity: Mexican American Grandparents Optimize Intervention Learning, Increase Self-Efficacy, Improve Physical Health and Educate Grandchildren

Despite low levels of income, education and food insecurity, older Mexican American grandparents participating in a Nutritional and Physical Activity intervention achieved highest retention; learning and translating recently gained nutritional and physical activity information to grandchildren. Across cultures, stereotypes of grandparents often portray them as indulging and spoiling their grandchildren. These stereotypes appear to be even more pronounced in western held perceptions of grandparents from traditional cultures, especially when both groups co-reside in shared physical spaces.

Contrary to the above, results from a healthy eating and physical activity intervention conducted with Mexican American older adults in South Texas find that grandparents reported a strong agency when translating newly received information on nutrition and physical activity to their grandchildren. Results point to the learning capacity of resource poor older participants to respond to the intervention content, which strengthened their self-efficacy, increased their sense of agency and improved their physical health.

In a multi cluster intervention design, biomarkers, eating and physical activity behaviors were collected from 1002 Food Bank clients. Ethnographic observations were collected at 16 treatment sites. Older adults (>50 years) made up 38% of the total sample, had significantly higher completion rate ($p = .008$, $OR =2.4$) than younger participants and higher levels of satisfaction and self-efficacy ($p= .001$ $OR= 2.6$.) Results indicate increased self-efficacy among older participants and an improved capacity to construct important and meaningful roles for themselves in family interactions.

Data indicate that each intervention dose strengthened participants' self-efficacy, further enhancing and supporting their agency. Text will be presented that describe how the theme of increased self-efficacy emerged and gradually strengthened. Improved results in blood pressure, fasting glucose, A1C, weight and quantifiable behavioral modifications will be presented to illustrate the benefits of lifestyle interventions with resource poor older populations.at various levels of intersectionality

BASTOS, GABRIEL* (CPDA/UFRRJ, Brazil)

Memory, Identity and Peasant Resistance in Pedra Lisa

The main intention of this work is to analyze how the process of social construction of memory of a "defeated" political actor takes place in the region of Pedra Lisa, located in the countryside of the cities of Nova Iguaçu and Japeri, State of Rio de Janeiro, Brazil, which went through intense land conflicts in the decades of 1950 and 1960 and political repression during the civil-military dictatorship. In these decades, the region's association of rural workers was engaged both in a judicial and armed struggle against attempts of forced displacement carried out by farmers and land grabbers, making articulations with the Brazilian Communist Party (PCB), the Social Democratic Party (PSD), the Brazilian Labor Party (PTB), unions, the progressive local press and a state federation of rural workers. After a process of political persecution and repression in the decades of 1960 and 1970, carried out by the military, which consisted in arrestments, kidnappings, physical aggressions, murders, tortures and the destruction of the association's headquarters, houses and crops, the peasant political mobilization returned to this region only in the decade of 1980, inspired by the liberation theology, in the context of the end of the military dictatorship, involving former actors and continuing past conflicts. Nowadays we find in Pedra Lisa multiple agents of elaboration and interpretation of this memory under an identity and mnemonic dispute. Categories such as "peasant", "invader", "land grabber", "squatters", "communists", "military coup", and "revolution" are within a dispute both of identity and memory. Thus, through an ethnographic and historical documental analysis of the region's land conflicts, we seek to comprehend the social memory dynamics of multiple agents, such as families, social movements, religious groups and political associations in this rural community.

BASU, CHANDNI* (Independent Researcher, India)

Consent Vs Sexual Agency: Young People's Presence within the Legal Domain in India

Social marginality remains a pertinent concern within the legal domain, especially with regards to young people. In this respect, legal minority and social marginality merge to create a complexity of legality. Instances of young age sexual interactions and marriage within the Indian context, especially from marginal social backgrounds remain a case in point. The existent dominant discourse of child marriage puts forth the victimised status, especially of girls. This comes along with the recognition of such instances as derogatory. Existent legal restrictions, however, puts in perspective the absence of recognition of sexual citizenship/agency of young people within the legal domain. This further points to the absence and invisibilized position of young people within the legal domain, especially with respect to their voice and participation. It calls for the recognition of young people's voice as an inclusive practice within the legal domain, by devising new strategies to amplify their voices to enhance presence and participation.

Reported cases of sexual offences within the juvenile justice system in India establishes consensual sexual interactions among legal minors as offensive. This positions consenting legal minors as perpetrators and victims. On one hand this foregrounds the gendered nature of law on the other hand it highlights legal notions like statutory rape and age of sexual consent. Such legal notions however remain in disjunct with the social reality of young age sexual interaction and marriages. These occurrences establish young people's sexual agency beyond the narrative of lack of development and modernity. How does a direct interaction between young people and law as witnessed within the juvenile justice system in India impact and influence the domain and discourse of children and childhood hence remains a pertinent concern.

BATAILLARD, CAROLE* (ISC Paris Campus d'Orléans, France)

Involvement of the Body in CSR Integration. A Study through the Lens of Structuration Theory.

To effectively tackle today's environmental crisis as well as social issues, the CSR concept has yet to be "reintegrated". Namely, Nature needs to be reintegrated into CSR theorizing and CSR objectives better integrated into firms' strategy (Gladwin et al, 1995; Fisher, 2011).

To find ways forward in addressing these challenges, we studied the integration of CSR in the social system of three groups of actors from the organic products sector through the lens of Giddens' Structuration theory (1984). More specifically, we explored the structural modalities which attend CSR integration in order to reveal the mechanisms underlying the interpretative schemes, norms and resources used by the actors.

The content analyses of interviews, historic documents and self-narratives yielded insights which enabled us to build a model describing the necessary conditions for CSR integration to occur. Analyses were conducted in a comparative way, allowing a fine-grained understanding of the different levels of CSR integration.

Results show that, at the individual level, symbolism (embracing meaning areas between Humans and Nature), socio-ecological sensemaking, moral complexity, emotions (fear, anger, gratitude, vulnerability), familiarity with Nature, knowledge of and vocabulary related to Nature, influence actions at the organizational and institutional levels through reasoning processes (e.g. biomimicry), moral pressure, behavioural intentions, environmental salience in decision-making, group membership and commitment.

Our results are conveyed through a set of 12 propositions and integrated inside an empirical framework. Notably, this research shows that the multisensory elements reported by CEOs had consequences in their relationships with CSR through history imagery. Actors respond to impressions from external stimuli by encoding sensory inputs: they use body feelings and experience to assess situations pertaining to the natural environment or even social encounters.

In conclusion, we propose that CSR contributes best to society's challenges when its interpretation is influenced by a physical experience of the world.

Comte's Plan for Obtaining Consent for Inequalities

Comte's Plan for Obtaining Consent for Inequalities
Steven Bates, PhD

In the nineteenth century Auguste Comte coined the term sociology. He came of age in France during the period of the French Revolution, and his career nospanned decades of political chaos as he sought, along with many others, to quell the violence which continuously disrupted social stability. As he struggled to find a way to restore what he saw as normal and civilized order, he came up with a plan to obtain the consent of the people, to convince them, to accept the hierarchical economic social structure rather than rebel against it. He detailed what he saw as the main problem to address: it was not the hierarchical capitalist economic system that was to blame, but rather, it was people's reaction to it. The answer for him was to be sought through a ubiquitous and common educational system that would train everyone to learn the duties and expectations of their position in the system, and to treat all others in accordance with *their position*, with bankers at the top, and laborers at the bottom. Through education everyone would be trained to see capitalists as performing their duties, and laborers theirs. Equality would thereby be found in equally performing the duties of one's place, though

remuneration would vastly differ. Through a common identical education, which Comte insisted "must have a European character," everyone would be convinced of their place and act accordingly. His plan was to be extended beyond France, and beyond Europe, to all the nations and people of the world, "beyond the white races" to all others, once they "become fitted to enter the system." This paper will address Comte's plan for obtaining consent to an inequitable capitalist system, with a critical eye toward present-day consent and education.

BATISAI, KEZIA* (University of Johannesburg, South Africa)

Care Policy Reform: The Perceived and Real Impact on Career-Oriented Women

Global wide literatures alerts us to a shift in traditional care models as women increasingly join the productive labour force in response to the professional demands of the global economy. This has created a void in the household or what is referred to as 'a professional household without a wife' (Sassen, 2003:259) or a mother who has historically been constructed within the ambit of reproductive labour as the carer. This paper analyses how technological advancement, which in the 21st century is framed as the 4th industrial revolution, has witnessed both perceived and real shift in care work and the historical gendered labour structures that undermine women's maternal realities. Focus is particularly on how organisations and institutional cultures are shifting towards the implementation of technological-related flexible work policies that allow women to work from home or virtual office spaces and strike a balance between care (reproductive) work and productive work. The paper also argues that the shift in care policy promotes men's involvement in the nurturing of their children through paternity and parental leave; and addresses the gender-based inequalities that have historically reduced care work to a woman's responsibility and undermined her development beyond motherhood. Care policy reform deconstructs longstanding reductionist constructions of women as carers and objects of reproduction and produces a career-oriented class of women who, in the past, exercised their agency and deferred mothering in order to pursue their professional choices and simultaneously circumvent the perceived strain of mothering on one's career (Batisai, 2018). The paper concludes that care policy reform allows women to become and be mothers; juggle between motherhood (and all the care involved) and a career; and make a meaningful contribution to the labour market and the global economy.

BATISTA, PAULO CÉSAR* (UFRJ, Brazil)

Catholic Teaching at Rio De Janeiro's Public Schools: An Analysis of Some Neoconservative Guidelines

In september 2000, after an intense debate with christian churches leaderships, the State governement of Rio de Janeiro approved confessional religious education in public schools. The goal of this presentation is to demonstrate the partial results of a PhD research on catholic education in the public schools at this city, which stood out on the last censuses as the least catholic of Brazil's cities. This paper analyzes in which way some teachers of Rio de Janeiro's public schools develop catholic teaching within the school program, that is, how they do their religious teaching. Inasmuch as Rio de Janeiro's public educational system offers confessional religious classes to their students (in spite of the secular character of Brazilian public schools according Brazilian Constitution), my purpose is to investigate which teachings are endorsed by those teachers who consider themselves to be catholic. In order to do that, I interview some catholic teachers throughout the city. Insofar as these interviews suggest a predominance of neoconservative assumptions among catholic teachers, I argue that this predominance must be studied in connection with the "neoconservative wave" that currently takes place at Brazilian society.

BATTHYANY, KARINA* (FCS UDELAR, Uruguay)

Social Relations of Care Work in Uruguay and Latin America.

Care work may be defined as a social function, part of the set of activities, goods and relationships directed at the daily wellbeing of individuals, and that take place in various spheres, including the material, economic, moral and emotional dimensions. In the Latin American region, academic debates over this concept have increased in the last 15 years. The notion of care has developed gradually, on the basis of observing daily practices and unveiling the complex arrangements that permit to meet care and wellbeing needs. One advance has been the separation of caregiving from domestic work, thus defining a separate field of problems for research and social intervention.

The reality of Latin American countries still evidences a sluggish development in the formulation of public policy on this issue, while deeply rooted dynamics persist where the largest load of care is borne by women in the households, with-

out receiving pay, and under a structure of unequal sexual division of the work. However, in a context of major social and demographic transformations, with the increased participation of women in the labour market, the reluctance of men to advance towards a culture of shared responsibility for unpaid care work, the aging population and, therefore, the increase in the demand for care services, this regime is undergoing a crisis. In the absence of appropriate State interventions, responses vary distinctly according to the socioeconomic level. The responses of the population in the face of the care crisis reproduce, and even reinforce, the existing inequalities.

Cruise Tourism and Leisure

Global tourist numbers are increasing rapidly every year. One tourism sector that is highly effected by this development is cruise tourism. Many tourists prefer this type of vacation, because it is an easy and safe way to travel and to see several destinations in a short time period. In consequence, seaports that are of tourist interest struggle with higher pressure. Lay days at ports and the position of tourist attractions in cities lead to a temporal and spatial concentration of cruise tourists. But what does that mean for people living in these cities and their leisure practices? This paper examines the connection between cruise tourism and local leisure practices. Using the case study of Dubrovnik, Croatia, the influence of cruise passengers, while attending shore excursions, on leisure practices of locals will be examined. Therefore, expert interviews and observations were conducted and evaluated. It will be stated that technical, urban infrastructure systems play an important role in this context as an essential interfaces between the two phenomena of leisure and tourism.

BEAUFILS, CONSTANCE* (French Institute for Demographic Studies, France)

The Consequences of Non-Employment on Women's Later Life Health: Contributions from a Life Course Perspective.

Background/objectives: Withdrawals from the labour force are overrepresented characteristics among women's life courses. They stem from a persistent gendered division of domestic labour and could be a social determinant of women's health. Most studies on the health outcomes of non-employment have used a cross-sectional or short-term perspective. This work investigates the consequences of non-employment along the life course on later life health status for French women, and their variation among social groups and family history profiles. It outlines how conceptualizing non-employment from a life course perspective contributes to better assess the consequences of non-employment on health, since it tackles usual methodological issues of this work status heterogeneity, delayed effect and reversed causality.

Method: We work on women aged 50+ (N = 2820) from the French Health and Occupational Trajectory survey (2006-2010), which contains retrospective data on work, partnership, parental histories, and detailed health information. Distinct patterns of work histories including non-employment are identified with *optimal matching* analysis. Non-employment histories are also described by the total time and number of episodes spent in this status. The associations between those variables and three health status indicators (self-rated health, major depressive episode, and physical limitations) are estimated by a set of logistic regression models. We stratify the sample to examine the variation of those associations.

Results: We find significant associations between non-employment history characteristics and later life health outcomes for women. The length and the frequency of non-employment episodes increase the likelihood of declaring a

degraded health status. Women who return full-time or part-time to the labour market after a long career break are significantly less likely to report a poor self-rated health and functional limitations than never employed women. Those associations are unequal across family profiles and social groups. The life course perspective helps determining when non-employment plays a role in health.

Work-Family Trajectories and Multidimensional Wellbeing. Evidence from France.

Several studies have focused on the work-family spillovers, or on how balancing work and family influences wellbeing, yet little is known about how those two domains' life courses interact and affect wellbeing. This paper adopts a holistic and multidimensional life course perspective to study how work and family trajectories are separately and jointly associated with wellbeing. We draw on data from the French Health and Professional Itinerary longitudinal survey, that includes long-term detailed retrospective information on work, parental, partnership histories, and also on socio-demographic characteristics, current and past health problems. We apply sequence analysis and identify long-term dominant patterns of work and family life courses. First, we describe those patterns, their intersection and their social determinants. Subsequently, we test their association with multidimensional measures of well-being, including physical and mental health and satisfaction with social network and professional life. We explore variations in these associations, depending on gender and socio-economic status. We observe interaction effects between work and family life courses patterns. The results unveil types of work and family life courses that may interfere with distinct dimensions of well-being for men and women. They suggest that similar work and family life courses might have different well-being implications for men and women.

BECCI, IRENE* (University of Lausanne, Switzerland)

When a Sacred Nature Comes into Town. Sociologizing the Spiritualization of Ecology Thesis

The scholarly and religious visions of what nature is and where it stands in the world have been changing over time and space and have created a whole set of oppositions. One of them runs between what nature is opposed to, in other terms, what actually defines nature by its absence. The opposite pole to nature commonly is identified in built environment, in the city. In ecology literature humans have longtime been seen mainly as disturbing ecosystems and cities as responsible for polluting the planet. Of course, such a "urba-phobic" vision has a long history, drawing also on religion. At a micro-level, city parks are the places within the urban context, which is detached from the city and where nature is staged. Now, interestingly, it is often in city parks that ecological activists organize events to mobilize for environmental issues. This presentation draws on literature of ecology scholars as well as on empirical research run in Switzerland to argue that through the increasing number of urban dwellers concerned by environmental issues a change is at work in the representation of the relation between humans and nature. This change can be framed in terms of "spiritualization" since discourses and practices increasingly refer to the notion of spirituality be it variously defined. This presentation shall adopt a spatial approach (Knott 2005) to city parks offer a study of the ways in which nature emerge topographically as sacred. The aim shall be to clarify sociologically what the notion of "spiritualization" entails as a cultural process defined by empirical and representational endeavors instead of endowing the notion with a normative or teleological view. The argument shall propose that for about two decades in an increasingly large milieu, nature is getting closer as is the notion of spirituality or the sacred.

BECK VILLARROEL, GUILLERMO* (Centre for Social Conflict and Cohesion Studies, Chile, Chile)

Preferences and Perception of Inequality: An Approach to Chilean Society Using Cross-Sectional Data

To inquire about the redistributive preferences that people have, necessarily, implies to link it to the question about the inequality level considered fair within a society. Empirical evidence has found that self-interest and society´s normative beliefs would be key mechanisms to explain how redistributive preferences are shaped in people. Specifically, in the field of norms, values and beliefs, literature identifies distributive justice as a relevant value to explain redistributive preferences. However, this evidence not always attends in how changes in time could reshape society's preferences or attitudes regarding to distributive justice and,

therefore, on the justification of social inequality. For all of the above, it is worth asking: To what extent, changes in time are related with perception and justification of social inequality in the Chilean society?

Using the International Social Survey Program of 1999 (n=1503), 2009 (n=1505) and 2019 (n=1380) for Chile, with national representation, descriptive results show that people's perceptions of inequality and preference for inequality have change through the time. On one hand, in 1999 over 80% of consulted person's perceived that people mainly belong to low income distribution, in 2019 this preference decreased over 20 percentage points. On the other hand, since 1999 to 2019 people's preferences for more equal income distribution has decreased and preferences for a more meritocratic society has increased. With Multinomial Logistic Regression explored whether time influence on people's perceptions of inequality and preferences. Primary results show that the variable for time is statically significant.

The results show that change through time can reshape society's preferences or attitudes regarding to inequality. Thus, studying these types of variables can help to understand the conformation of distributive justice ideals and redistributive preferences of a country.

BECK VILLARROEL, GUILLERMO* (Centre for Social Conflict and Cohesion Studies, Chile, Chile)

Volumen De Las Redes Sociales e Imágenes De La Desigualdad Social

Respecto a distribución de riqueza de manera justa, investigaciones previas indican que existen factores individuales y contextuales claves para explicar las percepciones y justificaciones sobre desigualdad que despliegan las personas. Sin embargo, exista una variación del fenómeno que aún no ha podido ser explicada.

En tanto, desde otro enfoque de la sociología, existe literatura que señala que el contacto interpersonal colabora en los juicios evaluativos que realizan las personas, de tal manera que los lazos sociales influencian el comportamiento de las personas. Específicamente, la teoría del grupo de referencia sostiene que las percepciones sociales de las personas incluyen los elementos de su propia experiencia social, así como la experiencia de: familiares, amigos, colegas del trabajo, razón por la cual solo se incorpora limitadas dosis de información sobre la sociedad en su conjunto u otras imágenes abstractas a partir de la cual las personas realizan generalizaciones sociales. Sin embargo, no existe evidencia que señale cómo el contacto interpersonal puede relacionarse con la percepción y justificación de la desigualdad social específicamente, motivo por lo cual se torna relevante indagar si, en Chile, la experiencia grupal se relaciona con los aspectos recién descritos.

Con los datos proporcionados por la Encuesta Nacional de Conflicto y Cohesión Social (ENACOES) 2015 (n=2025), se testean una serie de modelos de regresión multinomial, dónde, como variables dependientes se utilizan ítems que muestran cinco pirámides de distribución de ingresos con las cuales se consulta a los encuestados como creen que debería ser y como creen que se distribuyen los ingresos en Chile, mientras que las variables independientes de interés son: el tamaño de la red (scale-up) y el indicador de homofilia (EI). Los resultados indican que homofilia religiosa y el tamaño de la red son variables estadísticamente significativas. Se discuten las implicancias sociales y políticas de estos hallazgos.

The Influence of Friends on Children's Attitudes Towards Immigrants

In the last few years, the debate about immigration as well as societies negative attitudes towards immigrants has become more prominent in society and politics. When analyzing key determinants of these attitudes many researchers found the social network of the individual to be of great relevance. So far however, these studies all used adult samples. Little is known about the influence of friends and their attitudes on children's attitudes towards immigrants.

We expect children whose friends have more positive attitudes towards immigrants to have more positive attitudes as well. Further, we expect this influence to grow with friendship strength and age, since close friends are known to be more influential than peers in general and research has shown that older children are more susceptible to their friends' attitudes. We will examine whether the relations hold in two different countries: Switzerland and Poland.

For the analysis we utilize a Swiss-Polish panel data set (2015-2017) collected among school children by the research priority program "social networks" at the University of Zurich. The sample includes 5332 children aged 8 to 19. The data set was collected in classroom settings and includes questions on children's attitudes

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

towards immigrants as well as measures of closeness perceived between each student and all his/her classmates. The friends' attitude describes the average attitude towards immigrants among those classmates that the individual labeled being close to. The effects of the friends' attitudes on the individual child's attitudes towards immigrants are analyzed using autoregressive cross-lagged models.

Preliminary results using a subsample indicate that indeed the friends' attitudes towards immigrants influence the attitude of the individual child. However, the effect appears to be weak. Concerning the influence of age and friendship strength on this relation, no conclusions can yet be drawn.

Reconstructing Processes of Settlement and Urbanization in Jordan: Advantages of Multigenerational Research

Analyzing the life stories of different generations of an (extended) family, neighborhood, village or other grouping is an aid to detailing and deepening historical reconstruction. Multigenerational research makes it possible to open a longer historical time frame and to analyze communicative memory, reconstruct different interdependencies between groupings, changing we- and they-images, or prevalent discourses in different periods. Sociological biographical research can be especially helpful in research contexts for which a relatively low quantity of archival material or other historical sources are available. Oral transmission is then important for approaching historical processes, especially from a bottom-up perspective.

In this presentation, we introduce the case of an extended family in Jordan which exemplifies the advantages of multigenerational research. The analysis of a series of seven biographical interviews with family members from three generations highlights how rapid processes of social change in the 20th century have been perceived, addressed, and shaped by the family, and how they are discussed in the family memory. These include the process of settlement of the previously (semi-)nomadic family in the first third of the 20th century, the integration of the family in the Jordanian nation-state which was founded in 1946, the family's increasing urbanization in the 1960s and 1970s, and relations with other groupings, such as previous urban dwellers, or various groupings of refugees in Amman. We show how the family members made strategic decisions to strengthen their established position within the new state's institutions.

The presentation is based on empirical research conducted for the project "Dynamic figurations of refugees, migrants, and longtime residents in Jordan since 1946", sponsored by the German Research Foundation (DFG).

Soci(ologic)al Distance? – Challenges of Biographical Research in Times of the Pandemic

In our presentation we will discuss various ways of continuing interpretative research during the pandemic and despite the lacking possibility to return to "physical" field work. Building upon research experiences during Covid-19 in two larger transnational research projects we will introduce ways in which we nevertheless managed to remain in contact with our interview partners and to conduct follow-up interviews. By this, our focus shifted towards including the diverging individual and collective experiences with the pandemic into our research. We will detail how this thematic shift fit into the methodological framework of social-constructivist biographical research and how it resonated with our previous findings. Staying in touch with people from a distance in times of "Corona" – especially with migrants in different geographical contexts – not just gives us the insight into different state responses to the pandemic and the pandemic's diverging implications for people's lives. Additionally, the follow-up interviews help us to reconstruct how collective and individual experiences *before* the pandemic (e.g. previous experiences with diseases) shape people's views and patterns of action. Furthermore, it expands our knowledge about the life histories and collective histories of the cases we were already working on. We will discuss challenges and benefits of this changing research focus and research style during the pandemic.

Farm Resilience: On the Importance of Considering Household Level Difficulties, Lived Experiences, and Institutional Arrangements

Farm resilience scholars study farm families' ability to stay on the land despite on-going changes and crises in their local and macro-level environments. Largely focused on the challenges of the farm operation and often drawing on objective measures, these scholars have found that the household plays key functions in supporting the resilience of the farm. Yet despite the deep interconnections between the farm household and the operation, the extent to which farm households faces difficulties including those connected to meeting social needs such as health, childcare, and sufficient income and the role played by supports targeted to household (i.e. social policy) are largely unknown. In this paper, we use the example of medical economic vulnerability to begin to fill these research gaps. We draw on a conceptual framework based on the medical and farm economic vulnerability bodies of literature and a survey of 1,100 U.S. farm households in 10 states to answer the following questions: (1) to what extent are U.S. farm households experiencing medical economic vulnerability? (2) which farm households are experiencing these difficulties? (3) what is the role of health insurance in shaping medical economic vulnerability? We find that the prevalence of perceived medical vulnerability is three times higher than having a medical debt, pointing to the importance of considering lived experiences besides objective measures as these lived experiences may point to early warning signs of challenges that may be easier to address early on. Our findings also point to the vulnerability of the farm population as a whole as few of the household and farm characteristics were associated with the measures of medical economic vulnerability. What shaped vulnerability the most were health insurance variables highlighting the importance of the role of institutional arrangements contrasting the focus of the farm resilience literature on individual and farm operation-level variables.

BEDE, FRANCISCO JULIAO* (Institute of Social and Political Research- Rio de Janeiro University (IESP-UERJ), Brazil)

Imaginary, Subjectivity and Power: New Theoretichal Horizons for Political Sociology

This paper aims to discuss the concept of the imaginary as a path through which political sociology could regain its analytical range and be able to support critical thinking in its confrontations with contemporary power dynamics and new political impasses. The objective is to present two contributions related to the results of my doctoral research, since its main subject is precisely this central role of the imaginary for a social and political theory able to open new theoretical-methodological horizons for political sociology. First of all, the article will discuss the works of three "post-marxist" authors who laid the foundations for such elaboration in the universe of social and political theory: Ernesto Laclau and, above all, Cornelius Castoriadis and Slavoj Zizek. The ideia is to demonstrate how political modernity, and all the variety of power manifestations related to it, can be understood through the imaginary element as the nodal point that creates the social bonds by which subjectivities sustain themselves, a point in wich power and signification are merged but that only exists because individual and collective subjectivities always engage with the world in their own terms (making that nodal point the lócus of affects and imaginary significations/fantasies). On the other hand, as the second contribution, the article will propose some theoretical-methodological guises throughout wich political sociology could effectivly mobilize the imaginary as the analytical core that enables us to analyze the State and the exercise of power in contemporary modernity. The discussion in this regard will focus mainly on a critical reevaluation of the gramscian central concept of hegemony by analyzing some contemporary political impasses regarding the new global wave of right wing populism.

BEDE, FRANCISCO JULIAO* (Institute of Social and Political Research- Rio de Janeiro University (IESP-UERJ), Brazil)

Subjectivity, Social Bond and Imaginary: Theoretical Reflections on Contemporary Dynamics

This paper aims to discuss the constitution of the social bond in contemporary social and political dynamics through the concept of the imaginary. It is argued that such a concept establishes a fruitful path for the fundamental interdisciplinary dialogue between psychoanalysis and sociology so that the question of the imaginary could be taken precisely as that which concerns the impasses proper

to the constitution of the social bond. The various modalities of those ties could be understood through such approach, insofar as they are, at the same time, the anchoring element of subjectivities from which they acquire consistency and, on the other hand, the element which exists only as long as subjectivity engages with the world in its own terms (therefore being the imaginary element par excellence, that which opens the doors of the dimension of affects and of imaginary significations/fantasies). The purpose of this paper is to discuss the imaginary in these terms and to present two contributions related to the results of my doctoral research. First of all, the article will present a discussion about how to mobilize the imaginary as a theoretical and methodological foundation proper to sociology, aiming to demonstrate its relevance and viability as an analytical instrument to discuss the relationship between subjectivity, social bond, and social and political dynamics. This argument will focus mainly on three post-Marxist authors who laid the foundations for such elaboration in the universe of social and political theory: Ernesto Laclau and, above all, Cornelius Castoriadis and Slavoj Zizek. On the other hand, as a second contribution, the paper will discuss the (im)possibility of social bond in contemporary social dynamics, seeking to present solutions to elucidate the relationship between the imaginary, the fluidity/dispersion proper to social network interactions and the impasses emerging from the current global conjuncture.

BEGICEVIC, ALMA* (Loyola University Chicago, USA)

Post-Conflict Societies and Human Rights Challenges in Contemporary Times

This article confronts some of theoretical and conceptual difficulties in understanding the meaning of monetary reparation and relevance of civil courts as the places to lay private claims in contemporary times. Approaching money as an institution and a representation of social life that embodies exchange relationships, the study offers a critical reflection of Bosnian war victims' monetary reparation pursuits to use domestic, foreign and international courts to claim justice. Taking a qualitative, case-study approach, the article illustrates the macro context of the problem at hand and shows how post-conflict structural changes and shrinking of socio-economic and cultural rights in a changing society brought the system of values where money is all. Bosnian war victims who lack equal parity of participation in the post-conflict political space face limited access to remedies and social security. Thus, they use law and monetary reparation as a tool to reinforce socio-economic rights as moral values and by restoring their position in the society, independently establish responsibilities as criminal justice failed them. The article rethinks the concept of rights and justice in light of victims organizing for monetary indemnities outside of the existing dualities that distinguish civil and political and socio-economic and cultural rights, quantitative from qualitative and judicial from administrative reparation.

BEGUM, NEEMA* (, United Kingdom)

"the Eastern Europeans Are Taking All the Asian Jobs": Black Asian Minority Ethnic Support for Brexit

Despite ethnic minority voters overwhelmingly supporting Remain, around a third voted for Brexit. Opposition to Eastern European immigration was significant to ethnic minorities voting for Britain to leave the EU. As well as being frustrated with EU freedom of movement, which they believed privileged white European migrants over those from the Commonwealth, some ethnic minority Leave voters also exhibited xenoracism towards Eastern Europeans.

This paper draws on Roediger's concept of the Wages of Whiteness which describes the ways in which past waves of Irish immigrants in the US laid claim to whiteness and reproduced racism against African Americans. This was in order to stake their claim to being part of the nation and insert themselves more favourably in the racial hierarchy. I argue that a similar 'Wages of Britishness' is at work among ethnic minority Leave voters who expressed racism and xenophobia towards Eastern Europeans. Drawing on focus groups and interviews, this paper argues that ethnic minority Leave voters draw upon these 'wages of Britishness' to legitimise their claims to belonging to the nation in relation to Eastern Europeans. BAME Leave voters emphasised their British identity in opposition to Eastern European immigration which manifested in their support for Brexit.

This paper sheds light on anti-immigrant and xenophobic attitudes held by immigrants and racialised minorities. Ethnic minority support for Brexit is part of a wider phenomenon of immigrant or minority groups voting for anti-immigration campaigns and right-wing parties, including Latinos for Trump and ethnic minorities voting for the Freedom Party in the Netherlands. The paper uncovers how immigrants or European-born ethnic minorities reinforce right-wing articulations of nationalism and racism to stake their claim to belonging to the nation, even when their position in the nation is challenged by the same right-wing movements.

BEIER, FRANK* (Technische Universität Dresden, Germany)

It Is No Methodological Question! Why Mixing Methods Only Works with Theory!

Many different quality standards and special analyzing tools have been developed in the long tradition of quantitative and qualitative research. Because of these well-reasoned differences in epistemological and methodological aspects, there are many social scientists that are skeptical about integrating both approaches. To mix quantitative and qualitative research questions is e.g. seen as a "deadly sin" (Przyborski/Wohlrab-Sahr 2014). However, textbooks about mixed methods often focus on the aspect of research design, neglecting these fundamental differences in regard to epistemological and methodological concepts (vgl. Bryman 2008). Thus, the integration of both approaches is either reduced to organizational problems or dominated by a perspective in which one approach is reduced as an assistant for the other one. However, it is quite obvious that urgent methodological problems and their specific solutions cannot simply be mixed without to destroy the foundation of their scientific justification. In this paper I want to argue that this is neither possible nor necessary. To mix methods is not a methodological, but a theoretical problem. Thus, mixed methods designs should not focus too much on technical aspects, but rather on the theoretical justification of the planned research design. Still many qualitative researchers think that their research is supposed to be free of theoretical assumptions in the beginning. This inductivistic self-missunderstanding restrains the possibility to combine qualitative and quantitative research methods. In the paper I want to show that it is fundamentally important to clarify theoretical assumptions in the very beginning of a mixed methods design to make well justified decisions in which case qualitative and quantitative methods are useful tools for a successful research. The big challenge of mixed methods is not to find new methodological principles, but rather to find a common understanding of theory.

Women and Resistance: The Interplay of Individualization Processes and the Socialist Life Course Regime in the GDR

The GDR has been an authoritarian regime which tried to intertwine political, economic and cultural processes in the society in a socialist way. Politics did not only aim to influence institutions, but also to shape the life style of the people. Some authors have described this kind of politics as "life-course regime" (e.g. see Nagel et al. 2005) with direct or indirect control mechanisms (see Beier 2017). One major aspect of this life-course regime was that migration (especially but not only to a western country) was a non-option in the GDR. Growing up in this society meant the obligation to live in a socialist way, feeling responsible for community and social progress by paying back what the society has invested in you. In this sense migration has been seen as an oppositional act, regardless of the personal or individual reasons people would have had. The majority of the people arranged their selves (satisfied or unsatisfied) with spending their whole live in the GDR without migration perspectives. In the same time, life in West Germany was an omnipresent comparison. However, to illegally leave the country was a highly risky action and only a minority has been willing to actively try to migrate out of the GDR. The presentation will show the results of a biographical study women who were politically persecuted, because they tried to immigrate to West Germany. The Migration decisions can be differentiated in to three different types: anomical, active and passive migrations decisions. Only active migration decisions had been a result of an individualization process, which resulted into an oppositional attitude towards the socialist state. However these women did not stand up for a specific political reason, but instead showed resistance against the specific life course regime which tried to control individual life plans and self-identities.

Making the Good Cool Again. Is Liberalism Fit for the Anthropocene?

Making Politics Cool Again: could this be an alternative formulation of Donald Trump's promise? Could the promise "make America great again" be understood as appealing to a deeper longing, one about re-enabling participation in political life as a pathway towards the experience of community, collective self-efficacy, and social recognition? Could the current upraise of right-wing movements be an expression of the impotence of the individual and the futility of a society that has sacrificed the substance of collectively shared meaning on the altar of procedural formality?

This paper seeks to defend the thesis that the privatisation of the collective spirit and its energy in liberal consumer societies has largely constrained the space for self-realisation in social life to private consumption. An extended resonance space (H. Rosa) in the political and social context would enable the (re)merging of the 'cool' and the 'good'. The bicentennial liberal political-philosophical tradition in Europe, however, which starkly divides the public and private, conspires against that.

The result is a cultural and psychic blockade that prevents sociopolitical actors from shaping a rapidly changing world, and, at the same time, prevents a pleasurable experience of the 'good'. Departing from self-reports from life-form movements, this paper shows how pervasive the influence of this blockade is, on the one hand; and, on the other, what potential lies in theories and practices from the "periphery", from postcolonial to feminist theory, to the Latin American Buen vivir experiment, in order to re-establish the disparate connection between one's own action and social reality.

Third Mission of Universities As a Tool for Equal Access: Inclusion or Illusion?

In this paper we analyse the Third Mission as a policy and mechanism of change and inclusion in academia. We also investigate the approaches and Third Mission activities of various European universities with regards to inclusion and juxtapose them with European policies aimed at equal access to education.

(Un)equal access to education has been researched from various perspectives. Yet, the report of the European Commission (2016) analysed more than 700 educational reforms undertaken in Europe between 2006 and 2016 but excluded the field of higher education. The same applies for research on educational infrastructure accessible for refugees (Hamilton, 2003; Dryden-Peterson, 2017) despite the recent "refugee crisis" in Europe or increased amount of "people of concern" in Brazil in the last years (UNCR, 2019). Whereas issues of equal access of vulnerable groups, such as ethnic minorities (Bowl, 2001) and low-income students (Neveda, 2013), are present in the academic discourse, the topic of higher education for refugees was generally marginalised in both academic literature and policy proposals.

Higher education institutions have been experiencing increased pressure to change ideologically and structurally in order to help the development of local societies, promote democratic values and equality, for instance through inclusion of vulnerable groups of students but at the same time to become commercially more sustainable (Boden et al. 2004). Thus,due to the focus on the entrepreneurial potential of university, its social impact did not become the priority. Moreover, Third Mission activities, were traditionally not directly connected to the primary mission of teaching.

Our paper argues that reshaping of the Third Mission mechanism through inclusion of students from vulnerable groups can be used by scholars and practitioners as a tool that both enables and promotes the inclusion and also highlights the social impact and democratic values of higher education institutions.

RC37-470.3

BELITSKY, MARK* (Not affiliated, USA)

Art As an Instrument of Social Change

To assess the potential of art to impact the society we must first define it in sociological terms.

Art is the alternative form of communicating non-life-essential information that defines man and society.

This information is not "life-essential" because society uses other means of communication for vital information, which are well established, unlike artistic expressions, which are constantly on a quest for new alternative forms.

The "man and society" clause here is indivisible and represents a complex notion encompassing human existence through time and history. A piece of work becomes art when it is accepted by a sufficient audience to define the human existence.

The alternative form is closely tied in with the notion of style. Art employs the *language of style* that appeals directly to our subconsciousness. These languages evolved over time and are dynamic entities, constantly changing along with society and in conjunction with individual artists finding their own unique voices.

Could this seemingly simple definition be true after centuries of contentious debate about what art is? Very few would argue whether the Mona or Beethoven's Fifth Symphony should be considered artistic works. Even in the case of works of much lesser caliber than those, we seem to know intuitively whether a particular work should be considered art. That means that the necessary and sufficient conditions of this definition are *programmed* in our subconsciousness. It also means that the notorious arguments are not actually about what *art is*, but whether or not a particular work or genre itself should be *considered art*.

Because art is capable of transmitting powerful subliminal messages, it is often taken as a symbol or even ideology by social movements, like, for example, rock music was during the anti-Vietnam war movement.

RC16-198.1

BELITSKY, MARK* (Not affiliated, USA)

Functional Theory of Social Systems

We exist within the confines of an information system called human culture which has evolved over tens of thousands of years. The aim of this theory is to identify the building blocks of this system.

Evolution is a dual process comprised of the evolution of the biological systems along with the evolution of the information systems.

Functional Idea (FI) – this is that smallest "piece of software", a concept developed to perform a function in society, may be identified as the basic building block.

Soft Force (SF) – this is a psychological force, a vector that has magnitude and "direction". There is a direct correlation between FI and SF, with a **SF vector being formed in the subconscious based on the FI**.

Idearchy – this is a collection of all the FIs comprising human culture. This term facilitates discussion concerning the evolution and health of the Idearchy and how a society maintains it.

Positive or attracting SF vectors are formed in the subconscious for each FI. Also, the negative or repelling SF vectors are formed. The SF vectors are summed up into two resulting vectors, one positive and one negative. **All decisions are made on the Soft Force level, not on a logical level**. The brain, like any other organ, communicates with our consciousness through a set of signals or symptoms. **Emotions are only symptoms of the SF vector interaction.**

There are two major reasons why the system of Soft Forces has evolved. First, social motives must interact and compete on a level playing field against basic instincts like hunger and fear. Second, the multitude of SFs creates stability in the fabric of social structures. Social groups compete not only for land, resources and power but also to prove the viability and superiority of their Functional Ideas.

The Meaning of Forced Migration for Physicians in the 21st Century

This paper explores the meaning of flight in the biographies of physicians forced to move from the countries where they lived and practiced medicine and then resettled in the United States. The analysis is based on qualitative in-depth interviews with 30 refugee physicians who entered the US within the past 15 years. It explores their multilayered and embodied experiences and situates them in refugee discourses and the politics of medical licensure.

Refugee physicians' flight from home is not for medical training or a career in medicine in the United States, but despite their training, professional skills, and medical careers. In the US, the system of medical licensure effectively places them in the position of physicians becoming physicians: to practice medicine in the US, all international medical graduates must obtain a US medical license. To obtain a US medical license, their education must be certified, they must pass the US Medical Licensing Exam and they must complete a residency program – a long and expensive process. The use of a hybrid term "refugee physician" signals, unsettles and stretches meanings of both "refugee" and "physician" in the contemporary context of forced migration.

The paper compares the construction of refugee physicians' narratives. It focuses on two of the interviews and compares their narrative strategies, the interview context and interactions, and the polyphonic rhythms (Tsing 2015) of their flights. First, it explores the strategies they use in talking about their experiences and connects these strategies with medical and political circumstances affecting and underlying their plans to leave. Second, it investigates how they (re)define themselves in specific locales in the US (e.g., social networks, physician career assistance programs and support groups). Finally, it considers the contribution of these flight biographies for understanding forced migration and physician migration in the 21st century.

BELLO, BARBARA* (University of Milano, Italy)

An Intergenerational Look at Human Rights in the Access to the Healthcare Sector and to the Labour Market in Times of Covid-19 in Italy

The Italian Ministry of Health has recently estimated that the highest number of people dying as direct consequence of covid 19 concerns old people, the highest peak of 92% regards those aged 60-69. The average age of people who died

due to covid 19 or are positive to it is 80. "Old age" and its intersection with chronicle illnesses are crucial factors when dealing with the equal access to healthcare during the covid-19 pandemic in Italy and beyond. At the same time, younger generations have been severely hit by unemployment in a scenario already featuring among the highest rates of youth unemployment in the European Union (approximately 40%). The tensions raised by the pandemic, concerning the aforesaid social groups, run the risk to exacerbate the existing intergenerational divide and decrease intergenerational solidarity.

All in all, in Italy three main situations raised public attention: the use of triage in the access of intensive care units; older people's conditions in long term care institutions, where high mortality rates have been reported; the risk of ageism due to the growing intergenerational divide and youth unemployment. If elderly people have been confronted with serious challenges in accessing treatments on equal foot with younger generations, the latter ones have been confronted with increasing difficulties in their journey towards an autonomous life. This contribution aims at discussing critically the elderly and young people's human rights as well as the new inequalities and threats that have been emerging in times of pandemic, through Appadurai's "capacity to aspire" approach. The question that this contribution seeks to address is how elderly and young people can exert their capacity to aspire vis a vis inadequate policy and intitutional responses to the effective exercise of their human rights.

BELLO, CARLOS* (Unifesp, Brazil)

Policies Against Poverty: Contradictions of Lulism and Perspectives of the Bolsonaro Government

The article departs from the premise that anti-poverty policies fulfill three functions in capitalism - accumulation, welfare and legitimation - and that they are all subject to contradictions between conflicting conceptions and interests, given the fact that the reproduction of inequalities and poverty is inherent to the internal logic of capitalism.

The central objective is to discuss the contradictions of lulism and how the forms by which they were processed allow us to analyze the Bolsonaro government's first actions and its perspectives on policies against poverty. Such contradictions emerge not only from the nature of social policies but also from the characteristics of lulism as a mode of government that sought to combine tendencies of opposite character, some aimed at benefiting the popular classes, others representing the maintenance of macroeconomic policies in tune with neoliberalism, under the strategy of obtaining support from the popular classes without threatening to produce strong resistance from the business segments generally refractory to lulism.

Analyzing how the combinations between opposite measures occurred within the functions of accumulation, welfare and legitimacy during lulism, the article seeks to evaluate how the results of these contradictions during the lulism crisis allow us to understand the actions of the Temer and Bolsonaro governments, as well as evaluate prospects to the next future.

Analyzing the situation that led to the impeachment of the Dilma government, the article concludes that the passivization of the popular classes, combined with segmentation and fragmentation of interests and actions of groups linked to these classes, would have allowed an advance of ultra-liberal measures of the Temer and Bolsonaro governments, although there are political aspects that do not permit to discern a reversal of policies against poverty.

BELLO, WALDEN* (State University of New York, Philippines)

"Counterrevolution As a Paradigm for Understanding the Global Rise of the Far Right."

The rise of far right movements is a marked feature of politics in both the global North and the global South. Indeed, in less than a decade, these movements have come to power or to the antechamber of power in a number of countries where liberal democracies have long held sway, confounding both liberal and left-wing analysts. A number of paradigms, such as populism, have been harnessed in the attempt to understand the different extreme right movements. This paper will contend that among the most useful is one that employs the "revolution-counterrevolution dialectic" framework articulated most cogently by the Marxist social and diplomatic historian Arno Mayer in his study of European movements from the French Revolution to the Bolshevik Revolution.

Developing Mayer's model, we propose that there are two-types of counterrevolution that have been in motion since the last half of the 20th century. One is the class-based counterrevolution, wherein the principal dynamic is the response of threatened classes, including the middle class, to an insurgent challenge from below. The other is a response by social groups to loss of social status based on income, race, ethnicity, or culture that takes the form of a reaction to the liberal democratic principle of fundamental equality amidst diversity. This second phenomenon is no less counterrevolutionary than the first since it is a "totalistic" response to liberal democracy at the level of the ideological, social, and political.

The paper further follows Mayer in distinguishing the three types of actors that make up the "anti-revolutionary coalition:" the " reactionaries," "conservatives," and "counterrevolutionaries."

What is distinctive about the paper, however, is the stress it places on the transformation of the middle class as a political force.

Political Parties and Transnational Governance. Reflections on the Changing Role of Political Parties in a Globalized World

In the postmodern age, the sphere of political relations is characterized by an increasing interdependence. Indeed, the transnational flows of knowledge systems, business practices, economic bodies and the new forms of social organizations produced by globalization determine a growing erosion of the state sovereignty. Both national and global governance become characterized by an increasingly dense interaction between public and private forms of authorities that play an active role across all levels of world politics. In this new political scenario – characterized by fluid boundaries, growing inequalities and social marginalities – traditional political actors that pursue public interests coexist, interact and sometimes collide with actors that follow private interests. In this context, the role of governments changes and consequently political parties transform their functions, their organization and reorient their policy positions. In the light of these considerations, the aim of our work is to understand and discuss the changing relation between political parties and the emerging forms of national and global governance.

Precarity in the Russian Healthcare Sector

In recent decades, the policies of many states, including Russia, are aimed at reforming healthcare system. Reacting on modern global challenges, the state introduces new ways of organizing work of medical workers, and therefore, it becomes extremely important to identify common models of employment and labor relations in healthcare system. A particular interest are those that lead to a partial or complete loss of social and labor rights of an employee, to a deterioration in his socio-economic status and socio-psychological state.

We will consider certain aspects of precariousness in the Russian healthcare sector on the basis of a three-tier approach: macro-meso-and micro-level.

At macro level it is represented by state policy, when existing laws forming conditions for the development of precariousness in the field of employment and labor. That is, existing norms not only contribute to the emergence of precariousness, "push" all subjects of the labor market to "adapt to new market conditions", but, in essence, legitimize precariousness in the field of healthcare.

Meso-level (the level of a single region, organization (institution)) working conditions are formed, according to the standards proposed by the state, in which the labor rights of medical workers are infringed.

Micro-level (the level of a medical worker) – a person consciously chooses (or remains) such conditions of labor relations and employment that can be attributed to precarious.

BELOVA, NATALIA* (Russian State University for the Humanities, Russia)

The Quality of Life and the Practices for Maintaining Health of Russian Pensioners

In recent years, studies related to the study of the active longevity of older people and their quality of life due to health have been of particular interest. A global trend - an increase in the share of elderly people in the population structure, is also present in Russia - such is a quarter of the country's inhabitants. The health status of Russian pensioners, their quality of life, is much worse than that of the population as a whole, therefore, the search for answers to questions about which practices for maintaining and maintaining health in old age are the most popular and effective is relevant. We conducted analysis and construction of models for maintaining health by pensioners through the prism of practices that dominate Russian society and are associated with a healthy lifestyle: regularly check their health, undergo medical examination; engage in physical education, sports; eat right; do not drink or smoke. One of the main characteristics of the behavior of Russian pensioners in the field of maintaining health is not the actual use of practices, but the desire to make a positive impression on others, which can be attributed to such a phenomenon as "pathos". Few (1.7%) adhere

to the "four-practice model of maintaining health", half use the "one-practice or two-practice model", in the structure of which, the most used practice is "giving up bad habits". Models for maintaining health (healthy lifestyle) are formed in accordance with the norms, values and traditions existing in society. They are diverse and depend on objective and subjective factors. At the same time, these models are presented in the form of a kind of mosaic, consisting of several, most often encountered in the group of health maintenance practices.

BELVEDERE, CARLOS DANIEL* (, Argentina)

The Duality of Power and the Phenomenology of Social Institutions

In a previous paper I dealt with power as a dual phenomenon, subjective as well as objective. Here I will focus on social institutions as one of the main phenomena of power. In accordance, I will argue that social institutions are dual phenomena, involving a subjective as well as an objective aspect. With that aim I will draw upon Alfred Schutz phenomenological sociology. I will borrow his idea that social institutions are, on one side, a kind of knowledge at hand which makes it possible for a person to achieve his purposes at hand obtaining the intended results through pre-established procedures, and, on the other hand, they are a part of the social world naively accepted in the natural attitude of the in-group which must be taken-for-granted by its members. Seen this way, social institutions are organized patterns of routines that allow people to master the problems of daily life without the need of redefining situations that have occurred many times before or of looking for new solutions to old problems that have already been handled satisfactorily. Yet, they are also cultural patterns of group live consisting of typifications and relevancies that define objective meanings such as social roles and role expectations, among others, which the individual has to take into account in everyday life. This dual character of social institutions as power devices can be depicted in line with Anthony Giddens theorem of the duality of structure. In this view, social institutions are both, enabling and constrictive.

Auto-Representaciones y Representación De Los Otros En El Proyecto Europeo De La Enciclopedia De Los Migrantes

La Enciclopedia de los Migrantes es u proyecto financiado por la UE que ha consistido en dar voz a las personas migrantes en ocho ciudades europeas. Se recogieron 400 testimonios en forma de cartas que los migrantes escribieron a una persona que quedó en su país de origen, acompañadas de una fotografía personal en la que la persona migrante se muestra tal y como quiere ser retratada por un fotógrafo artístico. En esta comunicación se realiza un análisis de la visión que las personas migrantes transmiten de ellas mismas en forma de auto-representaciones, así como el contrapunto de cómo perciben y describen a los demás en la sociedad a la que llegan. Se realiza un análisis de los documentos epistolares resaltando las categorías que los propios actores utilizan para describir sus emociones, sentimientos y percepciones derivadas de la interacción con los otros. Y se seleccionan algunos ejemplos de los retratos fotográficos de los migrantes que acompañan sus relatos en los que se alcanza a visualizar su auto-representación a través de la imagen. La comunicación aborda también el debate crítico sobre la consistencia de los relatos propios y libres como material de análisis social y los límites que plantean a la hora de pretender conocer la realidad social.

Impact of the Coronavirus Pandemic on Mental Health of Children and Their Parents: A Global Survey

This paper aims to investigate the impact of the COVID-19 pandemic on mental health of children and their parents in 72 countries. An online survey translated into 22 langauges has been conducted between March and October 2020. The questionnaire assessed the Depression, Anxiety and Stress Scale - 21 Items (DASS-21). A total of 82563 participants completed the questionnaire. Depression scale of DASS was (13.12±5.38) with 58% of parents had either severe or extremely severe depression and only 21% of them were normal on this scale. Meanwhile, 74.2% of children below 18 years had either severe or extremely severe anxiety. Twenty three percent of children were normal on depression score. In conclusion, COVID-19 pandemic has a negative impact on the psychological well-being of the children and their parents globally. The existence of such a high prevalence and severity of psychiatric disorders among children and their parents globally underscores the need for serious attention to the mental health support and services for families.

How Morocco Deals with Informal Settlements? the Assessment of "Cities without Slums Program" in Eradicating Informal Settlements in Urban Zones of Morocco

"Villes Sans Bidonvilles" (VSB) or "Cities without Slums" is a development project aims to eradicate slums from 85 Moroccan cities initiated by the government of Morocco in 2004, in an attempt to reduce social exclusion, as well as to lessen the chance of homegrown violent extremism in urban zones. The initiative consists of three strategies that were pursued in phases: phase (i) was upgrading, phase (ii) was rehousing and phase (iii) was resettlement. Some views hold that this government initiative is the first personal engagement of Morocco in the country's poverty reduction plan. In 2018, as a result of the program, the Kingdom of Morocco declared 58 of 85 cities across the country as slum-free despite another two million Moroccans still live in some form of informal housing. UN Habitat and other multilateral agencies including the World Bank have declared "Villes Sans Bidonvilles" a grand success and heralded the program as a replicable and scalable model for other governments in the region. The proposed work aims to assess how the program (VSB) has assisted the Moroccan government to reduce informal settlements in urban zones. To this end, this work will mainly focus on the secondary data, including the up-to-date annual and regular reports, published especially by the World Bank, African Development Bank, United Nations, UN Habitat, and the Moroccan Ministry of Housing, using three languages, namely, English, Arabic, and French. This proposed work will allow us to shed light on the on-going controversy regarding the effectiveness and challenges facing the new strategies aimed at eradicating slums in developing countries.

Religious Ideology and Urban Space: The "Garin Torani" in Mitzpe Ramon As Case of Moral Entrepreneurship.

How to instill religious ideology with in an urban space? This paper deals with the success of a group of religious settlers in Mitzpe Ramon- a town in southern Israel, in applying a process of religionization in the town. In 2000, the yeshiva "Midbara Kaeden" was established in Mitzpe Ramon. The yeshiva brought a community of Zionist Ultra-Orthodox called "Vealitem Lanegev" to settle in the town. This settlement is identified by a theology they name as "Lehitnachel Balevavot"(to settle in the hearts) and "hishtalvot bedalet amot"(to blend among the Jews). The aim of this religious ideology is to build "the God's state", or "halacha" (religions Jewish state). This aim is to be achieved by civilizing mission, or reeducation of the indigenous population. I argue that in the case of Mitzpe Ramon, the implementation of religious ideology is done by penetrating the systems of education, culture and welfare and taking over them. This process enables to increase the settler's community and as a result creates a demographic selective mechanism. The selection is embodied in enlarging the religious Ashkenazi population on the one hand, with the exclusion or emissions of traditional Mizrachi(eastern-Jews) population of the town on the other. The religionization process in Mitzpe Ramon is a product of "moral entrepreneurship", by which Zionist-religious community sanctifies, Judaizes and whitens the peripheral space.

BENITEZ, PAULINA* (Universidad de Concepción, Chile)

La Compensación Salarial De Los Grupos Con Mayor Escolaridad. Chile En La Década Actual.

La promoción de educación universitaria y la difusión de sus beneficios por una parte. Y el aumento de la matrícula universitaria basado en la valoración de la educación como estrategia de movilidad social ascendente de la población por otra; permitieron que la matrícula creciera seis veces entre 1983-2011. Y en los años 2000-2011 el ingreso de nuevos estudiantes universitarios aumentó al ritmo de casi el 7% anual (Meller, 2011).

La evolución del crecimiento de la escolaridad asociada a la retribución de la obtención de títulos secundarios y terciarios se observó ya en los ochenta (Sapelli, 2003). El impacto de mayor escolaridad de los individuos quedó plasmado en las tasas de retorno formuladas por expertos: *un año más de educación se nota en aquellos que tienen doce años y más (...)*. La *retribución de un año más de estudio en la enseñanza secundaria es del 10%, y en la educación superior es del 22%* (Beyer, 2000). La educación es la vía para disminuir la desigualdad en Chile (Beyer, 2000).

La ponencia analiza la relación del incremento de los años de educación universitaria y la compensación salarial proveniente de la ocupación principal de dos grupos con mayor escolaridad: (a) de 18 años, (b) 19 años y más. A partir de los datos de la Encuesta de Hogares de 2011, 2013, 2015, 2017.

Los resultados muestran un aumento de la dispersión en los salarios de los grupos, permiten sostener que la mayor escolaridad creó *nuevas desigualdades* porque personas con el mismo mérito educativo obtienen retribuciones salariales muy distintas, este hecho corroe la noción de mérito educativo. La discusión sobre estas diferencias también considera el concepto de desigualdad persistente y sus mecanismos (Tilly, 1998).

Indian Leisure-Tourism-Industry: Evolution and Evaluation

Tourism is the world's largest globalized industry and is also the fastest-growing economic sector. Tourism comprises the activities of persons travelling to and staying in places outside their usual environment for not more than one consecutive year for the purpose of leisure, business, and other purposes. Nowadays, Leisure has been taken as a motivating factor with its inherent multifarious socio-psychological and economic implications which leads a person for tourism of various kinds in general. The emergence of leisure-tourism-industry put both positive and negative effects on the environment, culture; society and economy have ever been in question and therefore an issue of discourse for the policymakers and social scientists.

Modi (2010:13) asserts leisure as universal phenomena and opines that, 'leisure exists universally and that it has a dynamic character, while it is structural in nature and cultural in orientation and operation'. It is a driving force that spins the wheel of development of socio-cultural, economic and environmental aspects of the tourist destinations. In 1988, the United Nations World Tourism Organization (UNWTO) defined sustainable tourism as leading to management of all resources. Leisure-Tourism and environment are closely interrelated and interwoven phenomena and can be understood on the basis of cause-effect relationships. In the present context, leisure has been taken as a motivating factor as it is closely related to our desire, which leads a person for tourism of various kinds in general. The main objective of the paper is to analyze scientifically the evolution of leisure-tourism and its impact on environmental, socio-cultural and economic facets of tourist destinations and host communities in India. The findings of this paper are based on the relevant secondary sources like public documents, the relevant published literature and research findings of the earlier researches.

Leveraging the Potential of Thewa Craft As an Experiential Leisure

Leisure and culture are closely related to each other and plays a vital role in maintaining and dispersing individual and communal cultural identities. "Culture is the set of distinctive spiritual, material, intellectual and emotional features of a society or a social group that encompasses not only art and literature, but lifestyles, ways of living together, value systems, traditions, and beliefs." (UNESCO, 2009: 1). One of the crafts that represent the cultural identity of India is Thewa Craft from Pratapgarh, Rajasthan India. This unique craft comprises of the coloured glass base, embossed with golden miniature artwork. Thewa, the traditional jewellery craft represents our country's rich cultural heritage and history as it is a 350-year-old craft created by fusing using 23Karat gold sheet to coloured glass and practised by the only family lineage "Rajsoni's". Kojonkoski-Rännäli (1998)

discusses that pleasure derived from handling and making is intrinsic in human nature. Kamla Devi Chattopadhyay (1980) defines crafts as "Crafts are valuable not merely as a beautiful heritage, but because we need to live with them, touch them, feel them, use them, have intimate communion with them so that our life is enriched by their grace."The study includes the experiential aspects of Thewa Artisan's engagement with the craft not only for an economic purpose but also for leisure and for significant contribution to preserving traditional cultural heritage. This qualitative study is based on data from primary and secondary resources. Primary data is collected from interactions with Thewa Artisans and secondary data collected from studies published by accredited publishers (both National and International).

Whatever Happened to the Maternal Element in Women's Peace Activism in Israel?

The Mothers of Plaza Mayor in Buenos Aires is probably the best-known mothers mobilization in the world. There are other examples over the world. Israeli society is a society engaged in prolonged conflict that from time to time erupts into wars and armed conflicts with casualties on both sides. Since the first Lebanon war (1982), we are witnessing the beginning of an era of the feminization of peace activism in Israel. Since then, three periods of increased **women's peace** mobilizations can be identified, each with its dominant organizations, modes of action and collective identities. At the first ISA Forum in Barcelona 2008 I presented an analysis of the identities that have evolved amongst women's peace activist in the first two phases. Six years later, in 2014, Women Wage Peace has emerged. In this presentation I am revisiting the women's peace camp in Israel focusing on elements of continuity and change among these periods of increased activism. Most particularly I will focus on the maternal elements in these mobilizations. From being a central element in the activism through opposition to its inclusion, to returning to the center stage with Women Wage Peace. Explanations will focus on changes in Israeli society; among the participant women; in Feminism and in the movements. I will further compare some of the findings to other women's movements in the West. I am basing my analysis on research projects that I have been conducting, on and off, for the past 25 years that consisted of participant observations, interviews of various types, and data collection from almost every available source. The most recent project started in 2016 and I am still collecting data and participating in the activities of the Women Wage Peace.

Political Sociology of Legal Education: Between Training Pedagogy and the Cultivation of Civic Virtue

This research deals with the brazilian contemporary legal education considering the transformations promoted in the field which has been increasingly the central object of translations for schemes destined to projects of oriented studies on the approval for public jobs. The hypothesis is that the last decades have been leading to the growth of a "prosperity pedagogy", in which the main purpose of University graduates – especially of Law – is to be approved and subsequently tenured in a public job within the State structure. Weber's pedagogy of training will be considered, which can be applied to the education of undergraduates since the construction and expansion of the Brazilian State. The perspective of social ascension is a common agenda among candidates associated in networks to share lessons, study techniques and motivation strategies. The element of financial prosperity is the main impetus for the heroic enterprise of dedication to competition, to the detriment of the old logics of the field, guided by the justification of public vocation and greater technical ability to think about the State and the common good. Therefore, after the first stage of qualitative emphasis, in which interviews will be conducted, a sample survey will be required to map the existing training courses providers, the types of courses offered, when they were founded and which ones yielded more results and expanded in size. The purpose is to problematize this lucrative market generated in a scenario dependent on public jobs offered by the State, as well as to understand the effects that it has generated in the legal education sector.

Changing Contours of Mine Work: Women Underground Miners

Since the mid 1800s, men from different labour sending areas across Southern Africa migrated to South Africa to work in the belly of the beast, the mines. These mines, from their inception, were known as 'a world without women' since women were prohibited from residing in mining towns and working inside the mines. From the late 1970s, however, scores of women migrated 'illegally' to informal settlements on the peripheries of mining towns. In 2004 a bigger shift in mine labour occurred. Women, for the first time in South Africa were allowed to work underground in occupations that were previously reserved for men. Their inclusion in mining has not only led to shifts inside mines, but has also made clear the links between home and work. In my paper I illustrate how, contrary to mining labour studies that posit the mines as far removed and separate from home, the two spaces are in fact in perpetual dialogue. In the context of women doing what has been traditionally seen as men's work, previously 'stable' and naturalised notions and categories of masculinity and minework are being challenged. By extension, the artificiality and contingency of gender boundaries are revealed and gender inequalities disrupted. In other words, changes in the 'bodies' that occupy the underground world is leading to reconstructions of gender normative acts, discourses and practices and challenging gender inequalities both at work and home. Data for this paper was collected through participant observation where I immersed myself in the world of mineworkers, working underground in a Platinum mine as a winch operator for over a year and living in a mine settlement with workers.

RC32-414.4

BENYA, ASANDA-JONAS* (University of Cape Town, South Africa)

Women Underground Miners: Experiences from South Africa's Platinum Belt

Mine work has for a long time been seen as allowing for particular masculine self-formations and mineworkers embodying specific mining masculinities. The recent entrance of women underground as miners and their allocation into occupations that were previously exclusively reserved for men is a significant challenge and a disruption to mining occupational culture. While some argue that legislative changes targeting large-scale mining have led to the inclusion of women underground and that symbolises a shift towards a gender inclusive mining industry, women's experiences tell a different story.

This paper looks at women's experiences as underground miners, how they make sense of their work, and how they negotiate the underground space. Central to their experiences underground is how their bodies are read as 'invaders' or out of place and thus perceived to be 'wrong' for mining. I show how bodily distinctions are used in the production of the ideal and non-ideal worker, the inferior or the normative. Underground, this is partly done by defining (and treating) subjugated bodies or those seen as invaders (women) as nothing but their bodies and dominant groups as neutral or disembodied. I argue that women's inclusion as underground miners has produced a disorientation and ontological anxiety for men and mining masculinity. Data for this paper was collected through participant observation where I worked underground in a Platinum mine as a winch operator and lived with the workers for over a year.

BEOKU-BETTS, JOSEPHINE* (Florida Atlantic University, USA)

Sexual Minorities and Gender Non-Conforming Citizenship in Africa: African Feminist Scholarship and Activism

This paper engages in African feminist and gender discourses around the struggle for equal and inclusive citizenship among sexual minorities and gender non-conforming communities in contemporary African societies. Until the recent past, this field of scholarship received little attention, if not silencing, as a site of critical investigation in scholarly discourses centered in the global North. While in many African countries there is strong opposition to non-heteronormative sexual and non-binary gender identities, justified on the basis of "African culture" and "African moral values", various scholars and activists claim that prior to colonization, sexual minorities existed and in some cases were valued by a range of communities across the continent. Scholars have explained this opposition to intimate

citizenship as deeply rooted in legacies of the colonial period still manifested in attitudes, norms, legislation and criminalization of these communities (Tamale, 2011; Finerty, 2012; Marler, Platero, and Anumo, 2018; Arnfred, 2019). Lister et. al. (2005) have argued that much of the theoretical debates about citizenship are framed in an 'empirical void' that especially overlook the views and perspectives of people whose status as citizens is extremely precarious. This paper examines African feminist and gender discourses that contest the exclusion of sexual minorities and gender non-conforming communities in understandings and practices of rights of citizenship in African societies. It explores strategies of engagement used by scholars and activists to disrupt the status quo and to redefine, transform, and build a more inclusive agenda of citizenship that reflects the perspectives of those who are marginalized. The paper is framed around global debates on Inclusive Citizenship (Naila Kabeer, 2006) and empirically informed by secondary sources, including newspaper reports on collective action, communication, and advocacy by scholars and grassroots activists in contemporary African societies.

Transforming Higher Educational Institutions: Gendered Perceptions of STEM Faculty on Diversity at Florida Atlantic University

Students are better educated and more prepared for the global labor market when they are trained in diverse educational settings and exposed to diverse perspectives and cultural environments. Towards this goal, Florida Atlantic University (FAU) in the United States was designated a Hinospanic-Serving institution by the US Department of Education in 2016. Given the increasing diversification of the student population at FAU, is the hiring, retention, and advancement of women and URM faculty in STEM fields proportionate to these changes? Few studies have been conducted to understand the perceptions of STEM faculty regarding institutional diversity policies and initiatives and whether this factor is associated with their satisfaction with career progression and salaries. This paper investigates perceptions of FAU STEM faculty by gender on institutional and departmental commitment to diversity. It is based on the FAU ADVANCE Faculty Climate Survey conducted in 2017. The critical mass perspective informs the study positing that when a small number of a minority group is present within a dominant larger population (less than 15 percent) the majority population gains privilege. The paper presents an overview of faculty and student ratios, findings of faculty perceptions of diversity, and institutional policy initiatives to promote faculty gender diversity through training programs in mentoring and implicit bias.

Social Movements and Contentious Branding. Lessons from the Digital Exploration of #Occupy and #Anonymous

This conceptual paper wishes to contribute to the sociological debate on protest movements by developing the notion of 'contentious branding', as a reflection emerging from the digital exploration of two empirical cases that challenge social movement theory: Occupy and Anonymous. The empirical research has followed the Occupy and Anonymous hashtags around popular social media, letting their appropriation to delimit the boundaries of the research objects. Network analysis and computer-assisted content analysis techniques have been employed to trace and unfold these complex assemblages. Adopting a branding perspective on contentious politics is aimed at highlighting the diverse and sometimes contradictory appropriations of the 'semiotic repertoires' of protest movements; this aspect, in the analyzed cases, is so evident and pervasive to problematize the application of current definitions of social movements to the traced 'assemblages'. Contentious brands such as Occupy and Anonymous are thus understood as affective devices, capable to catalyse and refract diverse mobilizations. This calls for a recognition of the analytical autonomy of branding and assessing its relation with the current conceptual toolbox of social movement studies. Whereas the paper argues that the materiality of digital media is involved is re-mediating the dynamics and relevance of contentious branding, it opens the question of whether even traditional, pre-digital mobilizations could be re-thought in terms of 'contentious brands'. A branding perspective on social movements, indeed, not only tries to fit these spe-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

cific cases better: it intends to provide an epistemological and methodological device to sustain a non-essentialist understanding of social movements, between (or beyond?) their connective and collective dimensions.

The (Re)Making of the Chinese Working Class - Biographical Perspectives on Habitus Transformation and Social Inequality

The presentation focuses on the biographical perceptions of "working class" in the context of educational upward mobility. While Western concepts of class are describing positions in production processes, todays Chinese context remain diffuse and still bears its historical roots. Moreover, in everyday orientations and articulations the so-called working class is paradoxically used to perform not being left behind and at the same time not being part of functional elites in an anticipated modernization process.While macro comparisons of contemporary societies and its social structure are highly problematic for various reasons, a praxeological perspective and biographically informed class analysis can be used to reconstruct habitus transformation to understand social inequality under conditions of modernity. On the basis of educational trajectories, I will show how individuals and collectives biographically deal with the ambiguity of social belonging under a rapidly changing society and its flexibilization of the economy.

BERHEIDE, CATHERINE* (Skidmore College, USA)

Are Women Faculty More Satisfied at a Former Women's College Than a Former Men's College? the Effects of Gender Segregation on Occupations and Organizations

The professional labor market in the United States remains sex segregated both horizontally and vertically. The academic labor market, in particular, is segregated horizontally with women overrepresented in some disciplines and underrepresented in others, particularly the natural and mathematical sciences. Even within a single field, women are more likely to specialize in particular subfields than in others.

Despite the influx of large numbers of women into academic positions in recent decades, in the United States, women still tend to hold lower-level and untenured positions while men are disproportionately represented in the upper ranks, producing vertical sex segregation. Globally, women are underrepresented at the rank of full professor. Furthermore, women have made more progress integrating the academic staff of predominantly undergraduate institutions in the United States,, especially women's colleges or former women's colleges, rather than at universities that award graduate degrees. I expect that women faculty will be more satisfied with their jobs at a former women's college than at a former men's college in the same metropolitan area in the United States.

A work climate survey was sent to the population of 341 tenured and tenure track faculty at two highly selective private liberal arts colleges, one formerly all-male and the other formerly all-female. The response rate was 70%, yielding 237 respondents. Contrary to expectations, multiple regression revealed women were more satisfied at the former men's college than the former women's college. Specifically, women faculty at the former women's college were less satisfied than their male peers with their opportunities for advancement in rank while gender had no effect at the former men's college. I argue suggest that increasing the number of women teaching at the former women's college constitutes a greater threat to the elite status of that institution than at the former men's college.

What Explains the Differences in Sexual Assault Rates at Colleges and Universities in the United States?

The Trump administration has revoked the Obama administration requirement that US colleges and universities treat sexual assault as a Title IX violation, that is, as a gender-based form of violence that limited access to education. The Clery Act requirement that colleges and universities report the number of sexual assaults remains in effect. The Clery Act data is criticized as severely underrepresenting the number of sexual assaults because so few are actually reported to campus authorities. Are the differences among colleges and universities in the number of sexual assaults they report under the Clery Act a result of differences in rates of assault or in differences in rates of reporting sexual assault? We analyzed data from US Department of Education, CollegeBoard, and NCAA to compare institutional factors that predict the average rate of sexual assault per 10,000 students (SAR10K) with those that predict the sexual assault reporting ratio (SARR) at 939 four-year colleges and universities. Our results suggest that research using

Clery Act data may largely be studying reporting behaviors rather than assaulting behaviors. The differences in predictors (percent first year students living in dormitories) for SAR10K and both estimates of SARR (percent women students) and in the magnitude of three predictors (being a public institution, acceptance rate, and being a member of NCAA Division III) suggest that the Clery Act data does more than simply reveal differences in reporting behaviors. Students attending smaller more elite private colleges tend to report sexual assaults at a higher rate than students attending larger less selective public universities. The policies and programs at these smaller elite institutions may be more successful in encouraging reporting and discouraging assaulting. The more privileged students who attend these elite institutions may be more likely to report sexual assault than their less privileged counterparts at less selective institutions.

Reconfiguring Privilege and Strategies of Reproduction: Studying Elites in Bikaner Town of India

Within the backdrop of recent revival of academic interest in elites and production of inequalities (Savage & Williams, 2008; Piketty, 2013; Savage, 2015), my empirical research aims to provide an empirical understanding of the reconfiguration of regional and local elites in contemporary India. This paper deals with the question of social mobility and renegotiation of power relations. Elite Studies is one of the neglected areas of social research in the context of Rajasthan. The existing literature on power politics in Rajasthan has mostly concentrated on rural contexts, and has ignored social dynamics of elite formation in urban spaces. This study aims to fill this gap by exploring the link between inherited privilege, social mobility, and elite reproduction in contemporary Bikaner city. Drawing on Bourdieu's concept of 'field of power', this paper will look at how elites, their institutions are undergoing change in the post-independence period. This paper would try to problematize the exclusive emphasis on 'social background' in elite studies in India and make a case for studying elite strategies to understand renegotiation of power relations. It shows that the traditional system of feudal power organized around princely families has been challenged by the rise of new political elites from non-princely backgrounds. Therefore the elite strategies to reproduce their monopoly over a particular field has experienced a renewal. Instead of ascription based group claims to power, the predominant language is now individual capability, possession and mobilization of privileges to deliver sources and mediate between state and individual. With the entry of new elites into urban politics and business, Bikaner city's elite structure has become highly competitive. This shift has led established old elites to adopt new practices of social closure and simultaneously reconfigure their relations with each other.

Senior Professorships in Germany. an Exploratory Study on Change and Continuity of Careers in Academic Fields

A good starting point for investigating change and continuity in academic fields is to focus on university careers. In recent years sociological studies on this have focused mainly on "young researchers", which resulted in discussing primarily questions of access to and success in the academic field. In comparison, research on later career developments is relatively rare. This situation is unsatisfying for two reasons: Firstly, later developments may challenge our assumptions on university careers. And secondly, if we investigate the full life-cycle of university careers we can learn more about the generational reproduction of academic fields. This is why we want to contribute to the knowledge on later career developments with our research project "The end of the academic career?". Our project investigates the (age-related) retirement of university professors in Germany and is funded by the German Research Foundation (DFG).

During the last decades, retirement of university professors in Germany has changed in several ways. In our paper we address one major development of the last decade, namely the growing number of senior professorships. These professorships are offered by Bundesländer or even single universities. Basically they create a new way of postponing mandatory retirement. They have been mostly established for those professors who have been successful in terms of acquiring research grants. However, there are also senior professorships given to those that are hard to replace in teaching, for instance in small disciplines. Our paper explores this phenomenon in two steps: Firstly, it provides an overview of the evolving landscape of senior professorships in Germany based on internet research and expert interviews. Secondly, we discuss the experiences and strategies of senior professors related to postponing retirement, drawn from our problem-centered interviews with senior professors. The phenomenon of senior professorships allows a new perspective on change and continuity in academic fields.

BERMÚDEZ-FIGUEROA, EVA* (Universidad de Cádiz, Spain)

Where Are We? Women in Local Administration. a Study Case of El Puerto De Santa María in Spain.

This work addresses the social and occupational space that women hold in local administration in Spain. We expose some of the findings of the research project "Under-representation of women in el Puerto de Santa María", conducted in the University of Cadiz, which main objective is to make visible and demonstrate the existing inequalities between men and women in local administration. Based on a study case in the South of Spain municipality, we analyze women representation in the occupational structure on the local administration and government, paying specific attention to vertical segregation or glass ceiling, horizontal segregation, and another aspects related to the occupational distribution, power and social consideration.

Firstly, we use a theoretical approach based on the concepts of gendered organizations and inequality regimes (Acker 1990,2004). Secondly, the methodology employed was based on secondary analysis of data, disclosed from the transparency web of the Local Governement, as well as qualitative methodology founded in interviews to women workers. We analyzed civil servants and ordinary employees, together with the external contracts delivering fundamental essencial public services for citizenship. We address diverse aspects as the access to the job, professional categories, labor relations, power distribution, the access to decisión-making process, work and familly life balance, and their perception of how women's work is socially (under) valued.

Second Language Learning As Refugee – Evidence from a Longitudinal Qualitative Study in Germany

Scientists and mass media consider host country language proficiency 'key' to the opportunities of immigrants. While there is a vast quantitative literature on language learning, we still know relatively little about individual language learning processes and how they interact with biographical trajectories. Against this background, this presentation addresses the question, how refugees learn German from a longitudinal qualitative perspective. Based on two waves of narrative biographical interviews with refugees from Syria in Germany, we show that experiences and life paths interweave with language learning processes in complex ways. Refugees face manifold obstacles when learning the host language. We identify typical dynamics of language learning and show how that these relate to personal ambitions, life situations, and institutions.

Overcoming the STEM Gender Gap from School to Work at the Time of the Fourth Industrial Revolution

Despite their increasing rate in education and their better performances, women remain largely under-represented in technical-scientific tracks. This formative segregation, due both to enduring gender stereotypes and to a peculiar structure of Italian education system, tends to exclude women from more requested professions. Without further education policies and targeted interventions supporting the transition from school to work for young people, the school work mismatch persists. In Italy, this encompass all students supply chains, but particularly those of the female component with the risk of creating a dual labour market in the 4.0 economy. This work intends to design a best practice in order to bridge gender disadvantage in STEM area, both in schools and later in employment. Paper presents results of action research "STEM women: a challenge for the school, an opportunity for businesses, a search for talents", carried out in Italy in the Piedmont region. For this purpose, an operative network has been created linking university, public institutions, school teachers and technological enterprises. A survey has been conducted on a sample of 572 high school students, aiming to measure male and female STEM preference, quality of teaching and orientation to future occupation. In order to increase girls' confidence in their scientific abilities and to encourage them to choose careers in STEM, training meetings led by researchers and women leaders in technology companies were held in high schools. And also a STEM firms' tour was organized. In the final phase of the action research project a public meeting was realized where male and female students discussed cultural, economic and social implications of a wider female presence in the STEM professions. The results can contribute to implement policies, sensitive to the evolution of the productive world; innovative business models, including organizational ones, which adequately include the gender dimension.

Public Policies, Aging and Scientific Disciplines: A Qualitative Study Based on Actors Discourse

This paper analyzes the discourse of the actors/actresses that participate in the process of executing public policies on aging and old age in Uruguay. This country is one of the oldest in America, along with Cuba and Canada, with 20% of its population aged 60 and over. The main objective is to identify and characterize the discourse of civil servants and representatives of civil society about four dimensions: a) meanings given to aging and old age b) main policy approach, c) meanings assigned to public policies, d) scientific-disciplinary references used. The work is based on an approach that considers policies as significant practices that contribute to the social construction of aging. Sixteen in-depth interviews were conducted with civil servants from different areas: health, social security and social policy, as well as representatives from civil society. A thematic analysis was made. Heterogeneity were identified, and two main political orientations: one described as "possible", based on a biomedical and economic approach, related with the civil servants on the areas of social security and health, and another that embody a life course approach, a gender approach, an intersectionality approach, and that takes into account the capacity for action of the elderly. These orientations coexist, makes friction and dispute public spaces, expressing social horizons in tension.

Competences of the Graduates of Sociological Higher Education in Accordance with the Requirements of the Professional Community

The purpose of the study is the development of a competence-based approach in Russian higher education, taking into account the requirements of the labor market. This area seems especially relevant for the process of professionalization of sociology.

The methodological basis for the implementation of the competency-based approach is the development of indicators for each of the graduate's planned competencies. In this paper we corrected the lists of indicators proposed in our previous studies (ISA Congress, Toronto, 2018).

When working out the lists of indicators we took into account:

- the requirements of professionalization of sociology reflected in the draft professional standard of the sociologist;

- comments on the wording of indicators in the discussion of lists of indicators in the professional community (in social networks, round tables, webinars);

- indicator verification schemes developed for checking the indicators.

The decisive role in the development of the draft professional standard and the expertise of the requirements for sociological education belongs to professional associations and large agencies: the Association of Regional Research Centers, the All-Russian Center for the Study of Public Opinion, and the Russian Society of Sociologists..

Results:

Russian universities are offered competency indicators associated with the requirements of the draft professional standard. It is shown that the indicators of bachelor's and master's competencies correspond to labor functions and labor actions agreed with professional associations.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Schemes of testing indicators of bachelor 's competences have been proposed and tested.Examples of compiling specific tasks show the ways of evaluating indicators as structural elements of competence, and, in their totality - the ways of assessing competence as a whole.

The results obtained are the basis for setting up fundamental and applied research on the development of methods for assessing competencies and creating a database of evaluating tools.

Higher Education in the World Countries: The Results of Webometrics Ranking 2016-2019

The purpose of the study is a comparison of world systems of higher education taking into account the scale factor.

Indicators: number of national universities starting with the top 2000: N2000, N3000, N4000, N5000, N10000, N20000, N25000

Results:

The growth in demand for higher education, due to the high percentage of young people in the population of developing countries, is reflected in the results of the Webometrics ranking 2016-2019.

Only 10 countries have more than 500 national universities in the top 25000 (N25000). Over 30% of these universities are located in the BRICS countries. Among them, India is confidently leading: 1st place in the world since January 2016. The USA takes the second place in N25000, the third - China with a noticeable lag behind India and the USA. They are followed by Indonesia, Brazil, Russia with a N25000 of more than 1,000. India remains among the leading countries in terms of N3000 N4000 N5000 N10000 N20000 (3-4 places), and only by N2000 is not in the top ten (12th place). The first place in terms of indicators is taken by the USA, the second - by China. Brazil, Japan, France are among the ten leaders in all seven indicators, Iran - in six indicators, Russia - in five.

According to the conditional indicator of the quality of mass universities (the ratio of N10000 to N25000) China stands out among the BRICS countries (67% - second place after the United States), followed by Brazil (27%) and Russia (26%), which has improved its position over the past two years. India lags behind - so far 17%.

On the whole, the results of the last five years indicate the growing influence of developing countries on the development of mass higher education. Taking into account demographic factors, this influence will increase.

Labour Transitions of Young Graduates in Spain. the Case of Graduates of Distance Universities

The impact of the economic crisis from 2009, together with the growing deregulation and flexibility of the Spanish labour market, have had a decisive influence on the fact that young people's job transitions have become more precarious and delayed than previous generations.

Based on secondary data from different statistics and surveys (INE, ESS...) and, mainly, analysing surveys from the Observatory of Employability and Employment of the UNED (Spanish Open University), we explore in this communication the differences in employment transitions between university graduates from face-to-face and distance universities.

We test previous findings that distance universities have the utility of allowing transitions for older graduates or those who had left the university system, and we analyze it in a new context with the effects of the Great Recession and the lengthening of studies that the introduction of the European Higher Education Area entails.

EU Inequalities: The Charter of Fundamental Rights of the European Union As a Disparities Maker

After the French Revolution, the European States gradually approved their Constitutions. As excellent guarantors of the fundamental rights of a state, they today no longer seem to have the effectiveness they once had. In fact, the protection prepared even by the most advanced and updated Constitutional Charters has, in some ways, proved insufficient to keep up with global evolution. In fact, technological development and globalization have created new dynamics from which new rights have arisen, some of them of constitutional rank. However, these rights have not always been covered by national constitutions, except through forced interpretations (e.g. environmental rights and rights linked to digital evolution). They have therefore proved necessary to be supported and supplemented by additional guarantees that can only be provided in a supranational context in an appropriate manner.

The Charter of Fundamental Rights of the European Union, has been able to intercept the needs and it included these new rights.

Although the Charter is today the point of reference, together with the European Convention on Human Rights, for the protection of these new fundamental rights, they are not protected in the same way in all European countries.

This is because the European legal system is shaped in such a way that it has a wide margin of discretion in implementing European law.

This discretion had the effect, on the one hand, of ensuring that each State was in a position to introduce protection mechanisms, but, on the other hand, it caused major inequalities. Indeed, the result has been the creation of considerable differences in the legal protection afforded by individual Member States to those new rights. In light of this, this paper aims to show the differences between the European citizens caused by the European law system bringing out these inequalities in the fundamental rights.

Fear and Loathing in Academia - Subtle Mechanisms and Symbolic Domination within the Academic Field

In the course of globalization and transnationalization, the scientific field has been increasingly subjected to standardization effects. Today, in a world of 'academic capitalism' science runs the risk of becoming a tool for political governance by way of measurable standards and controllable dimensions. The transformation of the scientific field impacts academics and their practices who often experience pressure, stress and emotional discomfort. In this contribution, we discuss how fear, anxiety, and concern can corroborate and legitimize hierarchies between human actors (scientists) and institutional actors (universities). Using interviews with scholars from the US, we illustrate how fear structures the actors' social practices as well as their informal esteem, and how this translates into their positions within the academic field. We conclude with theoretical considerations on how fear operates as part of mechanisms of symbolic domination within the academic field.

BEZERRA, CARLA* (Universidade de São Paulo, Brazil)

In between the Local and the National: Scaling up Participatory Policies in Brazilian States

In this paper, I compare two different participatory policy designs adopted by two Workers' Party (PT) governments at State level. The cases are separated by a 10 year time lapse, but they are both at the State of Rio Grande do Sul State (RS). I trace back these processes through in depth interviews and a vast document analysis.

I argue that the different design choices are explained by two key features: policy diffusion in between different government levels and different coalition support types. In both cases, the broader space that citizens and civil society gained to influence decisions on the State Budget and Policies were also key for a leftist government to help push for a more redistributive agenda.

In 1999-2002, PT took State Office for the first time. Until then, its only government experience had been at local level where Participatory Budgeting was its showcase policy. The choice was to directly transpose the PB city model to the state level. Its implementation faced harsh resistance from opposition parties, who tried all sorts of political actions, including judicial litigation. PT had a minority support coalition in Parliament and few local governments. Mayors and State Assembly members, argued that the Program overlapped their competencies to define the State Budget.

On its second time at the State Office (2011-2014), the PT had acquired a totally different policy repertoire after almost ten years at the Brazilian Federal Presidency. The effort was to put together the State institutional legacy and the lessons learned at the Federal Government. This time, the Party had built a majority coalition at the State Assembly and ruled most of the local governments. The Participation System proposal had a good reception both by the citizens and by the opposition parties, who held no public contestation for the system institution.

BEZERRA, LAISSA* (Universidade Federal Fluminense, Brazil)

Melancholy in Civilization- How the Development of Modern Capitalism Promoted the Disarticulation of Social Ties

This paper aims to conduct an analysis of the development of what Max Weber called the spirit of capitalism, and later, with the advance of global capitalism that today reaches the subjectivities of individuals, Luc Boltanski and Éve Chiapello identified the new spirit of capitalism. We will use the work of Pierre Dardot and Christian Laval in *The new way of the world: On neoliberal society* to illustrate how this modern life ethos that is accompanied by the development of capitalism has been deteriorating the ties that bind individuals to society and, ultimately, the individual himself. With this, we will analyze how capitalism in its advanced form, the neoliberal management that internalizes market coercion, introduces the uncertainty and brutality of competition and makes individuals admit it as a personal failure, an embarrassment, a devaluation, destroys collective dimension of existence. Within this logic of the advanced capitalism as a producer of inequality, the middle class is the one who suffer this pressure in a most evident form when the risks are transferred to the wage earner with this, producing the increased sense of risk, companies were able to order much greater availability and commitment from them. In neoliberalism everything is equivalent, has price and negotiates, so everything seems possible, everything is doubtful, everything is suspicious, because nothing is law to anyone. Thus, the argument to be analyzed is that capitalism along with the new spirit of capitalism, the spirit of neoindividual, promotes the disruption of social structures, in what Zygmunt Bauman identified as liquid modernity, which sustained each and every individual who lived there.

BEZERRA, LAISSA* (Universidade Federal Fluminense, Brazil)

Who Watches the Watchmen?- an Analysis of the 21st Century Rio De Janeiro Military Police

I want to present here how the culture of belonging of the institution of the Military Police of Rio de Janeiro (PMERJ) is developed, how these actors understand the work they perform, the adherence to the warrior ethos that permeates the PMERJ and from the experience of the military, present the main problems encountered by the PMs when performing their function. The research presented has as its main objective to seek the understanding of the identification rituals, the social dramas through which the security agents go through, the explanation of how the police understand and perform their functions, as well as the conditions provided by the institution for the performance of the police so that we can then understand the symbolisms that constitute the ethos of the warrior policeman. In the Brazilian state, the individual is subject to impersonal laws and the ferocious power of the police, which methodically discriminates against him and ruthlessly oppresses him, making him "equal down" in open corruption of liberal concepts. Thus, the process by which modern police institutions strengthen and ensure the continuation of traditional hierarchical social relations extends to impersonal public space. We aim here to give voice to those who are ultimately responsible for the execution of public safety at the tip, we hope to produce knowledge that provides both for the management of commands and for monitoring the execution of this process by the population. We also seek to understand the way police officers perceive and evaluate what they are doing and monitor the changes the institution has gone through and how they express themselves in the agents' perceptions.

LGBT Movement and Judicial Activism in Brazil: Hypotheses and Perspectives

This paper reflects on the process of expansion of LGBT rights in Brazil, related to the debate of cultural wars around the issues of gender and sexuality. The objective is to raise some hypotheses as to why, despite the conservative rise, the Supreme Court (STF) has acted in support of the LGBT agenda, especially regarding the judgment that occurred in June 2019 and resulted in the recognition of LGBTphobia as a type of discrimination to be comprehended as part of the law of racism. It adopts the theoretical perspective of Michel Foucault, Judith Butler, Laclau & Mouffe, etc. The method includes the documentary analysis of the judicial processes and governmental actions, as well as a literature review pertinent to the theme. The main argument to this decision was that the National Congress has overlooked his constitutional mission to create a law to protect the LGBT people and so the Court had to acted answering the demand of the LGBT movement. It analyses three different hypotheses about the behavior of the Court: that it has judged as an impartial body that interpret the Constitution; as part of a "pinkwashing strategy" to expand its support towards the progressive sector in spit of its participation on the rise of conservative sector to power after the impeachment of the president Dilma Rousseff in 2016; and adoption, by

the Court, of a perspective of modernity based on the expansion of freedom of sexual and gender expression. It concludes that the most feasible hypothesis to explain the role of the Supreme Court is the third one, as it intends to be a kind of illuminist vanguard of modern society, ensuring the expansion of human rights to excluded segments, such as LGBT, although it has support conservative sectors in other issues.

BHADRA, BULA* (Sister Nivedita University, India)

Intersectionality & Multiple Childhood: A Tale of Inclusion/ Exclusion

UNCRC 1989, though an ice-breaking document, generally depicted homogenization of first world experience in a decontextualised, ahistorical way by focusing on rights discourse which generates from liberal individualism and thus, defining child only by chronological age. The increased recognition among scholars to highlight the irreversible and constitutive influences of history on constructions of indigenous childhood rejects on the one hand childhood essentialism and on the other welcomes the expansiveness of the concept of 'multiple childhoods'. Multiple childhood is an exciting epistemic shift precisely because its social constructionist lens released the concept of 'childhood' from its normative moorings and moved away from the functioning of the Euro-American bourgeois childhood as the hegemonic ideal and universal notion of rights, linking it to the histories of modernity, colonialism and capitalist expansion, thereby making it available as an object of historical, sociological and intersectional study.

It is necessary to interrogate practices and discourses surrounding childhood and childhood studies, asking, for instance: What forms do childhoods take in various social arrangements? How do the dynamics of social class, ethnicity, race, nationality, gender, sexuality, and disability configure notions of "apposite" and "inappropriate" childhoods? How do children comprehend various kinds of social difference and inequalities? The purpose of this presentation is to bring to the fore the theoretical potentialities of Multiple Childhood from an intersectional framework globally alongside the interplay of both inclusionary and exclusionary processes and practices taking educational institutions and system of contemporary India as a glaring empirical example . The paper attempts to demystify the so-called normative conception of childhoods acknowledging and underscoring intersections of diversity and difference and respecting the agency of the child and his/her contexts throughout focusing constant contestation, negotiation and reconstruction of spaces for children and by children.

BHOOLA, SHEETAL* (Univeristy of KwaZulu Natal, South Africa)

Labour Force Participation Rates within the Tourism Sector: A Case Study of the Durban Hospitality Sector during a Peak Tourist Season.

This study is aimed at analysing the changing rates of labour participation in the hospitality sector in Durban, South Africa during the peak season for tourism. Within the South African labour context, there is a dominant perception that the majority of wage earners within the hospitality sector are black, young, unskilled and female. The Labour Research Service indicates that the pay is low and not sustainable for these employees (Vettori, 2016: 2) not permanently employed but rather employed on a flexibility basis for long periods of time. South African Statistics indicates that local South Africans are constantly losing their work opportunities to foreign immigrants from neighbouring African countries. Chaskalson (2017) explains that Zimbabwean immigrants are educated and skilled and therefore can easily be employed professionally in South Africa in numerous sectors. These trends in Durban all contribute to the global challenge of wage inequality within the workplace coupled with the lack of institutional labour rigidities and policies which facilitate illegal practices within this employment sector. Primary objectives of the study included investigating the participation rates of employees that are employed permanently and temporarily within this sector and in which capacity African immigrants are employed. Permanent employment is defined and differentiated from temporary and casual employment within the Hospitality sector. Exploitation through "wage flexibility" is also addressed especially amongst casual and temporary employees. A qualitative research approach is used with a sample size comprising of 50 waitrons and 5 restauranteurs through interviews and focus groups.

The Praxis of the Movements to the Social Intellect. Research Coproduction in Public Spaces

Scientific development has privileged theoretical production in the classroom and laboratories. Latin American science and technologies currently have regressive effects. In this time it is a crisis differentiated from those that have distinguished the progressive changes in "normal sciences" (Kuhn, 1971). It is a crisis that deepens the subalternity of knowledge (Mignolo, 2000, 2009; Wise, 2016), and due to a sharpening of policies to reduce scientific expansion, from its productive base, the number of its intellectual producers and its resources and infrastructure. Then, a crisis is set up aimed at its "cientificida" (Giniger y Carbone, 2019) sustainability through a blockade to its productive and reproductive bases; that is, directed especially to the components of the epistemic framework. Therefore, the scientific producers have discovered the need to extend their praxis as a collective resistance in the public space. These Latin American movements (Bialakowsky y Lunisch, 2015-2019) framed in the denomination of movements to the collective intellect they contribute with theoretical-methodological innovations of investigative co-production. As a teaching learning factor in order to unblock the regressions, at the same time, they mutate the scientific paradigm and its praxis (Fals Borda 1987, Freire 1971) towards its expansion with new horizons of sustainable labor and social meanings . This paper will present the results of studies that refer to the production of knowledge of collective subjects that overflow the claustral spaces. Whose condition and additionally build an emerging critical theoretical perspective, detached from a praxis as a collective subject argued for accessibility (Chile), ethnicity (Mexico, Brazil) and expansive sustainability (Argentina).

Theoretical Emergencies in Collective Production. Knowledge and Praxis of Quilombolas Communities in the State of Paraíba

The academy has prevalently established scientific development through regulations with the instrumentation of "epistemic individualism", and privileged in its competitiveness metrics individual authorship. As well as it has privileged the theoretical production in the classrooms and laboratories. This paper will expose the results of studies that refer to the production of knowledge of collective subjects that overflow the claustral spaces. Whose condition and additionally build an emerging critical theoretical perspective, detached from a praxis as a collective subject. This will put into analysis the emancipated communities ex slavers Quilombolas of Caiana dos Crioulos (municipality of Alagoa Grande - Paraíba) and Rufinos (municipality of Pombal-Paraíba). The thesis that is Holding is the the flow of theoretical proposals that are expressed in forms of both language diversity and inter-languages, such as, oral and graphic narratives, the aesthetic, plastic, musical and community dance forms produced by the collective subjects, which transcend the mercantile labor logic. Thus entangling the environmental system with the demonstration of reciprocity with nature and the socialization of their

ancestral knowledge with other subjects. For this, it is considered for the analysis from the three convergent dimensions of research co-production: knowledge creation, creation of cognitive collective and interpellation to the hegemonic social intellect that segregates them.

Times and Spaces of Sociological and Social Theory: A Simultaneous Approach of "Peripheries" and "Centers"

The relationships between "peripheries" and "centers" have been fundamental in defining social and sociological theory, in indicating which productions have been considered as "theoretical" and which have not, as well as in understanding their concepts, analyses and diagnoses ⬚in which reflections on those same "center-periphery" relationships have been included. This is the consequence of having been developed in a field of tensions between different local or national traditions in interaction with wider contexts, be they regional or global, with an imbalanced knowledge circulation (of volume of flows, of legitimacy, of production and circulation possibilities). To account for such questions, we will propose the simultaneous approach as a methodological tool of theoretical research, which questions certain ways of understanding sociology and social theory and, therefore, criticizes the relations of domination implied in them. For this, we will reflect on the complex connection between spaces and times in the production of knowledge about the social. This means discussing both the "reception" and the "culturalist relativism" approaches. Both views can lose sight of the simultaneity of production, debate and circulation of these elaborations. Although this heterogeneous simultaneity is crossed by inequalities and diverse relations of domination, these can only be understood within the framework of the complex nexus between South and North involved in simultaneity itself. In this way, we intend to contribute to a comprehensive study of sociological and social theory both in the South and in the North, in particular, in contemporary times. This study seeks to investigate how certain perspectives face, elaborate and intervene in the specific "theoretical and epochal crossroads" that, although nationally situated, are fundamentally connected to each other: they are framed in a simultaneous and heterogeneous modernity, which neither homogenizes such crossroads nor undifferentiates them, neither isolates them or makes them incommensurable.

Organizations and Expectation States Theories

Expectation states theorists have always recognized that group encounters occur within embedded networks and organizations. However, few researchers have theorized about the linkages between organizational boundaries, behaviors or identities and status processes. This presentation provides not just a literature review of relevant studies within the research agenda of expectation states that pertain to organizations, but also both theoretical critiques of status theories and incorporation of concepts germane to organization theories. For example, organizations bound status beliefs in ways that may change their meanings from wider societal belief systems. External pressures on organizations may spur status generalization in ways not felt by societal circumstances. Organizations may be the perfect incubators for status construction, depending on the social circumstances that they provide. And, some organizational identity processes may promote behaviors that enact status generalization or status construction, perhaps without the intentionality of those who run said organizations. By theorizing about the role of organizations for status processes, expectation states theorists may consider important adaptions to current theories that create extensions, integrations, and even new expectation states theories. Considering another level of social reality, in the form of organizations, within expectation states theories may make an already fruitful research paradigm even more prolific.

Multi-Level Governance of Social Protection and Its Effects on Service Provision: The Case of Single Social Assistance System (SUAS) in Brazil

To coordinate social policies in a three-layer federation, in order to assure national parameters for local policy implementation, is not an easy task. Developed during the social reforms that occurred in the 1990s, national social policy systems in Brazil have played an important role in the federative coordination, especially in the areas of health and, later on, social assistance. In this innovative policy design, the national level is in charge of the policy decision-making and the municipal level is in charge of policy making, whereas the state level should coordinate municipal actions and to provide more complex services. According to the literature expectations, these nationally-regulated social policies would reduce inequalities in social service provision through induction mechanisms like the definition of macro parameters for municipal-level implementation and the dissemination of institutional capacities. In this article we aim to verify, empirically, if these coordination effects occur in a traditionally fragmented policy, social assistance, which has a recent and tortuous path of capacity building. Departing from the literature on social welfare, federal coordination and multilevel governance, the paper analyses the association between the degree of implementation of basic social protection services at the municipal level with local institutional capacities and exogenous social, political and economic factors. To do so, we use official data regarding social assistance in Brazil (Censo SUAS) and a multilevel regression model.

BIELER, ANDREAS* (School of Politics and IR, University of Nottingham, United Kingdom)

European Water Struggles in the Web of Life: Social Reproduction, Ecology and Capitalist Accumulation.

Since the global economic crisis of 2007/2008, austerity and neoliberal restructuring have continued unabated in Europe. This has also included pressure on privatising public services including water. Greece and Portugal, for example, were asked to privatise their water companies as part of a bailout agreement during the Eurozone crisis. And yet, resistance to water privatisation remains strong with broad based alliances of trade unions, citizens' movements, environmental and developmental NGOs organising across civil societies at the local, national and European level.

This paper focuses on the role of trade unions and social movements in the resistance to capitalist exploitation. I will first discuss how we can conceptualise these broad-based alliances. Rather than treating them simply as interest groups, competing with others over influence on government policy, I will argue that we need to conceptualise the way water privatisation reflects capitalist exploitation across the spheres of production and social reproduction. Hence, capitalist accumulation does not only depend on exploiting wage labour in commodity production but equally on appropriating unpaid work by humans in the sphere of social reproduction as well as unpaid work by extra-humans in the wider ecology.

In a second step, I will then focus on key examples of water struggles in Europe including the 2011 Italian referendum, the 2012/2013 European Citizens' Initiative on 'Water is a Human Right', as well as struggles in Greece and Ireland. Analysing these struggles through a focus on class struggle allows me to unravel the internal relations between class agency and the structuring conditions of capitalism, providing us with a clear understanding of why some struggles are successful, while others are not.

MOORE, MADELAINE (Kassel University, Germany)

Water Grabbing, Capitalist Accumulation and Resistance: Conceptualizing the Multiple Dimensions of Class Struggle.

Water grabbing is a global phenomenon and comes in many forms: from the commodification of water for beverages, privatisation of water and sanitation infrastructure and provision, or water enclosures for energy production and mining projects. It can occur in urban or rural areas, often facilitated by state power and imbricated in ongoing capitalist accumulation strategies of expropriation. Never-

theless, water grabbing also elicits strong resistance movements. These struggles may look different, occur in different geographies, and mobilise different people. Despite diverse appearances, we argue, these struggles should be theorised as mediated forms of Class Struggle.

Such a theorisation requires moving beyond an economistic understanding of capitalism. Drawing from feminist social reproduction theory, post-colonial studies and world ecology, we approach the capitalist totality as inclusive of the necessary background conditions of social reproduction and nature. We focus on how dynamics of devaluation and expropriation are vital for capital accumulation to occur, acknowledging that these dynamics of expropriation are gendered, and racialised. This broader conceptualisation of class struggle is located within a historical materialist understanding of capitalism as an open and articulated system of social relations. It captures best the multiple and often successful social struggles occurring on the terrain of social reproduction and ecology in our time of climate crisis.

BIFULCO, LAVINIA* (University of Milano Bicocca, Italy)

Between Sharing and Control: Social Investment and Social Innovation in the the Everyday Practices of Social Policies

The paper focuses on Social Investment and Social Innovation, two crucial policy strategies within the current reorganization of European Welfare States. The starting point is the twofold dynamic through which the domain recognized and treated as "social" expands, on the one hand extending well beyond its traditional boundaries and on the other hand taking on more vague and blurred meanings. The aim is to illuminate the ambivalent dynamics of change, adaptation or resistance that they unleash in the everyday practices of social policies, especially regarding social citizenship and rights.

The analysis is based on the empirical investigation of two cases in Italy: the implementation of an anti-poverty measure in Lombardy, a Northern Region of the country; and a project underway in Milan since 2015 aimed at reconfiguring the balance between supply and demand in care services within the context of a more comprehensive reorganization of local welfare system.

The research, conducted through semi-structured interviews, draws on on the theoretical perspective of sociological studies of public action and on the studies of street level bureaucracy.

The two cases show different aspects of social services governance, in particular concerning the coexistence of increasingly strict control mechanisms with the emphasis placed on principles of sharing and cooperation.

BIFULCO, LAVINIA* (University of Milano Bicocca, Italy)

Philantropy, Financialization and the Welfare State

According to approaches such as Venture Philanthropy or Impact Investing, the philanthropy is undergoing a shift, mixing up the logics of giving with market and finance based logics, on one hand, and techniques of measurement, on the other hand. The label "new philanthropy" emphasizes this "new" mix as well as the "new" role that scientific expertise and assessment have in legitimizing actors and activities.

Yet several scholars wonder what is actually new in the new philanthropy and concentrate on the bases of legitimization, highlighting the symbolic/normative repertoires mobilized as well as the role played by instruments of measurement. Both are linked with the financialization processes and the growing role played by financial investors, intermediaries, logics.

In this picture, the paper focuses on the cognitive/ideational dimension of the"new" philanthropy, bringing to the fore the relationship between philanthropy and knowledge.

The issue of metrics is central from this perspective. The spread of devices of measurement such as social impact assessment responds to the growing demand for objectivity of the giving and in parallel justifies the growing influence of philanthropic actors in the management of social issues.

This focus opens up a range of questions. Among them two are crucial: how institutionalization of "new" philanthropic practices affects welfare policies and the State; whether and how the social domain is redefined by financial logics on one hand, measurement tecniques on the other hand.

The paper deals with these questions presenting the first findings of a research on organized philantropy, fiinancialization and Welfare State in Italy. It investigates practices and discourses that philantropic organizations are developing around the definition and measurement of Social Impact.

The theoretical scheme is based on three main fields: study of public action, governing through numbers and informational basis of policies; socioloy of quantification; analysis of European Welfare States.

Heritage Lawfare in a Decolonizing State: Indigeneity and Intangible Heritage in Bolivia

From the beginning of the 21st century, intangible heritage declarations have proliferated at various levels of Bolivia's governing structures. Such declarations usually take shape through legislative processes that produce multiple laws, each one naming as heritage an individual dance, musical instrument, or genre. This "heritage fever" is occurring in a country that has an indigenous majority in its population. Since the 2006 election of Bolivia's first indigenous president, the country has undergone fundamental constitutional and legal transformations. These heritage-making laws now are emerging in the context of Bolivia's 2009 Constitution that re-founded the country as a "Plurinational State." Paying attention to this proliferation of laws about culture, we borrow and retool the Comaroffs' concept of "lawfare" in this explicitly named "process of change." This paper follows a pre-emptive heritage-making case that competes with the neighboring nation-state of Peru, but also considers case studies that point to a logic of abundance rather than scarcity in the heritage-making realm. The paper works from ethnography and interviews with heritage-making protagonists, highlighting the present mid-level workings of a self-proclaimed decolonizing state, including heritage technicians in the Ministry of Cultures and a new Commission attached to the more diversely populated Legislative Assembly. Although Bolivia's many heritage laws currently have no accompanying regulations and do not provide property protections, we nonetheless argue that this lawmaking has other significant political effects. While some of these cultural politics use idioms of property and point to attitudes about heritage as property of a single nation-state, we point to other realms of this heritage lawfare that operate not by the logic of scarcity and zero sum equations central to propertied ideas, but rather by principles of abundance and reproduction.

Empowerment of Nursing Home Actors: How Participatory Action Research Contributes to an Inclusive Praxis in Public Nursing Homes in Denmark

The objectives: The project addressed the residents' reports about lack of both choice and influence in their everyday lives at the nursing home. Furthermore, the project engaged the employees in the development and implementation of strategies that could improve the quality of life for the residents.

The project goal was to engage the public nursing home employees in establishing actions to enhance the lives of the residents at a public nursing home. More specifically, to increase residents' autonomy and involvement in decision making at the nursing home.

Theoretical frame: Action research was used to organize democratic learning and acting (Lewin 1948) in order to transform a habitual practice into a more social reflexive, collective and morally obliging praxis (Kemmis 2008). Ethics guided the research project and power structures were investigated throughout the action research process (Brydon-Miller 2019). Theoretical concepts of empowerment (Freire 1974) and the importance of participation for older people (Barnes 2018) were applied.

The applied methods: Group interviews, 'future creating' workshops (Jungk & Müllert 1987), network conferences and task force groups with residents, relatives and staff.

Results obtained:

Learning processes were initiated, enabling employees to respectfully engage in dialogue with residents and their relatives about their needs and wishes

Involvement of residents in decision-making was achieved

The development of democratic knowledge building is based on the perspectives of the residents, relatives, and employees

Alternative strategies were implemented to address challenges in the New Public Management agenda of standardized care service

In conclusion, the project contributed to the development of a more reflective and democratic praxis focused on the actors in the daily life of the nursing home. Furthermore, the project led to higher job satisfaction for the staff.

The Rationalization of Hiring: New Evidence about Algorithms, Intermediaries, and Information

The Rationalization of Hiring: New Evidence about Algorithms, Intermediaries, and Information

In a remarkably short period of time, how people search for jobs has shifted from making a direct application to an employer to an activity that is done primarily online through portals that target many potential employers. Faberman and Kudlyak recently observed that "Online job search (OJS) has become a pervasive part of job-finding and hiring in the U.S. labor market."

This shift to digitalized and rationalized hiring presents both challenges and opportunities to researchers. Traditional survey-based data drawn from either employers or job seekers have become less useful in capturing the dynamics of labor market behavior. Opportunities for innovative research now lie in the new availability of huge troves of data that can be collected from such online job search sites as Monster, CareerBuilder, Snagajob, and others.

Established research methodologies are not adequate to a full understanding of algorithmic hiring and labor market intermediation. First, the signals that are now being sent by job seekers and read by employers are increasingly opaque. Second, labor market intermediaries are typically secretive about the nature of the algorithms that they develop and market. Third, the rationalization of hiring is only one piece of the rationalization of the workplace/employment relationship, and cannot be fully understood separately from this broader process of rationalization.

I present findings from an empirical case study of the rationalization of hiring in a particular workplace. I report the results of interviews with those organizational agents who have been assigned the task of developing and implementing a rationalized hiring regime in the organization. I interview both managers with supervisory roles within the organization and representatives of the organization's Human Resources Office, an increasingly strategic location for the enactment of stratification processes and outcomes.

Reception of Asylum Seekers and Training of Operators in Italy. an Empirical Research and Recommendations for Professional Practice

In the last years, one of the main social problem in Italy is the emergency connected to the refugees, who arrive escaping from war, violence and extreme poverty. Micro-level, decentralized *Accoglienza Diffusa* is the predominant approach to the 'management' of the asylum seekers adopted in the Tuscany region. What makes the so called 'Tuscany model' different from other strategies is its effort to integrate not just the individual refugees, but the entire project into the surrounding communities. It would have been preferable than having all the refugees concentrated in single, over-crowded, and inhuman shelters. In the so called 'Tuscany model' the refugees and asylum seekers are accommodated in local governments' properties, second houses or used-to-be municipal kindergarten, otherwise hotels. Beyond the local policies, the core of the system are people working towards the refugees and asylum seekers' integration. In the Italian scenario these workers are new professional figures, not defined throughout specific regulations, but in which mainly young social workers find a space. Whereas it has been written widely about welcoming and integration policies and interventions for migrants, this paper investigates a relatively understudied field in the scientific debate about migrants and social worker methods and practices: young professionals' identity carrying out a profession not always planned into degree courses and professional projects, owing to an high demand of this positions in the job market. Through in-depth interviews, conducted among young professionals working in the welcoming immigration field, can be studied the tuscan and the piedmontese model, and the model of Sicily, territory of migrants landing and hotspots. Satisfaction and fulfillment for getting actively involved against discrimination, for being engaged during a social emergency and for working promoting social justice arise from the interview. Nevertheless it is possible to observe serious inhomogeneities and discrepancies in the social worker training across the Country.

BINGMA, VANGILE* (University of Pretoria, South Africa)

Lecturing Large and Diverse Classes at a South African University: Teaching Practices and Institutional Knowledge

Many universities are starting to turn their focus on diversity and how it is harnessed in classroom practices. Drawing from experiences of teaching large and diverse undergraduate classes, this paper reflects on lessons learned over a period of five years. Two first-year quarter-modules "Race, Class & Gender" and "Social Institutions" with a minimum of 650 students as well as a second-year quarter-module "Gender, Family and Households" with a minimum of 300 students are considered. The reflections are consolidated into two themes. The first theme focuses on a lecturer's positioning in relation to students. Being aware of how students read my body as a black female academic was important. Some students identified me as an ally and assumed that I would affirm their worldviews whilst others thought I would not give them a fair hearing. It was important to create a conducive environment where students felt they could be heard and engaged. The second theme deals with critical moments of openly engaging students on their privilege, sexism, homophobia, xenophobia and disablism. At all times, students were engaged in an effort to disrupt their taken-for-granted ideas and to highlight the structural inequalities buttressing such ideas. Although many students reflected deeply by the end of the modules, some students actively resisted any engagement. Of late, a callous language about the 'other' is taking hold and needs to be confronted. Ultimately, to make and manage space for critical engagement, it is essential to have sufficient formal and informal institutional knowledge.

Creando Conocimientos (i)Legítimos En El Contexto Del Cambio Climático, Chile.

Dentro de los desafíos de la gobernanza del cambio climático, integrar a la ciudadanía no sólo en la necesidad de cambios profundos en nuestros comportamientos, sino también en la movilización de conocimiento es central (Aldunce, Beilin, Handmer, & Howden 2016; Arriagada et al., 2018; Blanco & Fuenzalida, 2013; Hasbún- Mancilla et al., 2017; Sapiains, Ugarte, & Aldunce, 2017). Los conocimientos indígenas, o locales, "han sido ignorados como estrategias viables frente a la problemática climática" (Ulloa, 2008). La ciudadanía ha quedado al margen de la toma de decisiones frente al liderazgo de actores gubernamentales y científicos o expertos en el problema del cambio climático (Ulloa, 2008; Urry, 2015). A partir de esta desigualdad en término de participación, este trabajo analiza cómo la sociedad civil se organiza en Chile para construir y legitimar saberes sobre la gestión y definición del problema. Gracias a un enfoque etnográfico, nos centramos en cómo se vuelven (i) legítimos los saberes movilizados en diferentes instancias participativas. Gracias al enfoque de la sociología pragmática – aún incipiente en América Latina (Breviglieri, Diaz, & Nardacchione, 2017) – rescatamos la idea que en la democracia representativa, la experticia no es inequívoca ni objetiva (Barbier et al., 2013). En ésta, es importante otorgar legitimidad a los problemas formulados por los "profanos" o "locales" (Biskupovic, 2015; Biskupovic & Canteros, 2019; Estades & Rémy, 2003). Cuando no todos los conocimientos son incluidos en la toma de decisiones, aumentan las incertidumbres. Nuestro objetivo es mostrar que los diversos actores

de la sociedad civil involucrados en el problema climático en el país desarrollan procesos participativos en los que se generan conocimientos que son claves para mejorar las acciones, a la vez que traducen, generan y desclasificando saberes distintos ("nativos", profanos, técnicos, científicos, etc.), creando espacios de discusión y desarrollando una cultura política propia.

Mujeres Que Cuidan a Otras Mujeres: La Confianza Creada En El Campo De La Salud En Cuiabá (MT)

El estudio analiza la confianza entre mujeres profesionales de la salud y mujeres que fueron víctimas de violación, en el marco de una política pública de atención a las mujeres víctimas de violencia sexual en un hospital público en Cuiabá (MT). Se busca identificar las tácticas construidas por las profesionales de la salud para atender a este público de mujeres. Considerando que el cuidado es un trabajo que abarca dimensiones prácticas, cognitivas, sexuales, relacionales y emocionales, este estudio se propone reflexionar sobre cómo las emociones, especialmente la confianza, opera en los cuerpos de las mujeres víctimas de violencia, a partir del trabajo de atención. El material empírico que se analiza es producto del trabajo de campo y de la realización de diez entrevistas semi-estructuradas a profesionales de la salud. De acuerdo con los resultados obtenidos, se concluye que las profesionales de la salud enfatizan que el poco tiempo para atender estos casos, la falta de infraestructura y la incipiente formación en estudios de género constituyen obstáculos para construir confianza en estas situaciones; aspecto que, según las entrevistadas, puede ser un factor limitante para que las víctimas de violencia sexual regresen y realicen tratamiento psicológico. Sin embargo, las profesionales buscan tener cuidado de no reproducir el discurso de revictimización, por lo cual son capacitadas para el recibimiento de estas mujeres. De modo que, escuchando "al otro", la confianza parece generarse en el momento en que no interrogan a estas mujeres que fueron víctimas de violencia sexual, considerando el discurso de la cultura de la violación fuertemente difundido en el imaginario social brasileño.

Disputes of Meaning Around Confessional Religion: Tracing Afro-Brazilian and Afro-Christian Strategies Against Religious Persecution in Contemporary Brazil

This study seeks to analyse the strategies of leaders of Afro-Brazilian religions and their allies, among various Christian denominations, against forms of religious persecution prevalent in contemporary Brazil, particularly those operated by militant groups of Neopentecostal Christians against *terreiros* and other such spaces of Afro-Brazilian culture, in a systematic aggression that first came to prominence in the 1980s. The analysis focuses on the recent activity of two collectives, and on the meanings of religion, diversity and (in)tolerance that stir them amid and against the grave sociopolitical contrition of the country during the present decade. Among leaders and adepts of Afro-Brazilian religions, the Tradition of the Orishas group, originally formed to defend their right to religious liberty, begins to question the very western concept of religion, denouncing it as an engenderment of coloniality, which belittles the full civilizational reach of the relationship between the devotion to the orishas and the African diaspora. Among Protestant Christians, a predominantly black group, with ties to *favela* militants, to the Front of Evangelical Christians for the Rule of Law and to the Rio de Janeiro section of the Socialism and Liberty Party, strives to re-signify their confessional allegiance as a specific position of moral stature and doctrinal orthodoxy whence to oppose the alliance between Christian fundamentalism and the Brazilian far-right, in the defence of the basic civil rights of the black population to life and religious freedom. The alliance between progressive actors of Afro-Brazilian religion and members of the many denominations of Protestant Christianity does not occur without a measure of tension, with the recurring possibility of a definitive rupture. Yet, their very conjunction further evinces the fractures of the secular-religious divide in the 21st century, requiring that sociologists of religion engage in a critical reflection concerning the most central categories of their discipline.

BIZZARRI, CARLOTTA* (Università degli studi di firenze, Italy)

Donne: Democracy on New Net Emergency. the Infodemic and Italian Women

The concept of infodemic – WHO's term for an excessive accumulation of information – suggests that the media may have opened the doors to a worrying flow of information during the Covid-19 pandemic. This article sets off from data provided by a survey distributed internationally by RC36, in conjunction with the Institute of Population and Human Sciences, Bulgarian Academy of Sciences, in order to examine the effects of this "media disease," whose spread is intensified by the new digital media. Stéphane Haber argues that the digital revolution has absorbed capitalism and its alienating consequences, much as the Frankfurt School had recognized the role media play in the consolidation of industrial society through alienation. Evgeny Morozov also examines the mass-manipulative capacity of new media, particularly that of GAFA (Google, Apple, Facebook, Amazon), world monopolies that delude people about the free and democratic use of the web.

This presentation investigates these arguments by questioning women who responded to our questionnaire concerning how they redefined their relations with the media during the pandemic in order to understand 1) whether they were able to distinguish between fake news and genuine news and 2) whether they perceived an increase in their distance from institutions and politics, which involves a form of agency deprivation, or, in contrast, took advantage of their online presence, primarily for work reasons, to identify new issues and acquire voice. The answers to these two questions provide an opportunity to grasp either the presence of an alienated gaze concerning the particular problems created by the new digital media, or, on the contrary, the emergence of a potential new awareness and agency building. Our investigation employs a two-stage methodology. The first stage comprises the distribution of the survey noted above, while the second involves a series of in-depth interviews with women respondents.

Enfoques Sobre La Infancia En Una Ocupación Urbana Horizontal En Las Afueras De Belo Horizonte, Brasil

El objetivo del trabajo es analizar las condiciones de participación y agencia de niños en movimientos sociales. Con este fin, fueran contemplados los discursos de los adultos y las expresiones de la participación de los niños en una ocupación urbana en Belo Horizonte, Brasil.

Las ocupaciones colectivas organizadas son fenómenos recientes en las metrópolis brasileñas, que constituyen un movimiento social centrado en el derecho a la vivienda de familias de clases populares. Los niños participan en el movimiento desde las acciones de ocupación y su presencia es un elemento legal importante para legitimar la propiedad del territorio. Al mismo tiempo, en la vida cotidiana, las demandas de los niños movilizan las acciones de los adultos en la producción y gestión del espacio.

En un escenario de infancia marcada por la participación en procesos de resistencia colectiva, el trabajo consistió en escuchar y observar la vida diaria de un grupo de unos 10 niños de diferentes edades, vinculados a líderes de movimiento, aliados con la exploración del territorio ocupado y de instalaciones culturales de la ciudad. Al mismo tiempo, buscamos, a través de entrevistas con las madres, captar su percepción de la participación de los niños en el movimiento, así como dar visibilidad a los proyectos de futuro y a los deseos de transformación social expresados en sus discursos.

La investigación se basó en el estudio de la dinámica de las relaciones intergeneracionales que informan las condiciones de participación y agencia infantil en las redes de familias y vecindarios. En vista de la composición de los núcleos familiares observados, típicamente matrifocales, donde las mujeres son las principales líderes del movimiento, la investigación contempló la participación y la agencia de los niños dentro de las relaciones de género y generación.

BJØRKHAUG, HILDE* (Norwegian University of Science and Technology, Norway)
MUIRHEAD, BRUCE (University of Waterloo, Canada)

The Role of Finance Capital in Animal Welfare Standards

Good animal welfare (AW) in an ethically sound animal livestock production system is a basic premise in a sustainable food system. Societal values and attitudes have an important influence on food production and any shift in social attitudes about AW provides both significant risks and opportunities in farming. The GoodAnimal project aim to acquire knowledge that will mitigate threats and increase opportunities for sustainable farm and industry practices, in building

knowledge on 1) how societal attitudes and evaluations of AW are changing, and how this impacts on farmers' evaluations of their practice as 'good farmers', 2) the key sites and places where these evaluations are being mobilised or contested and how these create changing dynamics in farming's 'social contract to farm', 3) compare consumers' perceptions of a 'good farmer' with a biological perspective, taking physiological functioning, natural behavior, and animals' subjective experiences into account.

This paper focus on how AW has been elaborating as an increasingly complex terrain of regulation and the forces driving the development of new private AW in the food chain. Recently, private-sector AW standards and auditing has become an important parallel world to formal governmental regulation. The trend towards a shifting of food regulation from formal government to private governance has been widely discussed in the social science literature (Power, 1997) and has been increasing internationally in scope and scale over the last 20 years (Busch 2000). This has taken place very strongly in agrifood supply chains and retailing (Hatanaka et al., 2005) and is being identified as a key driver of changing farmer practices and culture both internationally (Rosin, 2008), and in Norway (Bjørkhaug et al., 2015). This paper shed light on the role of financial capital and private investment into these processes.

BLACHA, LUIS* (IESCT-UNQ/CONICET, Argentina)

Hunger, Obesity and Soy. the Agribusiness Diet in Argentina

The new uses of the territory in Argentina of the 21st century allow an increase in productivity that cannot be transferred to the nutritional field. The consequences of soy monoculture include a simplification of ecosystems and an augmentation in the overweight in the population, which increase existing social inequalities. A country of 45 million inhabitants that produce calories for 400 million human beings, many of them proteins, has strong nutritional inequalities. Despite having consolidated a unified food pattern since the late 19th century, with access to proteins of high biological value, Argentina begins the transition of its agrifood chains in a context of great social inequality.

This paper aims to analyse how agribusiness solutions end up generating new social problems that increase the existing asymmetries. The notion of risk of Ulrich Beck dialogues with the biopower of Michel Foucault to understand the rationality of agribusiness as a feedback that combines climate change with malnutrition. New forms of malnutrition where "the hunger fat people" are present in the strong bond are established between the decline in income and the increase in consumption of sugary products. This is a peculiar scenario in the global South because its characteristic diet was based on excess: native versions of popular European dishes with lots of meat. In the case of Argentina, the question of environmental sustainability must also include the population's healthiness as monoculture trends significantly reduce the omnivorous nature of the diet. The proposal is to carry out a critical sociological approach to the prevailing power relations that prevent transforming the agrifood system, that distance consumers from producers and question us if we can survive the Anthropocene.

BLACHA, LUIS* (IESCT-UNQ/CONICET, Argentina)
JUAREZ, PAULA* (IESCT-UNQ, Argentina)

Malnutrición Por Exceso y Nuevas Desigualdades En La Argentina. Un Análisis De Biopoder En Clave Socio-Técnica (1996-2019)

La actual transición del sistema agroalimentario argentino tiene su origen en los usos del territorio orientados al agronegocio. El monocultivo y la creciente incidencia del sobrepeso en la población argentina son consecuencia -entre otras causas- de las políticas neoliberales implementadas en la región. La degradación de la dieta en Argentina tiene un punto de partida distinto ya que el país contaba con un patrón alimentario unificado que permitía el acceso a proteínas de alto valor biológico y establecía vínculos similares con la comida, más allá de las diferencias sociales.

La incorporación de nuevas tecnologías permite una excesiva simplificación de los ecosistemas para incrementar la productividad, en especial cuando en 1996 se realiza la primera campaña oficial de soja transgénica. Un país con 45 millones de habitantes como la Argentina genera calorías para 400 millones de seres humanos, muchas de las cuales son proteínas, sin embargo, los usos del territorio y el sistema alimentario generan nuevas desigualdades: las nutricionales. Existe un fuerte vínculo entre la baja de ingresos y el incremento en el consumo de productos azucarados que da origen a "los gordos del hambre".

El objetivo de este artículo es analizar estos procesos de transformación en la nutrición argentina y los sistemas alimentarios durante el período 1996 a la actualidad desde un abordaje crítico de 'biopoder', 'riesgo' y 'seguridad' (Blacha, 2019) en combinación con un análisis socio-técnico que permite reconstruir los diferentes elementos heterogéneos que están en juego y las relaciones entre los mismos (Thomas, 2008; Juarez y Becerra, 2012). Se propone desarrollar una original caracterización de la 'racionalidad del agronegocio' que incluye al sistema tecno-productivo de monocultivos como a las grandes cadenas de supermercados,

vinculando la creciente epidemia de obesidad con el cambio climático. La comprensión sistémica socio-técnica de estos procesos genera insumos para nuevas iniciativas de seguridad alimentaria.

Genealogy of Violence

Abstract. This paper presents a genealogy of the concept of violence. Previous research by the author and others on thinking about terrorism can provide a useful guide to thinking about violence (Blain 2018; Schechter 2018). There is a biopolitics to the definition of violence. Genealogy focuses on the history of that struggle. Categorizing and counting incidents of violence is a governmental practice, requiring interpretations of the law, and operational definitions, and statistical analysis to determine rates of violence. These practices have applied legal definitions of criminal violence (e.g., "homicide" and "rape"). Some social scientists have adopted the FBI's definition of terrorism to operationalize this concept.

We know from the French etymological record that terror had positive associations until well after the French revolution. Sovereigns used violent victimage rituals (tortures, massacres, and wars) to extend and defend their empires, and glorify their rule. The response of the existing power structures to the French Revolution produced a re-articulation of democratic "terror" in negative terms--revolutionary liberalism and its "reign of terror."

The social sciences emerged as a rational-scientific response to the threat of terror. The social science would be the remedy to the twin threats of civil war or colonial resistance. There posed two problems. State interventions incite more violence. Secondly, acts of violence can be understood as a "normal" responses to acts of deviance. The elites write the laws; they may ignore certain forms of violence.

Changing Gender Differences in Dating and Partner Preferences Among Young Chinese Adults

Over recent years, China has experienced considerable social, economic, and political change as a consequence of ongoing modernization. Amidst the various changes in family structure, such as higher divorce rates, lower marriage rates, and rising cohabitation rates, young adults in China nonetheless attempt to seek out intimate partners. Using data from a multi-year (2015-2019) study of Chinese college students, this study examines the changing attitudes concerning dating and dating behaviors, along with the changing preferences for partners' characteristics. The analyses reveal males to have stronger desires to both date and eventually marry, as compared to females. Across the samples, males' desire to marry has increased, while females' desire has declined. Females report more conservative preferences concerning dating, with a lower desire to date, as well as a lower preference for physical intimacy within dating relationships. Young males place a higher premium upon the physical appearance of their dating partners, yet both sexes report preferences for partners with more pragmatic qualities, such as earnings potential and high educational attainment. Parental and family characteristics are significantly associated with males' dating and partner preferences, while females appear to be less readily influenced. While both sexes express strong preferences concerning romance and intimacy, higher educational and occupational aspirations are associated with lower desires to be involved in dating relationships, as well as a lower preference for marriage, among young adult females. The relative impact of educational and occupational aspirations is shown to have increased over recent years. Overall, the analyses suggest that contemporary Chinese dating patterns are evolving, with young adults' preferences becoming increasingly individualistic. Parental and family influence appears to be declining, and the difference between the preferences of young adult women and men appear to be widening. The results are discussed within the framework of both modernization theory and cultural globalization.

Organic Tomatoes in Heated Greenhouses. a Subordination of "Natural Cycles" to Capitalism?

The "natural cycles" of plants are forced to coincide with the imperatives of production and consumption that capitalism supports. Greenhouse farming is accurate in creating favourable conditions for extending seasonal growing periods, using different techniques (artificial lighting, heating, hydroponics etc.), in order to produce and sell off-season products all year round. While widespread in conventional agriculture (i.e. intensive farming systems using synthetic inputs), organic agriculture has been for a few years subject to deseasonalisation, under the pressure from industrial players in France. For less than a decade, powerful cooperatives have been supporting the conversion of their members' greenhouse production tool from conventional to organic, using oil heating. Such practice was not (and still is not) prohibited by European regulations, which left it up to each Member State to decide how to apply (and therefore interpret) the regulation on organic farming. In 2018, a controversy emerged between two coalitions of actors about the use of oil heating in organic greenhouses, in order to produce tomatoes - the most widely produced and imported greenhouse product - all year round, in a counter-seasonal manner. While a coalition of traditional actors of the organic sector argued seasonality in production and consumption patterns was essential in a context of global warming, it met with industries, together with chambers of agriculture and national political actors, who justified counterseasonality by the "distortions of competition" with southern countries - which benefited from favourable weather conditions to produce year-round. For them, "natural cycles" should be defined according to existing practices and consumer demand. With the help of documents, articles, and interviews of the main representatives of both sides, we trace the evolution of the controversy's framing, from Finistère, in Brittany, where the majority of the production of tomatoes under heated greenhouses (conventional and organic) existed.

Del Ejercicio Liberal a La Segmentación De Las Profesiones

Las profesiones han sido de manera tradicional consideradas como liberales. Sin embargo, como Freidson advirtió están pueden presentarse bajo tres formas o modelos según los procesos epocales que configuren a cada una: como de ejercicio profesional liberal, burocratizada o de libre competencia en el mercado. Esta ponencia, este sentido, busca analizar a partir de los modelos de Freidson cuál es el estado que guardan las profesiones en México, pero no considerados tales modelos como absolutos, sino como posibilidades o fragmentos de un ejercicio casi simultáneo por los agentes. En todas las profesiones hay segmentos que corresponden a cada modelo, aunque uno de ellos impere. Incluso, en algunas profesiones como la médica los agentes participan a la vez de cada uno de ellos, de lunes a viernes como empleados públicos de un hospital, por la tarde ejerciendo de manera privada, y los fines de semana ejerciendo en un consultorio de farmacia. En cada uno de ellos con una dínamica propia que genera condiciones laborales específicas. De ahi, que la propuesta sea pasar de los modelos a un enfoque de segmentación de las profesiones o segmentación del mercado de trabajo de las profesiones. La ponencia se resuelve a partir de un análisis cuantitativo de la Encuesta Nacional de Ocupación y Empleo, y como ejemplo a manera cualitativa de la profesión médica.

BLANCAS MARTÍNEZ, EDGAR* (Universidad Autónoma del Estado de Hidalgo, Mexico)

Una Revisión De La Profesión medica En México Desde Eliot Freidson

La ponencia analiza a partir de la propuesta de modelos de Eliot Freidson la situación y dinámica que mantienen la profesión médica en México. Esta ha pasado del ejercicio liberal a su burocratización en el siglo XX atada a las políticas de universalización de atención a la salud, no obstante, en los años recientes el mercado asume, al menos por el grupo de los jóvenes egresados de medicina, una preeminencia en la organización de la misma y las situaciones de trabajo. En este proceso la aparición de los Consultorios de Farmacia, un espacio con similitudes a las Tranbliclinicas, es determinante en un contexto de flexibilización global. La ponencia se resuelve desde un planteamiento teórico histórico, pero también a nivel empírico a través de la revisión de datos de la Encuesta Nacional de Ocupación y Empleo y entrevistas a profesionistas del campo.

What Narratives inside the Family ? Orphans of the Genocide Against the Tutsi Facing the (absence of) Familial History

For survivors of the genocide against the Tutsi, memory and family are highly connected. The loss of the relatives and the way they were killed have shaped and sometimes prevented the elaboration of any narratives and their transmission. The « structural conditions to access to the past » (Lepoutre, 2005) are a collective challenge for rwandan youth and for young adults. The absence of the dead people, the intertextual fabric of memories (Welzer, 2013) and the time that takes us away from the event increase difficulties accessing familial knowledge.

The object of my PhD research in sociology deals with transmission of memory within transnational rwandan families, considering genocide and migration. People dispersion is part of the consequences of all genocides.

My fieldwork has mainly been done in France. I made one to several semi-structured interviews with fifteen persons who were less than twenty during the genocide. I completed it with interviews of family members in Rwanda. And I observed commemorative events that were organised in a big french town.

In this session, i will focus on the psychological, social and economical difficulties to share memories to relatives. Transmission desn't only function from the elder to the younger but even between siblings. I will introduce the case study of three orphan brothers. Their kowledge of familial history is different ; their way to deal with memory too. Two of them wrote a testimony without including the others during the publication. The third one was one-year old in 1994 and has growned up with cousins, who did'nt talk to him about his family. As they can't talk about the past to each others, they try to discover it with an « affective community » (Halbwachs, 1950), medias or even with the researcher, as a « narrating third party » (Michel, 2016) ?

BLANCO, EMILIO* (El Colegio de México, Mexico)

Mecanismos De Discriminación Educativa En México: El Efecto De La Lengua, La Identidad Étnica y El Color De Piel En Las Transiciones Educativas

La asociación entre la condición étnico-racial de los individuos y sus oportunidades educativas ha sido poco estudiada en México, en comparación con la atención recibida por factores como el origen socioeconómico y el sexo. Este trabajo busca contribuir en dicha dirección, al indagar cómo inciden en la probabilidad de acceder a cada nivel educativo (primaria, secundaria, media superior y educación terciaria) tres dimensiones centrales de la condición étnico-racial: a) la condición lingüística; b) la auto-adscripción étnico-racial; y c) el color de piel auto-declarado.

Mi tesis central es que en la educación mexicana existen dinámicas de discriminación a nivel micro (escuelas) que afectan las oportunidades educativas, lo cual debería reflejarse en efectos significativos de las tres variables. Me interesan, especialmente, los efectos asociados al color de la piel. A diferencia de la condición lingüística y de la auto-adscripción étnico racial, estos efectos no podrían ser explicados tan fácilmente por mecanismos alternativos como la precariedad de recursos educativos a los que accede la población indígena, o la operación de criterios "legítimos" de discriminación (para los actores educativos) como el dominio de la lengua castellana. Subsiste, no obstante, la posibilidad de que al menos parte del efecto observado sea explicable por una relación causal inversa: el "blanqueamiento" de los sujetos con mayores niveles de logro educativo.

En el análisis se utilizan los microdatos del Módulo de Movilidad Social Intergeneracional (MMSI 2016) del Instituto Nacional de Estadística, Geografía e Informática, para estimar modelos de regresión logística sobre cada una de las transiciones relevantes. El MMSI permite ajustar los coeficientes por un conjunto amplio de variables potencialmente confusoras, así como explorar la interacción entre las variables de interés y otros factores relevantes para la desigualdad de oportunidades educativas: origen socioeconómico, sexo, región y localidad de residencia.

BLASKO, ANDREW* (Bulgarian Academy of Sciences, Bulgaria)

Adopting the Perspective of the Socially-Constructed Inferior: The Acceptance of Power

The aim of this discussion is to draw attention to a number of potentially very troubling issues for the notion of social interaction, particularly in respect to adopting the perspective of the other. Even though doing so is typically presented in a positive light in terms of cognitive sympathy, I contend that it can in fact comprise a form of alienation from self. In particular, we must question whether it is possible to take the perspective of one whom we constitute as socially, culturally, or racially inferior. While adopting the position of the other may constitute empowerment from a certain perspective, there would be no motivation to value and/or seek such empowerment for one who already possesses and wields power over the other. There is no need to cooperate with the other, and thereby foster mutual empowerment, for one who already enjoys everything that power makes possible at another's expense. Moreover, taking the position of master over another whom I have constituted as inferior also constitutes an affirmation of the structure of power in society as a whole in that we endeavor to participate in that structure by doing to another what has already been done to us. This comprises the acceptance and reproduction both of the particular state of affairs in which we find ourselves, and of the social order of power as a whole insofar as we seek to propagate it.

Faces of Inequality: Multidimensional Inequality in Comparative Perspective: Evidence from Buenos Aires and Ciudad De México

Inequality is one of the great problems of our time. Yet while inequalities are studied by a range of disciplines and perspectives, there remains little sustained interdisciplinary or comparative work. This limits our understanding of how inequality affects people's lived experiences, and how it varies across countries. In this paper we tackle both challenges by attempting a multidimensional understanding of inequality and a comparative perspective between two capital cities in Latin America: Buenos Aires and Ciudad de México.

We combine quantitative and qualitative data on households throughout the social structure. Statistics alone give little sense of the effect of inequality on people's lived experience (Pla, 2017, Bayon and Saravi 2017), while ethnographic and qualitative research rarely explores the full distribution, focusing in detail on only a subset of it (Flemmen and Savage 2017). Instead, we merge the representativeness of quantitative studies with the depth and nuance of qualitative analyses. We probe inequalities both between individuals as well as between groups defined by class, gender, ethnicity, geography, and other salient characteristics.

We use quantitative data about inequality available in representative household surveys (ENIGH, Mexico and EPH INDEC, Argentina) to systematize 50 in-depth interviews from each city, taken across different social strata. These are the outputs of two projects: Faces of Inequality, a collaboration between King's College London, Oxfam Mexico, Revista Chilango and Periodismo CIDE, and PICT 2013 ¿Una nueva fragmentación social? Socialización/riesgos y movilidad social, funded by Agencia Nacional de Promoción Científica y Tecnológica, Argentina.

The comparative approach follows Robinson (2006), who explores the production of "social infrastructure," understood as the socio-material resources, practices and spaces that reproduce human life in the city. In this framework, contestations over care work, healthcare, transport, housing and education expose commonalities between cities, thus making Buenos Aires and Mexico City comparable in their diversity.

BLOIS, JUAN* (National Scientific and Technical Research Council (CONICET), Argentina)

Desafíos y Dilemas De La Sociología Como Profesión

En las últimas décadas, las actividades profesionales de los sociólogos en distintos países del mundo tuvieron una clara expansión. Al lado de la tradicional inserción en las universidades y centros académicos, una serie de prácticas destinadas a responder de modo más inmediato a las necesidades de clientelas y públicos no académicos fue ganando presencia. Tales prácticas, desarrolladas en el ámbito del Estado, las empresas, las agencias de investigación de mercado y opinión, así como en ONGs, han venido ampliando el abanico de opciones laborales de los sociólogos, que se vieron llevados a desarrollar un conjunto de nuevos saberes y destrezas diferentes de los demandados en el medio académico. Desde la orientación y confección de las políticas públicas contra la pobreza hasta el planeamiento de las estrategias de comunicación publicitaria de las grandes empresas, las actividades y espacios de intervención han sido heterogéneos. Aun cuando el trabajo de los sociólogos más allá del medio académico no carece de antecedentes, el nuevo contexto conllevó una profunda redefinición de los campos de intervención de la sociología y del propio escenario de la disciplina, caracterizado ahora por la consolidación y multiplicación de un conjunto variado de "oficios de sociólogo", con estilos de trabajo, destinatarios y desafíos particulares. En este marco, este trabajo se propone discutir sobre las tensiones y dilemas que las demandas de diversos agentes e instituciones suponen para la práctica sociológica contemporánea. Para ello, en base a una mirada que explora la situación registrada en diversas latitudes, se reflexionará sobre la relación de los espacios de formación con las prácticas profesionales de los graduados, los sentidos y dificultades de la participación de los sociólogos en el espacio público, los vínculos con las diversas clientelas, así como las relaciones entre los sociólogos trabajando en diversos escenarios profesionales.

BLOIS, JUAN* (National Scientific and Technical Research Council (CONICET), Argentina)

US Influence on Argentinean Sociology. Funding, Ideas, and Controversies (1950s-1970s)

The development of sociology in Argentina after WWII was the outcome of the interaction of local and international actors and institutions. The creation of the first undergraduate school at the University of Buenos Aires in 1957 was welcomed by its authorities; but the launching of its ambitious research agenda, the recruitment of professors from other countries to lecture, and the sending of young instructors to follow graduate studies abroad, was only possible because of the funding offered by a network of institutions, comprising UNESCO and OAS but also Ford and Rockefeller foundations. That network proved crucial since, in contrast to Brazil, Chile or Mexico, the promoters of sociology did not garner much support from local sources. In such a context, the influence of US sociology was strong, clearly visible in the theories and methodologies that were taught, as in the general disdain for previous local intellectual traditions. However, it did not take long for a younger generation of sociologists to question US ascendancy. In the context of the Cuban Revolution, the diffusion of an anti-imperialist stance, and a surge in political activism, those sociologists started to promote a "national sociology" that denounced US foundations as agents of imperialism. Based on different documentary sources and interviews, this paper seeks to analyze the controversies on intellectual dependency amongst Argentinean sociologists, along with the dilemmas concerning foreign funding in a context where local resources to do research were scarce. Addressing the period comprised between the mid-fifties and the mid-seventies, when those debates were cancelled by the establishment of a dictatorship engaged in brutal repression, the study will not only focus on the mutual influences between "cosmopolitan" and "nationalist" sociologists, but also on the dynamics and gravitation of their different publics, and the general situation of the academic job market.

From Micro-Level Experiences to Macrostructural Encounters: Retiree Socioeconomic Status and the Socioemotional Experience of Pandemic Time

This article integrates literature from the sociology of the life course, sociology of emotions and the sociology of time to examine how SES influences retiree civic engagement during the COVID-19 pandemic. Using longitudinal data and in-depth interviews, I find that SES is instrumental in shaping both the social experience of time and the prevalent emotions experienced by retirees while physically distancing during the early days of the pandemic. These individual-level experiences translate to markedly different blueprints for civic engagement. High-SES retirees were more likely to 'go global', organizing to advocate for their interests. Conversely, low-SES retirees were more likely to 'turn in', minimizing their civic engagement. Women's strategies for 'going global' differed. My findings reveal how existing sociopolitical inequalities may become further entrenched in public health crises. Policies aimed at combating inequalities in later life also need to consider socioemotional and sociotemporal factors.

BO, BOROKA* (University of California, Berkeley, USA)

Good Time, Bad Time: Socioeconomic Status, Time Scarcity and Well-Being in Retirement

We tend to think of retirement as a great equalizer when it comes to relief from the pernicious time scarcity characterizing the lives of many individuals in the labor force. Puzzlingly, this is not entirely the case. Using data from the MTUS (N=15,390) in combination with long-term participant observation (980 hours) and in-depth interviews (N=53), I show that socioeconomic characteristics are important determinants of retiree time scarcity. Neighborhood disadvantage gets under the skin via time exchanges that are forged by both neighborhood and peer network characteristics. The SES-based 'time projects of surviving and thriving' undergirding the experience of time scarcity lead to divergent strategies of action and differing consequences for well-being. For the advantaged, the experience of time scarcity is protective for well-being in later life, as it emerges from the 'work of thriving' and managing a relative abundance of choices. For the disadvantaged, the later life experience of time scarcity is shaped by cumulative inequality, further exacerbating inequalities in well-being. The final section of the article offers an analysis and interpretation of these results, putting retiree time scarcity in conversation with the broader literature on socioeconomic status and well-being.

Solving Arsenic Groundwater Contamination through Socio-Technical Innovation

As part of the UNDP Sustainable Development Goals (SDG 6), clean and accessible water for all is an essential part of the world we want to live in. Governance and policy should be supportive of affordable technologies that will provide safe and affordable drinking water especially in communities where access to water is compromised due to contamination.

In 2015, a groundwater analysis report found areas in the Philippines with high concentrations of arsenic. Between 2010 and 2014, there were 215 reported cases of dermatological symptoms of arsenicosis or arsenic poisoning (Dutch Risk Reduction-Team 2015). If left unchecked, the arsenic contamination plaguing the Philippine groundwater may trigger one of the most lethal health hazards that the country is to witness in the succeeding years.

Through a collaborative effort between scientists from UC Berkeley and the University of the Philippines, a robust arsenic-removal technology known as Electro-Chemical Arsenic Remediation (ECAR) was introduced to the affected communities in the Philippines to provide low-income communities with clean and safe drinking water. ECAR has been proven to effectively and efficiently reduce the amount of arsenic in groundwater to below the World Health Organization established safe limit in similar areas.

This article maps how efforts for technological intervention should account for the unique constellation of norms, actors, institutions, incentives, prevailing beliefs and political economy prior the installation of the technology in order for it to be ethical, sustainable and socially accepted. Both quantitative and qualitative methodologies were harnessed to gain a comprehensive understanding of the sociocultural context, considerations and implications of introducing a technological innovation to a locality in the Philippines. The article also provides recommendations to serve as guideline for further studies tackling the crucial role of social-technical innovations in solving the emerging water problems in the country.

BOADO, MARCELO* (Universidad de la República, Uruguay)

50 Años De Movilidad Social y Educativa En Montevideo y Buenos Aires. La Experiencia De Los Hombres Jefes De Hogar Entre 1959 y 2011.

Este es un trabajo comparativo entre las ciudades de Montevideo y Buenos Aires. Su objetivo general es medir la fluidez social en y entre ambas ciudades, y cómo esta se apoya en la movilidad social de clase, la desigualdad de oportunidades educativas, los retornos educativos de clase. Se limita en sus observaciones, y conclusiones, a los hombres jefes de hogar, porque los datos que se usan para 1959 sólo tienen información para hombres jefes de hogares. Para la época mas reciente se usan submuestras para cada ciudad provenientes de las encuestas de PISAC (Argentina ,2011) y ELPS (Uruguay 2013) que nos otorgaron licencia. Los datos para Buenos Aires 1959, fueron reprocesados y tratados, a partir de la licencia de ICPRS. Los datos para Montevideo 1959, fueron generados a partir de datos agregados de trabajos de IUtaka (1963), Labbens y Soalri (1966), por Iterative Proportional Fitting, siguiendo las propuestas de Lomax y Norman (2016) y Husinger (2008). Y verificados en varios paquetes estadísticos. Para el desarrollo de las hipótesis se optó por la propuesta de Gil, Perales y Fachelli (2017), y se procuró establecer un diálogo entre los autores regionales e internacionales en la interpretación y discusión final de resultados. Las ciudades no dejan de mostrar parecido, pero para las diferentes hipótesis exhiben a veces comportamientos convergentes y otras veces netamente divergentes. El papel transformador de la educación es importante pero no parece reducir la desigualdad de clases, y por momentos se yuxtapone a la movilidad social.

BOANADA-FUCHS, ANTHONY* (St Gallen Institute of Management in Latin America, Brazil)

Affordable Housing in India - the Multiple Roles of Real Estate Developers in Ahmedabad

The idea of affordable housing has recently informed several housing policies in the Global South, within which governments use comprehensive stimulation packages to attract market-based supply in order to address national housing shortages. While the academic discourse is slowly acknowledging this changed reality, little is known about the actual characteristics of projects as well as the involved stakeholders. The proposed conference contribution discusses the market-based affordable housing supply in the Indian city of Ahmedabad. The nascent market niche has seen a considerable development in its first five years before the government launched major stimulation packages. Real estate developers involved in the affordable housing projects differ not only in their business models but also in the range and depth of their involvement in urban development of the city. Large and/or established developers are able to influence policy making and urban planning while small developers are facing various institutional hindrances due to a lack of administrative capital. In order to achieve the pro-claimed goal of Housing for All by 2022, the government (and academic research) needs to deepen its knowledge on market supply logics and release more consistent incentives for market actors.

RC43-530.4

BOANADA-FUCHS, ANTHONY* (St Gallen Institute of Management in Latin America, Brazil)

Responses to the Global Financial Crises - Comparing the Indian and Brazilian Experience

The Global Financial Crises (GFC) has fundamentally impacted real estate markets around the world and (to lesser extent) local practices of financing and construction buildings. Countries have reacted very differently to the GFC and the challenges it represented for national economies and societies. The financialization literature has struggled to acknowledge this diversity (see Varieties of Capital) and still needs to convincingly connect global investment practices with local real estate markets. On the other hand, deeply-rooted analysis of real estate markets (e.g. British property development literature, institutional economics) face difficulties to explain in which path-dependent developments are influenced by global networks and decision making.

The proposed conference contribution analyzes the Brazilian (state focus Sao Paulo) and Indian (Gujarat) reactions to the Global Financial Crises by highlighting the different policy mechanisms deployed at the national, state, and local government level. While the overall aim is broadly shared (stimulating the local economy and demand) and the policy levers to a certain extent part of an international tool box (tax rabats, subsidies, grants, development rights; public housing programs), the specific answers can only be fully explained by understanding the local housing and planning traditions in place.

The Brazilian and Indian housing regimes can be explained by the pre-existing institutional configurations (historic constellation of decision makers and policy tools) but also the political economy of the place (nested interests, informal networks). The underlying information has been collected during a doctoral and post-doctoral research and is currently post-produced into a publication.

BOBOC, CRISTINA* (Ghent University, Belgium)

'the City Is Not for Everyone!'. Class Performance and Space Claims in Baku's Modernization Project

"Azerbaijan is rich. Now it wants to be famous" states an article from The New York Times magazine. Relying on the revenues from oil and gas extractions, the Azerbaijani government paid special attention to "put Azerbaijan on the map," as the locals used to say, by hosting big international events and developing architectural mega-projects. Or as the New York Times suggests, to make it famous. In consequence, especially in the capital city, an intensive "modernization" process has begun; including "beautification" of the city, investments in the infrastructure, de-bureaucratization of public services, etc. Along with transforming the façade of the capital city, the Azerbaijani authorities decided to change the social stratification of the city, claiming the need to create a new middle class.

Drawn upon ethnographic-based methods carried out in the capital city Baku between 2016 and 2018, I explore how the radical and accelerated urban transformations affect the daily life of the citizens. More precisely, I examine how the aspirational middle class status is being performed, and how the newly built space has become an object of desire and prestige. While the authorities decided to "clean" the city center of the Soviet remains and signs of poverty, expelling the citizens who cannot afford the new center, the aspirational middle class would seek to distance itself from the new internal migrants (who came to the city attracted by the promise of a better life or to escape the conflict in Nagorno-Kara-

bakh area. Although the conflict between korenniye bakintsy (native-born bakuvians) and rayonniye (the internal migrants) is a tacit one, it is daily manifested in the language one speaks, the places one visits, or the schools parents choose for their children.

BOCCHINO, MATTEO* (Gran Sasso Science Institute, Italy)

Intermunicipal Cooperation in Italy. the Case of Municipal Unions

In Italy, inter-municipal cooperation (IMC) has been increasingly adopted to tackle issues of territorial scale and cost reduction. Implementing policies involves different tiers of government, defined as inter-governmental relations. This study aims to bring existing empirical data about several perspectives and different approaches into one articulated description of trends and practices of IMC in Italy, with a special focus on the case of Municipal Unions (MUs). MUs are juridical entities constituted by two or more municipalities for the joint management of functions or services. Though there are many calls to reshape administrative boundaries, little is known about how these organizations are distributed, about their internal governance structure, and how they are managed by municipalities. The research will contribute by proposing a way to analyse these organizations of municipalities based on their financial activity. The results of the analysis outline the fragmentation of the situation in regional terms and the heterogeneous implementation of MUs across the country.

BOCHATAY, NAIKE* (University of California, San Francisco, USA)

Learning to Manage Uncertainty in Residency Training

The practice of medicine is fraught with uncertainty due to diagnosis, treatments, outcomes, and communication. Learning to manage uncertainty can be a difficult process for medical trainees, as sociologists interested in processes of socialization into the medical profession have shown. In recent years, changes in the healthcare context and advances in medical knowledge and technology have led medical educators to stress the need to better prepare trainees to manage uncertainty. While managing uncertainty used to belong to the hidden curriculum of medical education, it is becoming an explicit focus of training and assessment. In light of these recent changes, I sought to understand how resident physicians learned to manage uncertainty in contemporary healthcare settings. Throughout 2017, I conducted ethnographic research at two teaching hospitals, one in Switzerland and one in the United States. Data collection consisted of field observations, informal conversations, and semi-structured interviews with healthcare professionals in internal medicine and surgery. Following constructivist grounded theory, I iteratively analyzed the data to develop a deeper understanding of how resident physicians learned to manage uncertainty in different settings. Findings suggest that resident physicians developed different attitudes towards uncertainty: in Switzerland, they adopted a pragmatic attitude and sought to minimize uncertainty; in the United States, they adopted an acceptive attitude and embraced uncertainty. These findings can be explained by contextual factors such as the structure of residency, work hour regulations, and salary, which meant that resident physicians were perceived as employees in Switzerland and as learners in the United States. These roles influenced the ways in which resident physicians were supervised: in Switzerland, they had little direct supervision and needed to accomplish more work. In the United States, they were directly supervised and had more time to address uncertainty. As a result, resident physicians developed contrasted attitudes towards uncertainty in medicine.

Social Stratification and Health Care System in India in the Era of Globalization

Social Stratification is one of the core issues in Sociology to describe inequalities that exist between individuals and groups within human societies. Today in a globalised society, there is stratification in terms of wealth, property and access to material goods and cultural products. Globalisation as a structural process is creating social inequalities at different levels.

It can be seen that at the global level, it is creating a hierarchy of structural units or organizations in different spheres of social life at different level. All these organizations are interlinked with each other, so they are passing through a process of transformation. Such changes can be observed in Health Care organizations as well. The emergence of a very expensive High Class Hospitals in metropolitan cities is a recent phenomenon. These hospitals provide world-class health care and attract patients not only from different states of India but also from the abroad both from the developing and the developed countries. There is an effort in public sector health organization too to compete with private sector

denotes a presenting author. Abstracts are organized by first presenting author's last name.

health institutions. However, the situation seems to be not satisfactory due to lack of incompetency in the management, political interference and corruption. This is also because of the mobility of the medical professionals to corporate sector health organizations. These changes in health sector may give rise not only to new patterns of health care in India but also stratify the health care institution of society. Therefore, the present paper aims to analyse these changes of health care system in the context of globalization in India.

Usage of Social Media Among the Students in North-East India: Emerging Patterns

Social Media is emerging as a most vital tool of different kind of communication which is equipped with the ability to share information, mold opinion, connecting people and communities. In India, the number of Social Media users stood at 326.1 million in 2018. The extensive use of social media like Face book, Twitter, YouTube and Whatsapp has been on the rise among the youths. This new age social networking sites have met a wide scale acceptance by youngsters in every nook corner of the country. North-east India, a significant part of India remains a centre of interest for Sociologists and Anthropologists. It has attracted many social researchers for exploration because of its rich diversified ethnic communities. It is to be noted that due to various socio-political reasons this region remains alienated from a very long time. However, emergence of Social Media and influx of internet connectivity in recent years has broken many barriers. Social media helps in transforming the mode of social interaction and reducing the geographical bondage. The present paper is an attempt to understand the impact of Social media on youths and attempts to analyse the emerging patterns of Social Media usage among the graduate students of Dibrugarh town (Assam) in Northeast India

Inequalities in Stratified Societies: How to Deal with Middle Classes

The idea of stratification refers to the idea of vertical segmentation in a sense of having more or less resources. Degrees of stratification are always relational and they express degrees of social inequality. Open stratification systems are given when a society leaves channels for upward- or downward mobility, where actors or families can change their position inter- or intragenerationally. The paper discusses middle strata in stratified societies which are between poor and rich households. In the sociology of change, middle classes have always held a central function. Middle classes serve as a kind of conflict buffer of modern societies. In his discussion why there is no socialism in the United States which was questioned in book format by Werner Sombart in 1906, the upcoming middle classes and their related relative wealth played a central role. Sombart argued that if people earn means to engage in different consumption activities they start to arrange positively with a political-economic system receiving a status, which is worth defending. With roast beef and apple pie all socialist dreams disappear, was somehow the answer by Sombart to the stability of capitalism in early 20th century. According to Collins (2013), technological displacement of middle-class labour is not much more than thirty years old; while it took almost 200 years to destroy the working-class labour force, computerization of middle-class labour is proceeding at a much faster pace than the mechanization of the manual labour force. Therefore, none of the previous ways to compensate job losses will work effectively anymore in the future. The paper will argue theoretically as well as trying to provide empirical findings on developments in recent international societies looking at convergencies and divergencies of middle class developments.

BOERI, MIRIAM* (Bentley University, USA)

Applied Ethnographic Research: Overcoming Challenges of Grounding Solutions to the Everyday Reality of Individuals and Communities

Ethnography is a method used in many fields, but especially in sociology and anthropology, to better understand everyday reality at the community level. It involves in-depth interactions with people in settings where they live, work, or play. To provide solutions to society's most pressing problems, an insider understanding of what is going is essential for designing programs, developing policy, or implementing services that effectively address the problems.

To do ethnography means to face barriers beyond what we learn in textbooks and universities. Much of what happens while in the field is hidden or rarely revealed in print. The intellectual, philosophical, and moral contemplation, and the emotional highs and lows experienced when using a research methodology outside the safety and comfort of clinical or classroom settings are rarely told.

What ethnographers do is get their hands and boots dirty while collecting data. They work with community members, engage with the marginalized, and participate in activities that put them inside their study, and sometimes at risk for personal safety. Their attention is centered on capturing reality at the ground-level and providing the most honest and transparent interpretation of what they have seen, heard, touched, smelled, tasted, and felt.

For applied and activist ethnographers, the search for the truth from the insider perspective is not merely to produce results for a paper, book, or the next grant proposal. Instead they are concerned about how their findings will make a positive impact on the individuals and communities they study. How can they influence policy with the reality they have discovered?

In this session I discuss how applied ethnographers grappled with these questions in their pursuit of solutions to social problems as they work with the communities they study.

BOERNER, SUSANNE* (Universidade de Sao Paulo, Brazil)

Challenging the Power Dynamics of Resource Insecurity: Entangled Differences of Age, Gender, Income, and Ethnicity

The complex dynamics of power relations, social exclusion, and inequitable access to resources remain a critical challenge to the long-term resilience of communities, especially in the Global south. Understanding the social dimension of resource insecurity requires involving multiple perspectives and voices. Particularly young people are among the most vulnerable groups. This holds true especially in countries such as Brazil where more than 42% of the population are below the age of 24 and young people are disproportionately affected by poverty, violence, unequal access to resources, and the impact of natural hazards. Despite a gradual recognition of the role of youth as 'everyday agents' within local environments, their potential as central agents of change has been neglected by researchers and policy-makers alike. Our research enables a critical reflection on the valorisation of the role of youth in knowledge generation in relation to the food-water-energy resource nexus and disaster risk reduction. We present results from participatory action research (PAR) with 40 young people aged 14 to 18 from vulnerable, disaster-prone communities in the Greater Metropolitan Region of Sao Paulo, Brazil. Our research engages marginalized voices in virtue of age, and reflects on the intersectionality of age, class, gender, ethnicity, and income and their impact on politics of power. Looking at these entangled differences in the access to and use of resources, we aim to develop a nuanced account of young people's experiences of resource insecurity as as well as their pathways to resilience that brave processes of exclusion and social inequality. Using PAR methods to explore young people's knowledge and social practices of resource use, we challenge the domination of 'adult' knowledge across multi-scalar processes that evidence uneven power dynamics, both in research and policy-making.

BOERNER, SUSANNE* (Universidade de Sao Paulo, Brazil)

Transformative Pathways to Resilience through Participatory Youth Action Research: Exploring Local Knowledge and Social Practices for Resource Security and Disaster Risk Reduction

Building long-term resilience to resource insecurity and ensuring the equitable access to food, water, and energy demands interconnected solutions. Transformative approaches should therefore address immediate threats as well as future challenges while taking account of vulnerable groups such as youth. Linking nexus thinking with disaster risk reduction, we propose a novel approach to explore young people's local knowledge and social practices regarding resource use in the context of recurring natural hazards. We present results from participatory action research with 40 young people on the water-energy-food nexus (WEF nexus) and disaster risk reduction (DRR) in communities affected by flooding and landslides in the Greater Metropolitan Area of Sao Paulo. We argue that involving youth as co-researchers in the data collection, analysis and interpretation of findings provides exciting opportunities for them to develop their own reflexive approach to nexus-DRR issues. It enables youth to focus on issues and priorities relevant to them to reflect their everyday experiences and social practices rather than responding to pre-established categories. We consider young people as agents of their everyday lives but also as agents of change with the ability and knowledge to contribute to long-term resilience. Our research combines novel technologies such as the use of mobile apps with more traditional approaches of PAR (i.e., participatory youth workshops based on principles of peer-learning) to document local knowledge and social practices, as well as youth knowledge on (unequal) access to resources, causes of vulnerability, nexus threats, and their vision of future scenarios. Through the co-production of collective knowledge, we also seek to contribute to foster the voice of youth in the development of relevant (educational) strategies and policies for resilience. In our research, we

　　　　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

therefore encourage multi-stakeholder dialogue with researchers, policy-makers, practitioners and communities (particularly youth) to reflect on capacity-building needs and pathways to resilience.

BOESE, MARTINA* (La Trobe University, Australia)

Race, Class and Agency in Studies of Creative Labour from Manchester to Melbourne

From their early celebration as potential panacea to youth unemployment and disenfranchisement in the era of 'Cool Britannia' in the UK in the late 1990s, the 'creative economies' have been both a symbol of the validation of creative work in neoliberalism and the tension between the symbolic and material positions of racialized practitioners. This paper reviews and distinguishes different scholarly approaches to examining racialisation in the creative economies, from a concern with criminalisation to a focus on the empowerment of minoritized groups. Drawing on my early research on racialized practitioners in Manchester's club culture industry and arts-based approaches to empowering racialized young people in Vienna in the early 2000s and an ongoing analysis of discourses on creative labour and multicultural arts programs in Australia, I examine continuities and changes in the social construction and sociological analysis of racialized cultural labour in the context of governmental support of both, 'creative economies' and 'multicultural arts'. The paper reflects in particular on the variable role attributed to race, class and agency in these different policy contexts and in the growing field of scholarship on creative labour.

Social Media Research in Medicine: Challenges and Possible Solutions

Today sociology is facing numerous problems with classic approaches to collecting sociological data, e.g. critical decline in response rates for telephone polls or housing surveys. Thus we feel the need to develop new methods of data collection and data analysis of social media unloading appears to be a promising option. Another reason to turn to social media analysis is the fact that today social media are becoming one of the leading factors for shaping public opinion.

In our research of the public image of healthcare, we turned to social media analytics. The topic of interest was how population perceives nurses, doctors and certain medical services.

While conducting the research the authors faced several challenges due to the limitations of data collecting programs, e.g.:

Today there is no optimal algorithm of getting data unloading from social media. The unloading relies heavily on the program/algorithm used. This leads to the situation when researchers using different tools to analyze social media data are working with different general populations.

The current efficiency of machine learning algorithms is far from "almost 100% accuracy" promised by advertising (e.g. sentiment analysis).

Visual content is growing in numbers, and again machine learning doesn't offer a suitable tool for sociological analysis nowadays.

Our strategy in research of medical workers image was to use mixed methods: combining quantitative analysis of unloading data with qualitative analysis of a rather small subsample of 400 messages (1), comparing the results with those from offline research (2), analyzing images obtained from subsample using socio-psychological methods (3), using separate content analysis of spam messages which gave us insights to what people are interested in according to spam creators (4).

Digital Work in the Public Sector: A Study with the Public Servers of Regional Labor Court of Paraná

The present work result´s from a research carried out with the public servants of the Regional Labor Court of Paraná who perform teleworking, which allows the execution of the work activity remotely from personal computer and virtual connection. The modality is regulated by the Superior Council of Labor Justice through Resolution Nº 151/2015, which incorporates the teleworking into the institutional practices of the organs of the first and second degree Labor Courts. The objective of this study was to analyze aspects of teleworking performed by public servants, such as: working hours, productivity, working conditions, strategies to conciliate professional and personal life and the impact of remote work on quality of life of these teleservers. The work performed by them was analyzed considering the absence of control of working hours and the requirement to increase their productivity, which must be higher than those servers who work in person. To this end, 25 teleworking servers were interviewed through twenty-four (24) online questionnaires and one (01) personal interview. It was found that these servers go beyond the contractual working hours in the telework mainly due to the workload, but also, in most cases, due to the lack of control directly related to the hours worked. It was identified that productivity is increased by 10% to 40% according to the respondents, who use strategies to be able to perform their work activities outside the dependencies of Labor Courts. Finally, it was observed that the intense pace of teleservers work is inherent to the functions they perform, especially due to workload, but other factors, such as flexibility and decreased interference from third parties in the physical workplace, collaborate to make the modality gain space in TRT and become a trend in the Brazilian public sector.

BOJE, THOMAS P.* (Department of Social Sciences & Business, Roskilde University, Denmark)

Global Civil Society and Civic Participation

The perception of civil society has increasingly become global. However, when we talk about civil society in a global context, there are important reservations. First, the idea of civil society comes from an American-European tradition anchored in an individualistic and liberal approach, while civil society in the South is associated with religious and ethnic groups. In the South, civil society is thus far from synonymous with freedom and tolerance. Secondly, global civil society is not like the national, anchored in citizen groups and a democratic structure. Global civil society is "an unfinished project that consists of sometimes thick, sometimes thinly stretched networks, pyramids and hub-and-spoke clusters of socio-economic institutions and actors who organize themselves across borders, with the deliberate aim of drawing the whole world together in new ways. These non-governmental institutions and actors tend to pluralize power and to problematize violence; consequently, their peaceful or "civil" effects are felt everywhere" (Keane 2003; 8). Most international NGOs are typically governed through a highly hierarchical structure and scarcely democratic in their decision-making processes.

There are three key issues, which have been on the global agenda and driven the development of global networks both for and against globalization. *First*, citizens, wherever they live and work, have common problems about the environment, climate and citizenship. These problems cannot be solved without international coordination. *Second*, there is a conflict between economic globalization without regulation and the nation states' control of their money and fiscal institutions. A conflict that has manifested itself in growing anti-globalization movements. The *third* aspect of the global agenda can be termed the creation of a cosmopolitan legal order, developing standards for citizen' rights at a global level. The paper will elaborate these three tends and evaluate the responses coming from the civic organizations – local, national as well as global.

Inclusion, Emancipation and Activism – the Significance of Citizenship

How to revise the traditional understanding of citizenship that it suits the changed conditions of citizenship – changing conditions for employment, diminishing importance of nation states, and growing diversity in the population – the core issues dealt with in this paper. The struggle for lived citizenship involves active participation in the workplace, civic organizations, the private sphere but also in the public sphere - political campaigns, demonstrations and civil action.

I distinguish between different forms of citizenship. The concept of citizenship links primarily to citizens as political agents. There is not much attention to 'ordinary citizens'. Citizens practices their *ordinary everyday citizenship* through daily routines. The individual citizen is thus 'active' in a wide range of contexts, which identify the citizen in its relationship to the local community and the society as such. Activities, which are not part of the 'act of citizenship' but essential for the cohesion of society. The *active citizenship*, concerns activities and forms of participation, which take place within the regulative frame of the society. An active citizen is a person who votes in elections, actively participates in public life etc. The *activist citizenship* challenges the traditional interpretation of citizenship rights and duties and intervening in the governance of the organization. The activist citizen is in contrast to the active involved in reformulating the economic, social and political conditions, helping to redefine the framework for citizens 'social lives. (Isin 2002 and 2009, Neveu 2014, Clark et al 2013).

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

In the paper, I want to analysis empirically how practicing citizenship activities vary in Europe. I want to explain how differences in practicing citizenship activities among European citizens depend on socio-economic resources, citizenship status and social network. Citizenship activities here defined by political affiliation, voting, association membership, non-parliamentary activities, formal and informal volunteering, and contacts to family, neighbors.

The Micro-Macro Dilemma: A Non-Reductionist Alternative through Max Weber

In order to reconstruct, even partially, the explanatory models most used by sociological theory, this proposal aims to present the theoretical foundations of the micro and macro scheme, specifically in its explanatory applicability in the Weberian theory. Despite unsuccessful in imposing itself as a canonical reference in the social sciences, such a scheme reflects the principles of the "multilevel model" refined by Edmund Esser from the theories of MacLelland (1961) and Coleman (1990). Shortly, such a model claims that the theoretical primacy of sociology is the explanation of the macrostructural phenomena, while its analytic-explanatory primacy lies within the micro-subjective level. Thus, it is up to sociology, making use of this alternative, and in order to enforce the function of intellectual abstraction of the micro / macro scheme, to overcome dichotomies often associated with it, such as the classic objectivism x subjectivism, agency x structure oppositions. Thus it would be possible to raise its content to the macro-micro-macro sequence, better in grasping the foundations of social reality in its different dimensions and translate them into explanatory models. From this contextualization, we seek to demonstrate that such a synthetic enterprise was successful in Max Weber's theory. Hence, we use Soziologischen Grundbegriffen's analysis of the conceptual framework to indicate that there are, in this work, contributions to a non-reductionist approach. Aligned with the efforts of Gert Albert (2016) and Schluchter (2005), we find tools to argue that Weber solves the problem of synthesizing levels of analysis with a moderate posture.

BOLLACHE, LOUISE* (EHESS, France)

"Should We Call Ourselves Feminist and Anti-Racist ?": Intra-Collective Conflicts between Alter-Activist Culture and "Classic" Activism in Environmental Struggles

Third year PhD student, I'm studying social-ecological movements devoted to the defense of agriculture land, forests and parks who face the implantation of large-scale commercial development projects. My thesis consists in a long-term ethnographic survey: the participant observation of "scene" activities (protests, events, occupations, construction blockages) as well as "behind the scenes" activities (around fifty organizational meetings) in three different collectives in struggle, on the outskirts of Paris.

A large part of my work focuses on understanding the cohabitation between very different political cultures in the same group. Whereas these movements attract a number of "classic" activists, who experienced a quite vertical political socialization (in major associations, political parties or large unions), we saw the multiplication of younger activists involve themselves in the past five years, bringing with them a specific culture. That culture centers around aims of horizontality and the will to deconstruct, *in* daily activism, criticized structural logics. More specifically, they seek to include the defense of diversity in their way of advocating for the protection of those lands.

What happens when alter-activists share action registries and mobilization spaces with pro-verticality "classic" activists? I will be focusing on that cohabitation intra-movement, the conflicts it creates and the negotiations on decision-making and internal organization it induces, through two main themes. Feminism in those movements went from being a specific area of knowledge of some activists (clearly separated from the ecological struggle) to permeating a number of internal discussions in only two years, following an arguably wider consciousness of gender issues in France. Anti-racism also started to be an issue, considering that those movements happen to take place in working-class areas with a strong concentration of immigrants and that the activists are mainly white and middle-class.

I will attempt a classification of the different attitudes towards those issues, intra-collective.

BOLSHAKOV, NIKITA* (National Research University – Higher School of Economics, Russia)

The Meaning of Deafness in the Process of Vocational Education and Professional Identification of Youth with Hearing Loss in Russia.

The present study is concerned with identifying career trajectories, as well as determining the key factors of occupational choice of deaf and hard of hearing young people who were part of secondary vocational education programs. On the one hand, transformations that occur with the modern system of vocational training for the deaf and hard of hearing open up new opportunities for these people. On the other hand, these transformations have become a barrier to professional adaptation and come across a counter process of searching for the cultural identity of the deaf community. We were interested how does the deafness in its social and cultural characteristics affects the process of professional identification of youth with hearing loss in Russia.

This research was carried out with the use of mixed-methods design included the All-Russian quantitative survey and qualitative interviews. In a quantitative survey, the total sample size was 187 people and the total sample size of the qualitative stage was 21 interviews, including several expert interviews.

Deafness in its medical terms is considered by deaf youth as the key barrier for obtaining good education and work because of the narrow corridor of opportunities and other problems. At the same time the shift of the focus of attention from external conditions to one's own identity of oneself as deaf, as a person communicating in sign language during the professional identification is one of the most popular strategy of adaptation to the existing conditions. The concept of Deafhood most accurately describes this way of perceiving reality: informants in their narratives give deafness important social and cultural characteristics, give it positive connotations, talk about the "own world of the deaf", which must be developed. That is, the system of education and training of the deaf ceases to meet the request of the deaf youth.

MICK, JACQUES (Universidade Federal de Santa Catarina, Brazil)

Sociology of Professional Groups in Brazil: Expansion, Diversification, Specialisation and Interfaces with Other Fields of Research (1999-2019)

In the last 20 years, sociological research in Brazil has experienced the effects of higher education expansion, such as the increase in the number of researchers and postgraduate programs, the diversification of approaches (both in terms of themes and theoretical-methodological perspectives) and the intensification of specialisation, with the consolidation of specific domains within this area of knowledge. This paper analyses the development of sociology of professional groups in Brazil during this period. We take as a starting point the appraisal of the area presented by Bonelli (1999), covering the period between the origins of this type of study in the country and the end of the last century, and then we focus on the analysis of changes in the sociology of professional groups in the last twenty years. The previous research addressed the studies of higher level professions in Sociology, Political Science and Anthropology, whether or not relying on the approaches of the sociology of professional groups. In the current paper, we analyse the theses defended in the last 20 years in this area and the papers approved by the Occupations and Professions working group within the scope of the biennial meetings of the Brazilian Society of Sociology. The main characteristics of the expansion of higher education in the country stand out in this set. The first is the emergence of new researchers and institutions that investigate this subject. The second is specialisation, with regular studies on particular professional groups and identities. The third is diversification, with the broadening of the set of professions or occupations under the focus of Brazilian researchers. We observed the development of theoretical interfaces combining the sociology of professions with other sociologies (such as those specialised in journalism, law, health, work) and with different social theories (notably, field theories, inequalities theories and social mobility theories).

BONETA, ZELJKO* (University of Rijeka, Croatia)
MRAKOVCIC, MARKO* (University of Rijeka, Croatia)

Confidence in Institutions, Political Orientations and Attitudes of Croatian Students

After the disintegration of socialist Yugoslavia, Croatian society underwent a transformation of its political and economic (sub)systems. Although Croatian society has faced numerous challenges in its transitional development, democracy, democratic rule of law and equality of all citizens have become values that are nowadays advocated, at least declaratively, by the vast majority of political and social actors. Nevertheless, the war and the challenges of transition have led to the fact that a large number of citizens do not have confidence in important social institutions whose functioning is necessary for the operation and legitimation of an effective democratic order.

Consequently, in this paper, based on the survey conducted on the student sample (N = 635), we analyze: (1) the level of confidence that students, as part of the "generation" born and raised in the post-socialist period, have in important institutions of Croatian society and (2) their political attitudes.

The results show that, on average, students do not have confidence in most institutions: political parties, political institutions, the judiciary, the Church, and tthe media. The institution in which more than a half of the respondents have confidence is education. When it comes to political attitudes, students mostly reject rigid ethnocentrism and clericalism. On the contrary, they accept multiculturalism and are indecisive towards scientism. Statistical analysis shows that the students' political orientations (left, center, right) and political attitudes are corelated to the level of their confidence in social institutions.

Given the fact that students express high distrust in key political institutions, it can be concluded that they doubt the efficiency (functionality) of the democratic order in Croatia. At the same time, the expressed confidence in educational institutions and the acceptance of multiculturalism can be the basis for an optimistic conclusion about the existence of potential for strengthening the further democratization of Croatian society.

BONHOMME, MACARENA* (Goldsmiths, University of London, & COES, United Kingdom)

Racism Against Racialised Latin American and Caribbean Migrants in a Multicultural Neighbourhood in Santiago, Chile

South-South migration becomes an interesting opportunity to understand the complex dynamics of racism and racial formations of Latin American and Caribbean populations. Accordingly, Chile –one of the countries with major destination flows from the region– is one of the quintessential settings to study such issues. Drawing on a 17-month ethnography, visual methods and 70 in-depth interviews between 2015 and 2018, I analyse the current ways in which racism operates in the everyday in a multicultural underprivileged neighbourhood in Santiago. This paper shows how the ideology of racism not only stands as a discourse but rather, it is embedded in the everyday experience and materialised in urban space. It contributes to unveiling the different forms of exclusions based on 'race' that I observed in several events that occurred in and beyond the neighbourhood. I unravel the emergence of new racisms in the context of migration, and how nationalisms and colonial sediments re-emerge to determine power hierarchies. Furthermore, I reveal how racial exclusions are performed in the city through different exclusionary dynamics against racialised migrants, especially afrodescendants. Chileans and former migrants claim to belong through different practices and interactions in urban space, constraining the 'right to the city' (Harvey, 2008) of racialised newcomer migrants. I analyse the emergence of hierarchies in the neighbourhood and how the production of difference reproduce colonial racial hierarchies in which African and indigenous ancestries are reconstructed, and an imagined 'whiteness' is produced to sustain the power dynamics in place. I particularly shed lights into how differently racism is performed against certain migrant populations. While some would face racism and hatred more directly, others would experience it in subtler ways, yet still experience exclusion: racism takes several and shifting forms to endure and reinforce social division in multicultural urban Chile.

BONHOMME, MACARENA* (Goldsmiths, University of London, & COES, United Kingdom)

The Blurred Boundaries of 'Legality'/'Illegality': How Latin American and Caribbean Migrants Negotiate State Racism in Chile

Racist state politics have not only been embedded since colonialism and the construction of the Chilean nation-state by the systematic denial of the presence and rights of Afrochileans and indigenous communities but reinforced by migratory policies that have historically made distinctions between 'desirable' and 'undesirable' migrants. The administrative amendments to the migration policies and the arbitrary character of border controls have progressively restrained the mobilities of Latin American and Caribbean migrants, predominately afrodescendants. These changes have not stopped these mobilities, but rather, have made migration more dangerous and challenging, producing different forms of 'illegalities'. Drawing on a 17-month ethnography and in-depth interviews, this paper examines the impact of those restrictions and exclusionary boundaries on migrants' everyday lives by understanding how they navigate such constraints and claim to belong amidst this continuously changing political scenario. Different life stories show how the path to 'legality' and certainty paradoxically entails resorting to 'illegal' means in order to achieve the desired permanent residency. Beyond border controls and the establishment of new consular visas, the state continues controlling migrant mobilities within the national border through the different immigration statuses that hierarchise migrants and impact their everyday lives due to its uncertain character. These lead to the production of multiple 'illegalities' as the only way to navigate these uncertainties, giving rise to different kinds of profiteering and abuse, which makes migrants subject of precarity and exclusion. I reveal how migrants are forced to negotiate the blurred boundaries of 'legality'/'illegality' in order to become or remain 'legal'. Furthermore, I analyse how the state has produced those 'illegalities' through the restrictions imposed not only at the border but also within the country. This study shows how the state and its immigration legislation, by producing a context of uncertainty, has created invisible, racialised and gendered boundaries for migrants.

Neighborhood Effects in Educational Trajectories in the Metropolitan Area of Buenos Aires

In recent years the analysis of the effects of neighborhoods on inequality has gained importance in social stratification studies. Traditionally, social origins, whether measured by class or educational origins, has been the focus of intergenerational reproduction analysis; nowadays, the neighborhood appears as a mediation mechanism that impacts on educational attainment. Specifically, neighborhood effects are considered relevant in educational trajectories and attainment insofar spatial inequalities have mechanisms that can favor social reproduction or upward social mobility. The aim of this paper is to analyze the neighborhood effects on educational trajectories from residents of the Metropolitan Area of Buenos Aires taking into account their class origins. For this, we will use quantitative methodology based on survey data which we will analyze with the R-package TraMineR that allows visualizing sequential data.

BONNIN, DEBBY* (University of Pretoria, South African, South Africa)

The State and Professions in South Africa

This paper examines the role of the post-Apartheid state in the regulation of professions in South Africa. Post 1994 the South African state embarked on a regulatory overhaul of the professions. New regulatory legislation was introduced for many of the traditional professions (medical, legal, and accounting). The primary concern of the state was to ensure that the broader public regardless of race or gender had access both to the profession and to the services of the profession. To achieve this, the initial focus of the state was to remove power from professional groups. Different professions responded differently to this initiative. But in all cases the regulatory bargain between state and profession had to be renegotiated. However, the eventual outcomes were different regulatory environments for different professions. Some professions (eg the legal profession) were able to retain their ability to self-regulate, while others (eg auditing profession) did not.

This paper uses this empirical example to examine more broadly the relationship between states and professions. It suggests that the one needs to look more closely at the different state institutions and actors who are involved in decisions and processes around the regulation of professions in order to understand outcomes regarding regulation and the power of professional groups. The paper will also highlight the importance of understanding the different interests and values, from the perspective of both the state and the professional group, that might influence the regulatory project.

BONU, GIADA* (, Italy)

The "S" Factor. Feminist Spaces and the Production of Safer Spaces in Urban Context

Despite the phases of more or less visibility and mobilization, feminist movements tend to produce structures of maintenance even in time of abeyance, according to Taylor's definition (1989). Feminist spaces are typical example of such structures (Spain 2016). Beyond protests and other type of repertoire of action, the opening and management of political space allows for testing prefigurative politics and everyday practice of social change. According to gender studies assumption about gender based violence as a structural organizing factor of contemporary society, feminist spaces develop counter-community of emotions, politics and relationships. How and why are these spaces safer? Why activists produce and preserve these spaces? Why the notion of safety politically matter?

In order to disentangle this puzzle, I will make reference to my PhD research project on the comparative analysis of feminist spaces between Rome and Madrid. Using participatory action research as a comprehensive approach I pursued three years of participant observation, interviews and focus group in three different type of spaces: quite institutionalized women's spaces; self-managed feminist services; radical transfeminist and queer squats. Retrieving from a constructivist grounded theory method of analysis, I focus on safer spaces as a working concept guiding different levels of understanding: actors; spaces; repertoire of action; in/out relations. Although these factors simultaneously occur, I am here disentangling them in order to shade light on all the facets of the emotional, political and relational density of safety. Safety, in contrast to neoliberal understanding of the concept, is not a stable configuration but an ongoing and relational process. While engaging with safer dimension of activism, feminist spaces are oriented to directly challenge and to re-shape democracy from below.

The Great Green Wall : Story of a Man-Made Forest in Assam, India

Human has been the prime accuse of the environmental degradation. Even then, some people have been trying to make the earth a better place of living. Jadav Payeng in India is one who contributes towards conservation of green earth. He is known as Forest Man of India, and recipient of Padma Shri, the fourth highest civilian award in India due to his single handed effort for 30 years towards building a forest. Started with 550 hectares, the area has grown up to 1200 hectares and still growing. This paper is an attempt to showcase the effort of the Jadav Payeng towards building a man-made wildlife forest, locally known as Molai Forest for preserving the global environmental diversity.

The Molai forest now shelters various species of animals and birds. There are several thousand trees and bamboo. A herd of around 100 elephants regularly visits the forest. It is also playing a major role in prevention of erosion and other ill-effects of flood in the area.

Realising the importance of forest conservation, people are voluntarily engaging themselves into expansion activities relating to the forest by involving village level organisations. Now, the Government has allotted and re-settled the land as a common property.

This study is based on field survey in the said area twice in the month of October and November, 2018. Interaction with Jadav Payeng, some of his associates and local people have been done for the present study.

The Molai forest has so many aspects to study and may be a case study model of green preservation. It is high time to appraise how a man-made forest can create an impact on the growth of tourism in the area. With focus from the media and widespread campaign, this forest can be easily turned into a major global tourist destination.

Empire and Imperialism: A Dialogue between the Contemporary Critical Theory of Partha Chatterjee and David Harvey

World historiography and postcolonial thinking had recently shed new light on the category empire as a major political form in modernity, displacing classical emphasis on the territorial nation-state. Meanwhile Marxist scholars had rediscovered the notion of imperialism as an ongoing process of capitalist accumulation, moving beyond its strict meaning of colonial rule overseas. Nevertheless, the two concerns seem to be moving away from each other. While the investigation on imperial polities has focused on strategies and connections established by colonial rule in non-European societies, the current discussion on imperialism stress the economic form of dispossession under neoliberal hegemony. The paper establishes a dialogue between these different streams of critical theory, grounded on the arguments of two of its leading proponents: Partha Chatterjee and David Harvey. The political theory of Chatterjee stresses the rule of colonial difference as key feature of modern empire-building, since universalist Western political imaginary is torn by concrete strategies of colonial governamentality. "Imperial prerogative", for Chatterjee (2011: 250), "is the power to declare colonial exception" and act accordingly. Harvey, on the other hand, recovers Luxemburg's insight to define "new imperialism" as multiple forms of capital accumulation that circumvent competitive surplus extraction of wage labor, through expropriation of communalities, control over territories and privatization of state activities. Neoliberal programme, hence, appears as response to 1970's capitalist crisis of accumulation by reshaping classic imperialism. For both, empire/imperialism illuminates present-day forms of oppression and exploitation. We acknowledge they are irreducible one to another, but we explore a common ground: Harveyan capitalist dispossession lies massively on narratives of territorial and cultural difference in order to uphold legal restraints, i.e., to declare exception. In this sense, historically, formal empires offered an "evanescent mediation" for the intertwining of "colonial difference" and "accumulation through dispossession," which subsists without its generative mechanism.

BORBA, PEDRO* (State University of Londrina (Brazil), Brazil)

Historical Sociology As Political Theory: A Reappraisal of Postcolonial State Formation in Nineteenth-Century Latin America

Current explanations for state formation in historical sociology have remained largely insensitive to major shifts in our understanding of political modernity as a global and connected process. In Latin American context, long-term political change has been framed by different Eurocentric and diffusionist accounts (ACEMOGLU & ROBINSON, 2012; CENTENO, 2002; XAVIER-GUERRA, 1992). Meanwhile the decolonial critical turn, albeit fruitful exceptions, have subdued the state to broader arguments on power, knowledge and race. The purpose of the paper, hence, is to develop an original explanatory approach to modern state-building grounded on Latin American experiences. First, it displaces the emphasis on degree of state capacity and its accumulation over time, looking rather to the process of disembedding of political practices from their previous local contexts. This shift assumes that "independences" were not a clear transition from "empire to nation", nor from traditional to modern ideologies, but rather a cross-cutting conflict for sovereignty in layered Iberian imperial spaces. Second, the multiple local claims for sovereignty formed a landscape of overlapping and heterogeneous political forms, such as constitutional municipalities, indigenous communities, federations and city-centered provinces. To explain the long-term change in such geopolitical landscape, three causal mechanisms are distinguished: (1) the political control of the strategic hubs of the emerging international division of labor, which offered disproportionate resources for certain factions; (2) the contingent control of violence in multiple competitive subsystems of states, which could provide protection rackets over time; (3) the state activism for disentangling market forces throughout cities and hinterlands, overcoming social resistance to mercantilization. Methologically, the explanation is process-based, based on circular causality (ELIAS, 1987; TILLY, 1990). In sum, postcolonial political order arises as a circuit-like dynamo eventually links, through space and time, increasing tax revenues, systemic capitalist expansion and the disembedding of local competing sovereignties, whose autonomy is gradually undermined.

BORCENA, PATRIA GWEN* (Greenresearch Environmental Research Group, Inc., Philippines)

Ecological Citizenship: Philippine-Based Catholic Green Priests in the Public Square

The increasing poverty of the Philippines's environmental and social landscapes is worsened by a changing global climate. Economic poverty and vulnerability to extreme weather events are interrelated crises. Against this backdrop in the Philippines, an increasing number of religious leaders and lay groups have responded to both the "cry of the poor" and "cry of the earth." As stated in Pope Francis' encyclical, Laudato Si': On the Care for Our Common Home: "Strategies for a solution demand an integrated approach to combating poverty, restoring dignity to the excluded and at the same time protecting nature." (No. 139)

This descriptive and exploratory research focuses on selected Philippine-based Catholic priests who consider being environmentalists, environmental activists or environmental advocates as among their key identity claims. This paper explores the careers of these selected Catholic priests to better understand how they promote *"ecological citizenship"* by integrating care for creation with their pastoral duties and/or supporting environmental social movements.

This paper also identifies the ways in which the environmental and social justice encyclical of Pope Francis, is relevant to these priests and has influenced them. This important development in the Philippine religious sector may well portend an emerging trend in the global Catholic community.

BORDA, ERIK* (State University of Campinas, Brazil)

Guests at the Table: The Emergence of Race in the Centre for Contemporary Cultural Studies

The work of the Centre for Contemporary Cultural Studies became, since the 80s, deeply associated with matters of race and ethnicity. Some of its members, such as Stuart Hall or Paul Gilroy, are now obligatory references on the matter. Yet, the usual narrative for the emergence of such themes is that of the interruption: like feminism, race would have suddenly broken in the Centre's activity during the late 70s. A recent effort by a network of scholars for the historical reconstruction of the institution has called our attention to the conflicted and discontinuous nature of its working practices. With these studies in mind, this paper seeks the emergence of the race agenda through some possible entrances. The first concerns the activities of some students of the Centre at an action community center in a multiracial district of Birmingham; the Forty Hall Road Project. The second concerns the role of UNESCO in tilting the CCCS attention towards the subject by requesting from its members some studies concerning race and ethnicity. These possible entrances are then discussed with their ties to the Centre's intellectual production during the 70s, the would lead ultimately to *Policing the Crisis* (1978) and *The Empire Strikes Back* (1982). We expect this approach can shed some light on a process that wasn't at all unexpected; as a historian of the CCCS activity puts it: these characters were invited to seat at the table of Cultural Studies right from the very start.

Digitalization of the Social Services in Russia; Digital Competences Issues

In addition to development of the communication infrastructure, the important component of digitalization of the social services is forming of "digital competences" of personnel. Recently the barriers of digitalization were connected with a lack of necessary infrastructure and high cost of services, now digital literacy and IT competences of employees are key issues. The research methods include secondary data analysis of the all-Russian survey "Index of Digital Literacy" which represents monitoring of digital competences of Russians since 2015, the analysis of statistical data related to IT , and data of expect- interviews with staff of the social services organizations conducted in 2019. The system of indicators, characterizing not only the levels of development of the corresponding infrastructure, but also level of digital competences, was used for evaluation of digital competences. The index of digital literacy is the integrated index which includes digital consumption, digital competences and digital security. The research results allow making a conclusion on insufficient level of digital competences of the working citizens. Besides that the considerable inequality between the city and rural areas is observed; it is caused by "cumulative" effect of a number of factors: lower level of development of infrastructure, lower level of education and income, high share of elderly people, etc. In additional, inequality in digital literacy of men and women and also different age groups is noted. All these types of inequality are presented in the social services organizations where most of employees are women of middle and older age. The training programs for social services organization directed to increase in digital literacy of personnel are necessary condition for digitalization of social services. Acknowledgments. The research was conducted with support by RSF, Project "Challenges of the transformation of welfare state in Russia: institutional changes, social investment, digitalization of social services" (№19-18-00246).

Out of Sight, out of Mind: Participatory Sensing for Monitoring Indoor Air Quality

In southern Chile, epidemiological studies clearly relate high levels of pollution in the air produced by the use of wood-burning stoves and the incidence of nu-

merous diseases. Using a quasi-experimental design, our study explores the potential of participatory sensing strategies to transform experiences, perceptions, attitudes and routine activities in 15 homes equipped with wood-burning stoves in Temuco, Chile. We design a device based on an ArduinoUNO microcontroller and a particulate matter low-cost sensor to evaluate changes in participant's perceptions and behaviors. The results suggest that the experience improves the household member's awareness of the air quality, their understanding of the issue and increases motivation among the participants. Our study shows the importance of instant feedback about air pollution levels as a critical element of reflection, from which wood-burning stove users can visualize the problem and convey their concerns to initiate dialogs designed to improve indoor air quality. Although the system of instant feedback does not seem to modify the beliefs of low self-efficacy to control air quality and protect themselves of pollution, the high degree of involvement with the participatory sensing experience recorded in the study indicates that the distribution of low-cost sensors could be a key element in the risk communication policies in cities saturated by wood smoke.

The Impact of COVID-19 Containment Measures and Policies on Family and Work Relationship: A Study in Italy during the First Lockdown

The health emergency linked to the spread of Covid-19 has impacted on people's lives both at family relationships level and at work, modifying the relationship between these central areas – work and family. To control the COVID-19 outbreak, local governments have adopted during the first lockdown (March –May 2020) restrictive and innovative measures: the unprecedented condition of forced isolation of families, the closure of schools, childcare and elderly services and the spread of working from home has generated an unprecedented situation. International literature proposes different theoretical positions regarding the impact of work on the family. In this contribution we adopt the conflict and the enrichment model (Evans, Bartolome, 1984; Greenhouse, Parasuraman, 1986), in order to understand how mandatory company policies and containment measure have impacted on work-family relationship in terms of conflict or enrichment. This contribution is aimed at assessing how Italian people during the full lockdown have faced work and care responsibilities, using data from a CAWI study done in March - April 2020, that surveyed over 1,391 participants, 73% women, most of them in a couple relationships (74%), with children (68%) and working from home (78%). Using multivariate analysis, the contribution will test the hypothesis that the restrictions imposed by the lockdown and the change of personal and family routines have upset the normal balance between family care and work burdens. Results show the impact of individual variables (educational qualification, age) on work-family dynamics as well as work polices. However, the presence of children oriented the dynamics of conflict / enrichment: having more children contributes to reducing the conflict between work and private life, but having no school age (6-13) children promotes greater enrichment. Finally, for those working from home having a positive identification with their company reported greater work-family enrichment during the lockdown.

BOSONI, MARIA LETIZIA* (Catholic University of Milan, Italy)

The Socio-Educational Alliance between Families and Early Childcare Services: Meanings and Practices across Italy

In the contemporary social context, characterized - as noted - by low birth rates and a complex care and work balance, European policies promote strategies to increase quality and accessible childcare services. In Italy the coverage rate in services for children between 0-3 years is still below the 33% target requested to Eu members. A recent legislative transformation has contributed to reshape the role of childcare services in Italy: the law n. 107 in 2015 established for the first time the right to education for all children from 0 to 6 years, thus promoting a reorganization of services according to an integrated and network logic, form 0 to 6 years, and the active participation of families. The challenge for services is therefore to build a positive and generative relationship with families, following the logics of personalization and collaboration. In this context and from a sociological perspective on family and children, results from the project "Children: from periphery to the center" done in Italy between 2018 and 2019 will be presented. The project aims to contrast educational poverty by supporting parents-educators collaboration in 0-6 years services. Based on a quanti-qualitative design and participative method, the study sheds light on 0-6 years continuity introduced by the 107/2015 low, identifying methods and practices for involving families into day-care services and promoting a shared representation of the socio-educational alliance. The sample includes 6 childcare services, in the North and Center of

Italy, with 67 educators and 129 parents involved. Results show that 0-6years logic goes beyond organizational-spatial dimension and contribute to re-shape the role of families and schools in the socio-educational process.

RICUCCI, ROBERTA (University of Turin, Italy)

The Religious and the Secular. Assessing the Public Role of Religion: A Urban Perspective from an Italian Case Study

Urban space can be seen as the social field in which the religious diversification of European societies emerges and assumes visibility. Here, religious places of minorities can be used at the same time as the marker of the presence – past and/or present – of a specific religious group and as a reliable marker of religious diversity, helping assess the state of health of religious pluralism in itself. More than the national level of State-religions relationships, the local milieu of the city contribute in shaping contemporary forms of religious life. At the same time, cities represent the arena where old and new minorities struggle for space, visibility and recognition, contributing in shaping the city and its public life. From this point of view, local public institutions increasingly stand at the forefront in the regulation of religion-driven needs. This contribution presents the results of a research conducted in the city of Turin: based on a comparative case-study, it focus different dynamics of symbolical positioning and material placing through the lens of four minority confessions: Judaism and the synagogue; Orthodoxy and the parish; Islam and the mosque; Scientologism and the church. Drawing on empirical evidences collected over a period of three years, we analyse the actor constellations involved in the regulation of religious diversity in Torino. The interaction (or its absence) between religious organizations and secular institutions help explaining the peculiarity of Torino's case study. Analysing the interplay among religious organizations and local politics and policies in the last thirty years, the research highlight the prominent role of religious actors in shaping urban space, as well as the role of local public institutions in shaping the urban religious field.

BOTTINELLI, EDUARDO* (Universidad de la República, Uruguay)

La Sociología y El Oficio Del Sociólogo/a En Uruguay: Prácticas y Ámbitos

El presente trabajo fue realizado en el ámbito del Colegio de Sociólogos del Uruguay, con el objetivo de aportar conocimiento actualizado sobre la situación de la sociología y la profesión.

Se presenta una aproximación a los rasgos destacables de la profesión y su proceso de despliegue en el país en los 60 años que lleva de desarrollo en el país. Posteriormente se presentan resultados de una encuesta on line de 221 casos realizada en 2018 acerca de la situación profesional y expectativas de los sociólogos en Uruguay. Adicionalmente se incorpora información de fuentes secundarias sobre la cantidad de egresados, el ejercicio de la profesión y la declaración en el Fondo de solidaridad y aportes a Caja Profesionales Universitarios.

Se ha podido establecer que en Uruguay hay 1170 sociólogos/as egresados/as de las universidades que otorgan el título (1062 de UDELAR y 108 de la UCUDAL)

El estudio refleja un panorama de los sociólogos/as del país, mostrando una centralidad montevideana, más bien de mediana edad (76% menores a 49 años) y con un perfil de egreso más feminizado (56% son mujeres).

Un hecho relevante para los sociólogos en el período más reciente es la expansión del espacio profesional más allá de ámbitos universitarios con un importante despliegue en el campo de políticas públicas, organizaciones de la sociedad civil y mercado profesional privado.

En la dinámicas de desarrollo se destacan cambios en el modo de producción del oficio del sociólogo, de una primera generación volcados a la generación de pilares de conocimiento sociológico general (estructura social del país), hacia una creciente división social del trabajo científico que produce múltiples sociologías especializada en temáticas.

Dinámicas y transformaciones que suponen nuevos retos que exigen la defensa y promoción activa del oficio del sociólogo/a en su desdoblamiento de producción de conocimiento riguroso y crítico.

First in My Family: The Contribution of Higher Education for Reducing Social Inequalities

Despite the persistent worldwide trend of massification of higher education (Schofer and Meyer, 2005), social inequalities in higher education remain among the major problems of contemporary societies. The crucial importance of this problem stems from the fact that higher education is the cornerstone of contemporary knowledge-intensive societies and that inequalities in higher education determine to a great extent other social inequalities, e.g. economic inequalities and inequalities in civic participation and social trust. Against this background, our paper aims to explore the contribution of higher education for reducing social inequalities using the case of first-generation students in Europe.

Theoretically, the paper is framed within the political economic perspective for understanding public and private goods (Marginson, 2016). We build on the combination of economic and political definitions of public/private goods in higher education. Whereas the economic definition of public/private in higher education is based on the non-market/market distinction and subjects politically defined public goods to tests of limited resources, the political definition of public/private in higher education is based on the state/non-state distinction and subjects economically defined public and private goods to tests of values, norms, social relations and system design. Following Marginson (2016: 97-98) we will analyse how „these issues look different from country to country".

Empirically, the paper uses the EUROSTUDENT survey to explore the association between inequality in society and first-generation students via correlation analysis. It also relies on the European Social Survey to study the influence of higher education on reducing social inequalities among the first-generation students via regression analyses. More specifically, we will test this influence on inequalities in labour market as well as in non-labour market outcomes. Our preliminary findings provide suggestive evidence for a significant association between the inequality in society and first-generation students and for positive influence of higher education on reducing social inequalities.

BOZIC, ALEKSANDAR* (University of Agder, Faculty of Social Science, Norway)

CSOs between State and Foreign Donors in a Post-Conflict Context: Chances and Barriers for Service Provision and Social Innovation

Cross-sector coordination and partnership are integral, not only for the successful implementation of SDGs, but also for the development of social innovation within social services. Although the dialogue between various actors can lead to the development of different forms of partnerships, it can also pose certain challenges, especially in terms of rebalancing the relationship between state and non-state actors in the provision of services. Nonetheless, there is a paucity of research exploring how cross-sector coordination and partnerships affect non-state actors in a fragile post-conflict context in developing socially innovative programmes within the domain of public social services. Guided by an institutional theory approach, this mixed-method research paper aims to examine the position of local civil society organisations (CSOs) in post-war Bosnia and Herzegovina (BiH) and their relationship with different actors in the context of post-war social welfare. This is a relationship marked by a complex power dynamic between influential international donor elites, fragmented state institutions, unstable local politics and increasing user welfare needs in the context of an ethnically segregated society. Data for this study is derived from 15 semi-structured interviews with representatives from local CSOs, international donors and public institutions, as well as a survey of 120 representatives of CSOs employed across BiH. By combining new institutionalism and resource dependency perspectives, this paper identifies the institutional isomorphisms and pillars that shape the behaviour of CSOs within the local context and that influence their relationships with foreign donors and state actors in the social sector and in the field of social services. At the same time, this paper explores how these relationships can simultaneously stimulate, but also block the capacity of CSOs to engage in social transformation and to develop both meaningful and socially innovative solutions in a post-war social welfare context.

Employment Arrangements in Mixed Couples: Is an Egalitarian Arrangement More or Less Likely When a Native Is Married to a Migrant?

In this paper, we study gender role behavior in mixed couples. We focus on employment arrangements as an example of persistent gender inequality in Germany. A mixed couple is defined as a union between a German-native non-migrant and an immigrant of the first or second generation. While classical assimilation theory has considered such unions as a means to and a result of immigrants' integration into the host society, less is known about the native partners. Our theoretical considerations are based on gender relations and household economics theories. Drawing on the scientific use file of the German Microcensus for 2013, we examine natives of employment ages (18 to 67, not yet retired) who are living with their partner in an opposite-sex union. Our sample consists of 47,969 native men (7.1% of whom are in a mixed union) and 47,102 native women (5.4% of whom are in a mixed union). We use a multinomial logistic regression. The male-breadwinner model has long been the most prevalent arrangement in western Germany, while an egalitarian division of labor has been more common in eastern Germany. We examine this regional difference by controlling for the region as well as estimating interaction effects. We find that among native men in mixed unions, the male-breadwinner arrangement is significantly more common, but that among women in mixed unions, the arrangements vary. Our results further indicate that in eastern Germany, being in a mixed union is associated with a re-traditionalization of gender roles for both men and women. In western Germany, by contrast, the arrangements vary more for women. We discuss the implications of these findings for our understanding of immigrant integration, and how forming mixed unions, in conjunction with the host society's structures, hinders or fosters the realization of gender (in-) equality.

BRAACK, MIRKO* (University of Rostock, Germany)
MILEWSKI, NADJA* (University of Rostock, Germany)

Exploring a Minority in the Minority: Same-Sex Couples Among Immigrants in Germany

We study the intersection of international migration and sexual orientation by looking at same-sex couples among international migrants in Germany. This study is exploratory because there are hardly any available data on this minority within a minority; the topic is sensitive; and the "target group" is assumed to be very small. Our paper is motivated by several different trends. Europe has become culturally and ethnically more diverse, and this diversity is reflected in demographic differentials. While same-sex unions have been "legalized" in most western European contexts, they remain expressions of "non-normative" lifestyles. Even less is known about the behavioral dimension of queer international migrants. Our study is conducted at the intersection of two minority groups, both of whom face social disadvantages and are subject to "othering" processes. Thus, migrants forming same-sex partnerships challenges classical theoretical considerations regarding partner selection and immigrant assimilation.

We use the scientific use file of the German Microcensus for 2013. We estimate the prevalence of same-sex couples among female and male migrant populations, and describe their socio-demographic characteristics. We use different approaches to imputing data to account for the possibility that the information on same-sex relationships may be missing or wrong. We calculate a range of estimates. Our results show that the share of couples who are same-sex is smaller among the immigrant (0.3 to 1.4%) than among the native population (0.6 to 2.0%). We also find variation by sex and country of origin, with migrant women and migrants from non-Western countries being less likely to be in a same-sex union than migrant men and migrants from European countries. Moreover, migrants in same-sex couples are shown to be more similar (endogamy) in terms of other socio-demographic variables (age, education) than migrants in opposite-sex couples with mixed countries of origin.

BRAGA, RUY* (Universidade de São Paulo, Brazil)

The Rebellion of the Precariat: Work and Neoliberalism in the Global South

In his new book, Ruy Braga seeks to ethnographically base the crisis of neoliberal globalization that began in 2008, comparing three countries - Portugal, South Africa and Brazil. "The rebellion of the precariat" proposes to understand the popular resistance to the policies of social dispossession that accompanies the diffusion of neoliberalism and the precariousness of work in the semiperiphery of the system. To do so, it uses the Marxist theoretical framework in an attempt to interpret both the advances in the commodification of labor, land and money, as well as the new forms of insurgency against the plunder carried out by the urban precariat. The rebellion of the precariat is the first book in the history of Brazilian sociology comparing three countries on three different continents, relying on both Marxism and ethnographies of the proletarian condition. In addition, in international terms, it is a pioneering book that aims to interpret the crisis of globalization that began in 2008 from the political practice and forms of resistance of the urban precarious.

BRAGA, VINÍCIUS* (Universidade Federal do Rio Grande do Sul, Brazil)

Política Penitenciaria Femenina En Rio Grande Do Sul (Brasil): Un Estudio Sobre Las Repercusiones De La Política Nacional Antidrogas (Ley 11.343/2006)

La investigación supone que el campo de las políticas públicas incluye asuntos gubernamentales y estatales; y considera como parte de la lista de políticas estatales aquellas que involucran a todos sus poderes (ejecutivo, legislativo y judicial) en su diseño y ejecución. En este contexto, analiza la política penitenciaria dirigida a las mujeres encarceladas en Rio Grande do Sul (Brasil), y la repercusión de la implementación de la Ley 11.343/2006, la llamada "Lei de Drogas". Con este fin, la investigación se limita al alcance del "1º Juizado da 2ª Vara de Execução Penal de Porto Alegre-RS", conocido como "VEC Feminina", responsable de la supervisión y el seguimiento de las sanciones en cuatro unidades de la capital y la región metropolitana: "Penitenciária Estadual Feminina de Guaíba", "Penitenciária Feminina Madre Pelletier", "Anexo Feminino da Penitenciária Modulada de Montenegro" (en proceso de desactivación) e "Instituto Penal Feminino de Porto Alegre". Buscamos comprender la intersección de las interacciones y representaciones sobre el tema en estudio desde la perspectiva de los actores e instituciones involucradas - "Poder Judiciário", "Ministério Público", "Defensoria Pública", "Secretaria de Justiça e Segurança", "Susepe", y mujeres presas - en la construcción del proceso político que involucra la cuestión penitenciaria. Además, estamos interesados en comprender cómo la aparición de facciones en las cárceles de mujeres ha tenido repercusiones en la dinámica de las prisiones. Teórica y metodológicamente nos guiamos por las nociones del gobierno de lo humano y las políticas de la vida, y de las economías morales (la configuración de la intersección de las normas y valores presentes en los mundos sociales que subyacen a las prácticas políticas), a raíz del trabajo de Didier Fassin, quien enfatiza la necesidad del carácter público en la investigación en ciencias sociales.

Sublimer Le Désarroi, Soutenir La Vie Sociale, Permettre La Critique ?

En contexte accru de mondialisation et de concurrence entre les villes, de nouveaux festivals et événements culturels ponctuent les vies urbaines. S'agit-il uniquement d'augmenter une attractivité ? Des ambitions économiques de positionnement sur un marché touristique peuvent-elles s'articuler au souci de s'ancrer dans le cœur (et le corps) des habitants et des visiteurs ? Comment les exigences de participation citoyenne sont-elles intégrées à ces organisations ? Quelles propositions critiques sont travaillées, par quels acteurs et au regard de quels objectifs ?

Ces questions seront discutées à partir deux cas : les *Métamorphoses* (1èreédition en 2016) à Liège (ancienne industrie sidérurgique) et la *Ligne Verte*(1èreédition en 2012) à Nantes (ancienne industrie navale).

Plus exactement, nous nous intéresserons aux productions narratives et matérielles associées à ces dispostifs culturels. Dans le cas de Liège comme de Nantes, des (re)configurations sont opérées qui racontent, traversent et pénètrent le territoire. Elles prennent corps dans des programmations d'événements culturels urbains sensés, parmi les divers objectifs poursuivis, soutenir la vie sociale. Ainsi, des festivités se connectent à de grands travaux urbains et tentent de préparer la population à l'avènement d'un autre territoire. Elles cherchent souvent à travailler en profondeur les identités et sentiments d'appartenance. Ce faisant des résistances se manifestent. Elles éclosent, soit au cœur du dispositif et s'en jouent, ou à la marge de celui-ci. Elles signalent aussi des dérives (gestionnaires ; justificatives,..) tout en rappelant les potentialités intrinsèques d'un engagement (Thévenot) par les arts. En bref, il s'agira ici de percevoir et de décrire les chemins (et conditions de possiblité) d'une critique, elle-même aux prises avec la question de sa mise en commun.

Imagination Against Imaginary: Toward Anthropological Cinemas of FIRE

This paper seeks to reorient the practice of scholarly filmmaking within a programme of fundamentally speculative anthropology by regarding it as a process that articulates vital dimensions, as well as technical ones. Directed by Guilherme Moura Fagundes and edited by Pedro Branco, Outro Fogo is a short film about affinity and enmity relationships with fire in the context of environmental management and conservation in the Brazilian savanna biome cerrado. Departing from an analysis of the film's features, its production process, and several events where it was screened, we draw on the notion of anomaly to build a theoretical and methodological framework with which to understand and craft unusual and destabilising moving image-based experiences. We advance an argument defending that films be designed to make manifest, in their material configuration, an open-ended anthropological insight through an unorthodox treatment of the audiovisual material that invites imaginative avenues of sense-making. This effacing of the boundary between form and content ultimately challenges the validity of adhering to established conventions and genres as a filmmaking method. If such conformity undermines anthropology's transformative potential, so does a confinement of the filmic event within the boundaries of its own materiality. Conceived as a finished product, a film espouses a status of document that interrupts its life flow and fends off unexpected mutations arising from its encounters with the world. In this context, we urge filmmakers and researchers to operate a shift from making 'ethnographic films' –descriptive artifacts which, to varying degrees, attend to the scientific vocation of the discipline– to putting forward 'anthropological cinemas' in which the anomalous film is only one element of a broader multimodal endeavour to unsettle assumptions and, thus, nurture modes of living and being not yet normalised

'Transnational Care Capital' of Older Migrants and Its Impact on Social Inclusion. a Comparative Study of Older Migrants in Australia and Germany.

Older people are predominantly described as immobile or left behind by their migrating children and age in place. Concepts of ageing in place emphasize the role of geographically close social support networks in the neighborhood that facilitate the social inclusion of older people. Similarly, social capital approaches on migration often measure the social ties in the country of settlement as a criterion for integration and social inclusion. In contrast to this perception, older migrants, possess social capital that extends the local neighborhood and geographically close ties, but includes transnational social support networks and ties. Thus, despite being seen as located at the vulnerable end of society, due to language barriers, lack of economic capital and localized networks, older migrants possess a different kind of capital: which is defined here as "**transnational care capital**". This transnational care capital extends the local neighborhood and includes distant forms of care of older migrants that is complementing local care support structures, but is often overseen in aged care concepts and policies. Drawing on case studies of older migrants in Australia and Germany, taken from a longitudinal ethnographic, biographical and network analytical study on transnational ageing based in Australia and Germany, this paper explores on the micro level how older people develop and employ transnational care capital in daily lives and in the current social structures and constraints they are embedded in and how transnational care capital can facilitate social inclusion not just in the transnational family but also in the emplaced local neighborhood.

Reading Women Reading Indigenous

Indigenous religions are characteristically based on oral traditions – 'the transmission of beliefs, rules, customs, and rituals by word of mouth'– rather than on written law and sacred texts. In these systems, indigenous women 'preside over rituals, preserve but also re-create traditions' Indigenous religions are not monotheistic, but tend to view the cosmos as made up of the living and the dead, each essential to the whole. Nature must, therefore, be nurtured. This is in stark contrast to the Western hierarchies of (masculine) intellect and (feminine) intuition or emotion, of objective and subjective, material and imagined reality.."[1]

Gender narratives in Manipur have been based on ingrained belief system with a framework of historical antecedents. Women in this region are women embed-

ded in their histories and these histories are in-turn embedded in their cultural past and mythical narratives. Therefore they bring out a different reading of women, from their western as well as the other Asian sisters.

The way we perceive our women is evident in the mythology and legends and folklore of our region. The popular image of woman is of an independent minded, happy, hardworking with a sense of justice. There are mythological stories of women etc who asserted their decisions, rebelled against the social order and had a mind of their own and are today used a complimentary nomenclatures for young girls and women.

Does this indegeneity make us look towards the window opening to South East Asia? Do we then need to dig these matri past to bring out the corrective view of looking at our world? These two will be then the focus points of this paper.

Agroecology and the City Hall of Belo Horizonte, Minas Gerais - the Sustainable Territories Project

The Sustainable Territories project, developed by the City of Belo Horizonte, Minas Gerais, through the Municipal Secretariat of Social Assistance, Food Security and Citizenship (SMASAC), seeks to make the city more committed to Food and Nutrition Security with the strengthening of urban agriculture. Among other actions, the project includes the construction of agroecological systems such as agroforestry, community gardens and productive backyards; the promotion of the commercialization of products from urban agriculture; and the promotion of local knowledge through the training of agroecology multipliers, and through workshops and actions on food and nutrition education. The Sustainable Territories project innovates by working in the Vitória, Esperança and Rosa Leão settlements, that constitute part of the Izidora set of settlements - supported by social movements, with over 8,000 families -, in addition to the urban Quilombo Mangueiras, through an intersectoral approach to public policies. Thus, this project is inserted in a space of political dispute and struggle for the right to housing and the city, articulating the housing problem with agroecology and food security. One of the keys to the success of the project, in its various locations, is the close relationship between the state and civil society. This paper aims to: a) understand the general and main characteristics of the Food and Nutrition Security policy of the Belo Horizonte City Hall; b) analyze the characteristics and normative frameworks of the project in focus, identifying innovative elements; c) analyze the forms of collective action and interaction between local government and civil society in the context of the project. In addition to the literature review and documentary survey, this work is based on interviews with policy managers and residents of the settlements.

Integrating Technology Development and Risk Assessment – Introducing the Research Project "Ubiact"

One opportunity to explore mutual effects of social and technological change and to realize socially acceptable technology development is to integrate social sciences into the process of technology development, e.g. through joint research funding. The third-party donor of "UbiAct" insisted on the empirically grounded exploration of ELSI-criteria (ethical, legal, and social issues) and tests with use cases in context of the research subject (smart homes) in order to grant funding. In this presentation, we will show how this is organized in research practice and present first findings.

The interdisciplinary research project "UbiAct" aims at two goals: (1) Developing a multimodal interaction system for networked environments in digitalized homes. With the use of AR glasses and a ring for gesture control, context information will be visualized in space and control options will be more intuitive in execution. (2) Exploring the needs, benefits, and barriers of (potential) smart home users. The focus of this project lies on kitchens and cooking.

The digitalization of homes is predominantly pushed by technology developers (e.g. Wilson et al 2015) and great benefits of this development are expected

for instance in the areas of lifestyle support and energy management. Nevertheless, it might also affect daily routines or privacy at home. E.g. Balta-Ozkan et al. 2013 have already identified social barriers for smart home adoption in the U.K. Amongst others, users are concerned about control, reliability, security, and costs.

For our mutually informed research, we organize internal ELSI- workshops. In order to grasp peoples' opinions, we conduct focus groups (quota plan; sampling criteria: gender, age, affinity for technology, and health status; content analysis). For exploring the use cases, we will organize cooking events in a Living Lab (smart home) with single persons or groups using video analysis. Additionally, we have regular meetings for continuous and joint discussion.

: The Business Representation Organizations in North America. Case Study in Mexico and USA in Usmca Context: Consejo Coordinador Empresarial and United States Chamber of Commerce

The business representation organizations are political actors in modern societies that are important to analyze because they are important subjects with influence in social spheres beyond economic life. In this case, the objective of this paper is to know the political actions of the main business representative groups of Mexico and the United States in the negotiation process of the New North American Free Trade Agreement (USMCA). To do this investigation, was realized a documental revision in different sources like journals, official documents and interviews. The worth of this paper is that permits inquire in the relation between business meta-organizations with the political power during a specific conjuncture like the negotiations of USMCA.

Paid Parental Leave, Labour Market Participation and Gender Equality in Lithuania

The activity of population rather than dependency on welfare state benefits is new agenda in EU (EU Social Investment Package, 2013). Among new social risks one is the family and work responsibilities balance. The challenge is to solve the problems and ensure favourable conditions for the reconciling family and work duties. Thus, we focus on the following research questions, which are not answered in the academic literature and previous research. The paper is focusing of answering to the following research questions: How are the family policy measures (paid parental leave system, availability of pre-school education and quality of services) applied in Lithuania is influencing the participation of parents of young (0-3) children in the labour market? How do family policy measures in Lithuania (paid childcare leave system, availability of pre-school education and quality of service) affect gender equality in the labour market? What scenarios do parents have in parental leave choices (temporary withdrawal / return to the labour market)? How does a paid parental leave system influence childbearing intentions of young parents? Therefore, the aim of the paper is to analyse of paid parental leave, parents labour market participation and gender equality in Lithuania. For the implementation of the aim we applied quantitative and qualitative research methods. Comparative qualitative analysis of MISSOC data were used in order to analyse the family policy, the child care leave model in Lithuania (in the EU context). Quantitative analysis of secondary and microdata data of (EU-SILC, EQLS and State Social Insurance Fund (SODRA)were used for the structure and priorities of the beneficiaries of parental leave (based on the SODRA data).

Climate Finance and Economic Development: Exploring the Relationship in the Caribbean

Focusing largely on the Caribbean region, including the country of Belize, and using several data sources and multiple methods, we explore the relationship between climate financing and official development assistance (ODA). Are they tangled or untangled? Should they be or not, and why? Answering these and other questions remains difficult. Climate finance is more inclusive than is ODA. There are political and administrative efforts dedicated to both tangling and untangling climate and development investments. While specific funders were created to invest in only climate change projects, the sources of funding often remain tangled.

Likewise, our data show that separating climate investments from development ones, at least in the Caribbean, is exceedingly difficult and development rationales were easily available for most investments including mitigation and adaptation projects alike. The new UNSDGs hinder efforts to make distinctions by labeling most non-large scale extractive development and climate investments sustainable development. Shortly, private climate financing will necessarily overwhelm public-based development assistance. Massive private financing needs may limit certain types of climate investments, especially in poorer countries, and enhancing even greater global inequalities.

Emotional Challenges of Images Showing Suffering and Violence

To make and look at photographs that show suffering and violence and are widely circulated in public media, is controversially disputed (Sontag 2003). What are the risks of such photos for those depicted as well as for the viewers looking at them? Taking two examples, one photo from the recent refugee movements and one from the Armenian Genocide, I will first explore what it means for those photographed to be confronted, time and time again, with their own image in a situation of severe suffering being shown in public media. Secondly, I will reflect on how we as viewers can deal with the defense that immediately arises when seeing photos of extreme violence and suffering in which we are not directly involved. What kind of emotional risks can occur when we expose ourselves to such photos and how can we handle them in order to better understand, also emotionally, what they are showing?

Visual Segment Analysis As a Methodological Approach. Social Media Photographs Seen from a Biographical Perspective

How can we grasp the specific pictorial meaning of images especially in compilations with huge numbers of pictures? In my paper I would like to introduce Visual Segment Analysis as a methodological approach for analyzing single images in depth (Breckner 2010, 2020). They are systematically chosen from larger image compilations by using image cluster analysis developed by Michael Müller (Müller 2016). Visual Segment Analysis reconstructs how from the relationship and formal organization of various pictorial elements an image emerges, thereby creating, at the moment of viewing, partly determinable and partly indeterminate meanings and connotations in discursive contexts. It is based on picture theories such as Mitchell (Mitchell 1994), Boehm (Boehm 2007) and Imdahl (1996), and focuses on the documentation of the process of perception of an image and the analysis of its compositional structure. The interactional contexts and negotiation of the meanings of an image is reconstructed by interpreting captions and comments. Thus, the potentially complex, explicit as well as latent meaning connected to an image is reconstructed and then confronted with the contexts in which it is actually produced, distributed and looked at.

In my paper, the approach will be exemplified with image analyses from a recent project on visual biographies in Social Media (*https://visbio.univie.ac.at/en/about-the-project/*). In the project VIS_BIO, different ways in which biographies emerge i.e. on Facebook, Instagram and are constructed in narrative biographical interviews are juxtaposed in order to understand similarities and differences of visual and narrative ways of performing one's life. In my presentation it will be shown how a biographically complex situation becomes visible in one photo album that was curated and posted on Facebook in a certain period.

BREITENBACH, ANDREA* (Philipps University of Marburg, Germany)

Digital Learning: Social Differences between Students

The digitization of teaching has been promoted in recent decades. For several years, the topic has also attracted the attention of universities. In the meantime, a growing number of different digital learning scenarios, such as the inverted classroom, is being offered and evaluated. There is, however, less of a focus on how students deal with digital media and the use of digital communication media, although this is an important aspect.

"Digital natives" is a catchword that is often used in relation to students in the context of digitization. The assumption that today's students generally study with a digital affinity is not tenable, as recent studies demonstrate. Students often use digital media privately, but not necessarily in everyday university life. Moreover, it seems that digital services are not used in the same way by all students. Social determinants probably play a role that should not be neglected. On the other hand, digital teaching methods seem to be of interest to students, as they are looking for more digital communication with their lecturers.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

In this paper, we examine both aspects: on the one hand, we investigate how students use digital media and investigate whether there are social differences in usage behaviour; on the other hand, we examine how students evaluate the use of digital communication media such as chatbots and etherpads and how they deal with it. The use of digital communication media such as specially constructed chatbots and other digital platforms in seminars is also investigated. Further, in order to investigate the research questions, qualitative and quantitative studies are analysed and evaluated. Subsequently, qualitative interviews are conducted to determine how students deal with digital media. The first results are given in this presentation.

Financialization in Brazilian Private Higher Education: Permanence By Indebtedness, Expansion By Public Benefit

This paper aims to verify and analyze the financialization of Brazilian private higher education, focusing on the Lula and Dilma governments, assessing their main characteristics. It is based on the hypothesis that the process of financialization, occurring at a global level, is expressed in Brazil with specificities and incompleteness, albeit in line with that of other countries, with a growing relevance in social policy, in which the higher education system stands out as a representative element. Thus, a general conceptualization of the phenomenon through specific *senses* is initially performed, positioning the concept approached. After that, it is investigated its origins in Brazil and the way in which it is currently manifested. Finally, the previously defined *senses* are used to indicate the financialization that has occurred in private higher education in recent periods. This is presented by two perspectives: on the one hand, a higher indebtedness of the families through a subsidized educational credit by the government, and, on the other, large educational conglomerates with highly aggressive market attitudes, guided by a constant stock valuation. The role of the state is seen as fundamental in this process, both through a costly educational credit system (FIES) and a direct and expressive subsidy to educational enterprises (PROUNI). The results are a growing number of students benefited and progressively indebted, coupled with a strong change in this sector, with numerous mergers and acquisitions, accompanied by a market concentration *pari passu* the entry of these large corporations into the stock market, with accelerated valorization. These characteristics corroborate at least two of the *senses* presented, allowing a critical conclusion of this process.

What If Social Policy Preference Research Was Causal? a Meta-Analysis of Modeling Choices and Their Theoretical Implications

Research on social policy preferences – and related concepts of attitudes, mass preferences, public opinion, support for the welfare state – has been around for over a century, nospans social science disciplines and has thousands of published studies. Typically, findings involve some measure of social policy preferences taken from a representative survey regressed on individual and contextual independent variables. The most common individual-level variables measure socioeconomic status, demographics and sometimes subjective attitudes or values. Common contextual-level variables measure social policy spending, economic development, group dynamics, cultural values and political institutions. There is no standard model. Each study is a unique combination of independent variables predicting social policy preferences. This reflects the fact that there is no standard theory of social policy preferences. Many studiese have little or no theory supporting their modeling choices. Yet every single regression model reflects several theoretical assumptions. Underlying the use of a 'model' of social policy preferences are causal assumptions. In fact, without these causal assumptions, the results of these models are mostly 'noise'. We suggest that social policy preference research is severely limited as a result. To try and move forward to more useful knowledge about social policy preferences, we question the assumptions behind the modeling choices researchers make. To do this we meta-analyze the modeling choices of a segment of all social policy preference literature – those using cross-national ISSP data published in the 10 journals with the most social policy preference research. In doing so we meta-analyze the assumptions underlying each model by converting each into a causal DAG. This leads to a review of the most common causal assumptions and identifies the key 'disputed' areas of assumptions that need further scrutiny and theoretical development.

Work-Injury Laws in Comparative Perspective: The Origins and Development of the Welfare State in 188 Societies 1800s-2018

The creation of nation states brought forth the origin of the national welfare state. This event took place at different times in different nations, but it unequivocally began with the introduction of work-injury laws ('workman's compensation') during and after the Industrial Revolution. This paper presents a first look at the global origins, development, dissemination and functions of work-injury laws in 188 societies. We say "societies" because many of the details involved shifting nation states and colonial occupations. The research on the history and political sociology of the welfare state is heavily biased toward the Global North. Here we look across all societies for which we have data, a far greater number being in the Global South. This gives a truly global picture of the emergence of the welfare state in human history. This is part of a larger collaborative research center with 16 projects investigating "The Global Dynamics of Social Policy" (CRC 1342 at the University of Bremen). Using institutional, Marxist and functionalist theories we analyze this incredible amount of data using sequencing and event history analysis. The results point at institutional factors, in particular the stability and effectiveness of both political and social institutions; war; timing of serfdom's end and the Industrial Revolution; colonialism; and the role of transnational actors. Initial results also demonstrate how work-injury laws covered different segments of the working-class and how this depended on occupation, group membership (ethnicity/race/immigrant status), and gender.

MAIRA-VIDAL, MARÍA DEL MAR* (Universidad Complutense de Madrid (España),)

La Ética Del Trabajo y La Vida a Comienzos Del Siglo XXI y La Vulnerabilización De Las Personas Desempleadas Mayores De 45 Años En España

La ética de la vida y del trabajo cambió de manera radical en el paso del siglo XIX al siglo XX. Si en el siglo XIX las empresas tenían dificultades para retener a los trabajadores, en los siglos XX y XXI no tener la posibilidad de acceder a un trabajo coincide en muchos casos con la percepción de que uno es inservible para sí mismo y los demás. Los trabajadores hacen depender su valor como sujeto del valor de su fuerza de trabajo. Esto desvela la intensidad con que el trabajo constituye una relación social totalizadora en las sociedades capitalistas. La vida social está simbólica y materialmente constituida por la relación de trabajo. Por lo general los sujetos desempleados están subjetivamente incapacitados para asumir que su desempleo no es un problema personal. Individualizan su problema. Los parados se explican su desempleo en términos individuales, culpabilizadores. En vez de aparecer como uno más de los millones de parados, uno se narra a sí mismo en soledad, en incertidumbre respecto al resto del mundo que trabaja. Los problemas causados por el desempleo se analizan en términos psicológicos y se medicalizan. En cualquier caso, hay que subrayar que el trabajo forma parte de una ideología que se nos ha impuesto, pero también de una relación social constituyente de nuestro tiempo histórico. En esta comunicación presentaremos parte de los resultados del proyecto de investigación I+D+i VULSOCU "Nuevas formas de vulnerabilidad socio-existencial, soportes y cuidados en España", financiado por el Ministerio de Economía, Industria y Competitividad en España, que tiene entre sus objetivos analizar las formas de vulnerabilización existentes en las sociedades actuales y su relación con el concepto de trabajo y vida en general y las consecuencias del desempleo de larga duración entre las personas de más de 45 años en este país.

BRICALLI, IAFET* (University of Genoa, Italy)

Governing the Poor: Neo-Pentecostalism and Neoliberal Subjectivation on the Peripheries of Brazilian Cities

Evangelicals, especially neo-Pentecostals, have been gaining increasing strength in Latin America (Mariano and Gerardi 2019). In the Latin American context, the case of Brazilian society is illustrative, where evangelicals represent about a quarter of the population and have a relevant influence on the country's political and cultural spheres (Mariano 2013). The purpose of this proposal is to problematize the neo-Pentecostal advance in Brazilian society, particularly the reasons that explain its predominance in the peripheries of large cities since the 1980s. The hypothesis is that the neo-Pentecostal advance reflects the arrival of neoliberalism in Brazilian society. Neoliberalism is understood as a policy of social dismantling (Schwarz 1999), with profound consequences for the most

disadvantaged social classes in the urban peripheries of large cities, but also as a rationality (Dardot and Laval 2014), aimed at the government and subjectivation of individuals by inculcating the values of competition and individualism so that state policies can thus be justified. It is believed that neo-Pentecostalism was one of the social devices found for the government of the poor population in the peripheries of Brazilian cities, since its theology of prosperity, characterized by offering magical solutions for the improvement of living conditions (material and non-material) of the faithful based solely on individual effort, coincides with neoliberal rationality.

Does Reduce Violence Lead to an Improvement in Democracy?

The sustained increase in violence in Latin America has caused an expansion of the fear of being a victim and has underpinned a growing demand from the population to the harsh and violent responses that lead to the control of violence, without take into account the cost of these policies have for freedom and democracy

The idea behind these support of the population for iron-hand policies is the assumption that a reduction in violence can immediately amount to the achievement citizen security.

Based on the analysis of three situations: a) territorial political control by the Colombian-Venezuelan guerrillas; b) hard-handed policies and extrajudicial violence by the police to reduce crime, and c) the sale of personal security in areas controlled by organized crime gangs, this paper intend to demonstrate how this presumption is misleading and that the reduction of Violence can mean a denial of citizen rights. It can mean a mutation of the forms of violence and social submission, but not democracy as rights-based citizen security.

The theoretical proposal of this work is that citizen security in democracy cannot be based on the reduction of violence by the "pax criminal", be it from criminal gangs or from governments. Democratic peace, as a continuous process to achieve unequal and different living together, and to resolve conflicts without violence, can only be achieved through the construction of a formal and informal institutional framework that allows to increase trust and social predictability, guaranteeing citizen rights.

If we assume that violence cannot be eliminated in society, the goal of democracy must be to build mechanisms to prevent the use of violence in social relations, and to manage violence to guarantee freedom and rights of non-violent, but without destroying in that way the institutionality that founds it and gives it legitimacy to democracy.

Los Trabajadores De Tecnología De La Información y Las Nuevas Configuraciones Del Mundo Del Trabajo: Tendencias y Desafíos.

Con la "revolución informacional" en las últimas décadas del siglo XX emergieron nuevas categorías profesionales en la industria, en el comercio y los servicios, tanto en el segmento de *hardware* como de *software*. Son técnicos, programadores de *software*, *designers*, consultores, prestadores de servicios de mantenimiento de redes, analistas de sistemas, digitadores y un conjunto diversificado de otras actividades vinculadas al sector de tecnología de la información, que emergieron en el contexto del régimen de acumulación flexible, marcadas, por lo tanto, por relaciones de trabajo "atípicas", flexibles, en el caso del Brasil, poco reglamentadas en el sector privado. Se trata de un sector que ha suscitado investigaciones y reflexiones sociológicas sobre el carácter del trabajo digital, informacional, sobre todo en lo que se refiere a la producción y desarrollo de software, las condiciones de la realización del trabajo, las formas de contratación, a los procesos de cualificación y cuestiones de identidad. A partir del análisis de los datos secundarios y una metodología cualitativa e informaciones sobre el sector, de entrevistas con los trabajadores y las empresas, además del análisis de documentos, el artículo abordará sobre las configuraciones de este trabajo, el perfil de los trabajadores, el mercado de trabajo marcado por la elevada rotación y la organización colectiva de los trabajadores en el Brasil, principalmente, a lo que se refiere a la organización sindical.

Occupy Again. Land Struggle and Peasant Organization at the End of the Brazilian Dictatorship (1964-1985)

The intent of this paper is to analyze through interviews, reconstruction of local memories, analysis of newspapers and a variety of documents, the history of occupation and the forms of collective action and resistance of peasants at the land occupation of São José da Boa Morte, situated in municipality of Cachoeiras de Macacu, in Rio de Janeiro, Brazil. The analysis is based on the author's research for the Master's degree and reconstructs the 1979 land occupation and the two peasants' prisons in 1980, presenting the collective action frame built over the 1950s-1970s.

Thereby, several moments of organization, demobilization, and continuity of daily forms of resistance are observed, identifying continuities and innovations that relate to the state and national peasants' organizational process. This paper also seek to highlight the construction of the narratives about occupation, presenting reports of peasants and leaders, apprehending the construction of these peasants' agency and their forms of organization, such as the use of mass-circulation newspapers, public prayers, bulletins and articulation with politicians in order to conquer, in 1981, the land expropriation. In a broad sense, this paper seeks to articulate a set of forms of collective action mobilized by peasants, identifying the potency of their organized action in political re-democratization.

BROADBENT, JEFFREY* (University of Minnesota, USA)

Power, Knowledge and Networks in Climate Change Policy-Making: A Japanese Case

Our knowledge, the information we believe to be true and the norms we act upon, may be profoundly affected by the distribution of power in society. UN-generated knowledge--scientific information and moral norms about anthropogenic climate change—urges nations to reduce their carbon dioxide emissions. How much nations accept and act upon that knowledge could be strongly affected by domestic structures of political power. Solution of the climate crisis requires detailed case studies to test this hypothesis. The policy network (PN) method provides a good tool for this task. The PN method analyzes how the structure of political power affects the policy-making process. It uses survey data on the meso-level: transfers of different types of incentives, network patterns of relationships, and influence hierarchies among the organizations involved in the policy-making process. The present PN study analyzes the reasons for the disjuncture in Japan's (misleading) 1997 proclamation that it would reduce its carbon dioxide emissions by 6%-- whereas its actual reductions amounted to almost zero. The PN survey collected data from 120 organizations on two incentive networks: scientific information and supportive cooperation, plus the relative political influence of the organizations and other information. The findings revealed a dual power structure that processed the UN information and norms in opposed ways. In an external "shell," most organizations accepted the UN information and norms and thought that the official 6% target would fulfill those goals. In an inner "core," though, the most affected businesses (electric power) and the economic ministry, rejected the UN norms and lowered the actual reduction to near zero. These findings support a theoretical model of the power structure in which affected producer groups and supportive government agencies subtly define the operant knowledge and resist emissions reductions. This finding helps explain the slow pace of national emissions reductions around the planet.

Ethnic-Profiling As an Enduring Police Thought-Style and Practice: A Douglasian Approach to Analysing Organisational Dynamics, Everyday Rituals and Resistance to Change

Ethnic profiling has become an increasingly visible and criticised feature of how police officers act amid pressures to proactively tackle crime. Several European studies have considered ethnic profiling as closely intertwined with various narratives around migration. These studies have thus noted the role of public sphere narratives regarding migration and how these shape police officers' thinking and language, as well as the way experiences of police harassment and discrimination shape the narratives and marginalised identities of some groups of migrants and children of migrants - particular young men of colour. Despite widespread criticism and commitments from within the police community to tackle the problem, evidence suggests the practice is enduring and that attempts to make police forces more diverse do not necessarily reduce ethnic profiling.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Drawing on critical social scientific approaches to risk and uncertainty, especially Mary Douglas's cultural theory, we analyse interview data (in-depth interviews with officers) and observational data (shadowing police officers in their everyday work in public spaces and meetings) regarding 'stop-and-checks' in a large city in the Netherlands.

Our analysis emphasises the multiple lines of accountability which render police officers vulnerable, the combining of different rationalities of decision-making, and the influence of everyday rituals which cultivate and reinforce particular thought-styles and related practices. Dominant categories such as 'ethnicity' powerfully frame the experiences of police officers in everyday ritual interactions. In turn these experiences affirm the salience of these categories within the organisational dynamics and thinking of the police.

By studying how "gut feelings of self-evident truth are produced not by external stimuli but by the way our classification system is set" through organisational dynamics (Reis 2019:2), our Douglasian approach helps us a) understand and unpick various mechanisms by which ethnic profiling has proved resistant to reform, and b) propose constructive possibilities for tackling this enduring problem.

BROWNE, CRAIG* (University of Sydney, Australia)

Rationalisation As Reification: The Changing Configuration of Social Conflicts

This paper argues that the contemporary reconfiguring of social institutions was shaped by the conflicts of the preceding phase of capitalist modernity and the harnessing of intersecting developments, especially those of technological innovations, the growing international division of labour, and financial capitalism. Although many of the empirical tendencies are well known and have been discussed under various categories, it will be suggested that the notion of the dialectic of control facilitates a better understanding of the transition to modernity's new phase due to its focus on the contestation involved in social relations of autonomy and dependency. My analysis will initially clarify how the changes associated with the current phase of modernization overcame resistance and opposition to them. It will argue that many of the sociological diagnoses of the times, associated with notions like postmodernism and reflexive modernization, gave expression to aspects of this transition but failed to effectively engage with the critical social theory problem of 'rationalization as reification'. It will be argued that the contemporary form of this paradoxical process is a major source of the current social regression that is evident in the exacerbating of social inequality, the erosion of the democratic public sphere, and the consolidation of reactionary authoritarian political movements. Although the existing critical social theory interpretations of rationalization as reification, such as Habermas' theory of the internal colonization of the lifeworld, illuminate current social pathologies and social conflicts, it is necessary to revise these diagnoses in order to comprehend the contemporary capitalist constellation and the metamorphoses of the dialectic of control. The latter has led to the development of reflexive control, the reconfiguration of social antagonisms in different social spheres, the complications of globalising dynamics, and the self-organizing tendencies of social struggles opposing injustice and domination.

BROWNE, CRAIG* (University of Sydney, Australia)

Reconceptualising Resistance

The concept of resistance is now pervasive in the social sciences and political culture. In one sense, the extensive use of the concept of resistance reflects a certain scepticism concerning other categories of radical transformation, especially those that refer to more long-term and encompassing social change. 'Resistance' does not necessarily contradict these categories, because it can be synthesised with notions like those of mobilisation, revolution, and change. Yet, the prominence of the concept of resistance does reveal a shift in social and political outlooks. Resistance represents a reaction or response to domination and suffering; it does not signify an extension of progressive change, rather, it tends to express subordinate groups and individuals' limited options. Resistance is perceived to be incarnated more in uprisings and civil disobedience than institutional reforms. It may be a precipitating condition of the latter, but resistance foregrounds the moment of opposition and it widely varies in its forms, from simple non-compliance to collective mobilizations. The different connotations of resistance have enabled its diffusion across intellectual fields and Foucault's claim that where there is power there is resistance undoubtedly contributed to the concept's expanded application. Foucault's approach, at the same time, evidences the limitations of strands of current discussions. The situating of resistance in the matrix of power and counter-power denudes the concept of some of its normative grounds and its connections, in Castoriadis' terms, to the social imaginary of the project of autonomy. Likewise, some conceptions of resistance suffer from limited accounts of social agency and are overly conditioned by that which they oppose. My paper argues that a more complex conception of resistance is required to

comprehend current social conflicts and that the normative basis of resistance lies in the relational dynamic of contesting heteronomous dependency by struggles for autonomy.

Constellations of Seeing – Analyzing Immersive and Explorative Image Practices

Everyday life is characterized by a diversity of visual media techniques. Through these techniques, people are confronted with a variety of visual experiences as well as possibilities to express themselves. The assembly of many images next to each other on social media sites like Instagram creates image clusters in which the images comment and complement each other. Here, recipients see themselves confronted with image artefacts that demand an explorative mode of seeing. In contrast the wearers of 3D glasses in Virtual Reality environments do not only see images in an immersive mode as they fill the visual field, but also experience themselves (partially) in the context of realities depicted in this visual medium.

To cope with the diversity of the visual media techniques, in the proposed paper we aim to present a way of image analysis which focusses not on single images but on the comparative nature of images themselves. The most important feature of this approach is the basic assumption that images cannot be understood through their mere existence, but rather by considering, e.g. their medial compositions and environments (displays, optics, spaces) as well as those stocks of knowledge, action routines and sets of rules that structure the use of the respective image media techniques. By applying the outlined method on a body of empirical data which consists of highly diverse forms of visual material, the rationality of different immersive and explorative image practices will be discussed.

A Study about Young Egress of Socio-Educational Measures in Rio Grande Do Sul

This study presents as its theme the trajectory of young egress of deprived socio-educational measures and, more specifically, those who were no longer involved in crimes after their institutional shutdown. It is intended to present partial results of an ongoing research that seeks to find out how protective and risk factors influenced the trajectory of young egress of deprived socio-educational measures who stopped practicing crimes. It is known that "the trajectories of individuals gain consistency from the more or less elaborate delineation of projects with specific objectives" (VELHO, 2013, p.138). The projects depend on the field of possibilities of individuals, their previous knowledge, constituted in a space of time in a social, cultural and historical context. The starting point of this investigation is the recent study on the egress of the Fundação de Atendimento Socioeducativo do Rio Grande do Sul (FASE) (SECRETARIA DO PLANEJAMENTO, GOVERNANÇA E GESTÃO, 2018), which investigated all egress from the Porto Alegre regional, from 2012 and 2013, totaling a universe of 728 young people. As a result, it was found that in the 5-year period after the institutional shutdown, 71.75% of the young relapsed in the practice of crimes, reentering at FASE or in the prison system. On the other hand, there is also a record that 28.3% of young did not reenter the FASE or prison system within 5 years. This qualitative research is conducted through individual interviews with these young people who did not commit crimes again after institutionalization. So far, it has been possible to understand that the form and ability to understand in relation to their history, violence suffered and the crimes committed were important in the trajectories of egress young people. Likewise, the relationship with the support network also provides a detachment of the youth from involvement in infringing acts.

LUDWIG, SUSANN* (University of Basel, Switzerland)

„Yeah! Let's Do It": A Collaborative Exploration in Writing

This presentation is about the article „From the perspective of space: A collaborative exploration" (Ludwig and Büchele 2019). It is a reflection on the process

and the product of writing collaboratively, which also takes into account our professional and personal background that allowed for this collaboration in the first place.

In an attempt to explore ways of seeing the authors engaged in a curious and playful collaboration of back-and-forth writing, the authors stitched together pieces of text but never thought to smooth out the seams. The process creates surprises even for the authors and more questions emerge. Instead of agreeing on the content, the authors put some simple rules in place. These rules are procedural and keep the space for content wide open. In this sense, content and writing process overlap: Writing about space while creating space to think, play and work together.

This collaborative method of writing allows for thinking along with each other, creating a text but without the urge to arrive at a conclusion, instead encouraging the reader to take the text as an invitation to collaborate and think along with the authors. Ultimately, the process as well as the product of writing together promote collaborative excitement and encouragement as a productive addition to critical feedback.

Think of the Autonomy of Rural Women: The Case of Guapi, Cauca

In this paper, we have the purpose of reflecting on the idea of autonomy applied in a rural context. We present the results of our work in Guapi, Colombia, which had the purpose of tracking the relationships of the experience of the autonomy of the rural women of this municipality. We inquire about the ways in which women and men understand this notion. Also, in its application from the private as the use of time dedicated to the care of children, the house, food, pleasure, and leisure. Also, in relation to autonomy within other spaces such as economic or health, we inquire about the uses and management of resources, income, quality of services, care, among others; publicly, about the knowledge of their participation and leadership. The intention was also to trace these relationships by strengthening the socio-cultural specificities of the region, that is, recognizing that the reality of Guapi has a presence of Afro and indigenous communities in dispersed rural areas, which cohabit in the same territory in the middle of a context. of forced displacement, of poverty, and of corruption.

This research is the result of the accompaniment to the process of formulation of the Public Policy of Gender Equity for Guapi, specifically in the design of the instrument for the definition of the baseline. We attended: Lina Buchely, director of the Observatory for Women's Equity (OEM), Salomé Arias-Arévalo, OEM researcher and Ana María Agredo as researcher of the Icesi University Gender Studies Program. We carried out a qualitative approach through five focus groups with women and men from the municipality of Guapi, Cauca. During our visit, we were in the village of Quiroga; as well as in Temuei in Bajo Guapí; We visited the indigenous town hall of Bella Vista located in the Chanzará district.

BUCHINGER, EVA* (Austrian Institute of Technology AIT, Austria)

Societal Innovation & Digital Transformation: A Social Systems Theory Perspective

Societal transformation is a popular term related to digitalization and sustainability. Since this term is weakly-defined, Niklas Luhmann's social systems theory will be used as a framework to advance its conceptual clarification by focusing on societal innovation. In the first part, societal innovation will be defined as comprising all novelties having an impact on the social macro-level, irrespective whether they arise from social or technologies entities, or from the private or the public sector. Thereby, the value of using the social system theory approach will be discussed via-a-vis the classical societal transformation literature (e.g. A. Smith's 'wealth of nation', K. Polanyi's 'great transformation') and the recent discussion concerning mission-oriented transformations/transitions related to technological innovation (as ongoing in the European Union or in the recently founded Transformative Innovation Policy Consortium). In the second part, social systems theory aspects such as meaning processing social systems and evolutionary and cybernetic principles (e.g. self-organization, variation, resonance, re-stabilization, and autocatalytic dynamics) will be applied to conceptualize digital transformation as societal innovation. Especially the European General Data Protection Regulation (GDPR) will serve as an empirical focus. That is, how the GDPR war introduced as a mean to protect 'privacy' as one of the critical aspects of digitalization (role of societal function systems, re-stabilization) – as a consequence of the coinciding of PC & internet & mobile phone and social media applications (variation & selection) which made the digital footprint a problematic issue (produces societal wide system resonance).

Negotiating Decision Narratives: The Role of Artifacts

Recent studies in the decision-making field are challenging the classical concept of decision as an instrumental phenomenon bounded into organizations upper echelons. Accordingly, it open space for researchers to analyze decision-making from social practices perspective. In this sense, the decision is constructed and reconfigured through a situated and dialogic process by different organizational actors. Nevertheless, little is known about the role of material artifacts on permeating this process. While artifacts are comprehended in accordance with the view of materiality as a relationship of objects and the social, they are not inseparable but mutually dependent. Those elements are conceived and articulated by decision-makers as fragments of narratives that support to and structure the sense made about the decision itself. Thus, this paper aims to analyze how individuals make their own narratives of decision mediated by artifacts and negotiate the meaning in the processes of change. This study was settled from an ethnography developed within a beverage industry organization over 15 months. Data came from interviews, documents, observations and field notes. As a result, visual artifacts such as worksheets, drafts of meeting and powerpoint slides represent artifacts constructed by different organizational actors amid the negotiated meaning process. Furthermore, those artifacts articulate and resettle decision-making process especially in the relation between middle-managers and top management. In addition, the narratives materially mediated conduct to an integrative role in that each actor shares the same decision, which is considered as politically accepted.

BUDHIRAJA, KRITI* (University of Minnesota, USA)

Constrained Optimism: An Ethnography of Delhi University

College education is considered a ticket to upward social mobility for those without inherited privileges. Yet, success in college depends in large part on inherited privileges. This lends higher education a contradictory quality: it is a resource *par excellence* for eroding inequality, and a classic mechanism that reproduces inequality. My paper examines this contradictory quality of higher education in India. Through an 18-month ethnography of an undergraduate college in Delhi University (DU), I ask: *what is the role of the university in reconstituting existing inequalities?*

With the world's largest affirmative action program that reserves 50% seats for students from marginalized communities, DU is a space of optimism. Students from diverse regional, caste, class, and religious backgrounds study at this prestigious university. But if university attendance fuels optimism, university life constrains it. In the first part of the paper, I discuss the routinized practices and quotidian mechanisms of university life that make the university an unequal playing field. These include an examination of the admission process, peer dynamics, academics, and extra-curricular activities.

Yet, these very practices that reproduce inequality also open the possibility for marginalized students to succeed. The second part of my paper argues that even if these possibilities materialize infrequently, it is instructive to examine when and why they do. In this part of the paper, I examine cases of marginalized students that succeed despite the uneven odds (Vaid 2019). I argue that their success underlines the importance of two factors: i) the role of cultural insiders illuminating

processes that would otherwise remain obfuscated to them as cultural outsiders; ii) student leaders from marginalized communities inspiring other students from similar backgrounds to step up.

In so doing, my paper examines both the routinized practices of university life that reproduce inequality and key moments that disrupt this reproduction of inequality.

Comparing "Universalisms" and Their Legitimation: Healthcare in Costa Rica and Cuba

In the wake of political revolutions in the mid 20th century, both Costa Rica and Cuba reformed their national health policies in a radical way, both focusing on what can be broadly described as "universalism". Ever since, the idea of universalist and rights-based health provision has been an important element of governmental rhetoric and action in both countries. However, the trajectories and current states of universalist policies in Cuba and Costa Rica reveal important differences. Cuba, with its one-party system and a top-down approach on social policy, appears to have developed a two-class healthcare system, which is rumored to be increasingly based on productivist logics. Costa Rica, in an interaction between state and civil society, has gradually expanded comprehensive policy measures, focusing on social citizenship and equal status in healthcare. Both principles still seem to have strong public backing and remain an important basis of political legitimation, although the option of private healthcare is becoming more popular. Via a comparative institutional approach, we analyze the role that political ("democratic", "authoritarian"), but also socioeconomic and sociodemographic contexts have played for the development of different forms and consequences of universalist approaches to healthcare in Costa Rica and Cuba. To do so, we account for key elements of the historical backgrounds of both countries (such as changes resulting from the revolutions and times of crisis in the 1980s in Costa Rica, and in the 1990s in Cuba, respectively) and focus especially on more recent developments in the past two decades.

RC16-JS-45.3

BUENO, ARTHUR* (University of Frankfurt, Germany)

From Neurasthenia to War: A Simmelian Account of the New Authoritarian Wave

This paper advances an interpretation of Simmel's ontological relativism which emphasises its dialectical underpinnings as well as his role as predecessor of Frankfurt School Critical Theory. It does so by discussing his definition of money as an absolute tool and the latter's expression in 'hypertrophied' or 'pathological' forms of individual action and experience: greed, avarice, squandering, asceticism, cynicism, and the blasé attitude. This is a fundamental dimension of Simmel's approach to the money economy and his diagnosis of modern culture, one that was articulated in terms of a 'colonization of ends by means' and is present throughout his oeuvre from 1889 to 1918. Simmel's arguments in this regard offer a point of entry into a core aspect of his philosophy of money and his theory of modernity, both of which take the form of a 'dialectics without reconciliation' (Landmann). They moreover prove crucial to his characterization of modern psychological life as 'neurasthenic', i.e. continuously oscillating between urgency and exhaustion, saturation and insufficiency, 'hyperesthesia' and 'anesthesia'. In conclusion, the paper will address the actuality of Simmel's theory of monetary pathologies by discussing how it contributes to understanding contemporary forms of social psychological malaise (e.g. depression and burnout) and their political expressions.

RC35-JS-40.3

BUENO, ARTHUR* (University of Frankfurt, Germany)

The Post-Depressive Constellation: From Political Effervescence to the Rise of the Far Right

This paper advances the idea that the current rise of the far right can be understood as one among various political expressions of a 'post-depressive constellation.' Such a diagnosis takes its cue from analyses in critical theory and sociology which, in the 1990s and 2000s, recognised in the rapid increase in depression rates an index of major social transformations occurring during the last decades of the 20th century. The foregrounding of depression in clinical diagnoses was considered then the sign of a new social order: one in which individuals were faced with ever stronger requirements of self-responsibility and authentic self-realization (i.e., the demand of 'being oneself') in a context of declining social support and escalating inequality, competition, and precarity. Today, however, we seem to have reached a point at which the tensions of this order – which can be designated, metonymically, as the 'depressive society' – intensified to such an

extent that its persistence appears to be seriously compromised. It is in this sense that we may speak of a post-depressive constellation: a situation in which the social psychological tensions of the depressive order have reached a peak, leading to a variety of reactions and struggles but not yet to the establishment of a new consensus and a stable institutional framework.

BUENO-ROLDAN, ROCIO* (Phillips-Universität Marburg,)

"Loosing the MAID". an Analysis of Status Loss in the Migratory Experiences of Middle and Upper-Middle Class Mexican Expat Wives.

Globalization and the blurring of national frontier barriers have led to an increase of high-skilled professional migrants as part of new international treaties, who usually come from Western countries. Their spouses and families have to adapt to new countries, often without support. They are a mostly feminine, isolated, upper-middle class bubble worth studying.

Contrary to other occidental (white) expat wives, the Latino expat must deal with "ideas of ethnic origin, visual discourses and representations of popular culture that tend to fix them in preconceived ideas of ethnicity, race and gender" (Lündstrom 2009). They are not able to pass as a native when sent to north western countries and cannot gain full advantage from white privilege in postcolonial countries. At the same time, these privileged Latinas "cannot be considered passive victims of their situation, but more an active agent" who cooperate with a structure that excludes them, but also makes them beneficiaries of numerous economic and social privileges.

In this paper I question how Latino expat wives negotiate ethnicity and class by focusing on the figure of "the maid", which symbolizes the domestic help that was used to gain, maintain and normalize dominance, class, status in Mexico and which due to their migration they have lost or "is not like back home". While domestic help such as gardeners, nannies and especially maids validated them as middle and upper middle class in the home country (Massi, 2013), equivalent support is not typically available in Western destination countries despite their privileged economic position. Additionally, in some destination countries, Latinas are associated with providing domestic help rather than receiving it. Studying this group therefore offers an opportunity to look at how they respond to these threats to their social position and reveals how ideas of social class and "Whiteness" change in response to migration.

BUHMANN, KARIN* (Copenhagen Business School, Denmark)

Global Commitments and Urgencies in Conflict: Addressing Human Rights Impacts Challenging the Speedy Transition to Low-Carbon Economies

Energy justice is arising as an academic discourse arguing that climate change mitigation should not cause social injustices in the process. Within the academic discourse of business responsibilities for human rights, it is well recognized that the renewable energy projects and agri-industry can pose risks to human rights, and that mining and minerals supply chains can do so as well. It is also recognized that economic actors should exercise risk-based due diligence to identify and manage their human rights impacts, including through 'meaningful engagement' with 'affected stakeholders' (potential/actual victims) and the exercise of leverage (influence) on business relations. The Paris Climate Change Agreement and the Sustainable Development Goals both recognize that human rights should not be harmed in the implementation. Yet the theoretical aspects of these normative issues and their organizational implications in regard to renewable energy production, raw-materials and facilities locations is under-researched. As the green transition creates a market for products required for renewable energy facilities, bio-fuel crops and minerals for wind turbines, solar panels and storage batteries, this risks pitching the urgent global challenge to deliver a transition to a low-carbon economy against globally recognized international human rights. Moreover, at the moral level, the urgency of the transition challenges practices and legitimacy ideas of affected groups rejecting projects, as this may delay the implementation of climate change mitigation, thereby enhancing risks of harm to

others as well. This complexity of dilemmas calls for enhanced insights into how risk-based due diligence can strengthen the collaboration and inclusion of affected stakeholders in planning and (re-)designing activities related to the transition in order to co-create solutions that work for all involved while limiting harm. To address the knowledge gaps above, this presentation outlines a prospective research agenda, combining the business and human rights, responsible business and impact assessment literatures.

BUJES, JANAINA* (UFRGS, Brazil)

Dangerous Youth and the Juvenile Penal Justice System in Necropolitics Times

Narratives about a supposed crisis in Brazilian public security policy come from a long time. Taking into account the data and the historical averages on imprisonment, it is possible to affirm that highest rates were reached in recent years. I analyse the formation of a notion of "dangerous youth" as well as the rationality of the Juvenile Penal Justice system, which combined with other state practices, can be understood as a necropolitics of public security. I present and discuss how the theoretical and legal narratives interact and co-produce certain state practices. I argue that youth is a heterogeneous historical and social experience. The analysis of the Juvenile Penal Justice system data could be helpful for the understanding of the state technopolitics logic, as well as its practices of selection and capture of the certain youngsters in the punitive dynamics of the confinement. This study is based on specific theoretical framework of the subject and also on official data from the Juvenile Penal Justice system. The official reports, it is possible to observe that the increase on the criminalization of youths follows the same reasoning of the adults criminal justice system: the majority are men (even though the rates of incarceration amongst women have increased), young, black and due to the practice of criminal offences related with drugs. The state technopolitics that is co-produced in the everyday life of confinement affects not only the individual existence of these young people, as well as the collective experience of this part of the population. From the interactions between social, legal and practical dynamics, we see the overpass of specific social markers of difference and the boundaries between naked/pure life and social life being determined by classifying them as "dangerous youth", in which state practices are situated from a necropolitical perspective of public security.

RC29-351.3

BUJES, JANAINA* (UFRGS, Brazil)

Medicalization of Arrested Adolescents As Government Technology: Notes on the Management of a Public Mental Health Policy in Correctional Practices in Porto Alegre, RS, Brazil.

The present study analyzes how the intervention practices for managing adolescents deprived of liberty at the Fundação de Atendimento Socioeducativa (FASE) in Rio Grande do Sul State are configured. Starting from accusations regarding the medicalization of incarcerated youths, this research approaches the constitution and follow-ups of such debates with the mobilization of a group of actors towards constructing a public cause. The goal, therefore, is to question the modes of governance articulated in outlining a mental health policy for these teenagers. The investigation draws on an ethnographic perspective to conduct the analysis of documents and the participant observation of meetings and state activities alongside the research interlocutors in order to trace the network of actors that engender such processes. The study points to different human rights performances which are being articulated in the politics "of" and "to" life, in the networks of relations that constitute the subjects, the senses, and the practices imbricated in the categories mobilized by the agents in the constitution of public policies. The center of the controversy seems to be the (non)site for these youths. Also, it allows the observation of state bureaucracy practices operating in dynamics that erase structural violence. The research shows that there is not a group or a specific alignment of actors within the discussions regarding this matter, but a constant process of negotiating support and gathering allies to implement the policy. Such processes are not pre-given. On the contrary, they are contingent and implicated in different processes of discursive disputes to reshape state practices. Thus, they produce politically situated knowledge which is promoted, reconstituted, and mediated in different levels, causing the displacement of boundaries and the dislocation of the engaged subjects and relations various (i)legibility forms.

BULLON, LAURA* (New York University, USA)

The Future of Politics Is Grassroots? UN Legitimacy and Global Youth Movements during the Climate Emergency

This article explores the various roles of youth digital participation in the fight against climate change in the context of the United Nations (UN). The UN, under the leadership of Secretary General Guterres, has made climate change an

organizational priority and planned a Climate Action Summit in New York City in September 2019. However, increasing nationalism and lack of compliance toward environmental agreements has led the UN Secretary General (SG) to make unprecedented comments such as calling on youth to "please be disruptive. Put pressure on your governments. Without you, the UN will fail." This article proposes a nuanced understanding of youth climate activism at the UN, as well as to distinguish the role of digital activism per se. Based on 25 semi-structured interviews with youth activists conducted in July 2019 during the UN High-level Political Forum in New York City, I show that digital networks are mobilized by youth activists both to express support for, and well as destabilize, the UN climate sphere. On the latter, the digital is used collectively to connect with other youth climate groups, such as Extinction Rebellion and Fridays for the Future, and build larger coalitions that can pressure the UN and its Member States. The paper thus proposes to understand how youth digital participation both exists alongside and impacts the legitimacy of international organizations who struggle to adapt to the needs of the twenty-first century, such as the United Nations.

Putting Transnational "Hybrid" Governance to Work: An Examination of EU-Red's Implementation in the Argentinean Biodiesel Value Chain

The struggle for environmental preservation has increasingly been shaped as a crusade for the reduction of greenhouse gas emission. In this battle, the replacement of fossil fuels has become a key objective. Biofuels have been heavily promoted as an emissions-saving alternative, making their worldwide production and trade grow significantly. However, many critical voices have raised concern about their sustainability, questioning their actual capacity to reduce emissions and the detrimental effects that the expansion of agricultural frontiers has on ecosystems and biodiversity. Against this background, the European Union (EU) decided to include a number of sustainability requirements in its key regulation: the Renewable Energy Directive (EU-RED).

This initiative has attracted the attention of governance scholars due to its "hybrid" character: the EU, a formal political authority, has set sustainability requirements in the form of a meta-standard, while it is left to private certifications to control their adoption and implementation by producers and traders. Through its resort to certification schemes, the EU's regulatory power expands transnationally, allowing for its meta-standard to shape the practices of actors overseas.

Much has been discussed about the comprehensiveness of EU-RED's meta-standard and the way in which different certification schemes have translated it into their own standards. However, only a few empirical analyses have examined EU-RED's actual implementation transnationally. In this paper we propose to look at the concrete way in which the notion of sustainability defined in EU-RED's meta-standard is materialized in the case of soy-based biodiesel produced in Argentina and consumed in the EU. We are interested in determining the way in which this transnational and hybrid governance initiative manages to promote sustainability in Argentina's biodiesel sector by looking both at its concrete social, economic and environmental effects and at the way in which relations of coordination between actors are affected along the value chain.

Digitizing Global Health: Infrastructures and Patient Subjectivities in Sub-Saharan Africa

This paper explores the ways in which digital technologies shape patient subjectivities and patients' understandings of health and body. It is focused on two early-stage projects of digital high-tech in the field of global health: first, the use of drones in healthcare and humanitarian medicine; and second, the introduction of so-called Pharmaceutical Dispensing Units (PUDs). In relation to the first, I explore the national drone programs of Ruanda and Malawi. Drones are used to transport blood samples and medicine, provide footage of disaster areas and offer mobile internet hotspots. Placed in suburban shopping malls, PUDs are medical vending machines and have been introduced in three underprivileged districts of Johannesburg that were chosen as pilot sites in 2017 with the aim to speed up, simplify and de-stigmatize provision as well as to contribute to decongesting South Africa's often crowded public hospitals. The introduction of digitalized solutions in the fields of healthcare and pharmaceutical provision have long been hailed as central to the management of South Africa's massive population of around 20 million people suffering from chronic diseases. Efforts to promote such solutions have finally come to fruition as the first cohort of 17.000 users has been enrolled in the program since spring 2017. Enrolled patients receive a card, which – together with their personal pin – identifies them at the dispensing machines and links them with a cloud system in which patient and prescription data are stored.

The paper suggests that engagements with digital technologies in the field of healthcare changes the ways in which patients or users understand and manage their health-related practices. In particular, I argue that digital control of healthcare and medication introduces new forms of patients' self-evaluation and that sociological theories of evaluation are particularly valuable for the understanding such changes.

Time and the Self: Autobiographical Storytelling in the Narrative Economy

This paper analyses and theorises the practice of biographical storytelling of HIV- positive AIDS activists in South Africa. Combining research in illness narratives, studies of emotions in social activism and analysis of global health institutions in Africa, I explore how biographical self-narrations are deployed to facilitate access to resources and knowledge and thus acquire material and symbolic value. I illustrate my argument through the analysis of the case of an AIDS activist who became a professional biographical storyteller. Based on the analysis which I claim to represent wider dynamics in human-rights-based health activism in the Global South, I propose the concept of narrative economies by which I mean the set of exchange relationships within which biographical self-narrations circulate and produce social value for individuals and organisations.

El Trabajo Precario En Las Relaciones Sociales De Sexo Como Factor Determinante De La Pobreza Femenina Brasileña - Estudio De Caso Urupiara - Alagoinhas-Bahía-Brasil.

La categoría de género contribuye a desnaturalizar e historizar las desigualdades entre hombres y mujeres, entendidas de manera histórica y relacional, y no como oposiciones que surgen de rasgos inherentes a diferentes seres, por lo que el error de no detenerse identificar los diferentes poderes que ostentan y padecen hombres y mujeres (SAFIOTTI, 1992).

La garantía de la autonomía económica de las mujeres es una condición fundamental para superar las desigualdades que experimentan. La construcción de una sociedad más justa e igualitaria no es efectiva sin la inclusión de las mujeres, que siempre han participado en diferentes espacios sociales, aunque de forma devaluada.

El estudio de caso realizado en Alagoinhas / BA / Brasil, se presenta como un ejemplo de empobrecimiento femenino frente a las condiciones mínimas de vida socioeconómica, al observar las categorías: sexo, ingresos, trabajo, clase, educación. Apresentamos algunos datos del estudio: los residentes son mayoritariamente mujeres (53,64%), con bachillerato incompleto (22,2%). La edad económicamente activa representa (57,32%). Los residentes asalariados registrados corresponden al (24,84%). Tenemos un 11,68% de parados. El tramo de ingresos (49,15% - 1 S.M.). Aproximadamente (26,4%) están desempleados y sin ingresos (26,41%).

Concluimos con el estudio de caso que la precariedad del trabajo en las relaciones sociales de sexo, están presentes, mayoritariamente, en las mujeres. Que esta precariedad laboral entre relaciones sociales de sexo es predominante para la pobreza femenina brasileña. En el Condominio, las mujeres representan (53,64%) y reciben hasta un salario mínimo.También hay residentes sin ingresos que viven en el programa de transferencias de efectivo.

When Faith, Hope and Love Are out of Tune: Religious Activism for and Against Neoliberal Governmentality

Neoliberal governmentality is growing in Latin America on the ashes of the center-left experiments of the last two decades. With it, a new political formation is drawing closer religious sectors in search of recognition and protagonism, but also in open dispute with social minorities who have benefited from policies that promoted equality and justice. As a result, expressions classically associated with peaceful and generous images of religion have become loci of intense contestation: faith, hope, and love are increasingly objects of contention between religious groups and trigger alignments of secular allies from each side. This work will explore, based on the idea of "religious activism", ways of renaming these signifiers of openness and reciprocity that have turned the Christian field into a locus of dispute for the reinforcement of neoliberal and neoconservative domination or its transformation. This religious activism will be observed through cases in Brazil and other Latin American countries where religion has occupied the public space divided between the reinforcement of domination and the generous openness to new ways of building the social bond. The very meaning of religious discourse is at stake and how it can connect with current struggles for the protection and guarantee of rights for vulnerable ou assertive minorities.

A Tale of Two Countries: Perspectives on Credibility & Digital Health Information Sources in Italy and the U.S.

In recent years, the Internet has become a popular source of information, thanks to the rise of interactive User-generated content and social networking sites. Therefore, people are increasingly looking for health-related information online. The widespread use of interactive and quickly refreshed content has not only helped create, but as well has increased, the potential target audience for Internet-based health-related information; however, source quality and credibility often vary. Some research exists about the online behaviors of those searching for health-related information more generally; but rarely have digital health information sources be discussed in a cross-cultural context. This presentation aims to explore research on digital health information sources from two countries – Italy and the United States – both focusing on the connection between health and credibility in the digital information age. In the Italian context, the researcher will focus on "Wikipedians' work" and how do they usually build their credibility in particular when they write about health-related issues. This research will draw from numerous studies conducted evaluating information provided via the Italian and English versions of the Wikipedia website, which has often been ranked among the top search results for topics on Google. Similarly, in the American context, the researcher will discuss how communicating about health can help build credibility - but will focus on the advent, and rise in prominence of, the "online influencer". This part of the presentation will draw from research conducted with over 400 influencers, which elucidated how influencers have become important sources of health information for their readers. Implications for social health movements – both positive (such as the democratization of health information) and negative (such as the proliferation of misinformation online) – from both the studies will be discussed.

Socio-Technical Controversies between Agribusiness and Agroecology: Reappropriation and Practices of Family Farmers in the Semi-Arid Region of Ceará.

In Ceara (semi-arid Northeast Brazil), although still fragile, the sociotechnical system "agroecology" has established itself as an alternative to the dominant agribusiness. The controversies and clashes between the respective public and private actors that defend them highlight two polarized visions for the rural territory.

In this work conducted in the Jaguaribe region, we questioned these controversies in the face of family farmers' practices and analyzed the determinants of farmers' practices. The methodology associated a participatory systemic and multi-actor diagnosis coupled with semi-structured interviews with farmers (40) and institutional representatives. On one hand, the two socio-technical poles were characterized (actors, visions, rules, instruments and mechanisms for strengthening, etc.). On the other hand, farmers' practices determinantes were analyzed through the framework of sustainable livelihoods and historical perspective.

In the field, the two systems coexist, increasing farmers' capacity to adapt. Without getting too involved in the controversies, farmers pragmatically take advantage of the opportunities offered by both systems to implement their life strategies: instruments (public and private), narratives, rules. Innovative practices often arise from this re-appropriation. They are sometimes in contradiction with the initial purpose of the instruments of both systems (such as subsidies, credits, etc.) that were designed within a polarized vision.

Access to opportunities remains strongly dependent on key actors, in often clientelistic relationships. Information and debate arenas are informal and not very inclusive. This contributes to the great heterogeneity in the capacity of farmers and communities and to social-environmental inequality. The absence of a formal local governance framework may favors adaptability and innovation at various levels (individual, family, community, …). But at the territorial level, the lacking of natural resources management increases socio-environnemental vulnerability.

BUSH, MELANIE E* (Adelphi University, USA)

Actors on the Stage of Change: The United States

The system as a whole – economic, political and social – is in a crisis of new proportions. In the United States, traditional rhetoric and ideology of the American Dream, Horatio Alger upward mobility and nation of no limits are being tested and strained.

A past project explored people's views about the contemporary moment and was published in 2015 in *Tensions in the American Dream: Rhetoric, Reverie or Reality*. We wanted to know how ordinary people in the U.S. reconcile the current economic and political crisis with the rhetoric of endless possibility. We discovered a deep concern that the stories being told about the exceptionalism of the United States and opportunities for limitless accumulation, wealth and well-being might not actually be true.

As scholars rooted in grassroots movements since the 1970s we were already aware of the energy afoot to actually be and build "the change", not only demand it from the current elite. Their questions led us to investigate what *are* people doing, both in the U.S. and globally and how they conceptualize their efforts.

The research discussed in this presentation brings an ethnographic lens to the experiences of individuals and communities involved in creating structures to address the challenges that they currently face. This paper shares some of what those involved have to say about their hopes, dreams and practices.The project methodology combines oral history (interviews) with ethnography (participant observation) and background research to explore the ways of thinking and experiences of people involved in "be the change" efforts over the last decade.

BUSH, MELANIE E* (Adelphi University, USA)

Who Are "We"; Who Are "They"? Race, Nation and Structures of Belonging

Situating the emergence of social phenomena such as race and nation within coloniality, Eurocentrism, and the modern world, this paper offers reflections about the state of white supremacy in the United States in the context of the organization of global society in the contemporary moment. Central arguments draw from analytic and ethnographic work particularly done in and about the U.S., given the nation's historical rise and global positioning.

Central questions explored include: What do we who study white supremacy seek to accomplish through our inquiries and how do these goals align with or diverge from that of social movements working to address its structural manifestations? In what ways is a framework of "zones of being and non-being" (Fanon) relevant to scholarship and praxis seeking to contribute to the struggle for a humane and just future? What defines the vision of the social world that we seek individually and collectively? Has it ever existed? Do the frameworks of "decoloniality" or "pluriversality" describe a world to fight for? If not, what is the appropriate language?

How is power (from above and below) to be reckoned with – both historically and in the contemporary and future contexts? What is the state of ideas about what the future "should" bring and what evidence do we have of those visions being actualized in building transformational structures and networks around the world? This returns us to questions of "Who are '*we*?" Who are "*they*"? Does it Matter? How?

Practices of Motherhood and New Ways of Defining and Doing Both Home and Family: The Dreamer Moms in Tijuana, Mexico

For more than two decades, the area of migration studies has paid attention to the intersection between motherhood, transnational families, and migration. Those early studies shed light on the reconfiguration of the family structure in general and that of women and their relationship with their social identities as mothers in particular as a result of the migration process. In those studies, however, the effects of migration policies on the reconfiguration of the family structure did not occupy the analytical attention of the researchers at that time. With the implementation of IIRIRA in 1996, not only did the criminalization of immigrants and their families begin, but also the securitization of the border intensified, leading to a new reconfiguration of the family structures of migrant communities. In this new context, scholars began talking about a "gendered and racial removal project," given that out of the 4.2 million people deported from 2003 to the end of 2013, 91 percent were from Mexico, Guatemala, El Salvador, and Honduras and 90 percent were men. Although most deportees are men, a significant number of women are also deported.

Drawing on an ongoing ethnographic fieldwork consisting of open-ended and in-depth interviews to a group of deported immigrant mothers, known as DREAMers' Moms USA/Tijuana A.C residing in the border town of Tijuana, Mexico; we examine the family reconfiguration process that both mothers and their children experience as a result of the process of deportation. Particularly, we explore how these "familias transfronterizas por deportación," develop a new set of caring practices for their families to cope with both legal and structural violence that these families endure on both sides of the US-Mexico border. Specifically, we focus on how these families reclaim new ways of defining and "doing both home and family" in a context of uncertainty created by deportation.

RC02-36.6

BUTKALIUK, VITALINA* (Institute of Sociology, National Academy of Sciences of Ukraine, Ukraine)

Escalation of Inequality Resulting from the Neoliberal Reforms in the Ukraine

Prior to the reforms the Ukraine had been one of the developed European countries and had good opportunities to further develop the efficiency of the economy and the prosperity of the population. The reforms didn't live up to the expectations as they had been designed by IMF for developing countries and were aimed at creating the most favorable conditions for "core" countries to maximize their profits at the periphery of global capitalist economy.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

The implementation of neoliberal imperatives has lead to the negative deindustrialization of economy, rising of unemployment, degradation of the social sphere, deprivation of the population, etc. This resulted in the growth of inequality through decline in labor income and limited access to social services.

Today the average wages of the top 10% is 13 times higher than the wages of the lower 50% and 159 times higher than the average wages of the lowest decile.

Economic inequality creates and reinforces other types of inequality, limits the social mobility and the ability of ordinary people to participate in decision-making. The commodification of social services has made education and healthcare unaffordable for the majority of Ukrainians. All this is contributing to the aggravation of the economic and demographic crises, and is transforming Ukraine into a "sick" society.

Sociological surveys indicate that the majority of respondents consider modern Ukrainian society as unfair and support a more equal distribution of public goods. The current income inequality is called unfair by 89% of citizens, the distribution of wealth - 87%, the employees wage system - 83%. 71% of respondents are sure that the economic system of Ukraine acts in the interests of the wealthy segments of the population, and not the majority. One third of the population (32%) believes that during the Soviet period the society was fairer.

The Return of the Slum II? Tipping Points That Undermine Informal Neighborhood Consolidation

This presentation will recommend that "slumification" is introduced into the contemporary lexicon to describe a process whereby consolidated settlements may face decay over time. This is useful in order to create innovative solutions that address the tipping points that undermine informal consolidation and could potentially lead to slumification worldwide. Adopting the term slumification will be useful for research, policy and mitigation. The current vocabulary used for housing policy and for the process of consolidation is outdated. The presentation will demonstrate how contemporary neoliberal policies accelerate slumification in both formal and informal settlements; this is happening in Latin America and in our backyards worldwide. The presentation will outline past and present paradigms of housing policy, including a robust discussion on what causes slumification and how to mitigate it in urban spaces in Latin America and worldwide. Ultimately, the presentation will provide policy prescriptions that include strengthening community participation imperatives as well as creating robust government structures to allow for the adoption of the Rights to the City principles. The goal by the end of the presentation is for the participants to have an intimate understanding of how and when using the term "slumification" is as an appropriate descriptor to define processes faced by today's consolidated informal settlements.

TG09-754.2

BYDAWELL, MOYA* (University of KwaZulu-Natal, South Africa)

Trapped in a Liminal Space? Belonging As Experienced By a Small Group of Students at a South African University.

Higher education in South Africa is regarded as a mechanism for improving living standards and enabling national economic growth (Council on Higher Education 2004: 14). An essential goal in a country which is both developing and developed, and evidences extreme economic inequality. As outcomes of higher education South African graduates are envisaged as lifelong learners who are positioned as national problem solvers - critical thinkers who are open to change and diversity (Department of Education 1997: 17).

The promise of improved life chances obscures the difficulties which may be experienced by first generation students from backgrounds of poverty. As suggested by Bourdieu (1986: 246) academic qualification can be translated into cultural capital, but students also need cultural capital to access educational success (Bourdieu & Passeron 1990: 43). In order to explore the experiences of disadvantaged students in an unequal society, a qualitative study used multiple methods including in-depth interviews and diaries to uncover the experiences of seven university students during their final year of undergraduate study, and again four years later. This paper discusses the narratives which unfolded in the research above-of separation from community of origin, of reorientation, of loss and gain, of cost and benefit. For successful student progression through university it is useful for Sociologists and university faculty to explore the polarising context in which many such students find themselves.

RC25-JS-72.1

BYFIELD, NATALIE* (St. John's University, USA)

Theorizing Methods: The Representation of Race in U.S. Sociological Studies

Sociologists often acknowledge the difficulty of operationalizing the concept race. Operationalizing race in quantitative studies often fails to take into consideration the socially constructed nature of race and consequently often reifies the concept. This happens sometimes due to a failure to incorporate indictors for racialization, ethnicization, and minoritization that point to how we make race. Racial Formation Theory incorporates social constructivism by acknowledging the role of the state in constructing race and it accomplishes this by defining race as a structural and representational phenomenon (Omi and Winant 2014). Critical Race Theory also incorporates social construction of racial categories vis-à-vis the state, acknowledging the state as a site for the convergence of white power and the maintenance of white supremacy (Bracey, 2015). Operationalizing the phenomenon of race in the context of these theories often still enforces reification of racial categories and their historical meanings. This paper theorizes the need for approaches to the operationalization of racial categories that intersect axes of class, sexuality, nationality, gender, and indigeneity.

CABALLERO, HILDA* (Universidad Nacional Autonoma de Mexico, Mexico)

Iniciativas Sociales Orientadas a Lograr La Autonomía Alimentaria. Aportes De La Lucha Indígena En El Cauca, Colombia.

El objetivo de este trabajo es analizar las iniciativas que emprende el pueblo nasa en el Cauca, Colombia, orientadas a lograr la autonomía alimentaria. La reflexión se aborda desde la perspectiva de la colonialidad del poder, tomando como eje de análisis la categoría autonomía alimentaria. Se analiza el proceso histórico-estructural de imposición de patrones de producción y consumo alimentario en América Latina, para identificar el discurso que sustenta y legitima las prácticas de diferenciación jerárquica, la imposición de patrones de producción y consumo y el papel de la alimentación como instrumento de dominación. Dicha imposición aunque busca constituirse como un proceso de dominación total de los diversos ámbitos de la vida social, particularmente en la fase neoliberal de globalización económica, siempre ha estado acompañada de variadas formas de resistencia y de propuestas alternativas para revertirla. Esto genera una constante tensión que se expresa en la disputa histórica por mantener y/o restituir formas originarias de producción y consumo alimentario, vinculadas fuertemente a procesos de lucha por la recuperación de la tierra y la territorialidad, la restitución de las capacidades productivas, de la tierra y de la comunidad, y el restablecimiento de sus formas propias de vida. La disputa conlleva ampliar los horizontes de la autonomía que no se limita a lo alimentario, sino a la auto-determinación en los diversos espacios de vida (educación, salud, justicia, gobierno propio y espiritualidad). Se toma la experiencia del pueblo Nasa en el Cauca colombiano, específicamente el Consejo Regional Indígena del Cauca (CRIC), y su lucha histórica contra la colonialidad del poder, ésta se expresa en el despojo de su territorio y sus formas de vida y la concentración de riqueza y poder en las élites terratenientes.

CABALLERO OCARIZ, CAMILO* (Instituto de Estudios de América Latina y el Caribe, Argentina)

Trayectorias Institucionales De La Ciencia y Tecnología En Paraguay, Análisis De Una Experiencia Incipiente, Inestable y Tardía Para La Región

Se analizan las trayectorias de las principales instituciones públicas y privadas que hacen parte del proceso de la ciencia y tecnología en Paraguay, cuyos indicadores convencionales muestran una situación incipiente en comparación con la región. El empuje del estado de la ciencia y la tecnología como factor de desarrollo en Paraguay tiene menos de cinco años de funcionamiento real, y más de 15 años de proceso institucional desde sus inicios. El desarrollo de la ciencia y la tecnología en Paraguay se desarrolla en un contexto particular marcado por una asimetría entre las metas establecidas y los recursos financieros, por un lado, y las capacidades estructurales y de recursos humanos por el otro. Además, existiría una debilidad institucional en el organismo rector de las políticas de ciencia y tecnología. Teniendo como fuentes documentos históricos e institucionales se busca cubrir una vacante de estudios sobre el tema en el país, aportando con una investigación tanto a las ciencias sociales como a los estudios CTS.

RC22-264.4

CACERES, IGNACIO* (Pontificia Universidad Católica de Chile, Chile)

Marco analítico para el estudio del impacto de la pluralización religiosa en la cohesión social en América Latina

Durante la última década, diversas dinámicas electorales han relevado la necesidad de considerar fuertemente el rol de la religión en la vida política. Recientemente, distintos países de América Latina han visto cómo los evangélicos –grupo que durante las décadas precedentes estuvo más bien al margen de la esfera política, en contraposición a la influencia histórica del catolicismo- han asumido un rol activo, y algunas veces decisivo, en las últimas elecciones (Boas, 2019). En particular, en Chile los evangélicos han pasado de caracterizarse por ser despolitizados y apartados de los grandes temas nacionales (Fediakova y Parker, 2009; Boas y Smith, 2015), a formar parte activa de la vida política a través de procesos electorales, movimientos sociales e incidencia en la discusión pública. El presente proyecto entrega evidencia sobre el cambio y continuidad de los patrones políticos de la población evangélica, en términos de conducta (electoral y no convencional), actitudes (estructura ideológica, identificación partidaria, interés en política) y evaluaciones políticas (confianza en instituciones, valoración de la democracia). Para ello, se utilizan datos del Estudio Longitudinal Social de Chile (encuesta panel con N=2,927 en su primera aplicación), que permite acceder a dinámicas de los cambios ocurridos entre 2016 y 2018 (tres mediciones). Análisis preliminares muestran que, en este período de especial exposición de líderes evangélicos en la arena política, quienes se declaran como evangélicos, muestran cambios en sus preferencias políticas. Ejemplo de ello es el aumento en su participación política no convencional, por sobre los grupos de referencia (católicos e irreligiosos), e incluso una modificación con respecto a valores políticos que la literatura define como estables. Estos cambios recientes parecen desafiar estudios previos que señalan para el caso chileno que es la intensidad de práctica y no la identificación religiosa la que influye en las preferencias políticas (Patterson, 2004; Barsted y Somma, 2018).

CADAA, RAUL* (, Argentina)

Aguante, Football and Resilience

Aguante, Football and Resilience
El "aguante" es una palabra utilizada por los argentinos para destacar fortaleza anímica; tolerancia y resistencia al disgusto; capacidad para reprimir o contener reacciones negativas; conformismo para soportar la adversidad o el control del sufrimiento ante una perdida. Durante las últimas décadas esta palabra ha estado muy ligada al léxico del futbol, y particularmente al lenguaje de las barras bravas. Los medios masivos de comunicación han difundido, erróneamente, la idea de que el "aguante" es cosa de machos. Ha sido replicado por los propios barras bravas, políticos, periodistas y público en general. Esto convirtió, de alguna manera, al "aguante" en justificador de la violencia dentro de los estadios de futbol.

En este trabajo intentamos analizar y demostrar que el "aguante" es una conducta resiliente; o bien una variedad dentro del campo de la resiliencia o una nueva categoría dentro de la misma. Entendemos que la resiliencia debe ser considerada como un proceso social por el cual determinados actores sociales utilizan estrategias, que son igualmente sociales, individuales, pero también grupales o colectivas, en un contexto social y relacional. Donde las estrategias desarrolladas tienen un resultado incierto, incluso pueden ser exitosas a corto, pero no a largo plazo, o viceversa, por lo que es necesario destacar el factor temporal e histórico de la resiliencia; comparable a la duración de un partido de futbol, un campeonato o la propia historia del hincha y su club.

Creemos que la confirmación de esta hipótesis, su utilización como política pública y su divulgación masiva; podrá ayudar a menguar la violencia en el futbol. Es decir, la generación de un círculo virtuoso que nace en la investigación académica, se convierte en una política pública y ayuda a desarrollar la solución total o parcial de una problemática social que parece no tener solución.

Do Brazilian Government Speeches on Gender Differences IMPACT on the Growth of Domestic Violence Against Women? a Study Based on the Municipality of Porto Alegre, Brazil

Since 2000 – when the Inter-American Commission on Human Rights issued Report 54/2001 (concerning Case 12.051 – Maria da Penha Maia Fernandes) –Brazilian governments have adopted public policies to reduce inequalities between men and women in public life, as well as to reduce and prevent crimes of domestic violence against women. However, since January 1, 2019, when the Government Jair Bolsonaro took office, we have observed that its members have adopted a posture of valuing the differences between the genders, reaffirming the position of predominance of men over women. In this situation, it is important to question whether the position adopted by the current Brazilian government has influenced the growth of domestic violence against women. This study is divided into three parts. Initially, we pointed out the efforts made by previous governments to reduce and prevent domestic violence against women, and how the discourses of current leaders represent a drastic break with the previous system. Then, we analyze the cases of domestic violence against women registered in the Women's Police Station of Porto Alegre – Brazil – in the periods from January to August of the last four years, examining the crimes committed against women in situation of domestic violence. Finally, we discuss whether the discourses of the current Brazilian government have influenced the increase in cases of domestic violence against women. The study was developed using the hypothetical-deductive method through a review of the bibliography on the subject and the qualitative and quantitative analysis of data on domestic violence against women provided by the Women's Police of the Municipality of Porto Alegre. Preliminary results indicate that the discourses of the current Brazilian government about the preponderance of man over woman have the potential to legitimize acts of domestic violence against women and, therefore justify the increase of these crimes.

Labor Market, Wealth, Gender and Generation: A Multidimensional Methodology of Stratification Applied to the Case of Brazil

There are different methodological traditions of social stratification. In the US a lineage of occupational prestige indicators dates back to Duncan's SEI, to the exception of Eric Olin Wright. The British tradition, and European to some extent, has relied upon social schemata, namely the EGP, in which work and market situations are the cornerstone elements to aggregate occupations into social class. There is an important body in the Brazilian class analysis literature that employs social maps based on the EGP scheme. In this regard we point several limitations: (1) social maps such as the EGP were developed in and for societies where most of the working population held standard jobs; historically, the informal sector (non-standard jobs) comprises almost half of the working population in Brazil; (2) in this scenario, same occupations may have different forms of employer-employee relationships (standard, monthly paid; non-standard, monthly paid; paid on a daily basis); (3) Brazil presents a considerable spatial, social and economic heterogeneity that ultimately results in different socioeconomic realities and in a heterogeneous labor market (São Paulo Metropolitan Area vis-à-vis small municipalities in the interior); (4) social maps do not incorporate collective, household wealth neither take into account gender and generation occupational segregation. In this article we analyze the results of a multidimensional classification methodology

that jointly takes into account the social class and the asset approaches. We include sex (gender), age group (generation) and status of the occupation in the model. Using data from the 2015 national household survey (PNAD) we stratified the Brazilian population into five latent socioeconomic strata (LSeS), each one with a distinct class structure. Our findings indicate a hierarchy between LSeS especially regarding race/ethnicity composition and household wealth as well as distinctive social class patterns regarding income and educational attainment between and within LSeS.

Social Stratification and Female Intra-Household Work in Brazil: Does Race/Ethnicity Matter?

The aim of this paper is to analyze differentials of weekly average number of hours spent in household work by race/ethnicity among Brazilian women stratified jointly by social class and wealth. Using data from the 2015 Brazilian national household survey and applying latent class analysis, we obtained five latent socioeconomic strata (LSeS), each with a distinct occupational class structure. The methods of stratification based on class schemes such as EGP aggregate individuals or families according to occupations. Given the gender occupational segregation, it tends to result in distinct class structures by sex, further compounded when race/ethnicity is considered. As for the intra-household division of labor it is established that women bear the brunt of the tasks. In Brazil, upper class women tend to contract domestic work while lower class women have to deal with it themselves. The information on race/ethnicity is gathered through a 'race-skin color' self-declared question with five response options: white, black, brown, yellow, and indigenous. A number of class analyses investigated whether race-skin color is relevant in Brazil, especially between browns and blacks, once social stratification is considered. The majority of them concerns educational inequalities, poverty, and social mobility. Gender inequality studies regarding intra-household division of labor abound but we found none focusing specifically on female stratification and the role of race/ethnicity. Our question is whether race/ethnicity matters with regard to time dedicated to household work once social class and wealth are jointly considered. We employ a Zero-Inflated model with LSeS, race-skin color, family arrangement, labor market participation, and educational attainment as covariates. We also run within-LSeS models separately for whites, blacks, and browns and compare the coefficients' confidence intervals. The findings indicate that race/ethnicity runs its own course with respect to inequality in Brazil.

CAFFERATA, FERNANDO* (Center for Latin American Studies on Insecurity and Violence, Argentina)

Hot Spot Policing in Latin America: The Good, the Bad and the Ugly. a Meta-Analysis of Regional Empirical Evidence.

Latin America is the most violent region in the world. This violence concentrates, as 80% of homicides occurred in 2% of the streets segments (The Economist, 2018a). Given this phenomena, experts on citizen security increasingly propose the adoption and expansion of "hot spot" policing (HSP) in the region. Research made mostly in the US shows strong evidence that this type of policing decreases violence and do not displace crime (Abt, Thomas & Winship, Christopher, 2016). Nevertheless, evidence of HSP effectiveness produced in Latin America is scarce and disparate. Some authors claim HSP works effectively (Chainey, Serrano, & Veneri, 2017; Di Tella & Schargrodsky, 2004; Lawrence W. Sherman et al., n.d.) while other authors claim HSP might not be an effective method to reduce crime and, worse, it might cause crime displacement (Blattman, Green, Ortega, & Tobó, 2017).

These problems motivate the present document, which has two general objectives. First, to order the discussion on HSP in Latin America in order to understand autochthonous evidence. The second objective is to improve the empirical evidence available, in order to make progress on the accuracy, reliability, coherence and transparency of public decision-making regarding police action. To achieve these general objectives, this paper: orders the evidence regarding HSP produced in Latin America up to know; classifies specific aspects of HSP in the region, providing an analysis on the nuances of the practice in order to identify potential factors behind dissimilar empirical results; finally, generates statistical estimators of the expected effect of HSP interventions in the region using meta-analysis techniques. This paper aims to help the academic public policy community to have a more precise idea of what results to expect with this surveillance technique in the region.

More Than Green: An Extended Model for Nature Based-Solutions in Urban Regeneration - the Case of Urbinat Project

The environmental crisis has been challenging humanity to rethink lifestyles and knowledges in a simultaneously plural and globalized world. Several issues have been arising to find responses: the interaction between scientific and non-scientific knowledges and practices; the participation and engagement of citizens in local governance; the enjoyment of urban spaces and green infrastructures according to socio-cultural characteristics, place of residence and inequalities; the complex combination of diverse human realities and natural systems.

The so-called nature-based solutions (NBS) address an alternative response to tackle social challenges by proposing sustainable uses of environmental systems. Since 2018, the project URBiNAT applies the concept of healthy corridors, driven by the co-creation of clustered NBS for the regeneration of urban areas and their integration in the broader urban network of seven European cities. It is developed by an international consortium including a diversity of partners: municipalities, research centres, universities, private companies and other stakeholders. The URBiNAT process is also supported by a concept of participation as a means and as an end that fosters the co-creation of social, environmental and marketable NBS. For this purpose, URBiNAT puts together an innovative and inclusive catalogue of NBS that can be deployed and tailored with local communities to address specific local challenges.

The present paper proposes to explore a broader conceptual framework around the concept of NBS, as an extended approach that combines four pillars in an urban regeneration perspective: public space, citizens' engagement, plurality of economic principles and practices, and rights-based approach. It also addresses URBiNAT's empirical framework regarding the short term effects and predicted impacts of the NBS.

The Life Histories of Political Activists: The Cases of Kurdish Refugees in Germany

Are some biographies more prone to activism? How about the sorts of activism that are more likely to leave a long-lasting effect on biographies? Due to their collective histories, it is more difficult for the members of certain groupings to stay uninvolved or indifferent, and pursue an "ordinary" life. They are more likely either to be pulled or pushed into political or social activism for a temporary or longer period of time. But not every member of such groupings automatically picks an activist path; also, not every devoted activist comes from these groupings. This is also true for the Kurdish people in the countries like Turkey and Iran: while some devote their life to high-risk activism such as armed conflict in the ranks of PKK, others shy away from any sort of political involvement.

There are many social movement studies which have grappled with the question of motivations of the people participating in activism; as well as the personal repercussions of activism. Yet, those studies have usually been limited to quantitative analyses focusing mostly on variables such as age, gender, ethnicity or socio-economic background of the participants. This paper, however, adopts a social constructivist approach based on a procedural and relational analysis of individual's decisions and actions to reconstruct the processes leading to the formation of activist biographies.

Drawing on the biographical narrative interviews with the activist Kurdish refugees in Germany, this paper attempts to identify patterns in the biographies of Kurdish activists which play a significant role in their decisions to participate and stay engaged in political activism both in the countries of origin and also in Germany.

CALDERON, JULY* (Comisión Nacional de Territorios Indígenas, Colombia)

Autonomías Bajo Tensión: Entre El Interés General y La Defensa Del Territorio Del Pueblo Nasa De La Çxhab Wala Kiwe

El despojo territorial de los pueblos indígenas ha sido histórico y ha tenido diferentes instrumentos para su legalización mediante el uso de dispositivos normativos y de la violencia. La implementación del acuerdo de paz ha venido configurando nuevos mecanismos o instrumentos normativos y políticos que buscan dar continuidad a la legalización del despojo de los territorios indígenas para favorecer intereses económicos a través de la implementación de megaproyectos en los territorios indígenas de la Çxhab Wala Kiwe, siendo un punto de tensión y configuración de la disputa entre el ejercicio del gobierno propio indígena y el accionar del estado colombiano en aras de implementar su política de desarrollo económico.

El actual proceso de reconfiguración de la violencia y la visibilización de conflictos territoriales y ambientales también han llevado al pueblo nasa a activar diferentes mecanismos de defensa del territorio desde el ejercicio del gobierno propio a través de la aplicación del derecho propio, acciones de control territorial, movilizaciones, alianzas con diferentes movimientos sociales. Así, me interesa analizar la configuración de la disputa entre las formas de gobiernos que se traslapan en un territorio como el norte del Cauca, en la medida en que el pueblo nasa adelanta acciones de Autoridad Ambiental, en contra de cualquier forma de intervención económica en los resguardos, constituyen repertorios comunes de la acción política y crean una narrativa crítica ambiental de relación con el territorio. Nos encontramos ante un escenario en el cual se redefinen las relaciones entre el Estado y el gobierno propio, en tanto el interés no es realizar las mismas actividades de las corporaciones autónomas regionales sino dar cumplimiento a la ley de origen y mandatos comunitarios en contraposición a la política económica del país.

Educating in Uncertainty: Crisis and Violence in Educational Organizations in Ecuador

In recent years, Ecuador has entered the logic of standardization in the field of education, in which the heterogeneity of its actors prevails. Some educational organizations have been confronted because their work takes place in contexts of vulnerability and violence, which demand alternative and unforeseen responses. This has triggered certain crises within the organizations, which have been forced to change their educational projects or to adapt to the dynamics of standardization.

In the context of this tension, and with the aim of analyzing the responses to the crises by the actors involved, a research was carried out in two educational centers linked to two organizations in Ecuador: 1) the Working Child Centre in Quito, whose special feature is the centrality of the family in the education of vulnerable children, and 2) a school of the "Fe y Alegría" network located in a border area of the country, working with popular education pedagogies*.

The paper will address the results of this work that relates educational processes at the state level, organizations and educators, focusing on responses to the crisis (as an internal factor) and violence (as an external factor). As a participatory action-research project, work has been carried out within the organizations, developing workshops on social mapping, open interviews and collective data interpretation meetings. The aim was to reveal the logic of action of the actors, and at the same time, to recover research as a source for the construction of action devices to deal with specific situations of violence in the analyzed contexts.

*The research is part of the "Project to strengthen community mediation spaces for young people in situations of violence and psychosocial suffering" which links universities and researchers from Ecuador and Belgium.

Life-Course Sociology Models of Stress and Telomere Length: A First Step Towards Social Interventions Protecting Human Biology

BACKGROUND: Previous research has explored the relationship between childhood and adulthood stressful life events (SLEs) and adult salivary telomere length (TL), but no research to date has tested different sociological life-course models

denotes a presenting author. Abstracts are organized by first presenting author's last name.

in which adulthood stress may fully, partly, or not mediate the relationship between childhood stress and adult TL. METHODS: To fill this gap, we elaborate over previous work by Puterman et al. (2016) and other standard models that do not account for the temporal order of stressors in childhood and adulthood, by using structural equation modeling (SEM) for a sample of 5,754 Health and Retirement Study (HRS) participants to compare the fit of three nested life-course models—social trajectory, early critical period, and cumulative risk. RESULTS: Results indicated that the *social trajectory* model, in which the association between childhood SLEs and TL in later adulthood is fully mediated by adulthood SLEs, fit the data better than the *early critical period* (no mediation) and *cumulative risk* (partial mediation) models. CONCLUSION: In the *social trajectory* model, childhood SLEs are related to TL in later life only through adulthood SLEs. If these findings can be replicated in other cohorts, the social trajectory model suggests that effective interventions and social policies at any point—childhood or adulthood—have the potential to improve weathering outcomes in old age. We conclude that the direct association of childhood SLEs and TL can be overestimated when life-course pathways linking SLEs and TL are overlooked.

CALZADO, MERCEDES* (CONICET, Argentina)
LIO, VANESA* (IdIHCS (UNLP/CONICET), Argentina)

TV Crime News in Argentina. Characteristics, Routines and New Sources.

The topic of insecurity is part of a social, cultural, and political process linked to the growth of violence and crime in contemporary societies, but also to the increase and transformation of its visibility. Crime news is a central part of TV information in Latin American. In Argentina, in particular, nowadays crime and insecurity represent the first topic in TV news, according to the data produced by the National Public Defender for Communications.

Our proposal presents some results of a research project about the new modes of production of television crime news in Argentina. Our central hypothesis is that technology and cultural changes are transforming the production of TV crime news and affecting the construction of fear in public spaces. Therefore, we propose to explore the creation of content regarding crime in television newscasts, focusing on the ways of accessing the sources, circulation of information, and exhibition strategies.

To reach this objective, we use a qualitative approach. The inquiry combines 18 interviews with journalists and news producers of the public (Television Pública) and private (Telefé; América TV; Canal 13; Canal 9; C5N; TN; Crónica) TV channels in Buenos Aires City (Argentina) with observations during the broadcasting of central TV news shows. We produced the data for 12 months in 2017.

In the interviews and observation, we examine news' contents; the ways of narrating and enunciating information regarding crimes on TV; the role played by the police in the structure of the news; the production routines, and the emergence of new sources of information related to digital media technologies. We structure the presentation around our three principal findings: i. Reasons for the prominence of crime news on TV; ii. Present characteristics of TV crime news; iii. Sources and new technologies.

Memories of Origins, and the Origins of Memories – a Sociological Analysis of the Construction of « Africanity » Amongst Sub-Saharan Immigrants' Children

Cette communication s'appuie sur l'enquête sociologique que je mène pour ma thèse, portant sur les destins sociaux d'enfants d'immigrés subsahariens en France. S'intéressant de manière fine aux parcours, discours et pratiques individuels, elle montre que la mémoire des origines peut faire l'objet d'appropriations différenciées. Les résultats présentés reposent sur l'analyse d'une trentaine d'entretiens biographiques approfondis et répétés, réalisés en région parisienne auprès de descendants d'immigrés subsahariens âgés de 20 à 30 ans, et des observations à leur domicile.

Dans la lignée des travaux d'Anne Muxel, on considérera la mémoire familiale comme produit du présent, résultant d'un processus continu de (ré)appropriations, (re)constructions, souvenirs et oublis. En contexte post-migratoire et diasporique, la mémoire familiale se confond dans la mémoire des origines, qui peut être définie comme une composition de souvenirs et de récits du passé renvoyant 1) à l'*histoire* migratoire familiale (appréhendée sous le prisme des transmissions / appropriations) ; et 2) à un *espace*, celui du pays d'émigration des parents (objet de pratiques et représentations variées).

Après avoir présenté des éléments d'analyse transversale et le cadre socio-historique des migrations concernées (Sénégal, Cameroun, Côte d'Ivoire), je proposerai une typologie illustrant la fabrique de différentes mémoires des origines. Nous verrons comment les socialisations, valeurs et modes de vie (*habitus* sociologiques) des descendants d'immigrés influent sur leurs (re)constructions

mémorielles et rapports à l'Afrique. Quatre profils-types seront présentés (le « grand sage africain » en devenir ; le « nègre blanc » ; le « Noir de cité » malgré lui ; le « beau black » entrepreneur), correspondant à quatre manières différenciées d'interpréter l'histoire familiale et de (re)construire – ou non – le lien avec le pays d'origine des parents. Nous verrons en outre comment les pratiques mémorielles participent à un processus de requalification symbolique de soi, propre à chaque profil-type.

CAMARENA-CORDOVA, ROSA MARIA* (Universidad Nacional Autónoma de México, UNAM, Mexico)

Family Trajectories of Mexican Children: A Sequence Analysis.

The family has been a classical subject of interest for Demography and the Social Sciences, either as an object of study by itself or in the search for understanding of human behaviors. In particular, the characteristics of the family context in which children and young people grow are of great relevance, constituting unavoidable elements to consider when trying to identify factors that influence their development and creation of living conditions and opportunities, as well as in explanation of child and youth behaviors in a wide variety of fields associated with their current and future life.

However, the study of family characteristics is generally based on cross-sectional data that express situations prevailing at a given time, without taking into account the dynamic and changing nature of family situations that children and young go through along their formative years. We seldom deal with systematically knowing their complete residential history, paying little attention to the fact that behind a situation observed at a point of time there may be a diversity of previous and subsequent histories.

From a life course perspective this contribution analyze complete kinship composition trajectories of households in which a sample of Mexican women and men lived each year of their childhood and adolescence (from birth to age 19). It aims to know the observed trajectories and changes, the characteristics and age of those changes and, in general, the continuity and stability of family composition, both along individual lives as through historical time. Sequence and Cluster Analysis are employed, the latter in search of typical residential patterns. Data come from the life histories of 23,000 men and women born between 1962-1997 collected by the 2017 Mexican National Survey of Demographic Dynamics (EDER). Analysis is made by cohorts and considering some socio-demographic variables (parents mortality, migration, socioeconomic level, rural-urban residence).

CAMARENA-CORDOVA, ROSA MARIA* (Universidad Nacional Autónoma de México, UNAM, Mexico)

School and Work Transitions of Mexican Youth. an Analysis of Their Relationship through Multichannel Sequence Analysis.

Leaving school and transition to work are widely recognized as important inflection points in young people lives that are closely related to each other.

In recent years, young Mexicans have witnessed a considerable expansion in their educational opportunities, which have allowed them to access and stay longer in school, reaching considerably higher levels of schooling than previous generations. This, however, has not been reflected in an improvement of its possibilities and conditions of labor insertion.

Today Mexican youth face strong difficulties in getting a job, as well as large and growing precariousness of existing jobs, which leads some to unemployment, while others have to accept low quality jobs, mainly in the informal sector, or to generate their own, far from their expectations, skills and needs, being all this sharpened among the young without work experience seeking their first job, and those recently graduated from school who want to find one according to their acquired training and capacities.

Youth transition to work is a complex process in which multiple factors intervene. It is carried out in different ways among the young and, at least in the Mexican case, does not always has unique and direct relationship with school, both in terms of time synchronization between school leaving and transition to work, as well as of correspondence between credentials acquired through school and the quality of jobs to which these give access .

This contribution aims to analyze the ways in which young people make transition to work and, making use of Multichannel Sequence Analysis, of the ways in which this process interweave with school trajectories. Longitudinal retrospective data are used, coming from life histories collected by the 2017 Mexican National Survey of Demographic Dynamics (EDER), on a sample of 7,047 women and men aged 20-29 years when interviewed.

CAMINIS, DESPOINA* (University of Piraeus, Greece)
PEKKA-OIKONOMOU, VICTORIA* (UNIVERSITY OF PIRAEUS, Greece)

Protection of Human Rights As a Core Value of the Ethical Corporate Governance.

The global ecosystem of Nations, Organizations, Institutions and Corporations is taking action to improve the Welfare system in the labor market, where the protection of human rights is determinant for the social welfare. From the Corporate perspective, boards should take the right decisions fostering equal opportunities and justice among stakeholders, according to the Universal declaration of Human Rights and the International Labor Organization.

Corporations and International Enterprises have faced challenges in the rise of human inequalities that have been intensively noticed in countries that were hit by the financial and economic crisis. Therefore, the role of the corporate social responsibility is having a progressive impact in the social welfare. Such as, socially responsible business is nowadays the keystone of the ethical corporate governance.

To this concern, we find the evidence of corporate best practices for the protection of human inequalities in the ethical corporate governance system, and we examine the code of conduct and the guidelines that are used in the Greek corporations after the post economic crisis of 2008.

The paper suggests that the democratic principles of equality and non-discrimination forming the code of conduct on human rights, should be the core value of the ethical governance. This will be the future path to achieve a sustained recovery and growth.

Keywords: human rights, ethical corporate governance, corporate social responsibility, inequalities.

CAMPANELLA, BRUNO* (Universidade Federal Fluminense, Brazil)

Mediated Recognition, Citizenship and Digital Media Practices

In the past few years media studies academics have started to pay more attention to recognition theory. Honneth (1992) and Taylor (1992), for example, have become key references in researches that investigate the role of media in the development of social justice.

I want to argue, however, that existing works on mediated recognition hardly investigate in detail the impact of the logics and specificities of media platforms such as Facebook, Instagram and YouTube on contemporary processes of recognition. Such platforms are marked by a neoliberal ideology that instrumentalizes sociality, intimacy and self-representation as part of a project of individual self-development, detached from collective ideals (Gershon 2011; Van Dijck 2013). In other words, they engender media practices that favour on-line self-care and the construction of alliances (like the constant addition of new friends, publication of popular photos and videos, status updates, sharing and liking posts etc.), suggesting the existence of forms of conditionality in the processes of mediated recognition. To be recognized and to recognize the other through the media can, consequently, become a self-serving process, which is at odds with traditional forms of unconditional love and solidarity.

Therefore, instead of focusing on the possibilities provided by platforms such as YouTube and Facebook for the creation of a type of cultural citizenship that fosters a sense of social justice, I want to draw the attention to the formation of a different project of citizenship connected to (social) media practices. It is a model of citizenship that sees the subject as an entrepreneur of the self, as someone who wants to broaden their visibility and connection with others as a way of self-realization. I will explore the idea that a social theory of mediated recognition should take into consideration the particularities and economic logics behind media dispositives used for intersubjective communications.

CAMPOLI, LARA* (University of São Paulo, Brazil)

Invisible Facets of Control: Constraints on Circulation, Communication and Body of Outsourced Cleaning Workers in Brazil

The consolidation of neoliberalism in Brazil in the 1990s was accompanied by the proliferation of more flexible forms of employment, a process in which outsourcing stands out. Studies on the subject with a gender perspective indicate that outsourcing expresses, once again, a differentiation between men and women, reinforcing the precarious insertion of women in the labor market. In general, it is in the outsourced cleaning and food services that women predominate,

employed in industry, commerce, banks and across the public sector, including public universities. In this study, we address the invisible facets of control behind the logic of outsourced cleaning work – a service performed almost exclusively by women – at a Brazilian public university. Through interviews and ethnographic observations we seek to identify and compare the economic aspects that differentiate the working conditions of outsourced and non-outsourced workers – such as wages, benefits and working hours – and to analyze subtle mechanisms hidden in the work routine that result in the exclusion of these cleaners from the rest of the university community. To this end, we examine the ideal type of corporeality expected of the cleaning women, as well as a set of temporal, spatial, and communication constraints imposed on them. We see how these interdictions act to erase these workers' gender – as a way of denying their women identity and of affirming their workers identity – and yet, how they respond daily to these controls. In this sense, we point to some silent practices of disobedience, such as reluctance, false submission and simulation of incompetence. Finally, we propose a reflection on how the contracting of outsourced service by an important Brazilian public university indicates a worrying institutionalization of neoliberal discourse; how it has reproduced social inequalities and how gender and race are articulated in its organization.

RC30-364.5

CAMPOLI, LARA* (University of São Paulo, Brazil)

Outsourced Cleaning Work in Brazil from a Race and Gender Perspective

A growing body of Brazilian literature shows a rapid and continuous growth of female working activity in the last fifty years. The growing presence and the new profile of economically active women are a phenomena directly related to recent changes in work organization, as well as to long-term demographic changes, including reduced fertility, changes in family structure, and increased female schooling. In this process, the tendency towards the casualisation of jobs related to care and domestic activities and the high levels of incorporation of women with low education in these occupations stand out. Through interviews with outsourced cleaning women (n = 18), we relate the educational and occupational trajectories of two generations of their families and the expectations for the generation of their children. We analyze the links between the passage from the countryside to the city, the experience in rural and domestic work, the struggle for the schooling of their children and the permanence in precarious jobs – all factors present in their trajectories. Being mostly black women with incomplete education, mothers, migrants, wives, heads of household and over 45, these cleaning women run into a set of obstacles that considerably limit the reach of better positions in the labor market. Even though the conquest of the outsourced service marks progress in face of unemployment or informality, this job is still characterized by insufficient income, a high degree of uncertainty about the continuity of activity, and the existence of labor disrespects. The comprehension of the reasons why they tolerate such precariousness indicates that there is a transmission of projects to their children, expressed above all in the understanding of the need for schooling and the struggle to achieve it.

Natural Behavior Produced By Scientists: Ethnography of Elephant Sanctuaries in Brazil

Considering practices that produce species conservation in times of global connections, this research project is concerned with investigating how the notion of natural behavior is constructed in an international elephant conservation network, Elephant Voices,. To do so, one of his projects, the the Brazilian Elephants Sanctuary (SEB), in the Chapada dos Guimarães, in Mato Grosso, will be ethnographed. In SEB, biologists seek to assess the effects of circus work on elephant behavior and develop practices to encourage those perceived as natural. It is interesting in this research to think how scientists construct the notion of elephant natural behavior and how they encourage it for the conservation of species. More broadly, the research seeks to destabilize the concept of nature as associated with the innate, through the description of the practices that produce what is considered proper to the nature of elephants. It also seeks to describe how the notion of natural behavior connects institutions, scientists and elephants in this ethnographic context.

CAMPOS, RICARDO* (SEECT - Secretaria de Estado da Educação e da Ciência e Tecnologia da Paraíba, Brazil)

The Pact of Social Development of Paraíba: Evaluation of Public Policies and Education

The objective of this research is to analyse the effects of the Pacto Social Program on the education indicators of the municipalities of the 10th Geoadministrative Region

of Paraíba (RGA), which is composed of the municipalities of Lastro, Marizópolis, Nazarezinho, Santa Cruz, São Francisco, São José de Lagoa Tapada, Sousa and Vieirópolis. The investment data come from Paraíba's Secretary of State of Municipal Development and Articulation and those referring to educational and population indicators are from INEP and IBGE, respectively. The results showed that the region concentrates 2.74% of the population of the state with prominence within the RGA for the municipality of Sousa (63.41%). The municipalities of São Francisco (24.72%) and Vieirópolis (24.43%) stood out because they received more resources compared to the others. Regarding the Basic Education Development Index (IDEB) score of the initial years, there was a significant advance in all the municipalities of the RGA, with the highest growth in the municipalities of Vieirópolis (75%) and São Francisco (42.86%), respectively. In the IDEB score of the final years, the municipality of Nazarezinho is the only one that does not show growth in the period. Thus, these movements of improvements in educational indicators occur in line with the increase in investments in education of the Pacto Social Program, suggesting a positive relation between investments in education and improvements in educational indicators in the municipalities of the 10th RGA.

CAMPOS BICUDO, MARCUS* (University of São Paulo, Brazil)

Mobilization of Immigrant Workers in São Paulo: A Study on Mediation and Applications of Work

The research focuses on the mobilization of immigrant workers in São Paulo and is based on field-work that took place at *Missão Paz*, certainly one of the main institutions (attached to the Catholic Church) to host recently arrived immigrants as well as to promote their so-called 'social mediation' in the city. Mainly engaged in the struggle against human trafficking and contemporary slavery as well as in the promotion of Decent Work, through the 'processes of intermediation to work' it promotes the meeting of employers and immigrants who are seeking work. Apart from direct observation of this entire process (22 sessions of interviewing and hiring), the field-work has been extended to a few hiring companies and is based on interviews with both employers (8) and candidates to vacancies or hired immigrants (14), all men and from seven different countries. The main questions orientating the research are: what managerial strategies determine the hiring of immigrant workers? What kind of enterprises is currently hiring *at Missão Paz* and for what kind of jobs? From the point of view of employers, which presumed characteristics make immigrants a desirable kind of employee? How do immigrants react to those managerial strategies? How do they see the set of jobs that are available according to their trajectories and migration projects? In what concerns employers, one of the most significant findings of the research was that all of them have expressed a negative and depreciative view of Brazilian workers in general and projected to have on 'immigrants' their exactly opposite (that is someone who prizes work and who 'works correctly'). In turn, immigrants have to choose between the acceptation or denial of such expectations – we seek, therefore, to investigate their subjective experience of labor conditioned by extra-mercantile factors as condition to the production of consensus.

Desposesión Patriarcal y Reapropiación Feminista Del Espacio Público. Un Estudio a Través Del Caso De La Manada

El 7 de julio de 2016, durante los Sanfermines, en la ciudad de Iruñea (Euskal Herria) tuvo lugar una agresión sexual grupal, que por sus características y el momento en relación a las violencias machistas que se vive en el Estado Español, supuso un antes y un después en la respuesta social y política a las violencias sexuales. Una mujer joven de 18 años fue agredida sexualmente por 5 hombres jóvenes que se autodenominaban la Manada. La justicia consideró que el delito cometido no había sido una agresión sexual porque no se había producido ni una situación violenta ni una situación intimidatoria y tipificó los hechos de abuso sexual. Esta decisión tuvo una clara oposición del movimiento feminista en las calles del Estado español, que evidenciaba que la justicia está mediada por una lógica patriarcal que reproduce mitos y estereotipos, es decir, que reproduce, en esta y en otras sentencias, la cultura de la violación. Con esta comunicación mostramos cómo el discurso del poder judicial y los marcos de referencia, con las que analizaba el caso, implicaron la reproducción de un discurso sobre la violación que genera que las mujeres queden desposeídas de derechos y de libertades en el espacio público. La respuesta del movimiento feminista sobre que es violación y que es consentimiento, además de sus acciones en la calle, implicó la exigencia y el desarrollo de prácticas concretas de re apropiación del espacio público. Los resultados de investigación son fruto de una revisión y análisis de la sentencia judicial y de entrevistas en profundidad a actores clave del movimiento feminista.

CANALES SÁNCHEZ, ALEJANDRO* (Instituto de Investigaciones sobre la Universidad y la Educación UNAM, Mexico)

Carreras Universitarias: ¿Cuáles Son Las Aspiraciones De Sus Estudiantes?

En este trabajo, tomando como referencia una encuesta realizada a estudiantes en el último año de tres carreras universitarias diferentes y de seis distintas instituciones, se intenta una primera exploración sobre el papel que desempeña la orientación disciplinaria en sus aspiraciones. Uno de los supuestos es que la base disciplinaria adquirida en la formación de los estudios universitarios, moldea rasgos sobresalientes de las identidades profesionales, los cuales generan ciertas aspiraciones en los jóvenes y les permite poner en marcha (o no) estrategias para proyectar su futuro y cumplir sus metas, sea para culminar satisfactoriamente sus estudios, extender su trayectoria educativa o buscar oportunidades laborales. En general, existen variadas formas para delimitar las disciplinas. Por ejemplo, para Whitley (1976), se trata de colectividades basadas en algún compromiso con ciertas prácticas y técnicas, y sus miembros se definen en términos de los procedimientos para especificar problemas de investigación y para operar sobre ellos. Para él, los miembros de una disciplina se identifican con ciertos relatos y maneras de formular los temas de interés común (Whitley,1976); para Knorr Cetina (1999), que las entiende de manera más amplia y las denomina culturas epistémicas, en su conceptualización incluye los procesos de conocimiento, sus productos y representaciones: entiende al conocimiento como *práctica*. Las fronteras entre las disciplinas demarcan especificidades en la forma de socializar, en la certificación y designación de tareas, modos de trabajo, criterios de validación, sistemas de recompensas, trayectorias, modos de producción, expectativas, prestigios y proyección de opciones laborales, entre otros aspectos.La exploración incluye contrastar las diferencias entre los jóvenes de las tres diferentes carreras universitarias, especialmente en lo concerniente a las oportunidades de futuro que advierten, sus niveles de satisfacción sobre su nivel de formación, relaciones personales, sociales y laborales.

CANDIDO, MARCIA* (Instituto de Estudos Sociais e Políticos (IESP-UERJ), Brazil)

Sociology of Political Science: Internationalization Patterns and Gender Inequalities

Several analyzes of Political Science in Brazil suggest that the expansion of internationalization is the main challenge of the discipline in the country. On the other hand, there is little attention to how gender inequalities influence the circulation of knowledge from peripheries to the centers. The aim of this paper is precisely to look at the interaction between the "peripheral condition" of national intellectuals and gender asymmetries, in order to observe if there are different patterns of work between men and women; as well as cumulative disadvantages to the female gender. To achieve this goal, the research analyzes and compares the trajectories of professors of graduate programs at the University of São Paulo (USP) and the Federal University of Minas Gerais (UFMG), institutions that are representative of the cases who have international qualifying status in the federal classification made by the Brazilian government (CAPES). The study discuss four aspects based on consultations with the *Plataforma Lattes*: (1) distribution of professors by gender; (2) bibliographic production and opinions in foreign media; (3) forms of academic mobility; (4) and presence in international networks of researchers, from participation in congresses to the integration in professional associations and research groups. The results show that although they are a minority in teaching staff, women do not have internationalization practices that are different from men: both, for example, publish little in other languages and do not usually interact regularly with foreign media. However, the male group tends to have a higher proportion in longer international mobility, such as the experience of attending part-time postgraduate studies or teaching at universities in different countries.

La Juventud Como Foco De Las Políticas Públicas: Un Análisis De Los "Discursos De Verdad" Sobre Los Jóvenes Que Participan En El Programa De Oportunidades y Derechos

Inicialmente, este documento comienza con un problema social que ha estado creciendo desde la década de 1980: el crimen violento en Brasil, que afecta directa y predominantemente a una porción específica de la población joven. En base a esto, la presente investigación tiene como objetivo analizar, a partir de un modelo de triangulación, las concepciones institucionales sobre los jóvenes vinculadas a

las visiones del mundo de los gerentes que estaban por delante de la elaboración del Programa de Oportunidades y Derechos en el estado de Rio Grande do Sul. (POD-RS), interrelacionando con las perspectivas de los implementadores de los proyectos POD en los Centros Juveniles, así como con el público objetivo de los proyectos: jóvenes de 15 a La juventud fue creada. A partir de esto, el enfoque será analizar la construcción de "discursos de verdad" (FOUCAULT, 2008) sobre los jóvenes y los posibles efectos de estos discursos y normativas sobre las subjetividades de los jóvenes que participan en el Programa, a fin de determinar qué concepciones, reglas , deberes, etc., construidos alrededor de programas juveniles y públicos dirigidos a esta población. Así, la problematización y los argumentos presentes en el trabajo se insertan en la intersección de los campos de estudio de la sociología de la violencia, las políticas públicas y la sociología de la juventud. Finalmente, los datos que se presentarán corresponderán al campo exploratorio de la investigación doctoral que está realizando el proponente.

CANHA, ANTONIO* (, Brazil)

Brazilian Labour Action between "Movement" and "Organization" in the 1980's.

This paper is the result of a Master's study in Sociology. The research aimed on the relations between the Brazilian Workers' Party (PT) and the Unique Workers' Centre (CUT). Two entities coming from the same historical moment - the Brazilian redemocratization - and created by the same union leaderships, PT and CUT do not have formal ties, but they present a great overlap of affiliations in the directions and in the militancy. Their relationship can be seen as a sociological problem due to the antipathy to institutionalized forms of collective actions that characterized the labour movement that gave birth to both organizations. The research was conducted by the analysis of the official documents produced by the organizations, documents produced by internal political tendencies, interviews collected secondarily and Social Network Analisys. It was concluded that the trajectories of PT and CUT, when taken together, mean a division of tasks between a predominantly political organization, the Party, and a predominantly economic one, the Centre. But in order to not follow the path of other party-union relationships, seen as over bureaucratized, their relationship never took a formal shape. On the contrary, this process of division of tasks was provided by a network of personal relationships that cross the two entities and connect them informally, building a strong *social* tie. At the center of this network stands out a sort of elite, political brokers that influence both the party and the union and keep them in the same strategic horizon. I suggest that this elite functions as a third partner of the relationship, effectively bridging the organizations. A social, informal elite contributes to rethink the long-standing assumption that informality and horizontality is some kind of antidote to Michels' (1911) Iron Law.

HERRERA VERGARA, JOSÉ IGNACIO* (Universidad de Chile, Chile)

Asociatividad y Confianza Generalizada En Chile.

Los niveles de confianza generalizada en Chile han sido durante décadas bajos en comparación a nivel latinoamericano. Si consideramos a la confianza como una dimensión de capital social fundamental para el desarrollo de la integración social, resulta relevante analizar los mecanismos a través de los cuales se constituyen relaciones que facilitan su emergencia. En esta tarea, las membresías asociativas han sido consideradas como un mecanismos fundamental a través de los cuales los actores aprenden a relacionarse y cooperar con personas diversas. El argumento básico es que, si bien las membresías asociativas se configuran de acuerdo a un patrón homofílico, muy probablemente las personas que se vinculan a través de las membresías sean distintas en varios otros aspectos.

Esta investigación apuesta por generar un modelo que logre explicar la confianza generalizada de las personas Chile, mediante un modelo de ecuaciones estructurales. Se contemplan como variables independientes a perfiles de participación activa en asociaciones voluntarias, variables de red, en específico, la diversidad de lazos de clase y un conjunto de variables que hacen referencia a atributos individuales, las cuales que han sido consideradas como relevantes en estudios anteriores. La hipótesis fundamental del estudio es que el efecto de la membresía activa sobre la confianza generalizada es mediada por la diversidad de lazos de clase. El estudio trabaja con datos representativos a nivel nacional, de la ola 1 de la encuesta ELSOC - COES.

CANTILLAN CARRASCO, ROBERTO* (Universidad de Santiago de Chile, Chile)

HERRERA VERGARA, JOSÉ IGNACIO* (Universidad de Chile, Chile)

Participación En Asociaciones Voluntarias y Adquisición De Capital Social a Nivel Individual. Evidencia De Un Contexto Neoliberal.

Los estudios de estratificación y movilidad social han informado frecuentemente que los grupos sociales tienen un acceso desigual a los recursos de capital social. Una posición ventajosa en la estructura social resulta de tener acceso a contactos sociales diversos, lo cual, a su vez puede proporcionar recursos que faciliten la acción instrumental. Así, resulta relevante estudiar los mecanismos a través de los cuales los actores contrarrestan los déficits de capital social. Uno de estos mecanismos es la membresía en asociaciones voluntarias.

Las asociaciones voluntarias han sido tratadas como fuentes de cohesión y segregación o, como fuentes de diversificación e integración social. Sin embargo, los estudios anteriores en norteamérica y europa, suelen abordar estos problemas a través del análisis de las redes cercanas. Por otro lado, los estudios sobre asociatividad en latinoamérica han hecho escaso uso de las herramientas analíticas del capital social. Otra cuestión importante es que los análisis del efecto de las membresías asociativas sobre el capital social a nivel individual suelen no recurrir a un análisis que integre variables de contexto. El presente estudio analiza cómo la membresía en asociaciones voluntarias afecta la adquisición de capital social en contextos comunales más o menos heterogéneos en términos socioeconómicos. Para esto, recurrimos a un análisis multinivel. La hipótesis fundamental del trabajo es que la participación en asociaciones voluntarias varía su efecto sobre la adquisición de capital social de acuerdo al contexto de heterogeneidad comunal en el que se encuentran inmersos los sujetos. Las variables de nivel 1 son las participación en diversas asociaciones voluntarias, junto con otras variables que describen atributos de las unidades. La variable de nivel 2 (contexto), son tipos de comunas diferenciadas según su nivel de heterogeneidad socioeconómica. Este estudio utiliza los datos representativos a nivel nacional de la ola 1 de la encuesta ELSOC - COES.

Relational Imaginaries of the Future

Relational Imaginaries of the Future
The objective of this presentation is to show how Simmel's relational approach and his theoretical perspective in 'How is Society Possible?' can be applied to the study of our contemporary imaginaries of the future. Concretely I shall focus upon the imaginaries of the future of (about and for) the young (aged between 15 and 30) in the Catalan province of Barcelona. Thus I shall try to answer the questions asked in the call for this session with an empirically informed analysis and theorisation of the imaginaries of the future.

Education Censuses and Recognition: The Politics of Collecting and Using Data on Indigenous Peoples in Latin America

A growing number of countries in Latin America are administering education censuses collecting individualised information on every student, teacher and school within their education systems. Despite the cost and complexity of conducting a universal data collection, instead of a sample survey, these sources are crucial for a more inclusive education planning. This universal aspect is particularly relevant in Latin American societies that are not only ethnically diverse but also highly unequal and excluding societies.

In this sense data produced by education censuses are becoming increasingly relevant for other policy areas in Latin America, including migration and population projections (UNESCO Institute for Statistics, 2016). After mapping such initiatives in Latin America, this work investigated factors associated with the existence of a regular education census that collects data on indigenous peoples.

For that, we have analysed and compared national regulations as well as data collection documentation and instruments from 10 Latin American countries. Having the past three decades as reference, we observed that the political con-

text of increasing tensions between neoliberal education reforms and recognition movements was decisive for the design of education statistical systems in Latin America.

Preliminary results indicate that the existence of regular data collection on indigenous peoples via education censuses is related to a broader national political commitment from governments to recognise these populations and their cultural identities. However, further analysis of national education plans suggests that despite this recognition, many governments do not use these data as reference for policy planning.

Are Grammar School Pupils Overrepresented in Prestigious UK Universities?

Recent empirical research suggests that pupils from more advantaged social class backgrounds and certain ethnic minority groups continue to be overrepresented in state grammar schools in England (Cribb *et al.*, 2013), which select students based on their performance at a cognitive entry-test. Those educated in grammar schools are among the highest achievers at national standardised exams (GCSE, age 16), leading to subsequent academic tracks to later access university. However, recent research shows that this appears to be due to the academic and social selectivity rather than to any 'school quality' effect (Gorard and Siddiqui, 2018). Similarly, the disproportionately high rates at which grammar school pupils attend prestigious UK universities (i.e. Russell Group universities) is explained by prior attainment and social background characteristics, rather than being a direct effect of school type (Sullivan *et al.*, 2014). Nevertheless, this latter evidence presenting a null effect of grammar school attendance on access to prestigious UK universities relies on data for those who came of university-age towards the end of the 1980s, immediately prior to the second-wave of higher education expansion and the subsequent proliferation of university league tables (Boliver, 2011, 2015). This paper draws on data for much more recent cohorts who came of university-age in a context of a 50% higher education rate and a highly prestige-stratified university system, in which the previous null grammar school effect might now be relevant. We use Next Steps data (i.e. born 1989-1990) and link it to the NPD data (i.e. students' performance at 11, 14, 16). We employ multinomial regression models to analyse the contemporary impact of attending a grammar school on access and degree achievement, differentiating by university prestige. Preliminary results suggest that grammar school pupils have an advantage in getting into university, but not in accessing and graduating in a prestigious one.

CAPSADA-MUNSECH, QUERALT* (University of Glasgow, United Kingdom)

ORTIZ, LUIS (Universitat Pompeu Fabra, Spain)

Crowding-out or "One-Size Fits All" Occupation? a Regional Exploration of the Causes of Youth's Overeducation By Educational Level in Spain

In several countries, educational expansion has recently grown faster than its demand, leading to overeducation (i.e. being employed in a job for which individual's educational level exceed job requirements), especially among youth. Overeducation challenges both education systems and economic sectors, as a potential underuse of skills might have negative results for workers' earnings/ satisfaction and economic productivity. Spain is one of the labour markets with a higher rate of overeducation among youth and clear cross-regional disparities (Ramos & Sanromá, 2008; Jimeno & Bentolila, 1998). While previous research has referred to regional differences as the size of the labour market and distance to metropolitan areas (Jauhiainen, 2011; Büchel & van Ham, 2003), we contribute to previous literature by exploring the role of supply and demand side factors to explain cross-regional variation in youth's overeducation. Moreover, we do it over time. We also consider the possibility of a crowding-out effect, according to which an oversupply of tertiary graduates would displace those with upper secondary education towards overeducation and/or unemployment. We apply a time-series cross-sectional (TSCS) analysis using the Spanish Labour Force Survey (S-LFS) data from 1977-2008, in combination with regional data from official statistical sources to better approach supply and demand side factors at the regional level. Results show differences in overeducation rates across Spanish regions and over time, suggesting that both supply and demand side factors contribute to explain it. Empirical evidence also suggests that there is some crowing-out effect, since an increase of overeducation rate among tertiary educated increases overeducation rate among upper secondary educated, but such a crowding-out effect is not

translated into an increase of their unemployment rate. We interpret this finding as a sign of employers' preference for the most educated candidates regardless of their educational match, rather than as a sign of scarcity of jobs.

CARBALLO, MARITA* (Voicesconsultancy, Argentina)

HERMELO, MANUEL* (Voices Research and Consultancy, Argentina)

Trust and Cultural Changes in Latin America

Interpersonal trust and trust on institutions it's one of the key aspects for social capital formation and development. Various theories, hypotheses and empirical evidence from different social sciences´ perspectives proposed and attempted to show that Trust is associated with wellbeing and that it mobilizes pro-social actions. This, in turn, generates important changes in terms of civic participation, democracy and economic development.

We put forth our argument in three parts. First, discuss some of the seminal authors who give prominence to the idea of trust and social capital. Then we present our empirical evidence with an analytical emphasis on three dimensions of societal trust: a) interpersonal and institutional trust b) attitudes and values toward democracy c) business and economic values. We use a mixed-method research approach, quantitatively analyzing trust and democratic and economic values in the region and their change and continuity since 1980 to date using the World Values Survey data, as well as a qualitatively approach analyzing trust and political values through a series of in depth interviews conducted in Argentina. To conclude, we discuss how attitudes and values regarding trust and democracy might influence public policies in the region.

Self-Management and Cooperatives of Catadores in the Rio Grande Do Sul State

Law No. 12,305/10 establishes the Brazilian *Política Nacional de Resíduos Sólidos* [Brazilian National Policy on Solid Waste]; it contains important legislative instruments regulating social and economic problems arising from the inadequate management of solid waste. The *Política Nacional de Resíduos Sólidos* allows a significant advance in terms of social inclusion: for instance, it allows the direct purchase of service of cooperatives of *catadores* [waste pickers] by the Brazilians "municípios" [city halls], thus encouraging the creation of cooperatives, and favoring social economy. In the Rio Grande do Sul State, *catadores* turned their profession: instead of spend their days searching for cans, plastic bottles, and other recyclable materials in the street trash or in a landfill, began to organizing into self-managed cooperatives, with a mission typically expressed in their altruistic ideologies of serving the public interest, as the environmental protection. The paper presents the results of an ethnographic analysis set to leaders of waste pickers' cooperatives in the state of Rio Grande do Sul: managers of cooperatives from different regions of Rio Grande do Sul, metropolitan and rural areas. In-depth topics such as management practices, the relationship between cooperatives and informal waste pickers, cooperatives and the waste management policy, labour conditions, are explored by interviews and field diary. In addition, the paper discusses living and working conditions of *catadores*, as well as the social construction of the *catadores* as a political subject.

ACHTERBERG, PETER* (Tilburg University, Netherlands)

"No Room for Thinking, Under the Dome". Flat Earth and the Boundary Construction between Science and Non-Science on Twitter.

With few exceptions, most of human history has been guided by the belief that the earth is round. Nevertheless, in recent times, the view proposing a flat earth has increased in popularity. Drawing from the literature about boundaries and boundary-work from Gyerin and Abbott, this study aims to explore how boundaries are constructed in public space. The Flat Earth Society (FES) is almost uniquely present online. Hence, the normative power of defining knowledge cannot be evaluated in its core dimensions – through argumentations in scientific journals. For this reason, the periphery of science, its connections with the public and the narratives adopted on Twitter, is the principal avenue where we study the acquisition of normative and classification power through which people delimitate knowledge systems. Based on a qualitative content analysis, this paper shows that FES supporters and adversaries are heterogeneous in the argumentations held to sustain their positions, and that boundaries appears to be mostly defined by FES adversaries

through framing strategies. Based on a network analysis we analyze the network structure of the boundary-work process, comparing coalitional and conflictual networks. The results show that adversaries are a unified front against fragmented groups of supporters. At the end of the paper, we discuss the relevance of these findings for theories about the constructivist nature of science.

CARDIEL, JORGE* (National Autonomous University of Mexico, Mexico)

Manifestos: Media for Networking in the Historical Avant-Garde

Despite their increasing visibility that we witness today, networks have accompanied each and every social formation alongside human history. As modernization and globalization develop, these networks reach beyond national borders. One particular episode of transnational networking that took place mainly in the first three decades of the XXth century is the historical avant-garde. The *modus operandi* of this global movement included art, literature, politics and mass media simultaneously. One of their privileged tools to call for action was the manifesto. Their use of this instrument is *sui generis* and paradigmatic. It is mainly used to communicate *how* art is to be done; but also, to suggest *that* the political situation needs to be drastically changed, in order to achieve the desired transformation of art and society. At the same time, the manifesto is understood as an example of an avant-garde work and performs the propositions that it contains. Additionally, each manifesto refers to other manifestos and engages in conversation with other actors and other isms in the international network of the avant-garde. The avant-garde manifesto emerges as a space for second-order-observation (observations of observations). In this paper, I will analyze passages of manifestos of the historical avant-garde to show how a transnational space is constructed through the use of a specific medium. This transnational space serves the discussion and the critique of ideas. I will show how the historical avant-garde manages to create a new use of an old medium. In their understanding of media, they are already aware that media re-create social facts. Nonetheless, through their re-descriptions of other descriptions, each manifesto accentuates visibility in certain events, and undeniably hides others. This leads the actors in the avant-garde network to struggle for a possible synthesis of the multiplicity of the isms, but also to hegemonic attempts.

Body in the Margin: Approaches between Body Practices of Amazon Riverine People and Their Relations with Their Territorialities

This paper is a narrative bibliographic review and aims to understand the articulations between territoriality and culture, related to the body practices of Amazonian riverine people, interpreting. It can be seen that it is possible to think about the human being and his actions as a social subject, who is (re) formulating different ways of being. The riverine interacts with the environment economically and culturally, the forest and the river become materialized elements, constituting the essence of the riverine identity, beyond the conception of a riverside dwelling, a relationship of belonging, it would be insignificant to minimize the identity riverside only for housing in the face of the plurality of Amazonian living. Thus, it can be understood that body practices, as a result of the process of different collective constructions, allow dense and meaningful experiences. The body practices in this context are related to the environment and culture, since they are integrative experiences, forming and maintaining social groups that share, communicate and replicate their forms, institutions and their cultural principles and values. Each group interacts with the surrounding environment, and their culture defines how to live in that physical environment. There can be found in the same environment several particular solutions that account for the survival of societies, and the culture is responsible for transforming individuals into members of each

other. certain group that recognize each other. Moreover, the socialization of individuals is responsible for the transmission of the senses about why to do it, which is especially important because it allows us to understand the integration and logic of a culture. The body is a synthesis of culture, because it expresses specific elements of the society of which it is part, establishing a process of incorporation and integration between the human being and their territoriality (s).

CARDOSO, LAYANA* (IFAP, Brazil)

Navigating the Body People's Body Practices: Notes about the Relationship between Culture and Health

This paper is a narrative bibliographic review, aiming to understand the relationship between body practices and health of riverine residents, from an anthropological point of view. In rivers, over bridges, it is in this environment that specificities mean that certain practices do not take place and others need to be maintained. Although it is understood that there is a relationship between physical education and health, there is also a need to question the concepts implicit in this relationship, considering that it is also the result of a biological-social hybrid. The cultural phenomena related to everyday body practices that occur in the cultural context of riparian occur in a systemic, dialectic and contextualized way in which all aspects are configured as revealing the subject's way of life and as indicators in collective health. In order to understand this universe, we have to effectively dive into the context without conceiving a reality that the riverine is an isolated being, mainly because its relations occur within networks. It is necessary to visualize the shortening of distances through the technological apparatuses that constitute aspects of the scenario where the island community develops a typical way of life, characterizing a kind of belonging, which is governed by various ways of looking at the world that are fruitful. of interactions, of knowledge, of doing, of a network. The riverine culture, therefore, is always rebuilt with the ebb and flow of the tides, as well as its relationship with health. The networks and their symbolic manifestations are the fruit and instrument of the way of life of these peoples. It is necessary to emphasize the importance of studies involving the so-called Social Epidemiology, because the information obtained through these researches, when analyzed within their specificities, allows a broader and more real view of the health-disease phenomenon.

Transiciones Educacionales Entre Los Niveles Medio y Superior En El Contexto Brasileño: Selectividades y Desigualdades

Este artículo discute la transición entre las etapas de la escolarización dentro del sistema educativo, considerando las transformaciones que ocurrieron en el sistema educativo brasileño en las últimas dos décadas. El objetivo es analizar cómo ocurren las trajectorias de los grupos de estudiantes considerando la relación entre acceso, permanencia, éxito y deserción. El acceso a subsistemas públicos o privados no es igual, ya que está sujeto a disputas por vacantes en escuelas o universidades selectivas, ya sea debido al pago de aranceles ecolares u otros instrumentos selectivos derivados del limite de vacantes ofrecidas en instituciones públicas o gratuitas. Para analizar las transiciones educativas en este contexto, algunas de nuestras inspiraciones teóricas provienen de Pierre Bourdieu y Pedro Abrantes. Metodológicamente, el estudio utiliza datos secundarios (censo) y primarios (encuesta) sobre admisión, inscripción y finalización en los niveles medio y superior. Además, son considerados indicadores sobre el origen social, capital cultural, trayectoria y proyectos de vida de los estudiantes. El análisis muestra que, a pesar de los avances recientes, existen estratificaciones que marcan las desigualdades y que se presentan especialmente selectivas en las fases de transición entre las etapas de la escolaridad, como en el nivel medio y en la transición para la educación superior. Las políticas de acciones afirmativas para segmentos de la población socioeconómica y étnica previamente excluidos, contrastan con las tendencias sistémicas, sin embargo, desde el punto de vista de las políticas públicas destinadas a democratizar la educación, la amplitud e intensidad de estas políticas deben profundizarse para abordar las desigualdades con más vigor.

KESSELMAN, DONNA* (Université Paris-Est Créteil, France)

The Regulation of TNC Companies and Drivers: An International Comparison of the Challenges of Digital Platform Work

We are currently co-editing a special issue for the *Chronique International de l'IRES* (Institut d'Etudes Economiques et Sociales, France) comparing the form of regulating the work status of ride-sharing drivers in 9 countries and the European Union (European Union, France, United Kingdom, Spain, Italy, Germany, United States, Canada, Brazil).

This issue of the *Chronique Internationale* proposes to develop a comparative analysis of the various forms of emerging frames of regulation in the individual passengier sector in urban settings in countries in the global North and South. This sector has been chosen as well as it is illustrative of processes underway where states are introducing new forms of regulation that are surpassing the typical tripartite relationship of « employeur, trade union, government » as it had been practiced more or less in all countries. This new framework of regulation creates more space for other stake-holders including drivers associations and consumers, cooperatives, etc. It is essential to analyse the breadth and forms of resistance, be they individual and collective, to be able to grasp the dynamics of the emerging forms of regulation (more or less institutionalised, more or less broad, more or less lasting over time) that have been recently observed (Chagny, 2019, Azaïs *et al.*, 2017).

We propose to share our conclusion and our work on the follow-up project.

MAGALHÃES SANTOS, LARISSA* (Universidade Estadual de Campinas, Brasil, Brazil)

Civil Society Mobilizations: Repertoires and Coalitions in the Context of Rio Doce Disaster

The article investigates the role of civil society organizations in the context of the River Doce disaster. It resulting from the Fundão dam rupture in Mariana, Brazil, from the Samarco-Vale-BHP Billiton mining companies. Despite the asymmetry of power and resources in relations between state, companies and affected people, the governance of the social-environmental disaster of the Rio Doce has been characterized by the administrative management of conflicts with extrajudicial instruments for negotiated conflict resolution (Conduct Adjustment Terms - TACs), unlike judicialization. In a marginal position to the circuit of extrajudicial devices, organizations of affected persons interact with ministerial bodies, the justice system, the legislature, entities and academic sectors producing strategies and repertoires of action that go beyond the norms of terms and instances established for negotiated conflict resolution. This article seeks to analyze the mobilization of civil society to guarantee the rights of the affected, identifying the repertoires of confrontation and the coalitions in the field of the affected, throughout the process of reparation. Analyzing the TACs, the strategic field of action of the affected, and the respective repertoire and coalitions, we examine how skilled actors in the field of the affected act to influence the decision-making process on reparations and compensations. The analysis combines the Theory of Strategic Fields of Action (Fligstein, McAdam 2011, 2012) and Theories of Social Movements (Tilly, Tarrow 2007; Tilly 2008). The empirical research is based mixed method research in the three-year investigation of the socio-environmental disaster (2015-2018): (i) survey of semi-structured questionnaire applied to social movement activists and civil organizations; (ii) documentary research on TACs and reparation measures and; (iii) participant observation. We defend the argument that the pursue for influence by civil society actors on the governance system of disaster occurs through contestation, cooperation relations and coalition.

Documentar El Rol Que Juega El Color De Piel En El Antirracismo Mexicano

En esta ponencia hablaré sobre la manera en cómo documentamos algunos casos de antirracismo en México para el proyecto Antirracismo Latinoamericano en tiempos Postraciales (LAPORA) desde la Universidad de Cambridge. En el proyecto se buscó documentar el antirracismo desde tres ámbitos: el Estado, organizaciones civiles y movimientos sociales. El proyecto tomó una perfectiva histórica-estructural pero también personal sobre cómo hemos vivido el racismo. Ahí nos dimos cuenta de que la mayoría de las personas que movilizaban el tema eran mujeres y uno de los factores más complejos de abordar fue el rol que tiene el color de piel en las lógicas de opresión racial. Además, gracias a estrategias como las entrevistas a actores clave, pudimos conocer las trayectorias personales de dichos actores y saber la forma en que el racismo les cruzaba de manera individual y emocional. Es decir, para comprender el posicionamiento antirracista que cada actor movilizaba desde el Estado, las ONGs o el movimiento social, era necesario no solamente ver el locus de enunciación de quién daba cuenta de ese antirracismo, sino cómo el tema le tocaba en su trayectoria personal. Estrategias como la observación me permitió da cuenta la manera en que ese discurso antirracista movilizaba recursos y "negociaban el antirracismo in situ" en un contexto de mestizaje, destacando que una de las conversaciones más difíciles era hablar sobre el rol que juega el color de piel en la opresión racial. Por ejemplo, desde lo indígena se le daba espacio a la discusión, pero se llevaba a cabo mediante metáforas como "los indígenas somos el color de la tierra"; mientras que, desde lo mestizo, sus discursos minimizaban su importancia dándole más peso a elementos culturales.

The Social Construction of Water Crises and the Spatiality of Supply Systems: The Cases of the Megacities São Paulo and Shanghai

In the context of limitations of natural resource systems, development processes in the Anthropocene and the dynamics arising from human activity, this article aims to analyze how recent water crises have threatened two megacities: Shanghai (China) and São Paulo (Brazil). This analysis seeks to go beyond simple correlations of demographic variables such as population growth with environmental issues, to discuss how different populations – with particularities in their cultural, economic and ecological diversity – appropriate and manage these resources. Water crises go beyond availability issues due to low rainfall and different water uses, and are mediated by various conflicts. The social construction must incorporate historical, cultural, economic and political processes in order to understand how they acted in the past and continue to influence the process of producing, maintaining and reproducing unequal conditions of access to water. At times of water scarcity, emergency measures that disregard the social construction of the problem have little effect on conflict resolution, and thus perpetuate the vulnerability of the affected population. The technical and short-term solutions to water crises that affect the two megacities, rely on water transposition between different regions and result in a relationship of interdependence and highlight existing disputes that may occur in scarcity scenarios. Conflicts involving water resources presented in this research consist of the connection of the Beijing and Shanghai macro-regions – through the South-to-North Water Diversion Project, and the São Paulo-Rio de Janeiro hydromegalopolis – connecting waters from the Paraíba do Sul and Piracicaba-Capivari-Jundiaí basins. Despite differences in the contexts of management and distribution of water resources in those two cases, this debate proposes applying hydromegalopolis as analytical spatiality, assessing similarities between Brazil and China, in water management, considering the asymmetries of the different actors inserted in the dynamics of the regions involved.

CARNICER, JAVIER* (Universität Hamburg, Germany)

Transnational Mobility, Education and Social Positioning between Brazil and Germany

Migration from Brazil to Europe has increased since the 1990s. Social inequality and poverty have been important drivers, but there is also migration among qualified specialists as well as students seeking higher education. This latter type of migration has been mostly related to high and middle-class contexts, since it requires a considerable amount of economic and academic resources. In this way, the transnationalisation of education seems to enforce new social inequalities between those who do and those who do not have access to the transnational educational market.

For the middle and upper classes international mobility is viewed as an educational strategy. For socially underprivileged migrants, however, it is perceived as a source of educational disadvantage. Below the middle-classes, migration (or mobility) has been seldom studied as an educational strategy and we know little about how educational aspirations and strategies influence families' and young people's decisions to migrate and how this might impact on transnational social spaces.

***denotes a presenting author.** Abstracts are organized by first presenting author's last name.*

This paper will present selected results of an exploratory study about transnational education and social positioning between Brazil and Europe. Drawing on multi-sited ethnographical research and interviews along migration networks between Brazil and Germany, the study investigates the connections between migration decisions, educational strategies and transnational family organization in different social contexts. Findings from this research indicate that educational aspirations are an important reason for migration decisions of underprivileged migrants. In these cases, migration is related to educational upward mobility.

The contribution will discuss how transnational, educational aspirations are developed as well as the institutional and informal support structures that helped to realize them. These structures result partly of the „crisis of care" (Fraser), and are therefore gendered. The presentation will also show how migrants from disadvantaged social backgrounds actively take part in the transnationalisation of education.

CARO MOLINA, PAMELA* (, Chile)

El Muro De La Maternidad En Trabajadoras Mineras: Conflictos y Prácticas Organizacionales

La industria minera en Chile en la última década ha aumentado su preocupación por crecer en participación femenina, desplegando una serie de acciones orientadas a atracción y retención de mujeres en áreas de la cadena de valor principal. Sin embargo, no se han abordado en profundidad las barreras y tensiones que enfrentan las trabajadoras para abordar de manera saludable el equilibrio entre trabajo productivo y maternidad, levantando interrogantes acerca del cuidado como cuestión social, conciliación y corresponsabilidad (género, intergeneracional, participación Estado y mercado), en un rubro productivo que cuenta con condiciones estructurales que complejizan dicho equilibrio, como el sistema de turnos, distancia geográfica y modalidad de campamentos. A través de una investigación en curso con fondos públicos, hemos podido levantar información empírica en torno a las principales tensiones que experimentan las mujeres, los recursos desplegados para enfrentarlas, así como la percepción del entorno cultural y de las prácticas empresariales implementadas o diseñadas en materia de conciliación. La investigación se basó en una metodología cualitativa, a través de la realización de entrevistas en profundidad a 33 mujeres y 12 hombres, de distintos cargos ocupacionales, así como a una decena de informantes claves (industria, estado, organismos técnicos). Ocupando para el análisis, la teoría de género (Scott, 2008), el concepto de trayectorias ocupacionales (Madero y Mora, 2011) tensionadas y la capacidad de agencia (Sen, 2000), dentro de los principales hallazgos encontramos la prevalencia de "neutralidad de género", como forma de privatizar los problemas y soluciones en materia de cuidado en madres trabajadoras, el "fantasma de la maternidad" omnipresente en trabajadoras jóvenes que aspiran a un desarrollo de carrera al interior de la industria, hostilidad y sesgo de culpabilidad en el entorno cultural homosocial, fragilidad y actitud dubitativa en las estrategias empresariales, y débil presencia del Estado en materia legislativa y de políticas públicas.

Jóvenes y Acción Colectiva En Brasil y América Latina: Multiplicidad De Actores y Formas De Protesta

Formas contemporáneas de acción colectiva, compromisos políticos y protestas de jóvenes actores desafían nuestra capacidad de análisis en sintonía con movimientos en curso. El esfuerzo es inventariar singularidades y cotejar secciones transversales de movilizaciones que se manifiestan con significados similares en diferentes partes del mundo. Analizamos acciones colectivas en Brasil, México y Chile. En 2013, hubo manifestaciones masivas de intensidad y enfoques variados en Brasil que alcanzaron su punto máximo en junio. El fenómeno fue nombrado de diferentes maneras por la prensa, los medios alternativos y los analistas políticos: "jornada", "manifestaciones", "revuelta", "protestas", "revolución callejera". A pesar de la dificultad de nombrar el fenómeno, lo llamaremos "jornadas de junio de 2013". Se puede decir que las movilizaciones en este período no estaban dentro de una "agenda juvenil" hacia plataformas de reclamos o protestas generacionales. Las frustraciones que han cruzado el rango de edad se han puesto en juego y parecen haberse originado en la baja capacidad de respuesta del estado al conjunto heterogéneo de demandas de la sociedad. Otras dos expresiones de la juventud en confrontación política, # YoSoy132 en México y las movilizaciones estudiantiles en Chile, se tomarán como ejemplos de las nuevas formas y modalidades de acción de jóvenes latinoamericanos. Los cambios estructurales, socioeconómicos y culturales en los sistemas educativos y las potencialidades de las NTIC configuran los contornos sociales en los que se desarrollan las acciones colectivas de los jóvenes analizadas. Es evidente que el desafío al estado por derechos y la desconfianza de los instituidos son caras de la misma moneda de conflicto puesta en juego por los colectivos juveniles. La agenda de

investigación juvenil plantea la necesidad de articular análisis que puedan contemplar tanto la acción colectiva juvenil como la complejidad de los fenómenos relacionados con los procesos de individuación en los tiempos contemporáneos.

CARRANZA TORRES, JAVIER ANDRES* (GeoCensos Foundation, Colombia)

Map 4 Census: An Innovative Experiment for Census Cartography Data Collection through Civil Society

The Cape Town Global Action Plan for Sustainable Development Data encourages data partnerships between external parties and National Statistical Offices (NSOs) to embrace a collaborative data revolution. Some statistical authorities are consequently aware of the need of data partnerships with third parties, particularly when pushed by the need of optimizing shrinking budgets for the collection of data .

In fact, since last round of censuses in 2010 data collection techniques at NSOs have greatly evolved and new arrangements have been essayed, including census data returns filled in digital formats. Also, pioneer statistical offices are experimenting with civil society groups using open crowdsourced platforms. For instance, the NSO of Canada worked out in 2016/2017 a single inventory of the location and attributes of buildings with the aid of the local *OpenStreetMap* community, essaying an unprecedented collaboration.

It seems that NSOs are considering in the future of their censuses to optimize budgets, but indeed they are transforming their data ecosystem increasing the external participation of civil society: GeoCensos Foundation, a citizen rooted NGO, is essaying a tailored solution by both supporting the production and use of crowdsourced open data through civil society at an NSO in Central America to add value to the preparation phase of the next census.

This paper will portray the MAP 4 CENSUS project highlighting its values and fundamentals in the preparation of the census for El Salvador. This description will not only include the assessment of co-creative training formats taking place in this scheme but will also explain the role that the different actors within the involved processes have. Identifying and analyzing roles can lead to answers about how to deal with the empowerment needs of the newly involved participants, provoking enlightening insights about the potential of the project and its impact.

CARRASCOSA VON GLEHN SCHWENCK, BEATRIZ* (Universidade Estadual de Campinas, Brazil)

Feminist Solidarity Economy and Social Movements: The Experience of the Association of Women in Solidarity Economy of São Paulo

Drawing on the case of the Association of Women in the Solidarity Economy of São Paulo (AMESOL), this paper questions the relationship between solidarity-based economic practices and participation in social movements. It is based on an "action-research" with AMESOL[1], which consisted in producing knowledge on and for the development of AMESOL and of feminist solidarity economy, taking into account the close relations between the political, economic and domestic spheres.

Based on this particular position, the paper argues that:

The construction of relationship between solidarity economy and social movements must take into account the plurality of these movements (here feminist, solidarity economy and black movements), which can reinforce each other, but also be fraught with tension.

The genealogy of these movements, in particular their degree and form of institutionalization in public policies, is a key factor in determining the possibilities of mutual reinforcement and supportive economic practices or, on the contrary, the risks of blockage.

Women's involvement in social movements is permanently linked to their work in production, commercialisation and domestic work and is only possible under this condition. This involvement takes the form not only of a struggle, but also and above all of participation in local public spaces, where relations of production and gender can gradually be renegotiated.

Action-research provides the theorists involved in the transformation of these relationships with the experience of the tensions outside and inside the organization (here AMESOL) and the possibility of becoming attentive to the often discreet and indirect paths of renegotiating these relationships and trying to overcome differences.

Regulation and Reaction: Studying the Agrarian Elite Counter-Revolution Against Environmental and Climate Policies

In January 2019, as one of his first acts as president, Jair Bolsonaro closed the Ministry of Labor, thus fulfilling a campaign pledge to business groups to weaken protections for workers and the environment. A crucial source of electoral support came from the agri-business lobby, who were eager to liberalize the regulation of activities in fields, forests, and factories. In this paper, I ask: how did racial and class grievances shape the agrarian elite backlash to laws regulating environmentally hazardous activities? To answer this question, I draw from 16 months of qualitative and ethnographic research in Brazil, where I conducted interviews with 70 elites from the sugar-ethanol industry. Producers in this industry have confronted increased pressure to improve labor and environmental practices, as Brazil sought to position itself as a global supplier of sustainable sugar and ethanol. I argue that agrarian elites saw a liberalized regulatory regime useful not only for increasing business profits but also as a promising pathway for restoring the class and race relations that labor and environmental laws had undermined. The paper first details the revival of rural regulation, with federal taskforces combatting slave labor and deforestation in the Amazon and eventually expanding oversight into traditional agribusiness areas. By mandating labor and environmental improvements at rural worksites, regulatory enforcement conferred new rights to a largely non-white workforce and protected natural resources long susceptible to exploitation. The second part discusses the backlash from white agrarian elites, who saw federal intervention as undermining the authority and autonomy to command labor and environment that was central to the racial and class order. This conservative reaction resulted in a campaign to delegitimize regulations, state inspectors, and pro-regulatory politicians, eventually elevating right-wing populism as a strategy for returning power to the rural elite.

Contending Hegemonic Projects in an Era of Climate Breakdown

Amid deepening climate crisis the longstanding hegemonic project of fossil capitalism now jostles with two contending projects, namely, climate capitalism and energy democracy. Climate capitalism's system-friendly reforms are a formula for continuity in change, managed from above. They appeal to subjectivities already normalized within fossil-fueled consumer capitalism, and portend only minor shifts in capitalism's historical bloc. In contrast, energy democracy presents a bundle of non-reformist reforms pointing toward a possible exit from capitalism, and recruits support from social forces excluded from the hegemonic bloc. This paper situates these projects within an organic crisis of capitalist civilization that is both political-economic and ecological. Whereas climate capitalism embodies a passive revolution intent on saving capitalism from its own ecocidal tendencies, energy democracy, through a green transformation, points toward democratic eco-socialism. The paper outlines the social forces and discourses that vivify and organize these alternative projects, and their prospects in the current conjuncture of visibly impending climatic tipping points.

Regime of Obstruction: Fossil Capital and the Construction of Hegemony in a Northern Petro-State

This paper reports on an interdisciplinary study of the relations and contours of a powerful regime of obstruction within contemporary Canada. Rooted in the political economy of fossil capitalism, and conjoined to a panoply of hegemonic practices that reach into civil and political society, and into Indigenous communities whose land claims and worldviews challenge state mandated property rights, the regime is driven by the quest for profit through the carbon extraction that continues to fuel capital accumulation globally. The regime combines several modalities of power – economic, political and cultural – operating at different scales to form an historical bloc supporting business-as-usual. Prospects for crafting an alternative historical bloc pursuing a socially just escape route from impending climate catastrophe are briefly taken up.

CARTER, JULIA* (University of the West of England, United Kingdom)

White Wedding Traditions and Inequalities in Britain

The (British) white wedding offers a unique lens for studying a number of social and cultural phenomena from practices of intimacy, consumption, and romance to macro level studies of economics, value and exchange. The wedding also represents an ideal focus for studying the intersection of intimacies and inequalities as it acts as a location for the practice and performance of intimacy which simultaneously encapsulates historical and contemporary gender inequalities. In Britain, weddings largely remain the purview of women who are expected to organise, plan and take the most value from the day. This paper aims to make an additional argument: that it is specifically *white* femininity and *white* traditions that are associated with British white weddings. I take a theoretical perspective to explore these issues further, using Vasquez and Wetzel's (2009) concept of cultural toolkits, Pitcher's (2014) culturally appropriate consumption and Gilroy's postcolonial nostalgia to explore the racialization of British weddings. Aiming to interrogate the notion of tradition in white wedding culture, the argument draws on materials from research of British wedding shows, including: micro-interviews, a bridal magazine and photographs taken by the author. This paper starts from the premise that white weddings in the UK are more than just white in dress colour, they are seen as emblematic of 'whiteness' and relatedly 'Britishness', despite Britain's long history of racial integration which would have had an inevitable impact on such a porous social ritual. Thus, while wedding traditions may have become increasingly reflective of diverse histories and cultural traditions, in the UK they are seen as a last bastion of white British identity. In this way, I demonstrate some of the ways in which wedding traditions are racialized as white and provided as legitimating resources for white racial authenticity.

CARVALHO, HUANA* (Université de Lyon, EVS UMR 5600, ENTPE, France)

Housing Policy in Brazil and France: New Roles for Public and Private Developers

Since the last world financial crisis, public developers have been displaced from their historical role by the rise of private developers in the production of social and affordable housing. This process creates new relationships between public and private actors, reshaping housing policies in contexts as diverse as Brazil and France. Considering public housing developers are not passive actors, the research proposes to explore their emerging practices evolving towards new managerial expertise in the financial sphere. If these practices enable their institutional reproduction, the hypothesis of the research concerns the fact they also change in a dialectical overcoming the nature of their role as "manager of the real estate capital" (Topalov, 1976). Ultimately, it results in the financialization of the housing policy. Grounded in a qualitative fieldwork on the biggest Brazilian and French public housing developers, the research explores documental sources and around fifty semi-structured interviews conducted between 2016 and 2018. This material, which bases the hypothesis, is interpreted through a theoretical framework in the intersection of urban studies and sociology of management.

CARVALHO, JOÃO MAURO* (UNESP, Brazil)
LAHUERTA, MILTON (UNESP - FCL/Ar, Brazil)

National Appropriation of International Guidelines for Educational Reform and the Promotion of a Market-Oriented Citizenship: A Case Study from the Brazilian Educational Reform of the 1990s

In the last decades, many international reports have focused the importance of education for the promotion of development. To achieve this result, they argue, education needs to fit to a new social context, adapting to the constant change that mark contemporary societies, such as technological innovation, changes in the sphere of work and production, new subjectivities and ways of participation in society. Our goal is to explain how this international rhetoric, as promoted by international organizations, has served as a guideline for reshaping the national systems of education. For this purpose, we aim to analyse the case of the educational reform that occurred in Brazil during the 1990's. We focus the analysis on the reports that served as normative guideline for the reform. We consider those reports as a form of legitimization and mediation of reform proposals. In analysing those reports with the methodological approach of the objective hermeneutics, it was possible to reconstruct the sense of the political process of the reform, explaining how it deals with the international normative guidelines. In doing so, we can explain how the national appropriation of the international guidelines products a market-based notion of justice, that shapes the educational system as a form of social selection of those able to take part in citizenship according to its capacity to compete in the market. That notion of competent citizenship based on performance restricts the commitment of the national state to the promotion of an equitable notion of citizenship as a way to diminish inequalities.

RC16-201.8

CARVALHO, JOÃO MAURO* (UNESP, Brazil)

Social Networks and the Rise of New Forms of Authoritarianism

In the last years, the world has testified the emergence of new authoritarian leaders that risen from the core of the liberal democratic societies of the western world. That reminds us from the warning of Adorno that the worst threat against democracy are the authoritarian tendencies that are latent in the democratic societies. Our goal is to analyse those authoritarian tendencies as they appears in the social networks. The social networks, a singular way of social interaction mediated by the new forms of digital technology, are a central tool in the contemporary political process. As the early Critical Theory examined the binding between political authoritarianism and the technologies of the culture industry, the binding between that specific form of social interaction and the predominance of the authoritarian political attitude in the contemporary society must be analysed. With that analysis, it is possible to understand the conditions of the political authoritarianism and the ways to preserve the democratic politics against the authoritarian claim that rise against it. For this purpose, this work intends to present a theoretical discusion and an empirical analysis of social interaction mediated by the digital media, reconstructing the logic of the interaction within the social networks and explaining how that specific way of interaction leads to the reproduction of political polarization, of authoritarian attitudes and the closure of potential forms of dialogical elaboration of the political conflict. With the predominance of that kind of interaction, the social networks appear as a fertile field for the spread of new forms of authoritarianism, which must be object of a Critical Theory compromised with the diagnosis of the present.

Expansión De La Educación Superior y Subempleo En Chile

Durante las últimas décadas, la educación superior chilena ha experimentado una expansión en su matrícula sin precedentes, a la luz de un proceso de mercadización y privatización de las instituciones y el acceso a la educación terciaria. Esto ha tenido como consecuencia un acelerado proceso de credencialización de la población. Esta expansión ha provocado una serie de fenómenos, destacando un financiamiento preponderantemente privado por medio de una elevada tasa de endeudamiento de los egresados y desertores; diferencias formativas significativas entre carreras y programas similares que se relaciona con una valoración diferenciada de las credenciales en el mercado del trabajo según la institución emisora; y una alta tasa de subutilización de la fuerza de trabajo. En este sentido, el objetivo de la presente ponencia es caracterizar este último fenómeno desde la perspectiva del subempleo por competencias. Para ello, utilizaremos las fuentes de datos de la Encuesta Nacional de Empleo, encuesta de carácter mensual que caracteriza la estructura ocupacional chilena, desde inicios de la década, hasta el último trimestre disponible a la fecha (2010-2019). Dentro de los principales resultados destaca las diferencias en el subempleo según el tipo de institución de egreso de la fuerza de trabajo, encontrando que en los egresados de las nuevas instituciones de educación superior privadas se reporta una mayor tasa de subempleo que en instituciones de educación superior estatales o tradicionales. Los resultados nos permiten inferir que la expansión de la educación terciaria no ha implicado un consecuente mejoramiento en las condiciones de trabajo de los egresados de ésta. Es más, si consideramos que la expansión educativa se ha concentrado en las instituciones de educación privada no tradicional, podemos inferir que la expansión privatizadora ha jugado un papel en el aumento de la subutilización de la población ocupada.

State, Market and Defense of Competition from the Perspective of Economic Sociology: Transformations in the Trajectories and Social Positions of Cade Agents

The aim of this work is introduce an analytical perspective on the transformations at the agent profiles (counselors) of CADE between 1994 and 2019. Based in this strand, it searches to understand how and which level of intensity the social links of these agents influenced, from direct or indirect way, the organ decisions in the field of Brazilian Economical Regulation. The research purpose is based in the theoretical discussions concerning the links that exists between State, market and competitive defense. Historically, when assuming a mediation function next to the economic field, specially through the regulatory agencies, the State became linked to the market. The view of economic sociology says that State and market can´t be characterized like antagonistic elements, in view of the social, political and legal constructions established between both. In order to achieve the central goal that was purposed, the empirical research of this work will occur from a qualitative approach, in which the prosopography will be adopted as a lifting and data analysis instrument. Using the approach in question, it has like intention map the CADE agents trajectories in their respective fields, inside and outside of the organ, being this review based in the sociological notion of *habitus,* idealized by Pierre Bourdieu. Before this scenario, this study intends to demonstrate, in its results, that the CADE judgements in the Brazilian competitive sphere aren´t ruled only in political and legal aspects, but also and essentially in the social and professional positions of the agents that find inserted in the functional dynamics of institution.

Los Reflejos Del Neoliberalismo En La Educación Básica: La Sustitución Del Ideal De Democracia Por El Discurso De La Calidad Total.

La discusión sobre la relatividad de la efectividad de las políticas educativas democráticas brasileñas inserta la pregunta sobre la posibilidad de que estas políticas estén en línea con los reflejos de un proyecto neoliberal y conservador. Por lo tanto, es plausible reflexionar sobre la existencia de un proyecto cuyo objetivo sería continuar excluyendo a los menos privilegiados y considerados injustificables, en un escenario camuflado por el disfraz de la democracia. De este contexto surge la inspiración para el presente trabajo, cuyo objetivo principal es verificar el desempeño del proyecto neoliberal en relación con el reemplazo del ideal de democratización por el concepto de Gestión de Calidad Total (TQM) y la consecuente dualización y exclusión social generada por un falso ideal de democracia. Este propósito tendrá como objeto de investigación la Base Nacional Curricular Común (BNCC) que se refiere a la Educación Primaria, más específicamente a los Años Iniciales (1 ° a 5 ° año), principalmente en relación con el período de alfabetización (1 ° y 2 ° año), en función de Esta etapa demuestra más claramente las desigualdades culturales y económicas iniciales que tienden a reproducirse en un contexto neoliberal, además de la relación entre la alfabetización y la formación de ciudadanía. Por lo tanto, se entiende que la investigación busca demostrar la posible contradicción en el desempeño de las políticas educativas, democráticas e inclusivas, en un contexto neoliberal.

CASES, RIZZA KAYE* (University of the Philippines-Diliman, Philippines)

Comparing Filipino Migration to New York and London: Divergent Histories, Commodified Care, and Migrant Networks

Comparing Filipino migration to New York and London presents an opportunity to examine how historical ties as well as labor market demands and changing immigration policies shape contemporary migration streams and migrant networks in both cities. In order to highlight how contexts shape migration experiences and networking, I compare Filipinos in similar occupations (domestics, nurses, and care workers) in both sides of the Atlantic. Doing so shifts the focus not on whether migrant groups are similar or different from each other but what sort of variations can we observe by looking into the same migrant group in two different contexts.

Apart from spatial comparison, I also track how support networks evolve from before coming to London or New York to post-migration adjustments and further settlement. I show how familial ties play an almost exclusive role in facilitating and supporting the movement of Filipino migrants given the emphasis of the 1965 US immigration law on family reunification and the long-standing relationship of the Philippines with its colonial master. This was not the case in London. While family members and relatives shaped the decisions of some to move to London instead of another destination, most of the research participants relied on former employers or recruitment agencies to enter London. These differences in pre-migration networks then shape subsequent network formations in each global city.

Situating the particular cases in macro- level context, I also describe how despite the divergent migration histories of Filipinos in the US and the UK, the current trend is one of concentration of migrant Filipino workers in the care sector in both countries. I explore how this is predominantly driven both by the need and demand for care labor in the US and the UK as well as the Philippine state-led marketization of high-quality workers as an export commodity.

CASES, RIZZA KAYE* (University of the Philippines-Diliman, Philippines)

Comparing Pre- and Post-Migration Support Networks of Filipinos in London and New York: Continuity, Stability, and Changes

The role of social networks in creating and sustaining migration flows, as well as in the adjustment and settlement of migrants, has long been recognized in migration studies. Pre-migration networks are opportunity structures that facilitate movements of would-be migrants to destination countries. Post-migration, migrants have to adjust to their new environment and circumstances. In this phase of the migration process, the function of migrant networks becomes adaptive (Gurak & Caces, 1992). Newly-arrived migrants must generate support and assistance from old and new ties. In cases when support from pre-existing connections (usually familial ties) is inadequate or unavailable, newcomers have to look for alternative sources of assistance.

This paper compares the support networks of 134 respondents (58 in London and 76 in New York) in three migration phases: before coming to London or New York; initial period of adjustment; and the current network as a result of the subsequent process of settlement in the place of destination. A sociogram, comprised of four concentric circles corresponding to the level of importance of each actor named and divided into geographical locations of the relevant actors, is used for each migration phase to facilitate the reconstruction of pre- and post-migration support networks. Conceptually dividing the migration process in three phases provided the opportunity to explore how pre-migration networks shape the support networks of migrants upon arrival and settlement in places of destination, albeit retrospectively.

Embedding the elicitation of networks in participants' narratives helped remembering what they considered as relevant ties and provided a space for the interviewees to reflect and evaluate their social relationships. While employing such a strategy does not entirely eliminate the problem of forgetting, it is argued that it enhances the recall and enriches the data, thereby providing a better understanding of network dynamics before and after migration.

CASEY, CATHERINE* (Loughborough University, United Kingdom)

Democracy, Voice, and Corporate Governance: Public Interest and Worker Participation in Corporate Governance

Corporate ownership, governance, and control are frequently opaque to public observation. In most of the world, including in many democracies, corporate companies assert that the governance of private enterprises is exclusively the business of companies and their shareholders. Companies take account of public and worker interests only as a matter of discretionary largesse, or strategic advantage.

Earlier debates and efforts in regard to industrial democracy have resulted in some socially responsive developments in the governance of companies. Some national systems, prominently Germany, have instituted practices of labour participation in substantive decision-making. But these modes of corporate governance, in global comparison, are rare. They are typically obscured by well-known and highly salient conventions of shareholder-privileged corporate governance common in Anglo-American political economies and their spheres of influence. Industrial democracy debates in recent decades in Anglo-American systems seldom pursue worker participation in highest level corporate decision-making. They more typically focus on workers' voice expression at workplace level and trade union collective bargaining. While these are vitally important, this paper argues for renewed critical attention to conventional Anglo-American corporate governance, its conceptions, interests, and practices.

This paper argues that conventional corporate governance poses considerable problems to democratic publics. It exposes the contradictions and ideologies of so-called shareholder sovereignty and narrow conception of fiduciary duties. It contends that greater political attention to corporate governance can assist labour actors, including trade unions, in formulating and enacting more effective and extensive participatory processes, including in transnational corporations at global levels.

The Languages of Trauma. Insights from Homeless Mothers' Narratives in Wallonia and Brussels

Public policies and social work devices toward homeless people give evidence about the ways these people are seen throughout decades, from people to be punished for their status to people who need strong care. However, the phenomenon seems endless; no universal or global idea were found to cope with it. Following the long history of attempts to improve this situation anyway, we focus here on trauma. Our research is positioned in two Walloon regions (Brussels and Wallonia).

While trauma daily life definition may be quite large, the clinical definition enables to clarify specific concerns toward homelessness. Indeed, trauma, as the effect of what threaten the physical and psychic survival, may be here underlined as a social fact. Including trauma in the already existing categorizations used in the social work fosters insights about some difficult paths to recover a home. It also has an influence about how the social work done is labelled, and on how homeless people are named.

On the basis of a corpus collected in 2015 in the framework of another research (Italiano and Kuçukyildiz, 2016), dedicated to the analysis of biographical discourses of homeless mothers toward their experience of violence, we proceed to a re-analysis of this material looking at the language of trauma. Looking at the language of trauma both from trauma measurement tools and from what is identify (or not) as a violence by the 30 homeless mothers met, highlights similarities but also some specificities of trauma for these women, in comparison to the audience met during the clinical practice in a psychiatric department. This leads to updated representations.

Between Agency and Aesthetics: The Performativity of the Migrant Bodies.

This communication will address the way in which certain works of *Tactical Media* make visible the condition of the border space, which is constructed and performed epistemologically to reproduce dominances that are inscribed in the bodies. I will also show how those projects address the condition of these bodies referring to their submission under a categorical racialization, and how they propose a resistance based on a poetic configuration, a counter-performativity that is opposed to the bio and necropolitical conditions that aggravate the displacement from one State to another.

But those counter-performativities for which the poetics of these projects are committed are also subject to agency by other means: by the intervention through which the projects have been constituted as artistic, and because that is an indication of the institutional agency that takes them as works of art, that is, the art institution has incorporated these works into a framework through which one can think in its cause, in its application in the process of undocumented migratory transit and, how does it relate to an artistic process.

As we will see, these projects are not self-sufficient, they require multiple agencies to be exercised in order to promote actions, to connect and resist, they are

　　　　　　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

transitional objects. They focus on their agent capacity in order of setting up a policy that recognizes the actors in the process of expulsion. This *cosmopolitical* operation, following the concept of Isabelle Stengers in her article "The cosmopolitical proposal" (2005), is an operation to make present and visible, the conquest of a type of visibility that shows the impact of the necropolitical scenario erected around the border crossing. The scenario that these works resist and counter perform through a differentiated poetics that gathers numerous kinds of agencies.

Profesionalización y Condiciones Institucionales De Los Investigadores Para La Producción Colectiva y Movilización Del Conocimiento.

La presente propuesta muestra el análisis comparativo de las condiciones de trabajo para la producción colectiva y movilización del conocimiento de los investigadores de un Centro de investigación Público, del Consejo Nacional de Ciencia y Tecnología y una Universidad Pública Estatal (UPE). Tomando como base el Programa para el Desarrollo Profesional Docente para el Tipo Superior (PRODEP), que promueve la producción colectiva del conocimiento en el caso de la Universidad de Guadalajara como UPE y en contraparte un Centro de Investigación cuyas reglas de colaboración no se encuentran normadas. En el caso del SNI, promueve y fortalece, a través de la evaluación entre pares, la calidad científica de los investigadores en el contexto mexicano.

Una de los programas que es implementado a nivel nacional para incentivar la producción y movilización del conocimiento es el Sistema Nacional de Investigadores; que sin diferenciación normativa pueden ingresar tanto investigadores de las UPES como de los Centros de Investigación con diferentes implicaciones y resultados en la puesta en marcha.

Los resultados que se presentan forma parte de la investigación "Libertad académica y las condiciones para la producción colectiva del conocimiento", aplicada con base a una metodología cualitativa en la teoría fundamentada que contempló la aplicación de 22 entrevistas semi-estructuradas, cuyo análisis permitió la construcción deductiva-inductiva de categorías que posibilitaron la generación de aportes para este objeto de estudio.

En las conclusiones encontramos que a pesar de que existen programas que promueven la producción colectiva y movilización del conocimiento, existen condiciones institucionales que permiten o dificultan la libertad de los investigadores para la producción y movilización del conocimiento.

CASTELUCI, EDUARDO* (PPGS/USP, Brazil)

Plea Bargaining and the Contest to Transform Brazil's Criminal Justice System

This presentation discuss the transformation of Brazil's criminal justice system following the legislative investment of prosecutors and police authorities with the power to bargain plea deals in 2013. First, I locate such act of law as part of Brazilian's State efforts to comply with a series of transnational conventions against organized crime and corruption and examine the process of legal translation, underscoring the effects of path dependency and the activity of legal entrepreneurs. Then, I empirically assess the effective usage of such discretionary power. I show that it has been mainly employed by federal prosecutors working on major corruption scandals, as the widely known Operation Car Wash. I also show that the proceedings follow a peculiar pattern, one that starts with the incarceration of a suspect and ends with a plea agreement that will substantiate the conviction of a third party. In almost all of the public disclosed plea agreements, private actors were granted reduced sentences or immunity from prosecution in exchange of information that would latter become pivotal evidence against public actors. This pattern of legal practice leads to a differential treatment between the parties of a corrupt relation and, at the same time, establishes the legitimate meaning of corruption. I argue that this pattern is sustained by an inherently unstable consortium of interests among a group of criminal justice actors. Prosecutors have made several attempts to revoke the authorization of police authorities to bargain plea deals and to further decrease judicial oversight over the deals. Criminal justice actors are competing parties in the dispute over hegemonic control of the politics of criminalization. Finally, I indicate that such competition also plays a central role in the contest to transform Brazil's democracy, one which has corruption at its core.

CASTIGLIONI, ROSSANA* (Universidad Diego Portales, Chile)

Right-of-Center Governments and Social Policy Development in Latin America

From the late 1990s and early 2000s, Latin American countries increased social policy coverage, public social expenditures, and, in some cases, State participation in the provision of social services. In contrast to what happened in previous decades, countries governed by right-of-center presidents, also expanded social policies. In fact, all right-of-center-presidents introduced or developed non-contributory cash transfers, some expanded contributory transfers, and a few expanded services. Yet, we know relatively little about why, to what extent, and how the right favors expansionary social policy. This paper offers an analytical framework to explain the scope and type of social policy expansion that right-of-center Latin American governments and parties adopted. This framework takes insights from the comparative social policy literature of Latin America and it is also informed by the European literature on the welfare state and party politics, spatial competition, and right-wing parties. It argues that the scope and type of social policy expansion depend on a process of strategic adaptation of right-of-center parties to electoral competition. In this way, parties will strategically adapt to the relative ideological placement and size of the leading antagonist party as well as to the characteristics of the electorate they would like to attract. Social policy expansion under right-of-center parties and governments also depends on policy-makers' perceptions on the economic and/or political costs of promoting an expansionary reform vis-à-vis maintaining the status quo.

Exposure to Information about Economic Inequality, Opportunity Beliefs and Redistributive Preferences: Results of a Panel Survey Experiment.

Social structures in contemporary societies have undergone significant changes over the last few decades. In advanced economies, there has been an increase in socio-economic inequality and pressure to dismantle the welfare state. Chilean society is not immune from such changes, but it has witnessed a substantial decrease in the level of poverty over the last 30 years. Recent studies have documented heterogeneous patterns in the policy attitudes among Chilean citizens in response to this and other changes. The present investigation aims to contribute to the understanding of the effect of information about dimensions of socio-economic inequality on citizens' beliefs. Based on previous pilot web surveys studies, this paper presents the results longitudinal web survey experiments which assess how information about changes in the social structure of Chilean society affect beliefs about meritocracy and redistributive preferences among the public over time. Guided by the opportunity model of beliefs about economic inequality, the presentation will discuss the design and results of a three wave panel (N=1,800) conducted in Chile during 2019. It is expected that the effect of information of poverty and inequality on redistributive preferences persist over time. Practical and theoretical implications of the results will also be discussed.

Social Work and Online Social Networks in the Face of Social Emergencies. the #Brumadinho Case.

On December 14, 2018, a dam was broken in the Brazilian town of Brumadinho, which caused a mudslide in the surrounding areas and dragged many local citizens, with more than 300 people disappearing in the mud. The hours after the catastrophe were crucial, as emergency services were trying to rescue and identify missing persons.

Online social networks in the face of this type of social emergency can act as an alternative for communication and cooperation, shortening time, mobilizing resources and improving the response to social emergencies. Through online social networks, help is usually requested, the situation is reported, attempts are made to locate missing persons, images of what happened in real time are

shown, reaching an unprecedented expansion, until recently unimaginable. They are used as a source of early warning thanks to their simple handling, their immediacy and their worldwide reach. Specifically, Twitter has proven to be a great help in the face of natural disasters. In the case of #Brumadinho we have analyzed the reaction of citizens and social actors on Twitter, just after the event took place. To identify leaderships and detect communities, netnographic techniques, social network analysis and different algorithms have been used. The results show how in the context of Twitter implicit communities are created that are activated in the face of such situations, reducing the risk and inequities of resources, involving the local population in mitigation and enabling the creation of organizational links that drive social support and resilience. Implications and potentialities of social networks for Social Work research and practice in emergency situations will be discussed.

Vulnerabilidad Socioexistencial En La Vivencia De La Crisis Económica. El Caso De Los Adultos Jóvenes Españoles.

Este trabajo analiza los procesos de vulnerabilidad socioexistencial atendiendo a la experiencia de la crisis económica de la última década en el caso concreto de los adultos jóvenes españoles. La juventud fue un colectivo especialmente golpeado en el contexto español por la crisis económica y social que comenzó en 2008, siendo afectados por altísimas tasas de desempleo y temporalidad laboral.

Manejamos un concepto de vulnerabilidad que permite atender a su dimensión material (en relación con los procesos de precarización y desprotección) y al mismo tiempo, a su dimensión subjetiva, en relación con la incertidumbre y las emociones asociadas a la vivencia de la adversidad.

El análisis de los proyectos vitales de los jóvenes permite comprender las especificidades que diferentes contextos socio-históricos imprimen a los límites intrínsecos a cualquier biografía, captando de esta manera las dimensiones antropológica y social de la vulnerabilidad, necesariamente imbricadas.

Acudimos al concepto de proyecto biográfico como categoría de análisis para comprender la vulnerabilidad entre los adultos jóvenes. El concepto de proyecto alude a la dimensión dinámica de la vulnerabilidad, y permite, por ello, entenderla como un proceso más que como un estado. En el análisis de la vulnerabilidad socio-existencial, nos centramos en las vivencias de precariedad e incertidumbre de los jóvenes, así como en las interpretaciones y elaboraciones sobre las mismas llevadas a cabo en sus discursos. Analizaremos, además, los soportes y cuidados en los que se apoyan para sobrellevar el presente y salir adelante.

Para llevar a cabo nuestro análisis nos servimos de un material cualitativo basado en tres grupos de discusión y 19 entrevistas con jóvenes procedentes de diferentes territorios españoles y con diferentes niveles de estudio y trayectorias de clase social. Atenderemos, además, a la variable género como una dimensión fundamental para la comprensión de la vulnerabilidad y las estrategias activadas para sortearla.

The "Traditional Military Family" in Brazil: Permanences and Transformations

The purpose of the presentation is to discuss a topic still little explored in academic research, despite the importance of the military institution: the "military family", a fundamental native category for the construction of military identity. Although this family model can be considered as similar to the "traditional" model of Brazilian society, there are some specific characteristics.

Because they keep up with the various city changes of their husbands, the wives of the officers can hardly have a job. Moreover, they come to belong to a social world that in many respects sees itself as symbolically separated from what they represent as the "civil world". Finally, the private lives of these women often take place under the ubiquitous institutional and group public eye, and to some extent reproduce the hierarchy of their husbands.

Despite the permanencies, however, some elements point to transformations in this scenario, resulting from both the historical and political context, which affects the interaction with the "civil world", and the effect of societal changes, such as the greater participation of women in the labor market, or institutional, such as the entry of women into the Armed Forces.

The presentation will be based on the analysis of autobiographical narratives from a group of 33 military women, included in three books published between 2008 and 2014. These narratives allow us to observe aspects of military life from the point of view of characters whose voice is little known out of the barracks. In addition, the presentation will also draw on consolidated empirical research in the book "The Military Family in Brazil," published by Editora FGV in April 2018.

Continuity and Changes in Political Culture in 30 Years of Wvs in Brazil

Although political culture research began in Brazil in the late 1960s and early 1970s, the introduction of World Values Survey (WVS) research paves the way for robust longitudinal studies. In fact, five waves were carried out in the country from 1990 to the present, coinciding with profound political, economic and social changes in the country. During these 30 years, Brazil faced the first elected president since 1962, two deposed presidents, at least one coup d'état blanche, political changes of left, center and right, three different currencies, hyperinflation, huge social cash transfer policies, a significant change in the demographic pattern, poverty reduction, increased in the number of people with university degrees and so on. The set of these changes profoundly influenced the values, attitudes and behavior of the Brazilians. This paper aims to indicate and explain the changes and continuities observed in the Brazilian political culture based on the waves of the WVS held in the country.

Cultural Backlash or Back to Reality: The Irruption of Deep-Rooted Cultural Values in Latin America

We have recently seen a change in the pattern of political behavior in several countries, with the growth of proposals and candidatures from the right and extreme right wings. This phenomenon has been called populism by several authors, given the common characteristic of downgrading political discourse and the use of so-called fake news. From the point of view of Political Culture, Ronald Inglehart and Pippa Norris (2018) called this phenomenon cultural Backlash. In this article, we defend the idea that, differently from what is happening in the US and Europe, Brazil and other countries in Latin America are not facing a cultural backlash (after all, we have never been there), but the irruption of a hidden but deep-rooted cultural support for anti-democratic practices and governments. In others words, Latin American countries are experiencing the political manifestation of an authoritarian and anti-democratic cultural pattern, which was being contained by the pro-democracy sentiment lived with the end of the dictatorships in the region, and by distributive public policies that had been made by progressive governments, such as those, for instance, of Fernando Henrique Cardoso, Lula and Dilma in Brazil. It seems that this cycle is over. Through a revision of the Brazilian case using the data from the World Values Survey, and comparing with other Latin American countries, we will test the backlash thesis, paying attention to generational changes within and among age cohorts. In light of the results, we will provide some options for understanding both cultural backlash and the election of right-wing politicians in Latin America.

CASTRO, VIVIANE* (, Brazil)

The Platformation of Female Work

I intend to present in the proposed work some of the initial impressions obtained through the ongoing research entitled "App Profession: the platform of female work" that is currently being developed in the Doctoral Program of the Department of Graduate Studies in Sociology at the State University of Campinas. Capitalism mounted on platforms, presents a mosaic of activities, a myriad of precarious jobs that are in the delivery services, passenger transport, beauty sectors, cleaning, care, etc. The platforms refuse to be employers, they argue only to provide the technology of the intermediation service between the consumer

and the worker. They are workers stripped of a large portion of labor and social rights. The gender cut within the platform work, however, is still a subject that is incipient discussed. The research under development intends to contribute to overcoming this gap, by 'illuminating' the incorporation of the gender issue in the work platform. Having as a central objective the analysis of gender relations in platform work.

In São Paulo, couriers met in front of the Regional Labor Court (TRT). Pictures show that the workers managed to close one of the streets during the protest. The scenes broadcast on TV news, circulating on social networks, are of men fighting for their rights. In the resistance, what is the story that women build for themselves - in which strikes did they engage, how did they articulate themselves? The empirical findings of this research support the hypothesis that new configurations of the resistance of this work model are being defined. As the "Senoritas Courier" demonstrates, composed of women and people from the lgbtq + community who deliver using the bicycle only. Seeking fair value for the service and to aiming to reduce people from work through the exploratory logic of large platform companies.

The Future of Capitalism in Dystopian Films and TV Series

In recent years, many authors, and especially Marxist scholars, have diagnosed the state of the capitalist system in its current phase and have even ventured what its future may be in the short, medium or long term. In general, and in the absence of a drastic change of course, the future scenarios that they draw are patently dystopian. Their prospects are embodied in different versions whose common denominators are environmental disaster, deep inequality, concentration of capital and authoritarianism commanded by a ruling class, who lives comfortably and enjoys technological progress, in front of the popular classes that survive with the crumbs, maybe in a "barbarized" environment (Piqueras, 2017). On the other hand, the 21st century film and TV series production is giving account of these and other anxieties (environmental crisis, post-11-S scenario, Internet vulnerabilities, etc.) to recreate threatening outlooks and design bleak futures. In this sense, many films and TV series portray dystopian future societies that sometimes match those ventured by Marxist authors (with or without alternatives). First, this paper aims to characterize the future scenarios posed by Marxist researchers in order to, subsequently, contrast them with the dystopian futures portrayed in recent films and TV series. From this analysis, a typology of dystopian productions emerges; one of whose types matches quite a lot the predictions raised by Marxist scholars. Films and series of this specific type will be further analyze to assess which of them contribute with their messages to the settlement of the capitalist system and which imply a challenge to it. A qualitative content analysis will be conducted in order to achieve our research objectives.

CATALDI, SILVIA* (Sapienza University of Rome, Italy)
IORIO, GENNARO (University of Salerno, Italy)

Social Engagement and Sensitizing Concepts in Social Sciences

For a long time, the prevalence of positivist and neo-positivist positions has meant that in social sciences the issue of value-freedom was confused with the absence of values. In the history of social thought, a parenthesis has been represented from the Sixties and Seventies of the last century, in which there was been a participatory and committed awakening of all human and social disciplines (Galtung, 1967; Gilli, 1971; Diamond, 1974; Scholte, 1971; Leclerc, 1972). Subsequently, the following decades were characterized by the emergence of fragmented and specialist knowledge where values and social engagement seem have no space.

However, nowadays, different voices converge on the need for engagement of social sciences, especially in the face of contemporary challenges, such as the ecological, political and social ones. On this track, for example there the public sociology (Burawoy, 2005), the postcolonial thought (de Sousa Santos, 2014), the approach of co-responsibility and collective responsibility towards future generations (Apel, 1990; Jonas, 1979) and the collective experience that has given rise to Convivialist Manifesto (AA.VV., 2013). A common point of all these proposals is the search for a new "universal point of view", or rather in the words of some authors, a "pluriversalism" or "universalism of many voices".

Starting from this basis, the paper aims at the development of a sociological imagination to see the changes which can take place and imagine a new future in a perspective of social inclusiveness and the promotion of a "multiple protagonist". In particular, the paper to focuses on a new interpretation of a category of human action, love-agape action, with the aim of investigating its potential, both in analytical terms and in terms of design and action.

CATTANI, LORENZO* (University of Bologna, Italy)

Gender Segregation in the Industrial Sector: Women in Male-Dominated Blue Collar Occupations

Women always struggled to work in the industrial sector. It is often said that this outcome is linked to two factors. The first is that women prefer to acquire general skills over industry-specific ones, the second is that employers are less likely to invest on female human capital because of women's more fragmented career paths due to their absence when they become mothers (Iversen and Rosenbluth, 2011). Estevez-Abe (2012) also found that different Vocational Education and Training (VET) structures produce in fact different segregational outcomes; company-based VET is more segregating than school-based VET.

Using microdata from EU-LFS and national data from EU-SILC and OECD, the paper will conduct a multilevel analysis, combining individual and "structural" data, in order to understand if these hypotheses are good predictors of the gender composition for those industrial occupations that are male-dominated, where men represent more than 66% of the workforce. The countries analyzed will be Italy and Spain, whose Vet system is predominantely school-based (Estevez-Abe, 2012; Ballarino, 2015), that also belong to the same Mediterranean model of capitalism (Ferrera, 1996; Burroni, 2016). The paper will show the importance of family policies favouring a dual-earner model, an issue around which Italy and Spain undertook different reform paths (Leon & Pavolini, 2014). From a comparative point of view it will also show how gender could be a significant tool for understanding the differences between countries that belong to the same models of capitalism.

CATTANI, LORENZO* (University of Bologna, Italy)

Labour Market Policies in Light of Female Employment and Poitical Mobilization: A New Framework

Gender is said to be an important predictor of policy preferences. Women should favour "investment policies" over "consumption policies" due to their more fragmented professional careers (Beramendi et al. 2016). Concerning labour market policies, women prefer active labour market policies (ALMPs) over passive labour market policies. However, despite higher female employment rates, among advanced capitalist economies there are no signs of convergence in terms of spending levels for ALMPs. Instead, important differences, that reproduce those between models of capitalism (Esping-Andersen 1990; Burroni 2016), are still visible.

Recent work focused on changes in the overall female employment rate across countries, but little attention was paid to the distribution of female participation among different professional groups. Beramendi et al. (2016) analyse how professional groups' preferences for investment, consumption and weak or strong state intervention contribute to the creation of hegemonic coalitions that shape policy demand. However, no quantitative studies have been made to test their theoretical framework.

This paper tries to explain why these differences still exist by providing a new theoretical framework, that considers two main variables: labour market stratification and female political mobilization. It analyses how female employment has spread over professional groups in light of the hegemonic coalitions theory proposed by Beramendi and his colleagues (2016). The paper will present evidence from EU-LFS micro-data on Italy and Sweden, showing how women are more integrated inside the hegemonic coalition in Sweden than in Italy. The framework will be completed by considering how female political mobilization and representation inside parties and trade unions shapes the opportunity structure that may lead to higher ALMPs spending. In order to do so, the paper will draw from the literature on state and party feminism (Lovenduski, 2005) and from Julia O' Connor's (1993) concept of "political opportunity structure".

Housing Regime in Brazil: The Case of My House My Life Program in Recife.

Housing has always played an important role in the political economy of a country, serving as a barometer of economic development as well as being a challenge for the urban poor and governments to house the poorest individuals. The struggle for housing land in urban areas has being largely investigated and the relations with power structure and land allocation as part of disputes amongst formal institutions and powerful elites and the destitute and the powerless. Housing for the poor has been gained by many actions by social movements including land

occupations, land subdivisions, the engagement on protests, and so forth. Policy responses have included the neglect of the poorest, the removal of families living in their housing areas, pro-poor policies such as slum upgrading programs and the production of mass housing neighborhoods. With the advent of the world crises of 2008, in Brazil, there was initiated a national policy towards the production of mass housing known as My House My Life program. The initial intention on the part of the national government was to provide housing for the poorest families, but the final program aimed primarily to the production of housing to favor the housing markets for the better off, similarly to the housing program implemented during the military regime. This paper analyses the case of My House my Life program in the Metropolitan Region of Recife to identify how local demands have been used and manipulated by national and global powers towards the strengthening of finance of housing in a globalizing scenario with a view to the opening of local institutions into global financial markets.

CAVALLO, FRANCESCA* (University of Kent, United Kingdom)

Predictive Modelling and the Aesthetics of Probability

In the current age of big data, visualisation technologies are entrusted with the big responsibility of informing decision making under conditions of uncertainty or risk. At the basis of their success is the questionable authority that comes from the fact that they are not subjective endeavours, but the results of objective data and rational calculations. However, what are the guiding principles behind such visualisations? Are they effectively trustworthy? Moreover, what can we learn from their visual analysis? This paper will be an attempt to realign risk predictive modelling and forecasting technologies with the calculus and visualisation of probability that is at the basis of their creation. The presentation will consider some evidence-based, structural and predictive risk visualisation techniques beyond their philosophical and scientific implications, and show how they are inherently aesthetic practices constructed around pattern recognition and time-steps visualisation. Such aesthetic features reorganise time and space through probability 'curves' that constitute the 'visions' of today organisational systems and decision-making processes. However, they also reorient what we deem and accept as reliable prospective futures. The aesthetic of probability, therefore, does not just show how risk is produced, but also how we experience it. In a time of predictive analytics and scenario modelling, to understand and recognise the procedural features of probability through their visual manifestations is as urgent as ever, not just to forecast risk trends, but to detangle the complex interests and politics that they often serve.

CAVALLO, FRANCESCA* (University of Kent, United Kingdom)

Sensing It Coming: The Visual Vocabulary of Risk

Recent research in risk studies points to the prominence of the visual dimension in popular risk representation technologies that construct particular understandings of risk situations. The fields of art and visual culture, however, have yet to address such techniques through a systematic visual analysis.

This poster presentation will be designed to fill this gap and offer a taxonomy of the *methods* (or visual vocabulary) that translate abstracts risks into experiences that we can see and 'sense'. From black-out posters to cigarette images, from insurance ads to survivalist booklets, from emergency drills to crime maps, from financial forecasts to predictive modelling, the poster will be an effort to map the visual repertoire of risk and its insinuations in artistic practices. It will feature several images, including contemporary artworks by Francis Alys, Rosa Barba, Andreas Gursky, Hito Steyerl and Troika, among others. The poster will map the diversity of approaches for the communication and management of risk through the production of an engaging visual panel.

It will be organised across six main subcategories: posters and instructions, images for deterrence, how-to guides, drills and pre-enactments, data visualisations, and predictive modelling. Such taxonomy, will not just provide an opportunity to glance at the aesthetic features and artistic legacy of the visual vocabulary of risk but suggest how different visual strategies can reorient perceptions of safety or threat. Such a presentation will aim to open up a discussion about the critical tools necessary to recognise, disentangle and reflect on the role of images and artworks in today's risk society.

A Tale of Two Sides: Exploring Religious and Scientific Discourses Around Gender in Spain

This paper aims to identify and examine the uses of religious and scientific discourses to conceptualize gender in the public sphere in Spain. Over the past two decades, gender has quickly passed from an academic concept explored in books and articles to political agendas, public policies, and social movements. The Spanish political scenario of the mid-2000s offered fertile ground for the development of liberal policies and laws addressing issues around gender equality and LGBTIQ rights in the country. Moreover, the media coverage of this trend has brought to the front stage controversial events and statements about gender involving public figures, often portrayed by the press in opinion pieces, specialized columns and news articles. More recently, the rise of the extreme right and conservative groups, such as the political party *Vox* and "anti-gender" organization *Hazteoír*, brought gender back to the news by making controversial statements against what they frame as the "gender ideology". The term is often used to politicize scientific facts by labelling them as "anti-natural, atheistic or left-wing ideologies", arguing that gender doesn't exist as a scientific concept and gender roles and sexuality are in fact supported by the biological assignation of sex. In this context, debates about gender seem to be discursively encapsulated within a spectrum of religious and scientific standpoints. Our objective in this paper is to explore the ways through which actors articulate these discourses by identifying the core arguments around gender and the key actors involved in this debate. Moreover, we examine the ways in which actors portray the notion of gender ideology and the responses given by different interlocutors involved in this debate. These findings are based on the analysis of articles from the press, legislation, parliamentary minutes, and the content of institutional websites, newsletters, bulletins, and posters.

Science, Belief and Covid-19: Exploring Narratives of (mis)Trust

In the current global pandemic of coronavirus, the public interest in science and scientific explanations seem to have found a privileged position in our daily lives as much as it has also reached the centre of social, political and economic debates. Science has become the epistemological and practical framework to address the uncertainty derived from the Covid-19. Nonetheless, this global health crisis has also given rise to the emergence of conflicting narratives that have spread worldwide. From online platforms, such as Twitter or Facebook, to street protests in Germany or Brazil, these narratives have travelled through virtual and physical spaces echoing feelings of mistrust and disbelief in mainstream science and medicine. In Spain, over the past three months, cities such as Madrid, Bilbao, Valencia and Barcelona have seen the proliferation of similar protests questioning the legitimacy of scientific knowledge about the Covid-19 and the restrictions to combat the pandemic endorsed by the scientific community. What are the key societal narratives questioning the legitimacy of mainstream scientific and medical knowledge related to Covid-19? What religious, spiritual or non-religious beliefs inform such narratives? Drawing on a qualitative content analysis of virtual and physical spaces, this paper explores the narratives that have questioned the legitimacy of mainstream scientific and medical knowledge related to Covid-19 in Spain. It aims to obtain an understanding of which beliefs are mobilised to make sense of the current health crisis and its causes as well as explore the political implications of such polarising narratives.

Online Interviews with People in the "Global South": Processes of Arranging the Setting of Interviews in Times of Covid-19

We will discuss in our presentation how "the needs of the interviewees in arranging the setting" for an interview – as discussed by Rosenthal (2018) – provide useful empirical data on global inequalities, the life situation and milieu of interviewees, and the regions where they live. We will show how interview arrangements give insights into positional and structural inequalities between the global "North" and "South", and especially within the "South".

We will refer to our experience with conducting online biographical narrative interviews and follow-ups from Germany with people living in Paraguay, Brazil, Ghana, Sudan, and Jordan to discuss how interview contexts help us to understand the concrete concerns of our interviewees. Our examples illustrate:

a) "safe spaces" in the life of migrants and families facing recurrent housing eviction in Amman (Jordan);

b) distrust in communications and state institutions after the end of decades of an authoritarian regime in Sudan;

c) dislocation challenges – and privileges – of "indigenous women" living between the city and the Chaco (Paraguay);

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

d) different perceptions of the threat posed by the coronavirus on the part of people affected by Nile floods in Omdurman (Sudan), and "indigenous women" amidst land disputes in the Chaco (Paraguay) with insufficient sanitary infrastructure and lack of basic services.

We will also reflect on our privileged position as South American migrants with European citizenship, which enables us to work for our doctoral degrees in Germany, and, in the case of Lucas Cé Sangalli, to work in research projects funded by the German Research Foundation (DFG).

We- and Self-Presentations of Refugees from Sudan in Germany: How Ethnic Belonging Shapes Life Stories

In my presentation I will discuss the different ways refugees from the Republic of Sudan present themselves and their we-groups, depending on which ethnic group in Sudan they belong to. I – a white Brazilian researcher – conducted these interviews with the help of Mahadi Ahmed – himself from the Republic of Sudan – in Germany. As I will show, this constellation had a considerable influence on the biographical self-presentations.

I will reflect on how socialization under authoritarian regimes in different regions of Sudan and as members of different ethnic groupings relates to the self-presentations of our interviewees. I ask why some of them clearly refuse to present themselves in terms of ethnic belonging, while others emphasize its importance. I will show how this difference in the self-presentations gives us insights into power inequalities between different groupings in Sudan, and to what extent their divergent experiences in Sudan still influence the daily lives of refugees in Germany.

The findings of the case reconstructions show how important it is to take ethnic belonging in Sudan into account when trying to interpret differences in the self-presentations, which can vary considerably depending on the framing of the interview, or in different interviews with the same person at different times. For example, it became very clear that interviewees who define themselves as belonging to the Arab ethnic grouping, unlike members of other ethnic groupings or groups, avoid thematizing ethnic differences in Sudan and the associated collective violence.

The study was carried out in the context of the German Research Foundation (DFG) Project "Biographies of migrants from Syria and West Africa in Brazil and in Germany – processes of inclusion and participation in the context of so-called irregular migration".

New Media Education to Combat Discrimination and Hatred Online. the Results of a Project in Five European Countries

In 1964, Umberto Eco wrote one of his most famous books, Apocalyptic and integrated, on the different perceptions of mass culture products in elite culture. The contrast between optimistic and critical positions is therefore something that does not depend on the "novelty" of the digital medium, but concerns the perception of the "new" tout-court. This point of view is undoubtedly integrated, optimistic, but does not underestimate an awareness: the process that leads to rationalize the fears dictated by the "unknown" is necessary to smooth the risks implicit in the introduction of new media. The work of accommodation is above all an educational work. One example is the distorted use of new media, starting with the younger generations: digital bullying, racial and social discrimination, stereotyping, fake news.

The project "Using the New media in Education to overcome Migrant discrimination Online - NEMO", funded by the European Union, was born with the aim of describing the European landscape with respect to this vast and articulated problem, to hypothesize an educational action through the creation of a toolkit and laboratories for young teenagers (11-14 years old).

This paper describes the results obtained, presenting the comparative analysis of five European countries (Italy, France, Austria, Hungary and Bulgaria), the toolkit designed and the laboratories experience.

Towards a Theory of Socialization in a Relational and Emotional-Corporeal Key. "Exchange of Effects" between Simmel and Bourdieu

This paper aims to discuss the Simmelian category "exchange of effects" in the framework of a theory of socialization, which recovers the approaches of dispositional sociology of Pierre Bourdieu. For Bourdieu, the acquisition of dispositions (and, ultimately, of a habitus) is centered on a type of "body to body socialization" that operates on the plane of the no conscious. In that sense, it recognizes "affective transactions with the environment" as the motive from which people learn ways of perceiving, feeling, evaluating and acting in the world, according to the social position they occupy.

Theoretically, this socialization model retrieves the "prestigious mimesis" category, whose intellectual roots go back to the works of Émile Durkheim and Marcel Mauss. This category captures two dimensions: values and affections; since, "prestigious imitation" combines respect and admiration. However, it lacks two obstacles to the understanding of socialization processes from a relational and, even, affective logic. On the one hand, "prestigious mimesis" points in only one direction: he who learns from the one who teaches him. On the other, omit what happens between them; that is, the effect that one causes on the other and vice versa.

Therefore, in this paper, I recover Georg Simmel's work within the framework of a theory of socialization in a relational and emotional-corporeal key. The "exchange of effects" category recovers the bidirectional nature of learning processes - where the people who learn are not mere receptacles of content transmitted by others, but that they appropriate certain content and affect those who participate with them. Likewise, this exchange is played in the affective plane: the tones, the gestures, in short, the attitudes that mediate the socialization scenarios are part of the exchange of effects that Simmel talks about.

Discursos Antiinmigrantes En Las Redes Sociales De Políticos. Una Aproximación Comparativa Entre Italia y Argentina.

La ponencia expone los inicios de una investigación en curso que, en perspectiva comparada entre Argentina e Italia, rastrea las representaciones sociales que en medios de comunicación y redes sociales circulan acerca de los migrantes como sujetos amenazantes e instalan un discurso tendiente a estigmatizar, controlar y/o perseguir la inmigración. La hipótesis del proyecto sostiene que las representaciones mediáticas participan de un entramado discursivo de poder que instala un paradigma securitario de gestión de las migraciones.

En Italia y Argentina, se han puesto en marcha Decretos Ley que modificaron las leyes migratorias hasta entonces vigentes. En ambos países los decretos fueron elaborados por gobiernos de derecha (en el ínterin en Italia el gobierno ha cambiado), y en tanto discursos de poder (Van Dijk, 2006), los discursos políticos colaboraron en la construcción y circulación de percepciones que vinculan la migración con otras alarmas sociales.

Esta ponencia presenta el análisis comparativo de las publicaciones en Twitter que refieren a migrantes, realizadas por el (ex)ministro de Asuntos Internos en Italia, Matteo Salvini, y por la ministra de Seguridad en Argentina, Patricia Bullrich - ambos vinculados a la gestión migratoria. Nos acercarnos al *framing*, es decir, al modo en que dichos políticos construyen la noticia y al sujeto migrante a través de la comunicación virtual, seleccionando el período que va desde su asunción al gobierno hasta el día en que entran en vigor los mencionados Decretos Ley.

Comenzamos exponiendo los contextos de la migración en cada uno de estos países y los fundamentos para su comparación. Luego repasamos las características de las nuevas tecnologías en la comunicación política. Finalmente presentamos los resultados que muestran puntos de contacto y diferencias en las publicaciones de cada ministro, evidenciando las formas en que a través de Twitter, expresan sin intermediación, discursos de odio frente a la migración.

Sociocybernetic Approach on the Construction of Gendered Emotional Models of Intimate Partner Violence

This presentation aims in analyzing the social acceptance of specific social emotions associated with each gender and its possible normalization of Intimate Partner Violence. Based on the results of a Post-doctoral research developed to understand how gendered emotions can enable violence by male perpetrators against their intimate female partners. Emotions like rage or emotional states of aggressiveness, are socially approved because they provided men's domination of the public sphere. However, emotions like shame, guilt are predominant in women passive-dependent orientation and socialization (Fischer, 2000; Brody & Hall, 2008; Scheff, 1991). Gendered emotions are also the result of a socio-historical and biological process. The social construction of gender is also inscribed emotionally and the motivation to follow gender prescriptions, and essential element in the formation and maintenance of the individual identity. Transposing this analysis to IPV and women as its main victims, a recent research revealed that gender models and values condition the emotional experience and limit significantly women's capability to leave the relationship (Cerejo, 2014). Whilst, in most male batterers', considered family only abusers, they tend to normalize the exercise of violence against their partners and blame the victims for the aggression for not corresponding to their models of femininity (Boira, 2010; Boira, Castillo, Carbajosa & Marcuello, 2013; Boira, Aragonés & Gaspar, 2013).

Because we live in an organized community of social expectations, meanings, values and emotions (Mead, 1934) we believe that the only way to deepen knowledge on IPV is to analyze the victims and their batterers' in an interactive emotional and gender experience. Assuming an sociocybernetic perspective, where the biological, physiological and cultural system interact in unisonant, we will demonstrate how the emotional experience of the batterer will have an impact on the emotional response of the victim and, consequently, on each other's' reactions.

The Role of the Amritsar Improvement Trust in Affordable Housing: Social Mix and Practices of Inclusion and Exclusion

In the Indian housing and urban planning context, the concept of social mix is indirectly embedded in urban poverty reduction and social inclusion policies, most recently under the framework of the "affordable housing for all" discourse. Against this backdrop, I explore the case study of Guru Tegh Bahadur Nagar (Mall Mandi), a housing scheme initiated in 2005 in the city of Amritsar by the Amritsar Improvement Trust (LIT), a public institution, aiming at providing affordable housing and improving a marginalized locality. Based on access theory and extensive fieldwork conducted in India in 2014-2015, I explore the practices that influence the ability of diverse residents to access housing and services (i.e. water supply, electricity, sewage, drainage). Findings show that the development of the housing scheme has contributed to conflicts and contestations between stakeholders over the allocation of resources and ultimately has resulted in the (re)production of urban inequalities and marginalisation of already vulnerable communities.

Social Composition Changes and Whole-School Reform: Evidence from Means-Tested Voucher Reform Effects on Achievement Inequality in Chile

To what extent do concurrent differences in school social composition influence the effectiveness of the means-tested voucher reform effects on students' achievement? This study addresses this question by studying the SEP reform, implemented in Chile since 2008 (*Subsidio Escolar Preferencial*). Although it has been widely studied, it is less known how the change in the social composition of the student body, contingent to the implementation of the reform, impact students' achievement, in a highly segregated school system. We use longitudinal census data of students and schools from the national assessment in Chile for eight 4th grade cohorts that attended voucher schools between 2005 and 2012. Using difference-in-difference designs and hybrid multilevel models we've found that reform decrease overall achievement gaps. However, we found diverging trends in the effect of change and enduring school social composition differences on achievement inequalities, respectively. The SEP reform equalizing effects on achievement gap over time is offset by the concurrent inequalities triggered by the change in social composition of schools, while we confirm the decrease in achievement gaps among schools that serve a socioeconomic differentiated student population. Changes in school social composition counterbalance the equalizing effect of the reform, increasing inequalities among students that attend relatively more advantaged schools. We discuss the implications for the effectiveness of SEP as compensatory reform on social inequalities, given potential dynamics of social selection and influence among students, and its limits due differences in the instructional regime and in strategies to meet accountability pressure within schools.

Critique Against Critique: Legal Discourse and the Projects of Modernities in Brazil

This paper will reflect on the legal culture and the different legal discourses produced at what, in the Brazilian historiography, has become to be known as the "Brazilian passage to modernity". Usually accepted to be comprised between the decades of 1870 and 1930, this period was marked by several processes: crisis of the Brazilian Empire (1822-1889), dawn of the First Republic (1889-1930), shifting on political action and a change in the socioeconomical structure, especially with the end of slavery (1888). Also, it involved a refreshed cultural scenario and an epistemological transformation driven by the legal field that affected the whole country's intelligentsia. This shapeshifting of Brazilian legal culture was an echo that echoed on the cultural and political life of the nation. We will address this issue taking the intellectual production of selected Law Schools, published in their academic journals during the period from 1891 to 1930, as main sources. The expression "passage to modernity" caries in its meanings the need of a new normative apparatus, fitted to a nation that was longing to enter the hall of the civilized modern bourgeois societies. These new laws and norms would be intensively discussed and, ultimately, elaborated within the Law Schools. Jurists and lawyers represented the ideological project of a modern civilization in the tropics as a critique of the previous imperial civilizational project. This normative apparatus, however, was not addressed in constitutional area, but in the criminal and civil one, via a long dispute over the Penal (1891) and the Civil Code (1916). Within these debates, the renewed legal culture birthed different legal discourses that revealed different projects of civilization within the intellectual elite. Our goal is to analyze these differences, stating the process that led the victorious endeavor, but also evoking the future past of the defeated.

Doing Family in the Context of Mass Migration: Family Practices and Configurations Specific for Lithuanians

Mass migration at the beginning of the 21st century, encourage the search for new methods of family research to reveal the relation with the reality. Previous researches have revealed that functions in migrants' families are often replaced by members of the extended family, or even persons beyond the nuclear or extended family, as well, individuals plan their life events accordingly in order to meet emigrated family members. But still little is known about practices related to family doing in the context of migration, and how family doing practices are related to personal networks.

The research idea is inspired by the theoretical approaches of family practices suggested by Morgan (1996; 2011), doing families suggested by Smart (2007), and family configurations developed by Widmer (2016). The main research question is the following: How personal configurations interrelate with practices that are doing families with members living across the boarders? In the analysis, empirical data of the representative quantitative survey "Global migration and Lithuanian family: family practices, circulation of care and return strategies" explored. The survey conducted in 2018, and represent habitants of Lithuania 18 years and older, independently of their citizenship, and legal status in the country. In total, 1005 habitants questioned by using standardized questionnaire. The methods of descriptive statistics, as well, of multivariate statistical analysis applied.

The research results proved that personal networks become wider and open to relationships beyond the blood and marital kinship in the context of emigration. Members of the procreative family retreat from routine activities, especially that performed on a daily basis. Meanwhile, members of the family of orientation and other relatives in many practices are replaced by members of the family of procreation or non-kin. That is, in the context of migration, persons are forced to do family with other than usually members of personal networks.

The Role of Personal Networks of Military Professionals in Conflict Resolution

Military professional is expected to be ready at any time to move, to take part in activities related to safety of the country, and etc. That is, military professional is involved into strongly defined structure with limited possibilities to construct personal events in the life course, as well, personal network. On another hand, as all other they have individual life and connections with members of personal network. Families of military professionals go through similar life course events like most families: marriage, birth of children, raising children, solving everyday problems etc. Situation start to be complicated when members of these personal networks go through stages of living-apart-together because of obligations to participate in military missions or other events. The questions are: Who constitute personal networks of military professionals? How these personal networks influence depth of involvement into armed forces' activities, i.e. short-term and long-term trainings, international military missions, etc.?

The aim of the research is to examine how personal networks changed during military career interconnect to attitudes towards military professional career. The research based on quantitative and qualitative data collected by the sociologists of General Jonas Zemaitis Military Academy of Lithuania. Quantitative data collected in 2015. The sampling includes military professionals who spent some time in military missions abroad, as well their wives. Standardized questionnaire applied in the survey. The research results revealed, that military professionals themselves, usually, focus on rather limited and defined personal network consisting from nuclear family plus friends – also military professionals. Meanwhile, their wives extend personal networks including extended family members, friends plus institutional servants and wives of other military professionals. It is especially true in cases of families of military professionals who spent some time in military missions abroad.

Policing a Smart City: An Exploration of Urban Transformation of Kolkata and Bhubaneswar.

The present study is an attempt to unravel the contentions and precedence of the people and the police in the smart city of Bhubaneswar and Kolkata. The recent announcement of Bhubaneswar and Kolkata among the first 20 smart cities in India has aroused a lot of expectations from the police and the governance of the city. In this regard it is quite a call of the day to explore what are the challenges that the police and people have to meet to prove worthy of the accolades. Further it is also needed to set the priorities that have to be catered to by the police and the people in making Bhubaneswar and Kolkata, smart 21st century cities in India. The present exploratory research seeks to explore and compare what the people and the police in Bhubaneswar and Kolkata opine about the challenges and the priorities that are to be met to continue fulfilling the expectations of being smart cities in India. The 21st century police in India has to keep pace with the newer dimensions of crime, newer trends in crime and decriminalization of the so called otherwise considered offences. Social Movements, people's rights , the rise of the civil society are making a call for new smart policing. The smart cities in India are looking for smart policing which will be proactive, people friendly, tech savvy, transparent and accountable to the cause of the people and the city at large. The present study will identify the problems thereby providing possible remedies to solve the issues of concern in the smart cities of Bhubaneswar and Kolkata.

Exploring the Effects of Student Habitus on Their Well-Being in Crisis Stricken Societies

The contemporary socio-economic situation in several countries in Europe prevents or limits students' well-being and happiness, as well as their ability to flourish, and strengthens inequalities and conventional class hierarchies. It could be argued that the inequalities that students face at school and in society involve not merely differences in wealth, income and economic security, but 'differences in access to valued circumstances, practices and way of life' (Sayer 2005). At a time of crisis in several countries in Europe, young people face inequalities in their potential for happiness and in their chances of obtaining access to ordinary forms of well-being. In this context, our research project uses a comparative and an intersectional approach to explore the impact of the socio-economic crisis on students' well-being in Cyprus and Greece, in order to understand patterns of inequality that affect happiness attainment in children. Moreover, it raises important questions about the possible role of education for the promotion of students' well-being in this context.

We employ Bourdieu's concept of habitus because it holds promise for exploring the affective aspects of living in an unequal society, and may help us develop a holistic understanding of the lived, embodied, affective experiences of inequalities in contemporary society and build more complex models of social stratification (Reay 2015). In this study, we argue that habitus can still be embodied in ambivalently located individuals within the field of education, generating uncertainty, ambiguity, anxiety and a sense of deprivation (Reay 2004). Students' habitus may allow for a better and richer appreciation of how the exterior – wider social structures such as the socio-economic crisis in Greece and Cyprus – is experienced and mediated by the interior, the psyche (ibid), and creates the proper conditions for a happy or unhappy life.

Inequality and the Political Individualization of Migrant Workers in China

How do policies intended to expand workers' rights end up undermining their claims to benefits owed to them? China's push to integrate 280 million migrants into its cities has increasingly individualized contention over social rights and situated its negotiation on the state's turf. Collective claims of exclusion and discrimination have been supplanted by one-on-one bureaucratic battles over eligibility and documentation. New regulations that grant social rights to a few while creating different barriers for others make it harder for migrant workers to make demands, much less organize. Local variations and adaptations only serve to further obfuscate the process and make it a complicated patchwork of policies that need to be navigated year to year or any time someone relocates for a job. This results in the state being able to nudge migrants to do what the government prefers them to do while avoiding being held accountable by those same targets. Public services as social control is part of a broader trend of what I argue has been the individualization of Chinese politics and state-society relations. The institutional structures behind inequality are deeply entrenched in social policy for migrants and its day-to-day implementation. It works as a stopgap but may cause further problems down the road.

Changing Youth Life Course. Decision-Making Process in Times of Discontinuity

Life courses of youths have changed over the past decades due to societal changes. They are experiencing faster-paced changes than before, more fractions, fragmentations and transitions in their life course. These challenges have a big impact on the individual life projects and influence the decision-making process, for instance, on educational choices or career pathways. Career decision-making is considered as complex process where critical moments have an impact in the life course and identity. This presentation on my doctoral research is designed to find out and understand the aspects that are relevant (= rationale) and how they influence the decision-making process of youths. The main research question of is: What is the relative weight of different influences on young people's decision-making about education and/or training on leaving school (e.g. further education, apprenticeships and other youth training programmes or work)? The research gap is that current research on the life course, on youth and their educational choices in Austria and specifically in Vienna and Innsbruck from a sociological perspective remains limited. With a research design, that combines secondary quantitative and qualitative data, it can help to get a broader understanding of the contextual factors how decisions are made. In this presentation the progress of the PhD project as well as the first preliminary results should be presented.

CHANDRA, MONI* (Babasaheb Bhimrao Ambedkar University, India)

'Ujjwala' Yojana: An Effort Towards Cleaner Environment & Sustainable Development

Access to clean and affordable sources of energy is the need of hour to check the impact of climate change. The issue of cooking energy in India has drifted from saving forests to empowering women with thrust on Liquid Petroleum Gas. To fulfil this aim, much acclaimed 'Ujjwala' yojana has been launched in May, 2016 to prevent the negative health implications from traditional cooking fuel. This paper discusses the extent to which adopting clean cooking energy (LPG) has reduced burden on environment along with promoting health and economic income. Also, to contain the ill effects of climate change, it is imperative to accelerate the adoption of clean, efficient cooking fuels, which can save millions of lives and help reach sustainable energy goals by 2030. 'Ujjwala' yojana aims to promote environmental, social, and economic benefits with focus on women's empowerment, since without women's participation; the aim of sustainable development will be difficult to materialize. By switching to clean energy, health problems can be contained and the time thus saved can be utilized in other productive activities. But there are several factors that affect fuel switching like level of income, literacy level (especially of females), fuel prices, accessibility and awareness of clean fuels. So, to make switching to cleaner fuels easy, female education and their decision making power in the family needs to be strengthened along with awareness campaign regarding healthy fuels.

CHANDRA, VINOD* (Lucknow University, J N P G College, India)

Transition from Higher Education to Work Place: Early Work Life Experiences of Indian Youth

This paper studies the early work life experiences of Indian youth after coming out from higher education institutions. Specifically, it looks into how the youth (between 22-28 years) with degree or diploma from a higher education institution succeed to enter into labour market and get a productive employment. The main thrust of the paper is to know whether youth is integrated into the labour market job. This study has been motivated by the fact that, while most of the empirical studies on school-to-work transitions are based on data from high-income countries, very little is known from the data from developing countries such as India. Recent survey based report has touched the issue of youth aspirations and their job satisfaction (Young India and Work: A survey of Youth Aspirations, 2018, Published by The Observer Research Foundation, India), however no attempt has been made to count the youth experience of their work life and wellbeing after the completion of education.

The learning experience in the educational institution plays a significant role in shaping the students aspirations. When these students join a productive work in the labour market, they evaluate the job conditions and work environment through a background of their expectations and aspirations. This affects their wellbeing. In this backdrop, the present paper examines following research questions: 1) How youth from higher education institutions start their work life? 2) Are they experience a job training or internship before taking up a formal job? 3)

Are they combining employment and studies? 4) Are they able to link their learning experiences with their employment? 5) What is their attitude towards the job which they have undertaken and is it influenced by their parents of friends?

Transitioning to Organic Farming in Thailand: Inequality Inclusion of Ageing Farmers

Recently, Thailand is facing with conflicts and inequalities in all aspects. Because of imbalance development with prejudice against agricultural economy, rural farmers comprising of one third of its population are perceived as unproductive and economic growth obstacle. As Thailand becomes ageing society, it is assumed that elderly workers are hardly to adopt new practice or technology or crops as young people. Elderly farmers are viewed as economic burden rather than food producers/workers in need of adequate income and food security. While organic farming is introduced to farmers as an opportunity of more earning and better health, the invisibility of elderly farmers in the policies has caused the exclusion of elderly farmers from training, credit and extension programs for all farmers. The purpose of this research is to investigate the current elderly farmers' situations in Thailand and explore the organic farming policy in response to ageing agricultural population, with the larger aim to assess the policy gap and address the policy opportunities. Mixed method is provided with both qualitative and quantitative data collections. Multistage samplings were conducted within Nan province consisting of 231 households, 40 of which would like to make a transition towards organic agriculture. It was founded that although elderly farmers were less productive, but were willing to adapt for better income. By transition towards organic farming, supportive factors for behavioral change and ecological change are required. In comparison with a success model by a royal project, more subsidized policies are prerequisite for at least 3 years' transition phase.

CHARTAIN, LAURA* (Ecole des Hautes Etudes en Sciences Sociales (EHESS) and Universidade de São Paulo (USP), France)

Desires, Collective Actions and the Role of Institutions. Analyzing the Circulation of Categories between Different Instances in Narrative Forms.

The work of American pragmatists Dewey, Mead and Pierce allows for the analysis, at the crossroads of sociology, psychology and philosophy, of the intertwining of both affective and cognitive valuation phenomena as well as individual and social dynamics. In this paper, I propose observing these phenomena in the narrative forms deployed by individuals who talk about certain moments of their life stories. I then analyze the circulation of categories of self-conception between various instances such as interiority and exteriority; past, present and future; ecological, social and institutional; affective and cognitive, individual and social; desires, action and reflexivity. This paper asks a central question: How do the desires of individuals, forms of collective action and the support that institutions can, or could, offer resonate and appear linked in socio-historical dynamics? I try to question how the role of institutions can be understood to support the desires of individuals in the sense of achieving individuation which, following Dewey, would be both a realization of individual singularity and forms of solidarity. In this perspective, collective desires and forms of solidarity are not defined in advance; they are revealed in the course of action and can be the constant object of reflection by the social actors themselves. In this sense, they can take forms that appear in a continuum whose two extremes would be reification and emancipation. The theoretical and methodological proposals put forward are tested by an empirical research conducted between France and Brazil in the 2010's, which puts in contact actors, very distant at the geographical and social level (French buyers-entrepreneurs and Brazilian small family farmers), who establish personalized forms of relationships in order to set up an agroecological and fair trade cotton chain.

CHARTAIN, LAURA* (Ecole des Hautes Etudes en Sciences Sociales (EHESS) and Universidade de São Paulo (USP), France)

Valuation at Work in a Certification Process in an Agroecological Cotton Chain.

Starting from a plural conception of value - economic, political and symbolic - I study how different valuation processes in a cotton chain lead to new classifications and hierarchies relating to work, the product (the commodity) and people. During the investigation, I followed the activities, as well as the trajectories, of various actors (French buyers-entrepreneurs, members of NGOs, Brazilian cotton farmers and producers) involved in the establishment of a segment of a cotton chain between Brazil and France in the 2010s. At the intersection of a pragmatic approach to valuation (Dewey, 2011), economic sociology (Beckers & Aspers, 2010) and the sociology of science and technology (Heuts, Mol, 2013), I present the dynamic and plural constitution of the valuation and prioritization processes at work in the chain, particularly when initiating a certification process for agroecological cotton production required by buyers and justified by a demand from the European market. I then study the developing controversy between different Brazilian actors about the aims of certification. While the certification and standardization process makes the criteria and standards required in the production process more visible and binding, some believe that it then serves the aims of agroecology, and more broadly of nature preservation. On the contrary, other actors in the sector believe that this certification process may run counter to the objectives relating to farmers' activities and incomes. Valuative and evaluative categories then circulate between work, product and people according to the positions taken during this controversy. I also observe how a new symbolic criterion overlaps with the economic one. Different arrangements emerge: one of remuneration for prestige - symbolic capital overlapping economic capital (Bourdieu, 2003) -; another of remuneration for concrete forms of income.

Forging a Diagonal Instrument for the Global Left: The Vessel

This paper proposes a project to build a diagonal political organization for the Global Left that will link local and national networks and prefigurational communities to contend for power in the world-system during the next few decades of the 21st century. The World Social Forum (WSF) process needs to be reinvented for the current period of rising neo-fascist and populist reactionary nationalism and to foster the emergence of a capable instrument that can confront and contend with the global power structure of world capitalism. This will involve overcoming the fragmentation of progressive movements that have been one outcome of the rise of possessive individualism, the Internet and social media. We propose a holistic approach to organizing a vessel for the global left based on struggles for human rights, anti-racism, queer rights, climate justice, feminism, sharing networks, peace alliances, taking back the city, progressive nationalism, and confronting and defeating neo-fascism.

Psweeps and Waves of Conflict in the East Asian World-System, 1800 Bce- 1830 Ce

This study is part of a larger effort that examines the temporal relationships between the growth and decline of cities and empires and changes in the distribution of power among states, the amount of interstate warfare and internal rebellions in five whole interstate systems (world-systems) since 2700 BCE. This larger study uses whole interpolity systems (world-systems) as the unit of analysis to address these questions: what are the causal relationships between changes in the sizes of largest cities and empires? Does empire growth cause city growth? Does city growth cause empire growth?. In this paper the focus is on the expanding East Asian world-system from the Bronze Age until it merged with the Central system in the 19th century CE to form the global world-system of today. Our main unit of analysis is the political/military interaction network – whole systems of interacting polities that were making war and military alliances with one another. This is what international relations scholars call an "international system." We examine the relationships between urban and polity swings and changes in the power configuration of these same systems. This paper presents our decisions about the timing of the series of systemic expansions that began with the emergence of early states in the Huang He (Yellow River) valley Bronze Age China. And we review the earlier research that has been done on cycles of conflict and their relationships with climate change, epidemics, famines and floods. Our first purpose is to develop a complete data set on interpolity and within-polity conflict by merging those found in other studies in ways that make comparable on and intelligible comparisons possible from the Bronze Age to the 19th Century CE for the East Asian World-System.

Class Based Leisure Patterns and Its Impact Onenvironment: Insights from India

Structural-functional analysis of leisure indicates that leisure has become structural in all societies in general and in India in particular. It means it is included in the modern way of life of Indians. Traditionally, people will say that leisure was not found among the lower class and was mostly found among the higher class and among the middle class. Further, leisure does not operate in the vacuum but in a definite socio-economic and cultural milieu. Different class of people contribute towards environment pollution through use of vehicle/aircraft/train for travelling, use of plastic in various ways, wasting food particles, creating heap of garbage, wasting water in various ways, degrading the forest in different manner and so on. Under this backdrop, I wish to find out different ways of polluting environment by different classes of people in India, particularly in the leisure spots like- tourist centres and pilgrim centres. Undoubtedly different socio-economic and educational status creates differences in the use of leisure. It also has different ways of polluting environment and contributing towards global warming and climate change.

Gender and Land Ownership: A Study in Rural Areas of Jammu and Kashmir, India

An important aspect of gender inequality is an unequal access to and control over productive resources between women and men. Land in rural areas of India and in the state of Jammu and Kashmir (J&K) is an important asset. Its unequal distribution leads to lack of income and property ownership, lower standards of living and quality of life and general poverty. A large number of women in rural India do not own land and fewer have effective control over it, despite depending on agriculture to a great extent (85%). In the state of J&K, around 70% of the population gets livelihood directly or indirectly from Agriculture and Allied Sectors. The people of the state have largely benefited from successful land reforms in terms of land distribution. But there are very few women enumerated as landholders in comparison to men and there still exists a huge gender discrepancy in land ownership. The women's rights in India are by and large related to the inheritance laws on the one hand, and land reform related legislation on the other. In the state of J&K, discrepancies exist in laws governing women's land rights though some efforts are being made to bridge the gender-gap by introducing legislation to ensure land rights to women in rural areas. This paper seeks to examine the relationship between gender and land ownership by analyzing the existing inheritance laws and land reforms – related legislation in rural areas of Jammu and Kashmir.

Living Near the International Border: Impact of Conflict on Women in Jammu Region of Northwest India

Conflict is understood as a state of opposition, disagreement, or incompatibility between two or more people or groups of people, which is sometimes characterized by physical violence. In political terms, 'conflict' refers to an on-going state of hostility between two groups of people or two nations. The regions of Jammu and Kashmir (J&K) state in India have been involved in an ongoing conflict since 1947 owing to the unsettled territorial dispute between the two neighbouring countries, India and Pakistan over Kashmir. The region has witnessed a long-drawn conflict with four full scale wars (1947, 1965, 1971 and 1999) and other lesser intensity wars, proxy wars, cross-border firings, artillery duels, and frequent skirmishes at the international border and the Line of Control (LoC).Consequently, there have been migrations of people from the border villages' innumerable times, even during the 'normal' situations. The borders are mined and fenced by acquiring cultivable land of the people who are mostly agriculturalists. Implications of all such events have been more severe and critical for women. This

paper attempts to understand the impact of war, conflict, and forced migration in the northwest border of India on the lives of women and the ways they respond, construct, and negotiate their lives. The study is based in the region called 'Akhnoor Sector' on the LoC in Jammu District of Jammu and Kashmir (J&K) state in Northwest India.

RC07-82.1

CHAUVEL, LOUIS* (University of Luxembourg, Luxembourg)

The Imbalance of Wealth and Income As a New Challenge for the Middle Classes in the World

The rapid socioeconomic development of the post-World War Two in the Western world has been associated with a decline in the Wealth to Income Ratio (WIR, expressing stock of wealth in years of income flux), and the rapid improvement of working class and wage earner middle class incomes, including social protection, improvement in consumption and housing condition. In the post WWII period, for a more equal, wage earner based society, more have been done in a generation than in centuries before. Today, in many post-industrial countries, the WIR doubled again over the last generation. This means a come back to before World War One in the relative size of capital accumulation, relative to wage incomes.

This well documented dynamics in the domain of Western societies (Chauvel, 2006 2019, Piketty, 2014 2019, Milanovic, 2012) must be extended different ways, in terms of new developed countries (in particular the BRICTs), in terms of extreme wealth (the number of years of average incomes top wealth owners can buy), and in terms of sociological processes (social class complexification, education expansion, increasing socioeconomic gradients in health, wealth or political control, generational replacement, etc.) that economists tend to ignore.

In the new global class system, we have to underline the role of wealth as a strong source of reverticalization of social stratification systems, generating massive changes in the relative cost of resources like housing in central cities, selective high quality service of education, health service, etc. Wealth becomes a (the?) strategic source again and middle class members are divided now between those with family wealth or inheritance to expect, and the others that are progressively excluded from their former valuable status.

An increasing number of educated young adults with no valuable socioeconomic position in the labor market express increasing frustrations.

RC02-36.4

CHAUVEL, LOUIS* (University of Luxembourg, Luxembourg)

The New Age of Extremes: The Return of Wealth and the Global Reverticalization

In the last generation, in contradiction with the former prophets of the so-called phenomenon of social *middlization*, we observe a general reverticalization of societies, and the reconstitution of extreme structures of inequalities. The return of Wealth as a (the) central asset of definition of life chances means a major destabilization of the wage earner middle class society of the mid-20th century. Based on a reexamination of Bourdieu (1979), Piketty (2013, 2019) and Chauvel (2006 2019) debate on class structures and the middle classes, we propose a Global Multipolar (di)vision of the middle classes between cultural, social and economic capitals. This theoretical reconstruction helps understand the "come back of extremes" (Hobsbawm 1994) in many regions of the World System. After the golden age of the "new wage earner middle class" and the Welfare state expansion in the West, comes a trend of "repatrimonialization" (or re-wealth-ization), generating a new extreme socioeconomic structure. Assets, housing, inheritance, savings, and wealth accumulation, are key issues again. After the 1980s, in the post-affluent overdeveloped societies, we observe a backlash in the system of wage earner middle classes. Shrinking and quartering of the middle classes in a context where the inheritance of assets and resources changed the previous equilibrium, declining returns to non-elite university education, declining access to institutional efficient politics, are symptoms of a more profound re-extremization of societies. Engaging in a cross-Global-System comparison, we sketch the diverging pattern of polarization and the middle class in terms of income, education and wealth across continents. Finally, we highlight the importance of addressing the problem of social sustainability when large strata of the middle class have less interest in the stability of the social order. In terms of future research, this means also a re-acceleration of "The Spiral of Capitalism and Socialism" (Boswell and Chase-Dunn, 2000).

CHAUVEL, SEVERINE* (1977, France)

An Admission Regime International for Students ? a Case Study of an Interdisciplinary Master's Degree in France

Since the 1980s, the student population has experienced unprecedented growth. In France, the number of students was multiplied by two over the period. The social characteristics of the student population have also changed, as working class and foreign students gained access to higher education. According to UNESCO (2005), in the early 2000s, six countries welcomed two thirds of foreign students in absolute numbers, among which France. Paradoxically, the share of selective tracks in higher education has increased with the democratization of higher education: it represented 27.3% of the student population in 1980 compared to 37.8% nowadays (MESRI-DGESIP, 2018). This presentation proposes to address the issue of internationalization practices of higher education at the key moment of recruitment of students selection into the master's degree. On the basis of an ethnographic and statistical survey, in progress since 2018 in an interdisciplinary master degree in France (135 students - most of whom are foreigners), the paper will firstly deal with the different practices that favor recruitment of foreign students in a context where tuition fees in French higher education were raised for foreign students. Unlike traditional competitive university masters, "good grades" in undergrad level is not a prerequisite for admission in this master. The observed principles of justice thus come closer to the paradigm of diversity than to that of meritocracy (Warikoo, 2016). The observation of the selection procedures, the interviews with the students, professors, coordinators and the statistical treatments allows one to understand how the competition between the formations (Musselin, 2018) concretely affect professional evaluation and, as a side effect, student selection. Finally, the paper proposes to identify a new admission system (Karabel, 2005), which can document the socio-historical evolutions of legitimacy registers in a context of democratization and internationalization of higher education.

RC31-395.2

CHAUVEL, SEVERINE* (1977, France)

The Role of Selection Mechanisms in the Recruitment of Migrants in Higher Education. a Case Study of an Interdisciplinary Master's Degree in France

According to UNESCO (2005), in the early 2000s, six countries hosted two thirds of foreign students in absolute numbers, among which France (together with the United States, the United Kingdom, Germany, Australia and Japan). The academic literature is quite rich in the field of student migration. Since the early 2000s, the analysis of international student flows reveals individual decision-making processes. This presentation proposes to analyze the mobility mechanisms of migrants in higher education through an observation of the selection procedure during their recruitment. We thus focus on the student population to better understand the effects of policies of education and control of international mobility on the individual courses. Our ethnographic and statistical survey has been conducted since September 2018 in an interdisciplinary master's degree in France, which counts 135 students, most of whom are migrants. The presentation will first address the different professional practices of student admission into the Master's degree. We will see how these practices promote the recruitment of migrant students, in a context where registration fees in French higher education were raised for non EU foreign students in September 2019 and where the master's selection procedures became formalized. The interviews with the students and the statistical treatments will then make it possible to analyze the student experiences with regard to the injunction of valuing "diversity". Finally, the communication proposes to draw up a typology of migration experiences according to gender and academic and migratory background. This study seeks to promote comparisons with other cases, at other levels of education or other national contexts.

CHÁVEZ SABANDO, NILA* (Universitat de Girona, Ecuador)

Los Límites De La Religión En La Garantía De Derechos

Históricamente las expresiones políticas han variado dependiendo del contexto social. Los debates en América Latina sobre matrimonio igualitario, interrupción voluntaria del embarazo y regulación de cannabis resurgieron y continúan planteados desde la garantía de derechos.

Por un lado, quienes forman parte del Legislativo expresan sus posiciones religiosas al legislar en matrimonio igualitario, interrupción voluntaria del embarazo y regulación de cannabis. Y por otro lado, una de las principales voces que han presionado frente al Legislativo de ambos países son los movimientos sociales. La razón de ser de los movimientos sociales es la de tener un sentido político, evitar que suceda algo perjudicial proponiendo valores e ideas (Rossi 2006) y, se centran en mirar los defectos de la sociedad.

El objetivo es entonces, presentar un análisis sobre los resultados obtenidos en dos países de América del Sur, Ecuador y Uruguay con respecto a matrimonio igualitario, interrupción voluntaria del embarazo y regulación de cannabis, en medio del debate sobre la garantía de derechos y los límites de la religión.

Rasgos y Valores De Excelencia Del Profesorado Universitario y Su Relación Con El Perfil Ideal

Esta comunicación es producto de la segunda fase de una investigación sobre Excelencia del profesorado universitario que se realiza en una universidad pública del norte de México en colaboración con académicos de la UNAM. La excelencia es un criterio importante para evaluar la calidad de las instituciones e incluirlas en los rankings internacionales, de ahí nuestro interés en explorar este tema. El proyecto atiende diversas líneas de análisis, en esta ocasión se recoge en particular la visión de los profesores sobre la labor docente y también se analizan los planteamientos institucionales, ya que éstos son referente necesario en este análisis. Los datos proceden de un cuestionario validado en universidades españolas y mexicanas que incluye diez rubros equivalentes a las tareas más importantes de la docencia, la investigación y la gestión en la universidad, así como también dos preguntas abiertas: 1. Cuáles considera usted que son los cinco valores básicos que la universidad debería promover con sus académicos; y, 2. Indique usted cuáles son los cinco principales rasgos de "ser un buen profesor universitario". El instrumento se aplicó a un total de 264 docentes de diversas carreras; en esta comunicación se estudian con cierto detalle los principales términos que escribieron como rasgos y valores del profesorado y se relacionan con el perfil ideal establecido por la universidad. Los referentes teóricos hacen énfasis en la excelencia, la calidad educativa y los valores y rasgos del profesorado universitario. En las respuestas que escriben los profesores se presenta una gran dispersión por cuanto los términos que usan, sin embargo, a partir de la contabilización es posible observar que el valor más importante es honestidad; y en cuanto a los rasgos, el que más aparece escrito, es responsable-responsabilidad.

Comparison of Social Schemes between Europe and China Based on Empirical Data

We aim to compare the social structures of Europe and China based on the European Social Survey 2014 (N=55,000, 15-64 years) and China Labor-force Dynamics Survey 2014 (N=14,887, 15-114 years) and examine how well the class schemes drawn from theories could explain the social inequality. Due to overlap of their study designs, We first adopted the analysis program of ESS developed by Leiulfsrud, Bison, & Solheim (2010) to the CLDS and construct three types of social class structure (Goldthorpe/Erikson/Portocarero Class Scheme (EGP), Wright's Class Schemes, Esping-Andersen's Class Scheme) comparably across the two societies. Moreover, using multiple regression model, we examined the relationships between social schemes and the distributional inequalities of economic as well as educational resources. The results showed that the knowledge and human capital were stronger explaining factors of social inequality than other indicators such as economic capital or power status in Europe. It suggested the social structure in Europe is more consistent with Esping-Andersen's post-industrialized class scheme, indicating that Europe has entered post-industrial society. Besides, it is worth noting that China is currently undergoing the progressive transition of post-industrialization from the west to the east, where the social stratification pattern in the eastern part of China is more consistent with Esping-Andersen's post-industrial class scheme rather than Wright's power model. Relevant impacts of this social change and cultural differences on individuals were discussed. Based on classic theories of social class, this study aims to provide a promising analysis tool with researcher to help disentangle the myths of social stratification and further the comparative studies across societies.

Visualizing Invisibility: Chinese Visual Artists in New York City

Abstract: China transformed from a poor country to a major power within the past four decades. However, reports on Western media about China's rise overwhelmingly focus on its exponential economic growth and technological development, while culture is either missing or ambiguous in the discourse. How does culture evolve during the past four decades in China? Does the power of culture revive with economic growth? Or is the power of culture constrained by the upsurge of state power? The answers remain obscure.

In this sense, my study offers an approach to discuss the cultural transformation by looking at career strategies and life chances of individual cultural practitioners and participants, namely, artists from China. My research question is how the two generations of Chinese visual artists vary in their strategies to gain recognition in New York City. First is the older generation who were born from 1946 to 1964, represented by Ai Weiwei and his peers. Second is "millennials", who were born in between 1970s and 1990s. The decades that set the two generations apart feature tremendous political, economic and technological transformation in China. Therefore, the generational differences offer me a chance to explore how culture changes amid the upsurge of state power and market power.

The strategies that artists adopt to gain recognition in New York City are divided into two perspectives. The first is regarding their social engagement and social network (Crane, 1989; Scott, 2006; Becker, 2008), while the other is related to how they present their artworks (Zolberg, 1990; Rothenberg, 2014). The former discusses the mechanism of the art world, drawing on structuralist theories such as the theories of social organization. The second perspective aims to reveal the self and identities regarding the invisible cultural memberships, racial boundaries, and political identities by analyzing their artworks as visual rhetoric.

Are There a Dominant Mother-in-Law and a Submissive Daughter-in-Law in a Floating Family?---Taking the K Family As an Example

For centuries, the relationships between mother-in-law and daughter-in-law are viewed as a troublesome, difficult and hot topic. The purpose of this study was to gain a clearer understanding of how social work facilitates the relationship between mothers-in-law and daughters-in-law among the floating families. This study applied social work intervention to deal with the conflict between mother-in-law and daughter-in-law in K family, which demonstrated that intervention of the social worker had a positive impact on relational outcomes for the family. Ultimately, this study revealed that social work intervention did facilitate relationship improvement between mother-in-law and daughter-in-law. Typically, mothers-in-law have been portrayed as one of the most frightening, unkind and dominant family members, while daughters-in-law have been as submissive members. In terms of the K family, however, the social worker argued that the daughter-in-law might not consider the other party's feeling due to her original growth background with being self-central rather than approaching the relationship with collaborative, shared and harmonious.

Social Innovation and Energy Transitions: Exploring the Case of Green Energy Charity Initiative in Taiwan

Increasing global concern over climate change and its potentially catastrophic effects has spurred a push to drastically cut carbon emissions. It points to the dire need to shift away from energy production that burns fossil fuels and moves towards renewable energy. Much of the energy transition literature, however, is dominated in economic and technical terms, with less attention to the social, political, and cultural dimensions. Actually, the energy transition cannot be understood merely as fuel change but about the social, economic, and political transformation and arrangements around a new energy system. More specifically, it is essential to assess the benefits and risks associated with the transition, for example, the issues of energy costs, energy poverty, and energy justice.

This paper intends to explore an innovative case, the green energy charity initiative in Taiwan, which was spearheaded by Sunnyfounder, a social enterprise. As the first green energy crowdfunding platform, Sunnyfounder allows people to invest and participate in solar photovoltaic projects. Since its establishment in 2015, it has already donated more than 10 solar projects to community-serving charity and socially disadvantaged groups in Taiwan, through crowdfunding campaigns and private sector donations. The installment of free solar projects to charity groups not only lowers their electricity bills but also broadens social and environmental benefits of renewable energy.

The aim of this paper is to twofold: First, it sets out to illustrate this solar energy charity initiative. It seeks to explore and highlight the appropriate institutional condition, mechanism and factors for its success. Second, the paper attempts to analyze major barriers to scale up this solar energy charity initiative and discusses the role of major stakeholders and civil society actors, including those charity groups. The analysis of this innovative case study stimulates policymakers and researchers to contribute to social goals of energy transitions.

Elderly Care in Wuhan City during COVID-19 Pandemic: New Strategies, New Phenomena and New Outlooks

When discussing "elderly care" from the perspective of COVID-19 pandemic, the essence is to analyze the issues of "elderly support, elderly protection and elderly assistance". It is believed that there are three aspects worthy of discussing, which are the new strategies to cope with the elderly care in the epidemic, the new phenomena rising from the process of elderly care and the new outlooks for the development of old-age services in future.

The new strategies can be called "System 121", which include "One core, Two frameworks and One idea". The "One core" means the combination of fighting against the pandemic with elderly care services, especially the application of "Health QR Code". The "two frameworks" refer to the "closed" and "semi-open" structures, which respectively correspond to the pandemic prevention measures taken by the elderly care institutions and the grass-roots communities. The "One idea" depicts that the basic idea of fighting against the pandemic is to foster the "the sense of health security for the elderly".

The new phenomena are consisted by five aspects: family reunion for the elderly, online "WeChat" educations for the elderly, online social work services for the elderly, urban community digital management for the elderly and volunteer support for the elderly during the sealing-off period.

The new outlooks include three aspects: First, "elderly care" should be regarded as a constant task of social construction in the "post-pandemic era". Second, the effect of "smart elderly care" is beginning to emerge, but it needs a further improvement. Third, the legal connotation of "elderly endowment" should be reconsidered and enriched.

Mask up! Public Communication and the Knowledge of Wearing Masks in COVID-19 Pandemic

Due to the Covid-19 pandemic, wearing masks become a compulsory and precautionary measure to decrease the spread. However, the public refuses to wear face masks and question the effectiveness of masks, especially people in the west. Followed by the lock-down policy around the world, the public accepts the importance of wearing masks, because of health education implemented by the propaganda system. The constructed knowledge enacts the ritualization of wearing masks. How does the transformation of wearing masks knowledge happen? How does the authority influence disease discourse and boost the popularity of wearing masks? This study examines the construction and distribution of health knowledge regarding wearing masks in China, which is an authoritarian regime that can control the media. Based on digital ethnography approach, this study investigates the ways the Chinese government and the medical experts emphasize the protection of wearing masks in the perspectives of solidarity, moral panic, and cultural norms. This study contributes to our understanding of the authority, knowledge, and culture in the politics of medicine and health.

More Glamorous, More Marginalized: Self-Entrepreneurship, Gendered Career and Family of Female Youtubers

Imagining "have it all" in digital media, female YouTubers take advantages of combining professional career and domestic responsibilities in self-enterprising online business. Self-entrepreneurship in digital media is tradeoff between autonomy and flexibility in high status but precarity and instability. Despite sufficient interest in work structure and conditions for female creators in digital entertainment industry, much of literature has emphasized additional affective labor of female YouTubers, however, less attention has been paid to the perspectives of gender and family. Based on online ethnography and in-depth interviews of female YouTubers, this study investigates self-enterprise experience of female YouTubers who face double marginalization in workplace and family sphere. How does female YouTubers perceive their digital entertainment career in persistence of social inequalities? How does female YouTuber's digital career trajectory affect their family and intimate life? This study offers new insights into gender and self-entrepreneurship with social media technologies, and shows the interplay between family and career of women that double marginal status in digital entertainment field.

CHERNYAK, ELENA* (Hartwick College, USA)

The End of the Family? the Impact of Globalization on Modern Family.

The term 'globalization' is well-known and widely used but understood differently. For some, globalization is an economic process by which the everyday experience is standardizing around the world. For others, it is strongly associated with advanced capitalism, progress in technology and a transformed means of communications. Others argue that globalization destroys old traditions and norms, but instead creates a homogenized world culture and increases interdependence. Overall, globalization is perceived as highly complex macro and micro-levels processes that are associated with the shifts in people lived experience. It promotes the integration of social, political, ideological, economic, and cultural systems of different nations into interrelated and interdependent systems leading to nations' assimilation and loss of identity. While globalization has caused transformations at every level of social life, it has affected the family and family structure and caused the undergoing modifications in intergenerational relations. This study discusses the impact of globalization on the modern family and family relations.

Through policies, programs, regulations and strategies, globalization directly and indirectly affects family and leads to its re-modeling. The nuclear family with gender-oriented roles and responsibilities (such as bread-winning father and stay-home mother) is declining while new forms of family take place of the traditional one. Families are integrated into the global economy through work, production, and consumption. Communication and technologies allow easier access to goods and services, offer more opportunities, enable and even stimulate mobility, and increase feelings of freedom. In addition, the process of globalization resulted in individualization, democratization, and the growing acceptance of alternative lifestyles. The transformation of family includes the crisis of patriachalism (or at least the problematization of patriarchy), significant changes of family patterns, norms, values, and roles. The complexity of modern living has changed people's perception toward marriage and family as the main provider for the basic needs.

Can Happiness be Inherited? the Intergenerational Transmission of Well-Being

Although family background is a strong predictor of adult outcomes in terms of education, employment, income and wealth, its association with subjective well-being is less clear. Research shows that subjective well-being is associated with each of these factors, however, there is no clear consensus about the direction of the association. High levels of education are not necessarily associated with high levels of well-being; and low levels of wealth are not necessarily associated with low levels of well-being. Using data collected by the Household, Income and Labour Dynamics in Australia (HILDA) project, we examine the association between levels of well-being of parents and their adult children. We track a cohort of young people aged between 15 and 18 years from 2002 to 2016 to examine the long term effects of family background on levels of well-being. The 2002 data includes measures of family wealth and income as well as parental characteristics such as education, occupation, health and levels of well-being. Therefore, we are able to compare the outcomes of these young people in 2016, controlling for objective and subjective measures of family background.

Parental Wellbeing during the COVID-19 Pandemic in Australia

The restrictions imposed during the COVID-19 pandemic provide a rare natural experiment allowing for the examination of how social isolation impacts on levels of wellbeing. Australia constitutes an interesting case study because the states and territories control their own borders and were therefore able to restrict movement into and out of their jurisdictions. Australians are quite mobile with young people moving interstate for employment and older people moving interstate when they retire. Consequently, when the state borders were shut, millions of Australians were isolated from their extended families. The isolation experienced by parents with young children was particularly acute and may have negatively impacted on their levels of wellbeing. To compare levels of wellbeing before and during the pandemic in Australia, I draw on longitudinal data collected from one cohort of participants in the Life Patterns project. Tracking the participants from age 18 in 2006 until 2020 allows for an examination of within-person variation due to the unique circumstances of the pandemic controlling for other characteristics and life course events known to impact on wellbeing such as marriage, parenting and job loss.

Participatory Evaluation of Government Projects and Programmes in South Africa: Context and Challenges

South African democracy turns 25 this year. In this short period of a quarter of a century, new institutional mechanisms aimed at fostering citizen participation have been initiated and are being entrenched in an attempt to deepen and strengthen democracy. Government policies, programmes and initiatives based on a 'pro-poor' ideology have been implemented with benevolent intent but to what extent have they been successful in achieving intended goals; more specifically, what impact have they had on the intended beneficiaries. The process of participatory evaluation ensures the active involvement of stakeholders throughout the process. It engages the evaluators and stakeholders (such as programme participants or the community at large) in the decision-making process when creating an evaluation and using results. Literature reveals that it can foster: improved programme performance; active stakeholder participation identifying relevant data, methodologies, and uses; increased ownership and investment; the link between evaluation use and the stakeholder perspective; capacity building and participant empowerment; a community or organizational culture dedicated to learning and improvement. It is however not without its challenges which include conflicts of interest among stakeholders; knowledge imbalance between the evaluation team and the stakeholder representatives; budget and other resource challenges; time and commitment of all participants. The paper presents an overview of attempts to advance participatory evaluations as a means of advancing democratic precepts in South Africa.

Examining Hindu Social Order: An Analysis of Social Inequalities in Contemporary Indian Society

Through the constitution of Indian state promises equality to all citizens. The various provisions of the constitution elucidated in this chapter on Fundamental Rights (Justiciable) and on the Directive Principle of State Policy (Non justiciable) delineate the states obligations to provide equal opportunities to all its citizens in social, political and economic sphere. While expecting this social fact of social inequality are without the shadow of doubt the result of deep rooted social structured formed of over century. The individual with the same endowments (assets entitlements, rights, skills, education, experience) but differing in social group. It is the experience of comparable endowments and widely differing treatments and outcomes that we understand as social discrimination.

The Hindu social order is based on classes and not on individual. It is an order in which classes are graded one above the other. It is an order in which the status and functions are determined and fixed. The Hindu social order is a rigid order. No matter what changes take place in the relative position of an individual his social status as a member of the class he is born in relation to another person belonging to another class shall in no way be affected. The first shall never become the last. The last shall never become the first (Ambedkar, Vol.3:115).

In this paper an attempt to social inequalities and its manifestation, and to suggest possible here and understanding of the ideology of discrimination is elaborated based on social stratification, caste system so here by the policy through constitution of India through Hindu Code Bill was planned to guarantee Liberty, Equality, Fraternity and Justice to individuals as a matter of social policy.

This study as the objective to explore the way this concept of social discrimination, social policy and social welfare are under operation.

Transiciones Generacionales En Las Pandillas Salvadoreñas

Desde la época de los noventa, El Salvador vio emerger el fenómeno de las "maras o pandillas" como un nuevo actor presente en la violencia del país resultado de las desigualdades sociales y la falta de políticas que respondieran al recién finalizado conflicto armado.

Alejados de políticas sociales, muchos territorios periféricos comenzaron a estructurar nuevas formas de poder, de gobernabilidad al margen del "sistema", estructuras que surgen como resistencia ante un sistema excluyente, es la forma para muchos de seguir existiendo y sobreviviendo, sin embargo estas estructuras se ven caracterizadas por actos delictivos, muerte, drogas y vinculación con el crimen organizado.

Según datos del Centro Antipandillas Transnacional, se estima que a junio de 2014 existían unos 32,310 pandilleros activos en El Salvador: 21.619 de los cuales están en libertad (14.868 corresponden a la MS; 6.585 al Barrio 18 y 166 a otras pandillas) y 10.691 se encuentran recluidos en los centros penales (5.280 de la MS; 4.099 del Barrio 18 y 1.312 a otras pandillas). Datos más recientes, hablan de 60,000 pandilleros activos y más de 200,000 personas vinculadas a sus entornos, entre familiares y colaboradores.

La presentación tiene como propósito hacer un recorrido histórico y generacional sobre las pandillas en El Salvador, con el objeto de comprender qué tipo de pandillas se han configurado a partir de las diferentes políticas de seguridad implementadas y las medidas de intervención que los diversos actores y el Estado han realizado en tres décadas. Se propone hablar de tres generaciones de pandillas, cada una de ellas influenciada por un contexto global, local y político que ha determinado sus maneras de expresarse socialmente.

Governmentality and Edu-Business in the Age of Neoliberalism

According to M. Foucault, the problem caused by the absolutism of juridical domination has eventually installed rationality into government. As reflexive government needs to calculate social risks and develop solutions in order to ensure social security, this change starts to take populations as object and its objective so that governmentality means governing without governing society. This purpose is accomplished by governing at a distance, the strategies of which are to shape people into the subject in rules of conduct. In this way, biopolitics creates the infrastructure for delivering education services in commercial forms as evident with the introduction of public managerialism that comes to blur the boundary between the public sector and the private sector. This great change in education policy thus opens up a huge space for the development of academic capitalism coated in philanthropy. Accordingly, education is commercialized into edu-business allowing hetero-agencies into play. Because shaping people's souls is the core mission of biopolitics, neoliberalism governments need to address the issue of teacher-as-problem so that they can promote the logic of entrepreneurialism. In this power arena, international institutions have successfully mobilized the value of performativity in comparable data of international testing results. In the regime of performance management, teachers are judged by their competence and contributions. While these correlations foreground structural constraints imposed on teachers, teachers may exercise agency against educational reforms.

CHIESI, ANTONIO* (State University of Milano, Italy)

Is the Question on Generalized Trust (GT) a Valid Measurement of Social Capital (SC)?

Studies on SC have proposed different definitions of the term, but it is possible to identify two broad approaches in the literature, respectively at macro and at micro levels. The former has been inspired by Putnam at the end of the century and conceives SC as a feature of the society or the community. The latter has been developed later, within the framework of network analysis.

In the former approach, SC is a public good people can enjoy; in the latter approach SC is a relational resource for the benefit of those who are in a network of interpersonal relations. While the latter approach implies expensive and sometimes-intrusive field analysis through sociometric interviews, the former has enjoyed a very straightforward measurement (ask people if they trust others in general or some institutions). The simplicity of this way of measuring SC is at the origin of its success, which has been supported by the endorsement of the World Bank and has granted the inclusion of the question on GT in general surveys around the world.

The relation of the two approaches with RAT is different. At macro level social capital is a public good, therefore it is subject to the prisoner's dilemma problem. At micro level SC is a personal resource at the disposal of the actor who can invest and spend it in order to maximise her/his own utility.

Using the latest edition of the European Values Study, the paper identifies and analyses relations between generalized trust and some behavioural indicators commonly associated to SC.

The results confirm poor or no correlation between GT and SC à la Putnam, as well as with SC at micro level.

The conclusions are devoted to some considerations on the ecological fallacy and on the correct interpretation of GT in the light of RAT.

A Global Exploration of Colorism and Attitudes Toward Intermarriage

Mapping attitudes toward intermarriage—who is and who is NOT an acceptable mate—offers an incisive means through imaginings of belonging-- race, ethnicity, nationhood, citizenship and culture—can be critically evaluated. Attraction, relationships and in essence family membership are the resources, which can be

given or withheld like access to education, employment, benefits and citizenship. These relationships serve as a lens to see the larger racial structures that operate and looking comparatively can help illuminate the global similarities and differences. Yet, existing research on intermarriage tends to look at just one country, or at best compares statistical data on intermarriage rates or characteristics of those who intermarry between a handful of countries. This is a particularly important time for research using a global framework precisely because there is so much discussion about multiculturalism, post-racialism, and color-blindness across the socio-political landscapes of this globalized world, even when that is far from the reality.

Drawing from qualitative interviews and ethnographic research I conducted in fifteen countries on six continents, my research offers an empirical basis to understand what differences matter and what boundaries are most salient in determining the attitudes of different groups toward intermarriage. Furthermore, how are social boundaries patrolled when it comes to intimate relationships, and why, or in other words whose interests are served. While countries may have different histories and contemporary realities, within discourses on intermarriage, there are clear patterns of colorism, anti-blackness and a privileging of whiteness. In particular, I argue there is a racialized hierarchy of desire and marriability that mirrors the larger systems of oppression operating globally. The language they use may differ---race versus culture/ethnicity versus citizenship---and the groups who are "unmarriable" may change, but the sentiment is the same.

Second Generation Mozambican Migrant Youth's Identity and Sense of Belonging in South Africa: The Case of Rural Bushbuckridge, Mpumalanga

This is work in progress project, centred on exploring the complexities surrounding second generation Mozambican migrant youth's experiences in an attempt to construct their identity and developing sense of belonging in post-apartheid South Africa, precisely in Bushbuckridge. Established in 1884, Bushbuckridge is one of the earliest districts to accommodate Mozambicans who migrated to SA in the 1970s. Bushbuckridge as a destination is crucial to their search for social freedom and a space to "belong to". The paper is governed by four objectives of

observing how second generation Mozambican migrant youth who are living in South Africa negotiate and construct their own identities

exploring of second generation Mozambican migrant youth narratives regarding their sense of belonging in SA

understanding ways in which social processes of identity and belonging influence second generation Mozambican migrant youth experiences and future aspirations in SA

examining how Sen's Capability approach is relevant in understanding participants' identity and belonging in South Africa.

This is a single case study informed by semi structured interviews and narratives with youth between 18 and 34years, born and raised in SA, Bushbuckridge to at least one Mozambican parent. Drawing from Crenshaw's Intersectionality approach and Sen's Capability approach, this study contributes to the existing knowledge on South to South migration. The subject of second generation migrants is often under researched in the context of migration in Africa. Through exploring migrant groups from a historical and present perspective, this research reveals how being born to a migrant parent(s) and raised in a hosting country complicates one's identity and sense of belonging. In quest of forming their identities and sense of belonging, migrants establishes resilient unity closely linked to Crenshaw's notion of agency and space. Hence, second generation Mozambican migrant youth experiences are explored through axes of social categories; nationality, gender, class, age and ethnicity.

Gender Ideology and Fertility in South Korea: Trends amid the Male Breadwinner Model in Transition?

Increase in dual-earner couples is seen as an indicator of South Korea's move away from a traditional male breadwinner model. At the same time, the society faces a continuing decline in its exceptionally low fertility. Previous macro-level research has pointed to gender ideologies as a factor behind low fertility in post-industrial countries, but how individuals' attitudes about gender shape their fertility decisions at the micro-level has yet to be examined. Using in-depth interviews matched with Korean General Social Survey (KGSS) data, we first investigate how gender ideologies among young, heterosexual Korean adults are changing. Across interviewees with varying socioeconomic backgrounds, the ideology of the male breadwinner was maintained largely through essentializing care as women's work. Furthermore, results showed how the interplay of economic insecurity and gender ideology influenced fertility intentions and decisions of interviewees. In a normative context which imposes a double burden of labor market participation and unpaid care work on women, economic insecurity was likely to lower individuals' fertility intentions.

Marshallese Migrants and Poultry Processing in Arkansas, USA: Contrasting Health and Safety Discourses

The Marshallese, one of the Pacific Islander groups, are the latest wave of migrants sourced as processing workers in Northwest Arkansas in the United States, a global center of the poultry industry. Despite the current hostile immigration policies, their unique legal status (work/live in the US without VISA) makes them preferred workers for the poultry industry. Poultry processing work has historically been carried out by marginalized workers, such as women, minorities, and immigrants. The US Department of Labor classifies poultry as a "hazardous" industry, with occupational injury rates five times the national average. Safety in the workplace has been emphasized for many years due to numerous occupational hazards and a very high turn-over rate. This study employs a mixed method approach to conduct a discourse analysis of how *safety* and *safety training* are framed by the three levels of actors in the poultry processing industry: poultry corporations, processing plants, and processing workers. The findings reveal that while all three levels are concerned about safety in the workplace and emphasize the importance of safety training, the underlying meanings of *safety* are very different in the actors' discourses: "food safety/safety of the product" and "productivity/profit" dominate the corporate and plant-levels discourses and "workers' safety" and "workers' injury, health and life" dominate the worker-level discourse. With respect to safety training, a major concern at the plant level is to meet the government guidelines regarding whether the corporation followed the government regulations. Safety provisions are used to protect the company/plant from the responsibilities for injury/illness of, compensation for, and lawsuits from workers. In contrast, workers are concerned about the actual knowledge and application of the safety training to their work, and how the trainings could be used to protect them from work-place injury and illness. Implications for policies and future studies are discussed.

GRACZYK, DARIUSZ (Institute for Agricultural and Forest Environment, Polish Academy of Sciences, Poland)

Infrastructures at Risk. How Extreme Weather Events Impact Local Communities in Poland.

Several episodes of extreme meteorological events, with considerable economic and social impacts, have occurred in Europe and in Poland in last decades. Researches indicate an increase in extreme rainfall in recent years (Lorenc and Olecka, 2006; Zolina, 2012; Scherrer, 2016, Pińskwar et al. 2018). Other studies show an increase of intensity and duration of heat waves. According to Della-Marta et al. (2007) since the end of the nineteenth century, the length of summer heat waves over Western Europe has doubled and the frequency of hot days has almost trebled.

Different types of infrastructures, on one hand crucial for local socio-ecological systems, on the other are vulnerable to meteorological hazards. The energy and transportation sectors consist of not only large actors but they are also formed by municipal institutions, small companies, as well as private units. Therefore preparation of a unified strategy to cope with extreme weather events seems to be an important but difficult issue.

In this study, authors are looking at the issue of extreme weather events adaptations strategies and decision-making schemes that are led by regional and local actors in the western part of Poland. The analysis is done with the combination of meteorological data and in-depth interviews with representatives of municipalities, transport and energy sector. Authors are especially focusing on smaller municipalities, where events of smaller scale, carry similar consequences for local communities, as large-scale events for large urban organisms (Voss and Wagner, 2010). Smaller socio-ecological systems have completely different potential to act, replacing organisational and material resources with an excellent knowledge of local specifics and direct contacts, which may enable multiple innovative actions that go beyond the standard measures implemented in large agglomerations.

Comparative Sociology of Education: A Case Study of Eight Villages of Jharkhand, India

Comparative Sociology of Education in the context of Indian society has broader significance as the deprived people of the country have been facing education backwardness. In this context, Goverment of India has been implimenting variuos policies from time to time. Right to Education is one of the major educational policies of Government of India. The RTE Act 2009 has had a long historical background of becoming an Act and hence it gets legitimacy to provide quality education to all children till the age 14 years. As the RTE act was implemented with effect from 1st April 2010, States and UTs were supposed to finish many activities within three years but even after completion of more than 9 years, the proper implementation of the Act has not been done. Many studies and reports have confirmed the poor performance of the Act at all levels of schooling. Jharkhand is one of the backward states of India where 26.2 per cent tribal people live. In the context of tribal state, it becomes necessary to look the various provisions of the RTE Act. Despite of Governments' attempt, it has failed to realise the goal of universal elementary education and the RTE Act has not been able help much. This paper has been based on the comparative study of educational sociology in eight villages of two districts. The study confirms that those areas having backward people due to various reasons are unable to concentrate on education despite variuos attempts made by the government.

Social Justice through Affirmative Action Policy in Brics Countries and Its Challenges: A Global Perspective

The BRICS stands for Brazil, Russia, India and China and later joined by South Africa in 2011. BRICS have the bilateral relationship which focuses on the mutual benefit, equality and non interference basis.

Affirmative action means special consideration for disadvantaged groups in publicly funded opportunities. The purpose is to level the playing field as the groups preferred are often those that have discriminated against in the past. Governments around the world have affirmative action policies in public service composition, education and in government contracting decisions. The public service is a vital ground for governments to demonstrate their commitment to affirmative action.

Through increasing social diversity, affirmative action also promotes functional diversity, so the performance of organizations implementing affirmative action should improve over time. The merit-based selection is considered an essential feature of a good public service. If officials are selected according to the social attributes instead of merit, then performance of organizations that implement affirmative action should deteriorate over time.

The words, affirmative action does not appear in the 1948 Universal Declaration of Human Rights, the foundation document for contemporary human rights discourse. The declaration does, however, contain two intellectual anchors for affirmative action. First, the declaration repeatedly endorses the principle of human equality. Second, it declares that everyone has the right to work, to an adequate standard of living, and to education. The declaration does not command that all will share equally, but it does suggest strongly that there are minimum levels of employment, education, and subsistence that all should share.

The democracies all over the world responded to the inequalities by enacting Legislations and incorporating equality clauses in their Constitutions. The group preferences, quota, reservation, affirmative action exists in different names and in different countries. I will discuss the affirmative action of BRICS countries to achieve social justice.

The Production of Global White Supremacy in the Twenty-First Century: Embodied and Disembodied Whiteness

How do we understand the durability and malleability of white supremacy across the globe in the twenty-first century? Scholars looking at whiteness through a postcolonial, Global South lens have notably explored the lingering, transmutable, and multi-faceted nature of whiteness in the wake, and new manifestations of, Empire. Applying postcolonial whiteness scholars' analyses of how whiteness "lingers" in postcolonial spaces, and global critical race perspectives on the evolution of white supremacy, I explore how white supremacy is signified and interpreted in postcolonial global, national, and local contexts. Three themes are examined, (1) the transnational assemblage of white racial logics and representations; (2) the global material production of racial neoliberalism; and (3) the diverse forms of "embodied" and "disembodied whiteness" across scales and geographies such as Uganda, China, Costa Rica, and Kuwait. The persistence of white supremacy demands the cultivation and support of resistance, confrontation, and movement practices rooted in the Black radical, indigenous, and intersectional feminist traditions.

The Ugandan Domestic Worker Global Labor Chain to Gulf States: Transnational Intersectionality, Violence, and Resistance

Gulf states are increasingly relying on migrant domestic workers from East Africa to fulfill reproductive labor roles. Many of these domestic workers experience abusive and exploitative conditions as precarious, invisible yet ubiquitous global workers. We apply a transnational intersectional lens to the production of the domestic worker global labor chain from Uganda to multiple Gulf states. By applying a transnational intersectional perspective, and examining four migrant Ugandan domestic workers' stories, we show how race, nationality, and gender inequities are reproduced across the chain and its violent manifestation on migrant domestic workers' bodies. Domestic workers are also resisting their treatment, however, and organizing with domestic worker advocates across the chain. Resistant actors, however, must contend with power imbalances across the chain, and the devaluing of Ugandan domestic workers' rights and precarious forms of informal labor.

The Burden of a Toxic and Invasive Weed: Gender, Labor and Rural Livelihoods in Ethiopia

Parthenium is an invasive weed that releases toxins which repel other plants and affect the health of humans both directly through contact and indirectly through the meat and milk of livestock. Chemical control is expensive, and many farmers are not convinced of its efficacy. Weeding (early and often) is the most effective method of control. In preparation for the dissemination of two new bio-control agents, the IPM Innovation Lab initiated a baseline survey of farm households in order to determine current weed management practices, intra-household labor burden, and the effects of parthenium invasions. Ultimately, these data will be used to determine the impact and effectiveness of this new control method. Our preliminary findings suggest that farmers perceive managing Parthenium as a "family affair," whereby all household members are mobilized to control the weed. The additional time required to manage Parthenium disproportionately impacts women, whose overall labor burden is substantially increased. Further we found that the greatest burden for was not necessarily the additional time spent in the field, but the additional responsibility of having to prepare more food for any laborers that were hired to help clear the weed. Several women reported that this additional responsibility of preparing food for hired workers and the additional time in the field was a source of additional stress and mental burden.

Strategic Mobilization of Shareholder Activists on Environmental, Social, and Governance Issues

This study advances a strategic actor-centered view of social movement mobilization, using evidence from shareholder activism on environmental, social, and governance issues. Shareholder activists face an important strategic choice when engaging with target firms: some shareholders raise issues with firms on an individual basis, whereas others participate in organized collective action by

collaborating with their social movement partners. Put differently, shareholder activists face a choice of either mobilizing with collaborators or individually pressuring firms they seek to change.

How and under what conditions does the mobilization of social movement coalition partners contribute to successful activist engagements? To study this research question, I analyze a detailed database of 2,218 shareholder resolutions targeting 386 firms from 2003 to 2016, filed by members of the Interfaith Center on Corporate Responsibility, a US-based coalition of faith-based and secular institutional investors. I investigate the interaction between factors relating to how activists "demand" specific actions from firms and firms' willingness to "supply" those actions. On the demand side, I examine the effects of the size of activist coalitions that are mobilized and their composition in terms of activists' identities. Specifically, I find that shareholder activists are more likely to successfully engage with firms when investors belonging to the "radical flank" mobilize their mainstream counterparts. Meanwhile on the supply side, I find that while an unfavorable corporate opportunity structure based on firms' attempts to shape their external environment—indicated by firms' participation in lobbying activities—inhibits successful activism, mobilization through larger coalitions helps to overcome firms' resistant tendencies.

These findings emphasize the strategic choices available to social activists regarding whether to mobilize, with whom they mobilize, and the effects of mobilization. Ultimately, I highlight important contingencies for activists to consider when seeking to participate in organized collective action targeting firms.

CHUAQUI, JORGE* (Universidad de Valparaiso, Chile)

Global Social Structure and Mentally ILL Persons

We elaborate a model of global social structure in which develops social life including the social relations of mentally ill persons, structure that includes the following parts:

1.THE ECONOMIC/MATERIAL STRUCTURE: Provides material products or their temporary use and financial resources to all members of other parts and for herself.

THE STATE: develops and applies standards that are supported in the use of physical and economic legitimate coercion.

THE IDEATIONAL COMPLEX: creates, disseminates and teaches (here there is a system of sanctions and degrees) systems of ideas.

SERVICES: provide (non ideational) living work. .

FAMILIES.

Adult peoples in its most frequent cases live in their families and work in the other parts of the structure, what provides for the economic maintenance of families.

In the case of persons with severe mental illness, frequently social relations in family changes toward a subordinated position, and the participation in work breaks, what impedes them to originate an own family with their partner (in the rare cases they have one).

The upbringing of the ideational complex give the mental health professionals the status that allows them to exert social control (especially in the case of psychiatry), guaranteed by the State, over the mentally ill persons. The health services have turned to being done in the community to which belongs the mentally ill persons.

The legal prescriptions of the State, includes:
- the special legal situation of mentally ill persons,
- the allowed pharmaceutical products provided by the econ economic/material structure,
- the non-voluntary internments, and the protection of the human rights of mentally ill persons.

Social stigma of mentally ill persons crosscut the whole social structure, families, work, professional health personnel, judges, etc., what leaves them in a reinforced subordinated position.

RC16-194.1

CHUAQUI, JORGE* (Universidad de Valparaiso, Chile)

Realism , Constructivism and POWER

Constructivism poses the question of the intersubjective dimension and the relativism of sociological knowledge. As the sociologist that observes is part of social reality that is being observed the knowledge produced will not have an independent cognitive value. How can we analys power at the level of the whole society with this theoretical scheme? Power is not only intersubjetive, it depends also on economic forces, which involves technology and property of capital, including material and financial economic goods and services, what includes economic material relations. There are enormuos diferences in power among two persons that excert intersubjetive domination, one in a organization of small or médium size and another that is owner of a big transnational enterprise, analysis that implies a realist (not only subjective) examination of economic and material forces. This that not presuposes that intersubjective relations are not relevant in this context, they may be crucial for the interpersonal relations within the economic organi-

zations, what are the social and ideological constructions that operates within, and of the population in these respects. Relative to the analysis of power realism and constructivism may complement. These are the relations we want to explore.

RONCONI, LILIANA* (Facultad de Derecho (UBA), Argentina)

La Perspectiva de Género en la Enseñanza del Derecho, Una Mirada al Currículum de la Facultad de Derecho de da UBA.

La producción bibliográfica y la investigación jurídica sobre género suelen estar enfocadas en temas convencionales como aborto, ley de cupo, violencia de género, entre otras. Sin embargo, aún no se ha reflexionado exhaustivamente respecto a lo que sucede en las instituciones que forman a los/as abogados/as.

El presente trabajo pretende indagar sobre la situación de las mujeres en la carrera de Abogacía de la Facultad de Derecho de la UBA. Para ello, se tomará como eje el currículum en dos sentidos: el currículum formal, en donde se examinará el contenido del Plan de Estudios de la carrera y el material con el que se dictan las clases a fin de identificar si ciertos temas se enseñan con perspectiva de género; por otro lado, se analizará el currículum oculto —aquel que entrega enseñanzas no explícitas pero esenciales— a partir del estudio de la participación de las mujeres en los eventos académicos de la Facultad, considerando los roles que ocuparon y temas sobre los que hablaron.

Entendemos que para poder incorporar de manera efectiva la perspectiva de género es necesario no sólo atender al currículum formal sino también a esos otros saberes, ya que la educación que reciben los/as estudiantes se vincula con la futura práctica profesional. Buscamos mostrar que para lograr cambios en la situación de desigualdad de las mujeres debemos atender a la formación de profesionales con perspectiva de género.

Este artículo se enmarca en el Proyecto de Investigación DeCyT "La transversalización del enfoque de género en la enseñanza del derecho, una mirada al currículum oculto en la Facultad de Derecho de la UBA". Los datos presentados son producto de investigaciones empíricas llevadas adelante por estudiantes y graduados/as que participan del proyecto referenciado y del Proyecto "La enseñanza del derecho con perspectiva de género: situaciones actuales y desafíos pendientes."

Cross-Country Comparisons of Personal Well-Being: Measurement Equivalence in the European Social Survey

Comparing personal well-being in a cross-country setting suffers from major validity challenges resulting from underlying cultural and economic differences between societies. While one of the main goals of cross-cultural surveys is to compare countries on the basis of values of latent constructs, such comparisons are only permissible, however, if the measurement process complies with cross-country equivalence. Thus, we explore validity issues involved in the rotating module "Personal and Social Well-Being" of the European Social Survey (Wave 6, 2012). Using the dataset covering 52.537 respondents form 29 European countries, we investigate the country invariance and validity of personal well-being, which is defined as a latent construct based on two correlated constructs: evaluative well-being (i.e., overall estimation of how well life is going; including feeling satisfied with life and overall happiness) and emotional well-being (i.e., positive day-to-day feelings such a happiness, enjoyment of life, feeling calm and peaceful). Configural and metric equivalence tests demonstrate that this construct can be considered reliable and cross-country valid. However, when the stricter scalar equivalence test is applied, the measurement of personal well-being turns out not be fully invariant, and especially the items 'feeling satisfied with life' and 'feeling happy overall' are posing major problems in a number of countries. Our presentation is concluded by offering suggestions on how to compare personal well-being across European countries. Finally, we demonstrate that citizens of Nordic States and of Western Europe evaluate their personal well-being at a much higher level in juxtaposition to the citizens of Eastern and Southeastern Europe. This paper is part of the project "Reflecting Europeanisation: cumulative data bases of cross-country surveys as a tool for monitoring European public opinion trends" supported by the National Science Centre (Poland), no. UMO-2018/31/B/HS6/00403

Historia De La Enseñanza De La Sociología Católica: Proyectos y Disputas En El Campo Educativo Brasileño

Este artículo analiza la historia de la enseñanza de la sociología católica en Brasil entre las décadas de 1920 y 1940. Se evalúa, a través de la manualística escolar, los proyectos y disputas en el campo educativo brasileño planteados por los libros de Francisca Peeters, Amaral Fontoura, Alceu Amoroso Lima, Fernando Callage, Guilherme Boing, Alcionilio Silva y A. Lorton, quienes se opusieron al proyecto de una sociología que explicara el mundo fuera de la concepción social católica. Además de destacar a estos agentes, buscamos comprender el proyecto de civilización de estos libros y manuales escolares, desde la perspectiva relacional de Pierre Bourdieu, con el fin de comprender las configuraciones del campo educativo brasileño en este período. Los resultados indican un vínculo entre los manuales y la perspectiva histórico-cultural desarrollada en Francia por intelectuales vinculados al catolicismo, así como la interpretación y difusión de las encíclicas papales Rerum Novarum y Quadragesimo Anno. También critican a Durkheim sobre estudios religiosos y a Marx sobre estudios de trabajo y economía, y el conjunto de manuales buscaba al mismo tiempo refutar a tales pensadores y presentar un proyecto que, en diversos grados, predicó el regreso de Cristo y los valores tradicionales de la familia, la Iglesia y la armonía social a través de una sociología educativa católica basada en la moral cristiana como un medio para resolver los problemas sociales a nivel nacional e internacional.

Young Workers and a New Cycle of Strikes in Rio De Janeiro

This article analyses the recent experiences of union activism of two categories of service sector, with a special participation of young people: the call-center workers and the supermarket workers. More specifically the objects of this article are the telemarketers of the state of Rio de Janeiro strike, in 2014, and the strike of the supermarket "Mundial" in the city of Rio de Janeiro, in 2017. Both strikes are inserted in a cycle of demonstrations that began in 2013 in Brazil, which intertwined social movements with a high participation of the youth and workers movements whose unions were made mainly by older workers. It is argued that in these two cases the tensions between older generations at the head of the trade union leadership and younger generations became evident, especially in the youth which in spite of being the voice of 30% to 50% of the whole workers in this category, show a low percentage of participation and representation the union's direction. Furthermore, it is debated the creative potential of the tensions and the tactical and organizational innovations realized by this youth of workers. The methodological procedures used to investigate theses strikes and their unions were semi-structured interviews with the analysis of the already produced of the two categories. As results of research, it can be observed that the creative tensions between distinct generations of workers and trade unionists and the strategies of the unions can make visible the approximation and detachment of Unions directors and their bases. Moreover, the participation of new actors in the traditional labor movement brought the experimentation of new tactics and tools, such as the use of WhatsApp in the conduction of both strikes.

Who Manages the Money at Home? Multilevel Analysis of Couples' Money Management across 39 Countries

Using cross-national data from 39 countries in ISSP "Family and Changing Gender Roles" 2012 module, we do a multi-level analysis in order to examine the macro-level explanations behind the non-traditional money management systems (joint and individualized money management). Specifically, we explore how variation in institutionalized behaviors and beliefs concerning gender roles shape money management decisions in intimate relationships. In particular, we ask whether the couples are more likely to use non-traditional (joint or individualized) money management systems in contexts where gender egalitarian beliefs and practices are relatively more institutionalized. We are also interested in the interactions between couple level variables and money management in different contexts, asking if the relationship varies on the basis of macro level beliefs and practices. Likelihood of using joint or individualized systems increases across countries as gender egalitarian ideology gets stronger at the country level. There

is no significant relationship between women's labor force participation and couples' money management decisions. However, we find a strong relationship between national dual-earner couple rates and more egalitarian money management outcomes. This association is even stronger for individualized management. We cannot find evidence for our interaction hypothesis predicting that in contexts with more gender egalitarian beliefs and practices, the relative income would have weaker impact on money management decisions. Finally, contrary to our expectations, within contexts where cohabitation is socially approved, individualized management is significantly more associated with cohabiting couples. Thus, the effect of being in cohabitation does not diminish in contexts where the social approval of cohabitation is high.

Solidarity As a Weapon: An Ethnographic Account of Migrant Workers' Struggles in the Italian Logistics Sector

Abstract
IV ISA Forum of Sociology, Porto Alegre Brazil
Gabriella Cioce _ University of Nottingham
gabriella.cioce@nottingham.ac.uk
gab.cioce@gmail.com
Solidarity as a weapon: an ethnographic account of migrant workers' struggles in the Italian logistics sector
This paper approaches the subject of solidarity in the context of migrant workers' organising. Through an ethnographic study of S. I. Cobas migrant workers' collective actions in the Italian logistics sector, it investigates how migrant workers transform their informal collective cultures of resistance into union organising. While shared social similarities like language and national identity seemed to promote a mechanical form of solidarity, cooperation and coordination among different groups of migrant workers, union militants and sympathetic actors appeared to favour the emergence of organic solidarity. Then, the paper highlights an articulation of organic and mechanical solidarity as well as some of the bottom-up and off-stage micro-processes that seem to facilitate it. Theoretically, the articulation of organic and mechanical solidarity suggests rethinking the dichotomous use of these Durkheimian concepts to study union renewal, bringing into the analysis migrant workers' subjectivities and the building of solidarities through a type of social movement union. Accordingly, the paper advises moving beyond the study of S. I. Cobas migrant workers only as warehouse workers and proposes looking at the broader processes that favour their collective actions at the workplace and beyond.
Keywords: Migrant workers, solidarity, Italy, logistics, social movement union.

The Quality of Religion in Italy. a Quali-Quantitative Survey

Twenty-two years after the research on Religiosity in Italy, the survey carried out in 2017 also covers 164 subjects appropriately selected, without the pretension of representativeness and generalizability. The stratification of the sample concerns three categories related to the degree (level of obligation, middle-superior diploma, degree), the distinction of gender (man, woman), residence (small towns, medium municipalities, large cities), geographical distribution (north, center, south and islands) and age (young, adult, elderly). The solution of a completely open interview, without predefined questions, was tested. In fact, for almost half of the sample, i.e. 78 cases, the interviewers tried to obtain narratives, reflections, interpretations and evaluations not solicited through specific questions on religiosity. For the rest of the 86 subjects interviewed, the first part was entirely free and the second part was on some concepts-stimuli relating to daily and festive life, happiness and pain, life and death, God, prayer, religious institutions and Pope Francis. The results of the qualitative analysis were also corroborated with sophisticated quantitative instruments: a program called T2K (Text to Knowledge), Lexical Correspondences Analysis and VoSpec procedure (Vocabulaire Spécifique des Groupes d'individus). An analysis sheet similar to a semi-structured questionnaire was then prepared to be applied to the interview texts, with the intention of capturing recurring patterns, values and representations.

Recording Devices and Their Structuring Effects on Participants' Interactional Organizational Work

This paper discusses data registering issues of research on interactional dynamics in English as a foreign language classroom. We take Sociolinguistic Scales Approach theoretical assumptions to approach dialogical construction of mean-

denotes a presenting author. Abstracts are organized by first presenting author's last name.

ings (BAKHTIN; BLOMMAERT; CANAGARAJAH), and Ethnomethodological Conversation Analysis theoretical assumptions to interactional order of intersubjective communication of situated action (GARFINKEL; GARCEZ; GOFFMAN; SCHEGLOFF) in decision-making performances. We relate compositional elements of local and translocal scales in agent's alignments in agencies and identities accomplishments in decision-making performances regarding sound and video recording devices' presence by a scales-in-action approach. Alignments-in-interaction are ways agents direct decisions by multimodal turns-in-interaction (MONDADA). From the perspective of interactive action as multimodal communication (KRESS), such turns are perceived so when triggering aspects of interaction – speech, look, body posture, etc. – with communicative effect. This effect is taken as marker of change in the pattern of interactional order of intersubjective communication (GOFFMAN). Recording devices are taken as semiotic artifacts (LEMKE) for orientational indexical values attributed to their presence. The conformation of these values considers elements of panoptic (FOUCAULT) and anomic (DURKHEIM) nature. The analysis points to alignments-in-interaction oriented to copresent observers – the teacher, the researcher, and peers – mediated by the presence of the artifacts (RAMPTON and ELEY). According to components of multimodal turns-in-interaction, strategic alignments-in-interaction are viewed in two ways: resistance to hegemonic power relations (FOUCAULT) and care with captured image (BLOMMAERT; LI and BLOMMAERT). We discuss how agents systematically orient their actions accounting recording devices' presence, and that their presence points to supranormative effects in participants' decision-making performances. With scales-in-action approach seen as an empirical heuristics of situated performed conduct in which participants display clear orientations to recording devices' presence we hope we add to 'methodological, theoretical, or ethical aspects of representing multimodal data in linguistic ethnographic or other contextually sensitive applied linguistics research'.

Co-Parenthood Dynamics in Belgium

In 2006, joint physical custody after a parental separation became the default judicial recommendation in Belgium (Swennen, Mortelmans, 2015). While this has led to an increase in the incidence of children with an alternating residence, custody arrangements can still deviate from an equal division of childcare. As such, it is possible that equal shared care is a temporary agreement which is later altered or, conversely, the finale of a trajectory of varying custody arrangements (Sodermans, Vanassche & Matthijs, 2011). This variability makes it difficult to identify in which family contexts shared care is most salient (Feinberg, Kan & Hetherington, 2007). Furthermore, dynamics in the (non-)uptake of shared care have not yet received much attention. This paper uses longitudinal register data containing information on equal co-parenting arrangements to map the dynamics in co-parenthood in Belgium between 2007 and 2014. We investigate in which post-separation family situations co-parenting is most prevalent and how household and family characteristics serve as determinants for transitions in and out of equal shared care. As residing with both parents after a separation has proven to be important for child wellbeing (Amato, 2010), this study provides valuable insights on what may currently inhibit parents to both take up an equal amount of care for their children.

The Purpose of the Corporation? the Evolution of Accountability

The corporation is one of the most significant, if controversial innovations in history, but the impact of the corporation is questioned more than ever before. Corporations have to convincingly demonstrate their commitment to sustainable value creation in which the whole community shares, and this will need to be manifest in corporate structure, purpose and operations.

Continuously evolving, the corporation remains the primary instrument for wealth generation in contemporary economies but is increasingly challenged regarding its accountability and impact on society and the environment. The definition of corporate purpose and performance has evolved through a succession of paradigmatic shifts in the last century.

This paper aims to review and question how the debates on the corporation have evolved from Berle and Means (1932) onwards to the present day. This discussion takes place in the context of the US Business Roundtable, which represents the leading corporations of America, recently abandoning their three-decade commitment to shareholder primacy. The revised Roundtable statement instead favours the purposeful corporation that pursues the interests of all stakeholders including customers, employees and the community, as well as investors.

How this new purpose-driven policy will be operationalised is open to question. What strategies, practices and measures will be applied to pursue the interests of stakeholders? Rigorous measures, transparency and disclosure will be required if purpose-driven policy is to be more than simply a change in rhetoric.

The Evolution of the Unequal Territorial Distribution of Mental Health Professionals in Perú

The paper presents the updated mapping of how mental health professionals are distributed in the country, enabling the discussion of inter-territorial inequalities.

The mapping of the public offer is based on the consolidation and use of human resources databases in contrast with data from the last population census available (2017).

With basis on that information, choropleth maps were made, showing the availability of psychologists per 10,000 inhabitants in every region. Results showed that the region with the highest availability had 7.7 times the quantity of the region with the lowest one.

Even so, Lima region concentrates almost one third of the country's population, but its quantity of psychologists per 10,000 inhabitants is below the national average.

The paper aims to present the need of public discussion of the priorities that guide how national resources are distributed, and to establish some possible paths of action considering the inter-territorial inequalities.

The Tension between Educational Innovation, Best Practices and Their Context: Reflections on Lessons Learnt from Fondep - Fondo Nacional De Desarrollo De La Educación Peruana (National Development Fund for Peruvian Education)

FONDEP: Fondo Nacional de Desarrollo de la Educación Peruana (The National Development Fund for Peruvian Education) is part of the peruvian public education sector and it's attached to the Ministry of Education of Peru. By law, innovation is one of its thematic areas and has been its main one for the last 5 years. FONDEP funds educative innovation projects created by public schools, following a bottom-up logic.

The paper presents some reflections on important questions based on the observed experience of FONDEP and its path to establish a consensus within the sector about what does educative innovation entail, its limits and requisites, especially taking into account the heterogeneous nature of a developing country as Peru, and the huge inequalities in the distribution of resources and opportunities.

Contrary to being something undisputed, the possibility of designating something as innovative is the object of tension between organizations and plays a crucial role in the legitimation of a series of boundaries (for example, between what constitutes a best practice and what is an innovation) and in the identification of individual and collective agendas (for example, who does what about educative innovation in the country).

The paper aims to present how this non-neutral stances on educative innovation and how they interact condition and modify the basis on which schools can be recognized as platforms for educative innovation and get associated resources and recognition.

Transdisciplinarity for Environmental Management: Confronting Private Professionals' Experience to the Academic Proposal

The incorporation of social analysis into environmental management has been a long-time demand, not only of environmental sociologists but also of public institutions and researchers from multiple disciplines. However, the Social Sciences have struggled for decades with their integration in the daily practice of environmental management, which is usually controlled by professionals with a technical and Natural Sciences background. Transdisciplinarity offers a strong framework for effectively integrating the social dimension into environmental management. This is achieved not only through the collaboration between social and natural scientists, but also through the formulation of problems by non-academic and non-technical social sectors, and through the direct participation of stakeholders. In this presentation, we focus on the application of Transdisciplinarity to Environmental Impact Assessment (EIA), an administrative procedure aimed at identifying and preventing projects' impacts. Our objective is to confront the Transdisciplinarity model developed in the academic literature to the perception and experience of the professionals specialized in the daily practice of EIA in the private consultancy sector in Spain, in order to assess the applicability of the transdisciplinary proposal. To this purpose, we conducted a qualitative methodology based on semi-structured interviews, which enabled us to investigate in depth the possibilities to effectively incorporating the social dimension

into the EIA procedure through new forms of knowledge and public participation. The interviews showed important cultural and epistemological barriers as well as discursive contradictions regarding the private/public purpose of EIA and the expert/non-expert juxtaposition.

Unemployment, Informality and Precariousness in Contemporary Brazil

The Covid-19 pandemic worsened a broad social crisis that was already underway in Brazil, and deepened the fundamental contradictions of the capital-labor conflict. This crisis directly impacts the configuration of labor relations in the country, which have already been significantly affected by the deterioration of working conditions and by the systematic prescription of inequality through legal regulation (a process that culminated in the approval of Law No. 13,467/2017, main landmark of the so-called labor reform in Brazilian neoliberalism). In this scenario, the unemployment rate reached a record of 14.4% in the quarter ended in August 2020 (13.8 million people), according to data from the Brazilian Institute of Geography and Statistics. This context affects, more intensely, young people between 18 and 24 years old. Also according to the same research, the level of occupation reached the lowest rate since the historical series started in 2012 (46.8%), and the underutilization of the labor power also reached a record level (33.3 million people). Only 29.1 million people are inserted in the private sector of employees with a formal contract, the lowest level in the historical series. In turn, according to data from the same research, 31 million workers constitute the informal sector. In view of these data and the austerity measures in labor matters deepened in recent years in Brazil, our proposal aims to expose the contradictions of the government and business hegemonic discourse that the Covid-19 pandemic would be the cause of unemployment and other negative rates of the Brazilian labor market today. We seek to expose that the pandemic only deepened the precariousness and the crisis that already existed. We will combine the quantitative research method (by secondary empirical data) and the qualitative one (especially, based on sociological articles of authors such as Ricardo Antunes, José Ricardo Ramalho and Graça Druck).

RC09-106.1

COHN, SAMUEL* (Texas A and M University, USA)

How Inequality between Nations Multiplies

Economic growth has two sources. One source is the stimulus to base industries. The other is the additional growth that comes from Hirschman forward and backward linkages to those base industries. Vassily Leontief called these multipliers. Development sociologists tend to exclusively focus on the determinants of base industries – such as the development of plantation enclaves in the Global south, the development of strategic high tech-sectors in the Global North (and South). However, many global north countries such as Norway, grew without any dramatic high-tech export. Their secret was high multipliers giving them tremendous secondary growth from the limited stimulus they had.

We look at a sample of nations between 1980 and 2010 to identify what types of countries have high rather than low multipliers. We consider the roles of pre-existing GDP, education, female labor force participation and social inequality. We expect all of these to raise both industrial supply multipliers and wage-based personal consumption multipliers. High education, feminist, egalitarian nations are more likely to have populations that spend more on consumer goods which leads them to grow faster. Following dependista arguments concerning disarticulation, peripheral nations are poor because they are unequal giving them low multipliers while more egalitarian core nations grow more because they are more equal giving them high multipliers.

Global inequality between nations is caused in part by differing levels of inequality within nations.

Does Fatherhood Affect Men's Educational Attainment? Evidence from Brazilian Data

There has recently been a flurry of research about the socioeconomic impacts of changes in the nature of marriage and in patterns of family formation for both women and men. The current effects of parenthood for women's, and especially for men´s educational opportunities, however, have been less discussed. This paper focuses on the penalty of fatherhood for young men´s educational opportunities, especially the opportunity of enrolling in higher education. The literature on the social division of labor, especially research based on time use data, highlights that despite new social perceptions about the division of domestic work, women still experience a much heavier workload than men, and that men´s increasing involvement in household chores is still far from equitable. Yet, the increase in time dedicated to paid work and household chores required from parents of small children may be as harmful to the educational advancement of young men as of young women. Using data from the 2014 Brazilian Household Survey (PNAD), we examine the impact of having children under 14 years for men, in comparison to women, in the amount of time dedicated to paid work and household chores. Further, we investigate how this impact could explain differences in the chances of being enrolled in higher education for young men and women in different household arrangements. Results indicate that parenthood and the amount of time shared between paid and domestic work explain to a much lesser degree the chances of being enrolled in higher education for men than for women. However, there are significant effects of fatherhood, and of hours of paid work and those spent in household chores, on the educational attainment of young men. This is true especially for single fathers, for whom the outcomes are similar to those found for women with small children, regardless of marital situation.

"Vivir De Lo Que Una Hace, Eso Siempre Me Gustó": Percepciones y Emociones En Torno a Los Trabajos Cuentapropistas De Rafaela (Santa Fe, Argentina)

El presente trabajo se propone explorar las percepciones y emociones asociadas a la multiplicidad de actividades productivas y reproductivas que realizan mujeres cuentapropistas de la ciudad de Rafaela (Santa Fe, Argentina). Los avances aquí presentados se enmarcan en trabajos de investigación individuales y colectivos en el marco de la Universidad Nacional de Rafaela (Argentina), concretamente el proyecto Prácticas y percepciones del mundo del trabajo en el siglo XXI: continuidades, metamorfosis y "nuevos trabajos" en Rafaela (2019-2021) dirigido por la Dra. Gabriela Vergara.

Aquí presentaremos los avances referidos a describir las formas de ocupación y las principales percepciones y emociones asociadas a las actividades del trabajo reproductivo de las mujeres cuentapropistas de la localidad mencionada, en la actualidad. Para ello, trabajamos con nueve entrevistas en profundidad realizadas durante el año 2019.

Se comprende aquí que las sensibilidades sociales y las emociones son elementos centrales de abordaje de los regímenes de acumulación, en tanto forma analítica de problematización de regulación de los cuerpos vinculados a la reproducción biológica, cotidiana y social y a jornadas laborales en el mercado.

En este sentido, las percepciones sobre los trabajos por parte de las mujeres permiten acceder a los modos en que se vinculan género, emociones y reproducción en el régimen de acumulación actual en tanto modos de regulación de los cuerpos/emociones.

The Fallacy of Overeducation in Employability: An Empirical Survey on Students Coming from Vulnerable Groups

This study explores the overeducation issue and its impact on vulnerable groups, especially young people. In order to attain our purpose, an employability questionnaire survey was conducted in a Greek Economics and Business University, entitled 'From Higher Education to labour market'. The sample used in this

research comprises 1,000 fourth-year students coming from vulnerable groups, such as disabled, students with learning difficulties, ethnic groups/minorities, work-family conflicts, those with economic difficulties etc. The field research started in September 2019 and was completed in June 2019. Our main findings indicate that students coming from vulnerable groups perceive themselves as over-educated and deprived from occupational choices. Further, as the participants stated, when they apply for an internship, they are more likely to be skill mismatched by their employers. According to the majority of the respondents, this practice is attributed to employers' lack of information as regards their skills and capabilities. Finally, it was reported that this mismatch affects students' earnings but also their attitude towards the importance of education in relation to their career opportunities. These results can inform better the employability challenges anticipated by Human Resources managers and policymakers, when they are asked to incorporate employees from vulnerable groups in the labour market.

Maladaptive Livelihood Strategies: The Impact of Economic Constraints on Women Along Lake Malawi

Fishing has been an integral component of women's livelihood strategies along Lake Malawi. With the global rise in eco-tourism, heavily promoted by the Malawian government, and the establishment of Lake Malawi National Park, development of lands that abut the lake has exploded. As hotels and guest houses are constructed, access to the lakeshore by locals for income-generating activities is being hampered. Women have traditionally been active in processing and selling the fish brought in from the boats. Development has displaced these activities. The negative impact on women's income generating capacity and economic stability is heightened by low yields as a result of overfishing and changes to the lake's ecology, making competition for the available fish intense. As a result, sexual access has become part of the bargaining equation. While the women who are engaged in exchanging sex for fish do not consider themselves sex workers, they are subject to the same challenges as prostitutes: disease exposure, sexual violence, extortion, robbery, a pervasive sense of hopelessness, and depression. This paper presents the findings from interviews with some of these women regarding their economic vulnerability, challenges, and future aspirations. This presentation will compare responses between women who participated in a small income diversification pilot program and those that did not.

Site Mapping As Participatory Action: A Methodology for Community Engagement

Site mapping is an important disaster methodology. It can be used to identify high-risk geographic areas and at-risk populations. It also allows local resources to be identified. Because it is both participatory and action-oriented, this methodology can help to bridge local organizations with disaster agencies and with broader local populations, identify opportunities for collaboration, building social networks and social capital, facilitate data gathering, and improve analytical insights into specific problems and possible resolutions. Disaster mitigation, response, and recovery requires the active participation of all levels of agencies, communities, and households to contribute to effectively understand community needs and engage in action-oriented planning to effectively address them. This methodology is viable at the local neighborhood or community levels, as well as at the broader institutional and more macro levels. This paper discusses the methodology and its applications within local communities for disaster mitigation and risk reduction. This privileges the voices, knowledge, and experiences of local citizen scientists in disaster preparation. Examples of successful utilization of this strategy in both urban and rural environments will be discussed. Cross cultural success will also be demonstrated by using examples from Mozambique, Malawi, Uganda, Japan, and the United States.

COMPARATO, BRUNO* (Universidade Federal de São Paulo,)

Trapped ET LE Détective À La Lampe De Poche

L'objet de cette communication repose sur la série télévisée islandaise *Trapped* (Ófærð) créée par Baltasar Kormákur et diffusée depuis le 27 décembre 2015 à la télévision et disponible sur Netflix. Plusieurs auteurs, depuis l'ouvrage pionnier de Siegfried Krakauer em 1922 (*Le roman policier*), ont réalisé des réflexions sociologiques sur le roman policier. Pour des auteurs comme Philippe Corcuff (*Polars, philosophie et critique sociale*), Ernest Mandel (*Meurtres exquis : Une histoire sociale du roman policier*), et Luc Boltanski (*Énigmes et complots : Une enquête à propos d'enquêtes*), le polar constitue une entrée éclairante dans les dérèglements existentiels et sociaux contemporains. Ce qui déroute le spectateur de *Trapped*, c'est que le détective Andri, « un homme ordinaire […] confronté à une situation extraordinaire », d'après le créateur de la série, ne correspond pas au stéréotype des séries américaines ou continentales puisqu'il n'est pas armé. De façon surprenante, il poursuit les malfaiteurs, équipé en tout et pour tout uniquement d'une lampe de poche. Comme dans les jeux d'enfants, quand il dit « vous êtes en arrestation », les malfaiteurs interrompent leur fuite. Ce qui parait invraisemblable aux spectateurs férus de séries américaines est certainement normal pour les spectateurs islandais puisqu'il ne s'agit pas d'un exercice expérimental. *Trapped* est la série commerciale la plus chère jamais produite en Islande. Elle a coûté un milliard de couronnes, soit près de 6,5 millions d'euros en 2015, alors que les productions habituelles coûtent entre 100 et 200 millions de couronnes. Ce qui constitue l'intérêt sociologique de cette communication est une réflexion sur le rapport à la loi et les formes de transgression admises par la société islandaise. Même si le réalisateur emploie le climat local et le blizzard pour reconstituer les caractéristiques de l'Islande, ce qui dépayse le plus les spectateurs étrangers est sans doute ailleurs.

CON WRIGHT, GÜLÇIN* (TED University, Turkey)

'Stand-By Mothering': Expectations Around and Experiences of Motherhood in Later Life

Studies on motherhood and mothering have predominantly focused on the experiences of mothers for younger children whereas motherhood in later life has received relatively scant attention. This might have stemmed from the dominant perception around the parenting role as drastically transforming and almost disappearing when children transition to adulthood, a stage idealized as signifying clear-cut independence from one's parents. Many family and gerontology scholars have investigated the gendered patterns in multiple dimensions of parent-adult child relationships, by overwhelmingly studying mothers' ties with their kids. Yet, there is a limited understanding of cultural expectations around motherhood in later life including what would be considered desirable motherhood responsibilities for adult children. In this study, I address this gap by asking whether culturally acceptable mothering activities change as children transition to adulthood. To answer this question, I conducted in-depth face to face interviews with 23 heterosexual and cis-gendered mothers who, at the time of the study, were between the ages of 58-75, married, with no disability, had at least two living adult children, and resided in a Midwestern U.S. town. These older mothers reported that they perceived themselves more as a resource and a background supporter in their adult children's lives. They were ready and willing to support their children emotionally and instrumentally, but with limitations due to their own availability as well as expectations on the autonomy and self-sufficiency of adult children. Additionally, adult children's needs, demands, and expectations were stated as factors shaping these women's mothering experiences and their expectations around motherhood responsibilities. These findings add to our existent understanding of motherhood by showing that mothering for children endures as a major role throughout the life-course with significant transformations in the way it is experienced.

The Circulation of US Social Psychology: A Comparison of France and Brazil (1920-1940)

This paper consists of a comparative study of the 'sciences of man' practiced in France and Brazil to analyze how sociological factors impacted the reception of US 'social psychology' in the Interwar period in both countries. It is intended to highlight the following aspects: 1. The position of both countries in the transnational space and the relationship both had with the United States through public or private funding institutions; 2. The role played by each national intellectual tradition, Brazilian and French, regarding the new sciences of man; 3. The social and intellectual trajectory of agents, in particular related to education, professionalization, and the international circulation of intellectuals in both countries; 4. The role of the institutionalization of the sciences of man at various levels of education – primary, secondary, and third-level – as well as in scientific-technical social policy institutions. This involves showing that, despite the differences, both intellectual contexts had the same oppositions: US social psychology was perceived as more positive and scientific in opposition to a philosophical or abstract knowledge of French inspiration. Moreover, this perception results in both cases from contact with US research/authors, publicized by funding from US philanthropy. Finally, the same type of adaptation of new knowledge can be observed in both national contexts, resulting in greater theoretical and methodological eclecticism. The differences resulted from the relationship of intellectuals with the state and teaching institutions: in Brazil 'social psychology' was practiced by doctors and given prestige by reformist educators, institutionalized in recently created higher edu-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

cation institutions; in France it referred to a debate about the borders between psychology and sociology in the Durkheimian circle and its competitors, whose institutional impact was restricted to extra-university scientific institutions.

Agrifood Knowledge Transitions in the Anthropocene

At the heart of recent debates around the conditions of living in the Anthropocene are ideologies and political economies that push for change in opposite directions: growth in productivity, increasingly precise knowledge (through data) and technological solutions vs. reduction of waste, a democratization of knowledge and nature-based solutions. Nonetheless, the imperative to change can be felt at global, national, sub-national and local levels around the world. We observe that agrifood actors are either changing, debating change, ignoring change or resisting change. These contemporary debates provide a ripe landscape for sociological reflection upon what transitions, transformations and other forms of change are currently unfolding. One of the biggest debates revolves around the type of knowledge that is needed. The green revolution benefitted from a strong industry and public research collaboration through the 15 research institutes that make up the Consultative Group of International Agricultural Research (CGIAR). Following the food-energy-fuel crisis of 2007-2008 that triggered a re-evaluation of sustainability in the dominant agrifood system, the type of knowledge needed to remain productive on the planet was also thrown into question. The CGIARs have since been underfunded and critiqued on all fronts, forcing a transition towards new topics of research and a new logic of organization. The private sector investment in agrifood research and development continues to outpace that of the public sector and their commitments to sustainability range from innovative ecological solutions to simple greenwashing. Finally, some farmers and social movement activists are rejecting the role of research itself in their systems of innovation. In this paper, we explore the question of transition within the Anthropocene by focusing on the types of knowledge that are being reprioritized and privileged within a selection of institutionalized debates over whose knowledge counts for agrifood systems in the Anthropocene.

Love Values in Modern Fiction: "Contemporary" Dreams in Television

Mythologies exist everywhere not only in fiction but also in official representations of the ongoing reality. The promoted TV productions (which also constitute a basic canvas of the social media references nowadays) reflect the frame in which dominant narratives are massively diffused. If for instance we compare a TV program of the nineties (in any Western country) we realize that the distribution of the main TV themes is slightly different (but not really very much) from the present distribution inviting us to conclude that the frame of values, beliefs and ideas remains a lot deal the same. This was at least revealed in our study of the Greek TV program of the last three decades.

The political agenda includes much of life style (for instance on the "first lady" better dressed) and thus also shows the mass-culture audience's lack of interest in politics (which define its life in reality).

What we observe, is the big portion attributed in the "clear mythology", such as the fictional productions of the serials with the same recurrent recipe: true love between sexes, jealousy, obstacles, the power of the wealthy, the possibility to dream over dramas representing ideal realities. Of course, this is not new; just to stick only in modernity, the same idea (very much appreciated by the public) is found in romantic novels of the 19th and 20th century, in American TV series or Latin American Telenovelas, in Turkish productions etc. where the "mainstream" myth is the **romantic love**.

How things should be or should happen, symbolizing a rather archetypal (at least for the two centuries of the modernity) concern which survives in time, and which seems the audience's biggest accepted value: how to surpass obstacles and "live" the big love (either in reality but most of the times in fiction).

Giving Sense to and Making Sense of Uber Misconduct Claims

The media repercussion concerning frauds and illegal schemes in business scenarios and involving corporative actors has been growing and therefore, became the focus of many academic debates and research. For instance, the study of motivations and consequences of misconducts practices. Although there is no consensus on the definition of the term, in this paper misconduct is understood as acts that social control agents (such as the judiciary and public authorities) determine as morally questionable practices. These acts can result in high social costs and affect directly economies. While decision process literature explores media as an intermediate responsible for deciding which one is spotlighted, little is known about how the media tries to construct this sense. Drawing upon the sensemaking and sensegiving literature, this paper examines how the media give sense to and make sense of Uber misconduct claims. In particular, we focused on the episode of the company's entrance in Brazil apart regulation. Data were collected from two major business news magazines and Uber press releases concerning the episode. Further, content analysis was done. This paper advances the discussions about how the media behave in sensemaking and sensegiving process about misconduct practices. Also, how this can impact the organization facing the misconduct claims. Whereas public authorities enforced the meaning of illegality, the media managed to support legitimacy accordingly to the company's media press. However, when an organization faces a misconduct claim, particularly when it has wider societal consequences, society expects that the company needs to apologize for its actions and resolve what has happened. In that the company never excused for its practices, the media acted as a central source of the misconduct sensegiving to the awareness of the public. This paper contributes to enlarge the discussion about the role of mediation in the social construction of reality.

Anti-Feminism and the Rise of the Right in Liberal Canada

In the contemporary global resurgence of right-wing politics, many variants of anti-feminism are becoming apparent -- in a range of social movements, political regimes, institutional initiatives, policy consequences, and on- and off-line cultural practices. Different explanatory frameworks emphasize the role of neoliberal austerity policies, religious movements countering sexual rights, reactionary responses to globalization, and mutating forms of misogyny, with variable intersections of sexism, racism and homophobia with religions and nationalisms.

Despite its international reputation as a bastion of liberalism and pro-feminist politics, Canada has also seen a rise of right-wing groups over the last decade, targeting political parties, electoral politics and policy reforms. University campuses are major sites for their proliferation and cultural political strategies. These groups include explicitly anti-feminist groups such as men's rights and anti-abortion groups. More recently, they have been organizing under the banner of free speech and academic freedom in order to wage campaigns against gains made in university contexts around a range of social justice concerns, many of them associated/aligned with intersectional feminisms.

For example, a 2016 controversy over a professor's highly-mediatized refusal to use transgender pronouns set off a chain of events that is still unfolding, one of which has been a government requirement that all Ontario universities implement free speech policies under pain of financial sanction.

This talk will consider these developments in Canada in relation to the transnational anti-feminist gender politics of the resurgent right.

Totems, the Corporeal Self, and Identity in Trans Local, Digital Space

At both the professional and amateur levels of global sport, the corporeal body of athlete and spectator have been infused with sporting totems which produced a strong social between the individual and the group. In the past, these symbolic identity links were forged in the connection between personal affiliation and the local cultural expression via the symbol of the totem, forming an imagined community.

These professional sporting bodies within global sport have most often been linked to commercial and corporate interests and more recently to urban metro poles, occupying a physical, material space. With an increase in digitized global economies which transcend the local as formerly expressed in geographic locales or commercial sites, what emergent forms exist in urban spaces that connect sporting bodies and identities to trans local and digital spaces. Whither the lo-

cal urban sporting spaces where identities are crafted and shown to persist over time? How have the fluidity and confluence of virtual space and digital identities transformed the professional sporting body in urban space into something other?

In this era of globalization, with its increase in mobility and fluidity of identity, how are local identities being transformed at the professional sporting body level, at the spectating body level, and in regards to the community at the local level? How is allegiance and expression of the local impacted by a transforming digital and trans local milieu? Out of these emergent patterns, would new linkages have been made between new cities and bodies in these spaces?

In a globalizing and digitizing age, what are the new meanings of geographic urban space and their tie in to identity construction and the body? How are the complexity of these identities and bodies being expressed corporeally?

COOPER, ADAM* (Human Sciences Research Council; Stellenbosch University, South Africa)

Space, Capital and Formal/Informal Economies: Understanding the Challenges of Black Tourism Entrepreneurs in Johannesburg

Entrepreneurship is often upheld as a panacea for job creation in Africa and elsewhere. However, few critical, deep ethnographic accounts explore the everyday challenges that 'entrepreneurs' in a range of African contexts experience and the lack of structural support thay receive to aid them in their endeavours. In this paper I explore how young Black entrepreneurs in the Johannesburg tourism sector are placed at a fault line between township and mainstream economies, hustling forms of cultural, social and financial capital from various spaces, to generate an income. The challenges they experienced were substantially shaped by physical space and spatial divisions in Johannesburg, as conflicting rules of the game occurred between the townships and areas where the mainstream economy plays out. The South African context and its economy illuminate characteristics that are both typical and atypical of the African continent, with a smaller informal sector and a number of large conglomerates. However, these young people's challenges across spaces with different degrees of 'formality', experienced through regulatory requirements and forms of control, resonate with other African contexts and parts of the global South.

A small number of youth used interesting stories, practices, historical artefacts and buildings in marginalized spaces *and* their schooling and English language, to navigate their way across the mainstream and township/inner-city economies. Bourdieu's (1986) conceptual framework therefore required indigenisation for the South African context. Sub-fields existed across this divided and unequal post-apartheid city, in the townships and mainstream economy, corresponding with physical residential areas. Despite cultural capitals empowering these young Black entrepreneurs to beat the odds and establish their businesses, each was confronted by a set of sectoral barriers which limited their success, creating ceiling effects.

COOPER, ADAM* (Human Sciences Research Council; Stellenbosch University, South Africa)

Speaking Back and Extending: Using Bourdieu's "Field" to Illustrate Theory Building from the South

In this paper I share some thoughts on using Bourdieu's concept of "field" to research young people's income generation strategies in South Africa. The difficulty with using Bourdieu's concepts in post-colonial or global south contexts is that these constitute what Bourdieu called 'undifferentiated' societies: they do not form independent fields, autonomised domains of activity that are regulated by widely accepted 'rules of the game'. This is because these societies do not contain unchallenged state power, in conjunction with a capitalist economy, regulating practices by functioning as a kind of overarching field. For example, widespread informal economies that largely do not pay tax and abide by state decreed regulations exist in such places, alongside the formal economy. I look at how 'the field', in this case one focused on income generating practices, may actually contain a set of overlapping fields or sub-fields, in post-colonial contexts, operating with different logics of practice and a range of struggles over meaning.

Using Bourdieu's theory in Southern contexts requires disentangling the local and global, the universal and particular. However, I argue that recentring our focus with Africa, Latin America or Asia as our primary reference point requires more than 'translating' theory to new contexts. The challenge lies in southern scholars speaking back to the theory and extending it, intentionally marking their contributions to its evolution with their own theoretical 'cairns' and concepts. This means signaling when their work moves beyond particular contexts to say something about human beings more generally, something which European and North American scholars have been very good at. The value of South-South collaborations is highlighted in this endeavor, as these contexts share much in common and can function to illuminate 'other universals'.

Institutional Support from Ford Foundation for the Brazilian Sociology during the Military Dictatorship in Brazil

This paper aims to present the role of Ford Foundation in the development of Brazilian Social Sciences. In general, the Latin American Sociologies experienced a period of recession because of the dictatorships. Contrariwise, the Brazilian Sociology has experienced a reasonable institutional expansion of training and research during this period. This small progress is related to the fortification of the new graduates program courses that were created after the universities' reform and the consolidation of new private centers of research, such as theBrazilian Center for Analysis and Planning (CEBRAP), and the Institute for Economic, Social and Political Studies of São Paulo (IDESP). Although the most important universities of the country deeply suffered with the dictatorship, the raising of independent research institutes saved the Brazilian intelligentsia and their intellectual production. These independent centers, CEBRAP and IDESP, received a fund from Ford Foundation, which was crucial for the maintenance of Social Sciences during (and even after) the Dictatorship. After helping to establish the center, Ford Foundation opened a program to financing researches and NOGs that worked with Human Rights. This program was crucial during the democracy restoration's process in the late 1980s. As a big expression of this support on Human Rights was the donation for establishing the Nucleus of Violence' Studies (NEV) at the University of São Paulo. Ford Foundation was engaged not only in the internal development of Sociology in the country, as well as the spread of Brazilian Sociology for foreign countries. For instance, in 1969, it published in English "The Negro in Brazilian Society" by Florestan Fernandes.

CORICA, AGUSTINA* (FLACSO, Argentina)

Elecciones y Posibilidades Educativas Post-Egreso: Un Seguimiento De Cohortes De Jóvenes Universitarios De Buenos Aires.

Las transformaciones estructurales de las últimas décadas llevaron a los estudios juveniles a interesarse por las nuevas formas de vivir la juventud. Como punto de consenso estos estudios indican que los pasajes de la juventud a la adultez se caracterizan en la actualidad por la diversidad de caminos, la superposición de actividades y la no linealidad de los recorridos. En este marco, la prolongación del tiempo dedicado a las actividades educativas se ha consolidado como una de las características de la nueva condición juvenil, donde el incremento y acumulación de años de estudio aparece como una tendencia en alza desde hace más de tres décadas. Sin embargo, la desigualdad que caracteriza a América Latina sitúa al contexto como una variable clave desde donde analizar las elecciones y posibilidades de los jóvenes en el campo de la educación. En este sentido, a partir de un estudio longitudinal de seguimiento de dos cohortes de egresados del secundario de la Ciudad y provincia de Buenos Aires, en dos décadas distintas (1999/2011), se reconstruyen las trayectorias educativas poniendo el foco en las elecciones de los jóvenes respecto a la continuidad educativa en el nivel superior y las posibilidades de sostener el trayecto educativo inicial comparando los recorridos y movimientos registrados a lo largo del seguimiento. Particularmente, se sostiene que los ciclos económicos inciden en la disposición de caminos transitados por los jóvenes, marcando rumbos diversos entre la relación entre educación y trabajo. Pero también las políticas educativas implementadas abren nuevos desafíos y debates sobre la igualdad de oportunidades e inclusión educativa.

CORRADI, LAURA* (Università Della Calabria, Italy)

Dealing with Diversities in Rojava (north Syria) after the Defeat of Islamic State. Gender, Ethnicity, Class, Religion, Sexuality, Age and Abilities.

By using an intersectional approach the author analyzes at the micro-level how prevention of structural inequalities (based on class, gender, education, age, status, different abilities) and forms of violence (based on gender, sexual orientation, ethnicity and religion) can take place in a democracy born in a post-war areas. An ongoing official research by University of Calabria looks at the quality of democracy, academic freedom, and new political structures dealing with diversities simultaneously. The specific agency of women's groups to reduce economic and social gaps in health and education is highlighted - as well as experiments meant to process the trauma of violence (such as the 'village of women') and prevent the occurence.

During the defeat of the Islamic State of Iraq and the Levantine (ISIL), the role of Kurdish women in the conflict has attracted global media attention and academic interest around Jineology (Science of Women) as a strategy of empowerment to contrast inequalities - yet little is known about social life, work, education, and

leisure. As the experience of Democratic Federalism in Rojava was developing - since the approval of an innovative Social Contract among different ethnic groups inhabiting the area and belonging to different religions - a political constituency based on gender, ecology and the valorization of diversities was established. During post-war re-construction, egalitarian state-less policies, innovations and processes of direct democracy have been said to affect social life significantly, in a positive way.

Girls in the Semi-Liberty: Resignifications of Narratives of Adolescents in Compliance of Social-Educational Measures

This research was carried out in a "House of Semiliberdade" of the city of Belo Horizonte - Minas Gerais-Brasil, taking as object of study the narratives of the adolescents in compliance of socioeducational measure, in closed regime. Since the masculine and the feminine constitute fields structured by relations of power, gender relations are one of the most important and permanent asymmetries of modern society, being structuring elements of social institutions (SCOTT, 1994; SAFFIOTTI, 1994). The research sought to detect the peculiarities of the measure of semi - freedom in the processes experienced by girls adolescents in situations of vulnerability and conflict with the law, analyzing their perceptions through their narratives, and trying to understand how they construct resignifications about themselves, educational processes and the world (SANTOS, 1992; SARAIVA, 2003). The study was characterized by a qualitative approach, using direct observation, documentary research, narrative interviews, intervention research and the circular processes. The results pointed out clues about the way in which adolescents embody their experiences in the house, from syntheses of social issues lived in the singularity of the youthful experiences and the narratives directed our look at some aspects that mark and influence the life of these "Minas na Semi" (girls in semi-liberty) (KEHL, 2003; PERALVA, 1997). Serving the socio-educational measure is a situation and not a condition in which they are immersed. In this sense, the semi- liberty house appears as a territory in which they construct forms of belonging (FOUCAULT, 2006; GOFFMAN, 1971). Strategies of resignification and resilience are experienced on a daily basis and gendered by these poor and young and girl in compliance with socio-educational measures.

The High School Counter-Reform and the Loss of Social Rights in Brazil

This research seeks to identify, describe and analyze the processes and effects of the High School counter-reform, regulated by the law 13.415/17, and its loss of social rights, especially for the Brazilian youth. The High School in Brazil, last level of compulsory education, has suffered many reforms proposed by the *Federal or states government*s in the last two decades. By studying the law 13.415/17, in this article we initially focused on the analysis of the counter-reform effects on the school subjects. After that, we examined the curricular structure proposal and the National Curriculum Common Core for the High School. The argument is that the flexibility proposed in the curriculum simplifies the purpose of the compulsory education to the preparation for the labor market, restricts and reduces the offer, increases the educational inequalities and can justify legally the public schools privatization. The conclusion is that the counter-reform represents a coup against the Brazilian education, because it doesn't consider the characteristics of the current High School (the teacher's labor conditions and the *infrastructure* of the schools), the achievements and orientations in the Educational National Plan (2014 – 2024), the subjects' experiences and knowledge and the researches that had been developed about the theme. The use of the concept "counter-reform" *strengthen*s the analysis of the regressive processes regarding social rights when considering this initiative.

Anti-Gender Politics and De-Democratization in Latin America

The presentation will examine the eruption and propagation of anti-gender politics in Latin America in the 2010´s, as part of the wider transnational landscape where similar dynamics are underway, in particular Europe. The analysis is informed by the outcomes of case studies in nine countries: Argentina, Brazil, Chile, Colombia, Costa Rica, Ecuador, Mexico, Paraguay and Uruguay, an assessment of transnational networks and actors engaged in these frays and an essay on the long term trajectories of the religious politics these dynamics imply. The frame used to process the data emerging from this exercise is organized in six blocks: a) the retracing of genealogies of anti-gender discourses both at transnational and regional levels (including its association with anti-Marxist parlance); b) a cartography of structural conditions and trends that have enabled the surge and propagation of these attacks and adherence to the content they deploy, with particular attention to the ongoing impacts of neoliberalism, the politics of the religious, inequalities and structural violence, bias and distortions laicité and political systems; c) the mapping of key moments of eruption and condensation of these battles; d) main actors involved and distinctions and similarities of strategies adopted in different contexts; e) the ways in which anti-gender systemic strategies and occasional outbursts are connected with anti-democratic forces and effects. A last set of reflections will be devoted to exploring limits and possibilities of interpretative lenses being used to address anti-gender politics in the region and elsewhere, such as the "populism paradigm" in its various version, the backlash and counter movement frames.

LACZYNSKI, PATRICIA (Universidade Federal de São Paulo, Brazil)

Youth and Work on the Outskirts of São Paulo: What's New?

The article discusses the preliminary results of a research that aims to identify youth groups and institutions based in São Paulo, which seek to build alternatives for productive inclusion, in a context of increasing precarious working relationships. Despite a series of public policies implemented in recent decades in Brazil, there are still serious challenges, especially regarding the reality of the poorest young people, women and blacks: the difficulty of finding a job and the quality of the jobs found. Another critical element in the analysis of inequalities concerns the concept of territory. Given these considerations, the study was conducted in two peripheral regions of the city of São Paulo, which concentrate the highest unemployment rates, informal jobs and homicides. At the same time, these areas concentrate an important presence of youth collectives, especially those organized around the arts, culture and technology. In many cases, this kind of participation contributes to the generation of job opportunities, income streams and increased education of many young people. The first results indicate a set of actions and conflicts between different actors, involving young people, non-governmental organizations, government officials and business institutions. Thus, this article will focus on the multiple perceptions and meanings attributed by young people themselves to the initiatives of job and income generation. The project is supported by FAPESP and the Canadian IRDC, as well as a partnership with FLACSO-Argentina.

CORTÉS SAAVEDRA, ANDREA MONSERRATT* (University College London, United Kingdom)

Desafíos Metodológicos y Teóricos En El Estudio De Las Construcciones Discursivas y Mediáticas Sobre La Infancia Migrante En Chile

Actualmente, los medios de comunicación y las políticas públicas enmarcan la inmigración en Chile principalmente como un problema social. Este carácter asignado a la migración Sur-Sur podría estar relacionado con construcciones históricas, que se han asociado fuertemente con la idea de homogeneidad social y cultural basada en una blancura chilena ficticia (Tijoux, 2013). La construcción de la diferencia social se hace patente cuando los orígenes de los inmigrantes no son europeos, es decir, los "otros" suelen ser los indígenas y migrantes latinoamericanos que a su vez son racializados y posicionados como un grupo desfavorecido en Chile que requiere intervención.

Esta presentación está basada en mi trabajo de campo en el que conduje un estudio etnográfico en una escuela con alta diversidad social localizada en el norte de Chile. Por una parte, mi investigación busca conocer como la "otredad", con relación a la migración, es construida, narrada, negociada y experienciada en la escuela y, por otra parte, mi trabajo intenta identificar como los niños y las niñas migrantes son posicionados/as por los medios de comunicación y cómo la escuela interactúa con los discursos mediáticos sobre migración e infancia migrante. En ese sentido, en esta ponencia expondré algunos hallazgos de mi trabajo de campo en cuanto a las formas de racialización de la infancia migrante presentes tanto en los medios de comunicación como en la escuela. Así como algunas reflexiones sobre los desafíos metodológicos y teóricos a la hora de interactuar y estudiar a la infancia en un contexto escolar diverso y con persistentes inequidades sociales y generacionales.

CORTÉS SAAVEDRA, ANDREA MONSERRATT* (University College London, United Kingdom)

Research with Children in a School in Chile: Methodological Challenges and Reflections on Taken-for-Granted Notions of Childhood

Based on my ethnographic fieldwork with migrant children in a school located in the north of Chile, this paper aims to present some reflections and methodological challenges in research with children in contexts of diversity. The fieldwork on which this paper is based is part of my PhD research that describes and analyzes how the social positions of 'otherness' during contemporary migration are being created, negotiated and narrated by migrant and non-migrant students, teachers and school staff. Given that this study takes as its focus on the social position of the 'migrant child', it is essential to problematise essentialised and taken-for-granted notions of 'the child'. I am grasping 'child' as a social position produced within intersectional and generational relations. In this regard, to understand how 'otherness' is produced in relation to migrant children, I am considering both the position of migrant and child.

Some of the central questions that arose during my fieldwork were: what are the implications of the methodological techniques on data production? How to manage the inequalities produced by my position as an adult when I conduct interviews? And how to deal with the consequences of choosing a school as a research setting (between a comfortable space for children and a place with implicit structural hierarchies difficult to avoid). Therefore, through my ethnographic fieldwork, I will seek out what it is to be a child in a diverse Chilean school, including how they are positioned and what social positions they can adopt, build or negotiate in an institutionalised and adult-centred social space.

COSTA, HENRIQUE* (Universidade Estadual de Campinas, Brazil)

Entrepreneurship and Engagement Among Young People from the Outskirts of São Paulo

In recent years, all formal and informal Brazilian workers have been following a proliferation of terms and prescriptions aimed to consolidate a new relationship with the world of work that expresses values and expectations of a competitive capitalism that encourages individual performance. Gathered and disseminated under the label of entrepreneurship, this discourse is reproduced by governments, foundations, the media and social movements, which reflects, on the other hand, a need for a much deeper global process of precariousness. It imposes contemporary forms of self-employment and self-management in small businesses through the creation of Individual Microentrepreneurs law (MEI) and "uberization".

The collapse of *Lulism,* raised during former President Lula's term - a period of economic growth, innovative public policies and low unemployment -, mirrors both the successful management of the consequences of the "collapse of modernization", and it's impossibility to reproduction under difficulties of the world economy and its crises in the last decades. In Brazil, self-employment reached a record contingent of 24,141 million Brazilians in the quarter ended June 2019, according to local surveys. Part of this contingent, however, seems convinced that entrepreneurship is not only an emergency exit to the crisis caused by the productive restructuring and the end of the expectation of for a Welfare State, but a more acceptable alternative even than formal work, with a formal contract, time and hierarchy imposition.

Entrepreneurship strategies on the outskirts of São Paulo reflect both the region's rich cultural production and the updating of precarious dynamics. In the outskirts of brazilians large cities, an entrepreneurial profile is multiplied through engaged discourse of "social impact" and the empowerment, associated with belonging to a place, the *periferia*. Places known for the violent sociability, the repressive speeches, the precariousness of public services, the unplanned occupation and the fate of thousands of migrant workers.

COSTA, JULIE* (Université de Caen, France)

Risk Narratives and Drug Scare: Local Media's Coverage of Crack Use in Paris's Open Drug Scenes

This paper focuses on the narratives of risk constructed and conveyed by the local media about crack use, abuse and addiction in Paris's open drug scenes. We first trace media coverage and some of its core claims about the destructiveness of this smoked cocaine freebase — chemically responsible for mendacity, prostitution, violence and all kinds of social problems geographically concentrated in areas like *Stalingrade* and *La Collina*, "the gate of hell" in the northeast of the city. Based in a frenzy approach to public health and public order, distant to scientific analysis and data evidence, these media's narratives on risk justify a large *social panic* and a local *drug scare* construction, misinforming population and presenting crack abuse and addiction not as symptoms of social disaffiliation problematic, but as its most important causes. With regard to it, we maintain that the local media narratives provide both a hysterical speech against historically marginalized social groups and a large propaganda to justify ostensive and urgent sanitary and police intervention against them. We analyze, in this context, how the mobilization of these narratives forges public opinion and impacts the institutionalization of the crack question in public agenda, influencing morally state discourses and practices concerning users, dealers and the urban territory of Paris

Innovaciones Tecnológicas Informacionales Y Confianza: Aspectos Teóricos PARA Construir EL Mercado De Plataformas Digitales

¿Cómo podemos ver la relación entre confianza e innovación tecnológica desde la perspectiva de que puedan presentarse como una de las válvulas de empuje más impactantes en los cambios sociales y económicos de los últimos siglos? Como señala Castells, "la evolución de la tecnología ha determinado en gran medida la capacidad productiva de la sociedad y los niveles de vida, así como las formas sociales de las organizaciones económicas" (2006, p.119). Han surgido nuevos modelos de negocio en una coyuntura internacional que causan profundos cambios en escenarios institucionales, como el mercado, que también son el resultado de ellos. Uno de estos modelos destacados son las plataformas digitales. La opinión general es que este tipo de negocio actúa como un mecanismo facilitador para satisfacer la oferta y la demanda. En la práctica, se ofrece un sistema tecnológico "seguro" a la sociedad, se recopilan datos personales, se establece la relación de confianza entre los actores y se alimenta la mercantilización de la información como materia prima básica para la prestación del servicio, se realiza el consumo y La legitimación del servicio ocurre en la sociedad. Estas prácticas se han vuelto cada vez más comunes en estos días. La velocidad de la interrupción que estos nuevos modelos de negocios han causado en las distintas dimensiones de la vida humana es expresiva, no solo ha cambiado el hábito de consumo de las personas, sino también su propia forma de realizar actividades rutinarias. El objetivo es observar el impacto social causado por una dada innovación tecnológica, con potencialidades disruptivas, como las plataformas digitales. Y observar si la ruptura del significado dado a los procesos de construcción de confianza del consumidor depositados en estas plataformas digitales puede conducir a un desequilibrio de mercado y a la generación de impacto social por parte de la empresa.

Convivial Sociologies: Exploring Transdisciplinary Futures

Three decades after the call published by Mary Jo Deegan (1989) for "convivial sociology", contemporary sociology is still searching for ways "to speak in a different voice". Yet the present moment seems to be more auspicious for those interested in constructing convivial sociology. Thus, the following recent theoretical and methodological advances in research on conviviality create a fertile soil for epistemological innovations:

Environmental critique of capitalism: building on Ivan Illich and contemporary degrowth scholarship, authors refer to conviviality here as synonymous for sustainable humans-nature relations.

Critique of anthropocentrism: based on concepts such as "living cities" and "multi-species entanglements", authors (e.g.: M. Given, D. Houston) in this field reject human exceptionalism in favor of a focus on interdependent assemblages including humans, animals, plants, microbes, etc.

Critique of sociocentrism: authors in this field (e.g: J. Overring, E. V. Castro) challenge the predominant definition of society of social sciences pointing to minor sociabilities in migrant or indigenous communities, in which separation between public and private or domestic and collective spheres is meaningless.

Critique of culturalism: rejecting pre-political cultural identities, authors (e.g.: P. Gilroy, M. Nowicka, T. Heil) use conviviality to refer to the contingent negotiation of differences in everyday life.

If coherently combined, these different developments allow for imagining convivial sociologies which challenge the fallacious decoupling of humans (culture) and nature and strict disciplinary separations as well the hierarchization of scientific and non-scientific knowledges and methods of knowing.

The present paper reconstructs the above mentioned developments and explores their consequences for the construction of convivial sociologies as a transdisciplinary scholarly space focused not on human societies as a whole but on interdependencies and interactions among humans and between those and non-humans.

Critical Theory Meets Contemporary Far-Right Politics: Equivocal Theories, Wrong Diagnosis?

Contemporary social scientists have generally failed to predict the conservative backlash culminating with electoral victories of right and far-right wing forces in different countries. In case of critical theory, which historically emerged in the context of struggles against authoritarian domination, this failure is especially painful.

The paper sustains the argument that in case of critical theory the erroneous diagnosis is connected with theoretical moves completed by authors of the second and third generations of the Frankfurt School. Three main developments will be analyzed:

After systematically neglecting critical engagement with capitalism (Kapitalismuskritik), critical theorists (e.g.: J. Habermas, A. Honneth) have not developed instruments to grasp contradictions between democracy and contemporary dynamics of capital accumulation (dispossession, precarization, financial traps) which feed far-right politics.

For disregarding the link between social structure analysis and democratic theory, critical theorists (e.g.: J. Habermas, J. Cohen & A. Arato) have developed theories blind for the relation between structural shifts (emergence of "new" middle classes, squeezing established middle classes, hyper-concentration of wealth by the top 1% richest, slight reduction of gender and ethnoracial asymmetries) and political preferences for far-right wing politicians and policies.

Inscribed in the work of different theorists of the second and third generations (e.g.: J. Habermas, S. Benhabib), teleological believes, according to which human rights, democracy and rationalization of life worlds are intrinsic properties of modernity, obfuscated economies of (dis)affections behind the contemporary conservative backlash.

Democracy, Family Transmission, Kinship and Political Power in the Bolsonaro Government

The persistence, in competitive political systems, of the family transmission of power is paradoxical; since it almost always inhibits the oxygenation of power,

limits renewal in competitive systems, empties the republican meaning of politics and contributes to the "oligarchization" process of contemporary liberal democracies. This research has as its object of analysis the social and political trajectories and origins of a set of protagonists in Brazilian politics in the Bolsonaro government, trying to understand the paradox of the family transmission of power in Brazilian democracy. The research sought to problematize Brazilian democracy with special emphasis on the following questions: Is there a pattern of family-based political occupation-domination in the Bolsonaro government? To what extent does the government break with the historic families of power from the regional oligarchies? In methodological terms, we made use of prosopography and documentary research, reconstructing trajectories, occupied positions, family ties, kinship links and/or inbreeding relations/relations between agents belonging to dominant positions in the executive, observing the variables: profession, background, gender, ethnicity, religion, class, positions held, families, relatives, and genealogies. The hypothesis is that family transmission is one of the strategies used by the ruling class in Brazil, and, with more emphasis, the Bolsonaro government, to remain in the state apparatus. The results achieved: a) the family becomes, in Brazilian democracy, the fundamental unit of politics and the transmission of power, making the parties secondary; b) the family is the strategic unit of the ruling class in the occupation of the state apparatus in the democratic regime; c) The Bolsonaro family is a successful example of nepotic acting; however, it is not the exception. d) Nepotism assumes a structural characteristic; putting in check the factual understanding that Brazil is a republic in its political sense.

Public or Private? Daytime or Nocturnal? Which Field of Study? How Did Blacks and First Generation Students Accessed Higher Education in Brazil between 2000 and 2010

Between 2002 and 2014 the Brazilian higher education system had a growth of 80% in its conclusion rates. The system grew from 466,200 to 837,000 students. During the period, several public policies were implemented to foster access in HE, both in the public and private sector. The purpose of these policies was to make the system more permeable for blacks and students of low socioeconomic status. The scope and speed of these changes makes Brazil an ideal case to evaluate how race and socioeconomic status shape the access of historically excluded groups in access to the higher education system in the country. Our aim in this paper is not only to investigate if access was broaden, but also *where* it occurred, mainly through the incorporation of field of study and two other crucial dimensions that structure the horizontal inequality in the Brazilian higher education system: sector (public or private) and shift (day or night). Through a conditional logit modeling strategy, we incorporate these institutional characteristics to understand how ascriptive characteristics (SES and race) operate differently to allocate students in the previously mentioned dimensions at two points in time. We use six databases constructed by the Brazilian Ministry of Education that are representative of students who entered higher education in 2000-2004 and 2010-2014, pre and post expansion contexts. Our empirical strategy will allow us to understand the heterogeneity of racial and socioeconomic effects across time taking the institutional characteristics of the Brazilian higher education system into account. In dialogue with the international literature, we can evaluate if Brazil is a case that fits the pattern of effectively maintained inequality or if redistributive initiatives such as the policies mentioned above operate in order to change the direction of inequality of opportunities in the country.

Social Mobility of Black and White Men in Brazil: 1976 to 2014.

The paper investigates trends in black and white men's intergenerational social mobility from 1976 to 2014 in Brazil. The period was marked by major social changes in the country and by an increase in social mobility in terms of education, occupation and income. Although there are some studies investigating social mobility differentials among black and white men, until the present no one had investigated trends in social mobility for these racial groups. This is unfortunate since from 1976 until 2014 there were significant changes in racial inequality in the country.

Therefore, our first task is to describe trends in income, occupational and educational mobility of black and white men across the period. Our analysis, how-

　　　　　　　　　　***denotes a presenting author.* Abstracts are organized by first presenting author's last name.

ever, are also designed to account for another parallel trend that had significant impacts on the population of black men. From the 1970's onward both homicides and incarceration increased very significantly in Brazil. Researchers have shown that black men are preferential victims of homicides and are also the majority among incarcerated people.

Therefor, we develop simulations to investigate mobility trends taking into account the missing black men in the labor market (those who were killed or incarcerated). Using these simulations we compare the observed intergenerational mobility trends with the simulated trends (including the black men who were in prison or were killed). Preliminary results indicate that the increase in black men mobility observed is also due to the fact that many of them were put in prison or victims of homicide.

COSTA-NETO, ALCEU* (University of Brasília, Brazil)

The Regulation of the Gig Economy in Brazil: An Empirical Analysis of Labor Rights

The paper analyzed the process of regularizing jobs through digital applications. These services that connect supply and demand by using georeferenced platforms have been deeply involved in the economy and in the behavior of Brazilians, especially with the arrival of Uber in 2014.

After intense conflicts over its legality, the practice, previously restricted to individual transport, has expanded to several services, causing questions in various sectors, such as taxes, competition, responsibilities over the consumer and, above all, labor rights.

Regarding the methodology, we focus on investigating the regulatory solutions that have been offered by the political and legal arenas, through the analysis of bills of the Brazilian Parliament and judicial decisions of the Superior Labor and Justice Courts. We also describe the pressure movement of workers portrayed by the media.

The results indicate that the biggest difficulty of the bills is to determine, or not, the employment link between workers and platforms. It also notes that most of these projects are to regulate temporary issues such as those related to the COVID-19 pandemic, which would be the responsibility of the executive branch. This means that the lack of administrative oversight is a point that needs to be resolved.

The decisions of the Superior Courts do not recognize the employment relationship. This fact reinforces the responsibility of the legislator and executive to establish minimum standards for these works.

Finally, we confirm that the pressures exerted by workers such as strikes and protests have had effects and impacts on parliamentarians, which expresses the impotence of social movements on the consolidation of this public policy.

Optimizing Professional Roles in Response to Pressures to Innovate: The Unavoidable Necessity to Coordinate Actors and Actions across Individual, Organisational and System Levels

Health systems face significant challenges with respect to care accessibility and continuity. These challenges require rethinking the organization of services in order to respond more effectively to the population's needs, which have become increasingly complex. The establishment of interprofessional teams and innovative approaches to organizing services, but also the importance given to greater involvement of clients in their care trajectory, aim to meet these challenges. These transformations necessitate a redefinition of professional roles and practices that is situated within new collaboration dynamics within teams. Professional roles must be optimised to maximise the effectiveness and efficiency of health systems within a context characterized by resource pressures and New Public Governance. In this presentation, we will propose a conceptual reflection based on the findings of four research projects conducted with different health professionals (advanced practice nurses, family physicians, social service professionals) working in various health organizations, as well as other key stakeholders, in Quebec, Canada. These projects shared a focus on work contexts and environments that promote a more optimal use of professionals' roles through a better understanding of the dynamics between the individual, the interprofessional team, the organization in which the practice is embedded and the broader structural dimensions of the health system. Different stakeholders working at different context levels were interviewed, including frontline service providers, middle and senior managers, service funders, union representatives, and representatives of professional licensing bodies. Our findings revealed the importance of considering a diversity of actors and issues at the micro, meso and macro levels in successfully redefining professional roles that can "co-produce" services. The findings also suggested that this redefinition requires both horizontal and vertical interactions within and between organizations that shape opportunities and constraints. At the heart of this redefinition lies the importance of professional identities, work meaning and agency.

From Idea to Implementation: The Emergence of Cascading Meta-Organizations

Meta-organizations – understood as associations of organizations, or as organizations whose members are themselves organizations – play an increasingly important role in modern society. Consequently, they have attracted significant scholarly attention over recent years. Despite this growing interest, many aspects of meta-organizations remained under-researched in the extant literature. In this proposed paper, we focus our attention on the emergence, lifecycle and dissolution of meta-organizations. We specifically seek to cast new light onto the processes that structure the formation and development of meta-organizations established in response to a specific sustainability issue.

Empirically, our research is based on a longitudinal analysis of an initiative established to address a road-traffic congestion problem in a major French city. Drawing on secondary data and interviews conducted with key actors, we chart the emergence and development of three, inter-related, multi-stakeholder meta-organisations dedicated to increasing mobility around the city's airport and beyond.

Our data reveal how the presence of major employers and their employees in concentrated industrial zones, combined with complex transport infrastructures operated by public actors, have created the need for greater information pooling and coordinated action. This has given rise to three structured meta-organizations – all linked to the issue of traffic mobility and composed of the same public, private and civil society member – over a short timeframe. Interestingly, each meta-organization appears to have played a different role in the initiative at different points in time.

We seek to derive from our data a theoretical model which suggests that the emergence of a meta-organization can be explained by an incremental, 'cascading' process of ideation-structuration-implementation that requires a specific kind of meta-organization at each stage, each one having a predetermined lifecycle expectation. Our model contributes specifically to our underdeveloped knowledge and understanding surrounding the antecedents of meta-organizations.

Building New Markets within the Context of the Sharing Economy? the Market of Medical Consultation Mobile Apps in Brazil

This paper aims to discuss how the medical consultation apps market was built within the sharing economy approach based on the concepts proposed by the economic sociology, understanding the relationship between the actors participating in this market, how services are established and if there were changes brought about by this new format in the health market in Brazil.

Sharing economy can be understood within the market-building process described by Flingstein (2002) in which markets are social arrangements that are established through the exchange process, making these markets function from defined roles between the actors. that participate in this market and rules that are established, and in which relationships are created so that the process is structured and stable.

To understand how this market is established, we use the concepts of networks that can facilitate market exchanges, through the development of trust relationships proposed by Granovetter (2005) and Weber's conception, that the economic fact is a social fact, since the search for scarce goods forces the agent to take into consideration other economic agents and the meaning they give to their action, that is, the social action of an individual is based on another individual (SMELSER; SWEDBERG, 2005).

Thus, we observe how a platform that works within a relationship of trust and belief in a common good, proposed as precepts of sharing economy, does not necessarily represent a new market, but imposes a new relationship format mediated by a platform, changing the roles of the actors involved.

COUTO ENGLANDER, ALEXANDER* (Regional University of Cariri, Brazil)

Dispute for Hegemony and Relations of Mutual Contamination in the Brazilian Workers Movement: A Study on the Democratic Alliance between Communist and Labor Unionists.

In his already classic book, *Capitalism and social democracy*, Adam Przeworski pointed that to have continuity in time and to be supported by the masses, a labor movement should institutionalize itself as a party within the bourgeois representative democracy. However, there is a contradiction on Przeworski's argument. In the same book, this author argues that the opponents of the participation in bourgeois democracy's official institutions have a constant presence on the political spectrum. My research intends to develop the study of this contradiction mentioned above, through the analysis of the Brazilian labor movement history. Different from Sweden and other European countries, in Brazil the institutional Unionism wasn't hegemonized by the revolutionary socialists converted to reformist practices and tactics. Reformist Unionism in Brazil was hegemonized by moderate groups linked to the Brazilian Labor Party (PTB), created by conservative reformist Getúlio Vargas. The Brazilian Communist Party (PCB), PTB's main competitor in the union movement, had its competitive potential undermined by being outlawed in 1947. Under these conditions, how can we understand the rise of an institutional and combative mass Unionism in the mid-50s, which was interrupted by the 1964 coup d'état but returned during the period of re-democratization (1978-1989), originating the Workers' Party (PT)? To understand this phenomenon, I use Chantal Mouffe's notion of (mutual) *contamination*, derived from Mouffe's concept of hegemony: to put its political agenda into practice, under conditions of illegality, the PCB militants established an alliance with the PTB combative unionists. In this process, the PTB unionists became more combative and the PCB turned away from its insurrectional political line and became a more reformist party, but capable of articulating democratic demands and constituting a popular demand in partnership with the combative factions of the PTB.

COUTO ENGLANDER, ALEXANDER* (Regional University of Cariri, Brazil)

Distortion and Hegemony: A Historical Sociology of Social Democracy and De-Democratization

This research develops a historical-sociological comparison between the limits of democratization both in the periphery and the center of capitalism in the post-World War II period, using empirical data on Brazil, Chile and the rich northern countries (Western Europe, USA and Japan) and concepts from social theory and political theory. The comparative analysis of unionization rates, data on the access to work protected by social rights, unemployment rates, wage levels and the ability of unions to intervene in national economic policy and decisions within companies allows us to obtain indicators of an unequal political and economic democratization in the center and in the periphery of capitalism. However, if the empirical data analysis, from a social democratic perspective, indicates a higher capacity for democratic participation and access to rights that expand both economic freedom and ontological security of the working class in the so-called "golden years" of the postwar period, from a neoliberal perspective, the same data are interpreted as a threat to the rights to liberty, especially to the absolute right to private property by a minority social class. In order to understand this contrast of perspectives, I use Žižek's thesis that the "objectivity" of social space is constituted of an anamorphic distortion. From this consideration, I analyze how capitalist modernity is composed of a traumatic core, the antagonism between two modern work ethics that foster diverse worldviews: the liberal work ethic as an individual enterprise and the democratic ethic of collectively organized work. To analyze how this distortion constitutes a political phenomenon, I turn to the theses of Mouffe and Laclau on hegemony. I believe this empirical, historical and theoretical perspective can contribute to a better understanding of contemporary processes - unequal and combined - which articulate neoliberalism, inequality and de-democratization both in the center and periphery of capitalism.

An Intersectional Approach to Migration: Experiences of Senegalese Women in Rio Grande Do Sul/Brazil

Migrations and migrants have been objects of study on social sciences for decades, since the classic *The Polish Peasant in Europe and America* (1918-1920). More recently, new dynamics have started to appear in this field, with the increase in South-South migrations and the phenomenon of "feminization" of migration. It is within that context that this research takes place, focusing on the Senegalese migration to the south of Brazil, which has been happening over the last ten years. The southern region of the country has been the one that received the largest number of Senegalese migrants, of which only about 1% are women. In that sense, in this research we analyze these women's experiences from an intersectional perspective, considering that gender is one of the social markers that they carry, along with being black, migrants, Muslim and non-native-Portuguese speakers. The intersectional paradigm (CRENSHAW, 1989; COLLINS, 2000; AKOTIRENE, 2018) was introduced in social sciences in the 1980's and has since consolidated as an important methodology for thinking gender and race studies. More specifically, this research analyzes the experiences of these women in the city of Caxias do Sul, one of the main destinations for the Senegalese community in Brazil. Considering that Senegalese migration is mostly economic motivated, it also represents a shift in the lives of these women, as many of them change from staying home to going into the labour market and start working to send money to their families. Even the ones that come with their husbands or get married in Brazil to Senegalese men still have their own jobs and careers, working as sellers of goods, in domestic works, in beauty saloons, restaurants, and even owning businesses.

CRESPI, BARBARA* (Technical University Berlin,)

Is the Driverless Future Inevitable?

The word "innovation" has undergone a change of meaning from a term with negative connotations to a positive one (Godin, 2015). As a result, the term is used in abundance and has evolved into an empty formula. It functions as a synonym for the solution of a problem, the improvement of a condition, the progress of societies or the success of enterprises. What all these concepts called "innovation" have in common is their orientation towards the future. The realisation of these goals is uncertain and unpredictable at present. Nevertheless, the term innovation is retained as the sole instrument for achieving these goals in the future. In fact, many of the technologies of the future described today as innovative, such as Autonomous Driving, currently exist only as visions of the future. This means, however, that "innovation" in this context should be better paraphrased as positive expectations of an innovation. In their "promise-requirement cycle", Van Lente & Rip (1998) describe how requirements are derived from expectations that lead to concrete actions. In the course of this mechanism, a vision of the future becomes an imperative that obliges the actors to follow it if the vision is to become reality. The paper examines the career of such an imperative using the example of autonomous driving in the USA. This example was chosen because the subjugation of the automotive industry to the dictum of developing autonomous vehicles involves a radical reorientation of the industry. After all, the industry is abolishing its most important end customer, the driver. What are the characteristics of this imperative that promises a driverless future? A text mining analysis of techblogs should uncover the imperative rhetoric and take a critical look at the moments when it reaches its limits and is caught up in reality.

Cultural Differences and Risk Perception: Foreign Media Coverage after 2016/2017 Earthquakes in Central Italy

Tourism is one of those sectors more exposed to risk perception that can have an impact on the tourist behaviours and affect tourism demands and trends. As a matter of fact, terrorist activities, political instability and natural disasters are the three main factors, in the contemporary society, which can influence and support the risk perception and thus, have an impact on the tourist decision making process. The purpose of the current study is to investigate the role of foreign tourists' cultural differences in relation to the perception of risk in the context of a "risky destination", as in the case of the Marche region, which has been stricken by several seismic events in August and October 2016 as well as in January 2017. Given these natural disasters effects, it is fundamental to understand the level of risk perception of German and British's tourists and the media coverage in their countries regarding the earthquakes. This study analyses cultural differences from the perspective of online newspapers media coverage in the two countries during the earthquakes period using an explorative approach. Analysing the online news contents, it was possible to identify the different level of risk perception between Germany and United Kingdom's society. This study draws attention to the cultural differences in risk perception of foreign tourists coming to Italy in risky areas and could will raise awareness among tourism marketers and policy makers about the importance of customized promotion and advertising strategies.

Extending the Current Theorization and Research on Cyberbullying: Potential Positive Impact of Including a Social Network Perspective

Cyberbullying is an emerging field of study (Berne et al., 2013) integrating researchers from multiple disciplines, backgrounds and schools of thought representing different philosophical, theoretical and practical interests. This social issue is a problem affecting a significant proportion of children, adolescents and young people, as they embrace online communication and interaction. Socially interactive technologies (SITs), such as instant messaging and text messaging, are beginning to redefine the social networks of today's youth and for new online youth social networks to form and evolve. Cyberbullying is not only an individual problem. It is clearly dependent on social groups, as it always includes perpetrators and victims who are embedded in larger social structures and environments. This socio-structural feature is very significant for the discussion of cyberbullying with reference to children and adolescents. The overview of the empirical evidence has shown that cyberbullying experience is often connected to the everyday school environment and that it can be conceived as a social or group phenomenon. In this regard, it shows many similarities to traditional bullying behavior. Both types of conduct are strongly linked to social relationships and social structures in everyday life. So, cyberbullying research only taking individual-level explanations in consideration (e.g., demographics, personalities, and psychological conditions) is somewhat reductionist and insufficient to fully understand why young people engage in it (Neves & de Oliveira Pinheiro, 2010). Social network analysis and its methods have information suitable for identifying structures and processes in specific contexts offline and online. To study the social context in which cyberbullying occurs, indices of relationships or social structure can be incorporated in traditional research techniques like survey research and qualitative or ethnographic approaches.

Instagram and Virtual Distinction: Restaurants' Practices of Stratification in Social Media

This paper aims to investigate how strategies of distinction that go through food consumption in restaurants are transported to virtual environments, particularly to social medias. After all, not just what you eat, but also the places were you eat, and nowadays the digital display of what you eat are factors related to social stratification. The data used for this qualitative analysis were obtained from Instagram profiles of two similarly priced São Paulo restaurants, although they address different audiences and present diverse gastronomic identities: the Maní and the Paris 6.

On the one hand, the Maní restaurant, headed by chef Helena Rizzo, won several national and international gastronomics awards. Currently, its Instagram page has 218 million followers. On the other hand we have the Paris 6, run by Isaac Azar, which is not acknowledged by food critics, whether they be national or international. However, it is very popular and boasts a waiting list of hours every weekend in their units. Today, It has about 1.3 million followers on its Instagram profile.

The hypothesis is that images and discourses published in their respective Instagram accounts are signs that allow the identification of how stratification strategies, which already operate in the offline dimension, are transported to the digital dimension. For this purpose, the following features will be taken into account: a) the visual aids used in the published images; b) if the focus of the post is the food served in the restaurant or other elements; c) if those publications are indexed to hashtags and, if so, to which ones; d) the textual content that follows these images; e) continuities and/or discontinuities between distinction strategies, either the restaurants' or the digital environment's.

Possibilities, Difficulties and Limitations in the Study of Police Officer Mental Health and Suicide Rates in Brazil

Every year, more than 50,000 people are killed in Brazil. The conflicts between organized crime and the police are responsible for an expressive number of these deaths. This scenario makes the work of the police even more stressful than under normal circumstances. Police officers are expected to always be ready for any kind of situation and must not express vulnerability or emotion.

At the same time, an ongoing process of mental illness amongst police officers can be observed. To try to analyze this process, we have put a set of strategies into place to understand it.

We then discovered that there is little to no data available on this subject. So, we have started to develop informal strategies to measure suicides and attempts amongst police officers.

Based on a network created together with police officers and psychologists around the country, in 2019 we published our first journal with suicide figures and the associated factors themselves.

Considering suicides, attempts, homicide followed by suicide and suspects deaths, we found 36 cases in 2017 and 88 in 2018. However, we could not access complete information, such as: age, motivation and marital status for all the cases.

It is an innovative study in this field, but there are still some challenges to overcome, such as: sub-notification, a general lack of information and disparity between data sources. The aim of this paper is to discuss the procedural steps adopted to analyze this subject together with their possibilities, difficulties and limitations. We believe that the improvement in data quality can help in the development of public policies to support police officers' mental health.

"Village Company" or Conditional Cash Transfers? Work Based Welfare in the Rural Communities of Hungary

The purpose of the presentation is to examine the transformation of the welfare paradigm and to analyze the consequences of the welfare state transformation on the local communities in Hungary. With extensive centralization of welfare services, the former welfare functions of the local governments disappeared. It is no longer a local responsibility to support the welfare of disadvantaged social groups and to organize the traditional welfare services for them (such as social benefits family care, etc.), nor the resources are locally available for it. With the transformation of the welfare paradigm and the redefinition of the role expectations of local governments and mayors in Hungary, the local governments are under pressure to organise the economic activities of citizens and to move from a social service-oriented approach to an entrepreneurial one on community level. It is demanded by the state to create of a self-sustaining village or a 'village company', and to also involve the most disadvantaged social groups in employment and self-care. Instead of independent family farms with the new model began to develop a quasi-feudal form of collective work.

In the framework of two consecutive studies organized in the framework of two H2020 projects (InnoSI and CoSIE) we studied local economic development programs to answerwhat alternative public welfare/economic services can be developed and under which conditions can this new service type be successful.

The present paper is based on an extensive empirical fieldwork involving 18 local communities and ca. 200 households. With the involvement of communities and households, a survey and 54 individual interviews were conducted in the past three years.

Self-Legitimacy: Perceptions of Police Officers in the City of São Paulo (Brazil)

Brazil's democratic transition did not engender structural changes in the policing apparatus. Police functions remained divided between two police forces. On one hand, the military police is responsible for crime prevention and day-to-day patrolling. On the other, the civil police continue to report and investigate crimes. Despite these distinct attributions, both police forces maintain strict hierarchies and institutional blockages that make it difficult for officers from ascending from low-level positions to leadership posts through merit and experience. With that in mind, this project presents the results of a survey of military and civil police officers conducted in the city of São Paulo in 2016. The survey sheds light on officers' perceptions regarding their work and their respective law-enforcement institutions. Specifically, the survey examined how officers perceive their self-legitimacy, which can be defined as the extent to which officers feel worthy of their own authority. Several studies indicate that the legitimacy of police officers affects

the way they treat the public and in the quality of police services. This study offers several hypotheses to decipher the survey results, including that police self-legitimacy is a result of internal relations within police forces and external relations with the public and other police forces.

Las Comisiones Para La Verdad En América Latina. El Caso De Iguala En México

La creación de Comisiones para la Verdad es un mecanismo que se utiliza cuando existen casos graves de violaciones a los derechos humanos. En las últimas dos décadas se han desarrollado más de 30 comisiones de la verdad en diferentes partes del mundo, América Latina es una de las principales regiones donde se han utilizado estos recursos para investigar los hechos ocurridos durante las dictaduras militares en donde el Poder Judicial carecía de independencia y encubría las actuaciones del Estado. En esta ponencia se pretende describir cómo se crearon algunas comisiones en países de América Latina como Argentina, Brasil, Chile, Colombia y El Salvador. Éstas ayudan a observar las particularidades que originaron la Comisión para la Verdad y la Justicia en el caso Iguala en México, la cual surge a partir de un caso de violaciones a los derechos humanos en el municipio de Iguala, Guerrero. La desaparición forzada de 43 estudiantes de la Escuela Normal Rural "Raúl Isidro Burgos" visibilizó la ineficacia de las instituciones de procuración e impartición de justicia y las omisiones en la investigación de la Procuraduría General de la República (PGR). Este caso se volvió emblemático por diversas movilizaciones sociales nacionales e internacionales y la participación de organismo internacionales de derechos humanos. En ese sentido, es importante conocer los aspctos sociojurídicos que permitieron la creación de esta Comisión y las implicaciones con la nueva administración.

Tejiendo Lazos. Narrativa Feminista

El objetivo de este artículo es revisar la narrativa feminista, al articular con el colectivo publico e interpelar la -lógica del poder- particularmente desde los paros feministas de NiUnaMenos. El enfoque metodológico toma como punto de partida la fenomenología feminista, al involucrar las distintas narrativas combinadas (teoría y práctica), desde una mirada decolonial. Al ser estas narrativas expresiones de una solidaridad interseccional. El enfoque teórico focaliza en el patriarcado como una construcción monolítica matizada por características propias de cada cultura (Segato, 2003). En este sentido los crímenes del patriarcado o femicidios son claramente, crímenes de poder, es decir crímenes cuya dupla función es, en este modelo simultáneo, la retención o manutención y la reproducción del poder. Se trata de desarrollar conciencia de que el poder, al legitimar actos represivos, involucra la idea de un colectivo subordinado (Butler, 1990). El poder ordena mediante un mecanismo de vigilancia y sanciones, para así determinar la individualidad desde una manera normativa y reproducirse (Foucault, 1984). El colonialismo creo muchos géneros relacionados desde la dicotomía colonizador/colonizado (Lugones, 2007). El feminismo decolonial define la -logica del poder- como dicotómica y desde esa visión ordenador de los valores genéricos como binarios (hombre/mujer - blancos/negros - ricos/pobres - heterosexuales/homosexuales, etc.). Las políticas de género implican recapitular la noción de -cuerpo territorio- como una biografía decolonial. El material demuestra que los paros feministas entrelazan narrativas y transgreden las normas regidas por el -orden patriarcal-. El grito "Ya basta" implica la ruptura de un silencio normalizado, desde una narrativa feminista interseccional. Las luchas de NiUnaMenos implican la desnaturalización de la violencia patriarcal, desde una agenda empoderadora de memorias transversales sobre cuerpos autónomos.

CUNHA, DANIEL* (Binghamton University, USA)

The Rise of the Hungry Automatons: The Industrial Revolution and Commodity Frontiers

The Industrial Revolution is traditionally understood as a British historical process. This paper presents an alternative framework for the study of this period (1760-1840). Using the world-system perspective, the Industrial Revolution is understood as a world-historical reconfiguration of the world-economy (Wallerstein 1989). Using a theory of capital accumulation/alienation (Postone 1993), it is shown that the process occurred through the objectified mediation between mechanization in Britain and extraction in commodity frontiers (Moore 2000). The resulting cheap raw materials, which incorporated the biogeochemical activity of the Earth (mineral veins and fertile soil formation) and were often extracted and processed with slave and slave-like labor, acted as a countertendency to the declining rate of profit in the industry of the ascending core (Britain). Commodity frontiers were spread from the Mississippi (cotton) to Sicily (sulphur), the Urals (iron), Cornwall (copper), Guyana (sugar), and others (see e. g. Cunha 2019). This approach recast the history of the Industrial Revolution in light of value relations and incorporates nature as an active component, and as such this reinterpretation incorporates the problems of the present (crisis and ecology).

Epistemologies of the South and the Economies of Hers the 'capuchinhas' Cooperative of the Serra De Montemuro

The 'Capuchinhas' cooperative is an initiative of women from Serra do Montemuro, one of the most isolated and impoverished regions of the interior center of Portugal. Since its beginning in the 1980s, this cooperative was thought of as a form of resistance, but also of creating a local alternative to unemployment and the women's emancipation. This co-operative pays special attention to the specific problems of its region and its population and seeks to tackle territorial imbalances and the increasing commodification of all spheres of life.

Our work has two main objectives. The first is the theoretical and analytical extension of the concept of solidarity economy and associated sociabilities. Secondly, through a dense ethnography we present the complexity of the creation and life of the cooperative giving centrality to the words and narratives of the protagonists who think about themselves and the world where they act.

Global Burden of Disease Knowledge and the Accountability Practices Which Organise Frontline Cardiovascular Disease Prevention Work in the UK

This paper highlights how policymakers in the UK draw on knowledge and narratives from the Global Burden of Disease (GBD) project to understand the problem of cardiovascular disease and how it should be prevented. Policymakers employ this GBD knowledge as an objective and neutral underpinning for an emotive narrative of lives (and costs) which may be 'saved' through particular forms of preventative action. I identify GBD texts as the 'boss texts' coordinating a variety of related accountability practices which extend into frontline clinical work.

I highlight how prevention's accountability practices are orientated around the delivery of standardised interventions (such as medications or 'lifestyle' prompts) which must be implemented efficiently and at scale in order to (theoretically at least) achieve the envisioned health outcomes and cost savings. Such practices are giving rise to increasingly 'industrialised' forms of preventative interactions between patients and healthcare professionals (e.g. support for dietary change, minimising medication use, dealing with side-effects) are side-lined, despite a rhetoric of 'patient centred care', 'shared decision-making' and so on. This is particularly problematic for patients who experience most disadvantage (and who have the greatest need for support to improve their health). I highlight current campaigns which attempt to 'talk back' to the ruling relations organising these industrial forms of healthcare.

CURRY, MARK* (National University of Ireland in Galway, Ireland)

Amplifying Relative Exclusion and Deprivation: The Role of Conditional Cash Transfers (CCT) in the Recent Shift Towards Neo-Populist Authoritarianism in Brazil and the Philippines

Brazil and the Philippines experienced near simultaneous right-wing shifts from 2016 following Rodrigo Duterte's election and the Temer/Bolsonaro takeover. Yet in comparative analysis the shifts evade routine explanation. Through 2016, Brazil's deleterious economy contrasted with the Philippines' steady economic growth and social policy improvements. Institutional politics differed: Brazil's centre-left Workers Party had dominated parliamentary politics since 2002 while centre-right plutocratic presidencies dominated the Philippines from 1986. Social movement demands also varied: Brazil's mass protests (2013-2015) con-

trast with small-scale church group and leftist anti-American protests in the Philippines. An overlooked factor common to both cases is the inadvertent impact of their conditional cash transfer ('CCT') programmes. Respectively, Brazil's and the Philippines' CCTs are the world's largest and third largest such programme. Whereas research consensus holds CCTs as a sure route to poverty reduction and boosts other developmental indicators, real social quandaries exist for non-beneficiaries. Relative exclusion and deprivation experienced by the 'almost poorest', the precariat, and struggling middle classes correlates strongly with digitally networked groups that voted in favour of the hard-right shift that would previously have been considered as fantasy. This study's framework reutilises O'Donnell's ideas on the bureaucratic-authoritarianism coup coalition to advance how the Duterte/Bolsonaro shift makes explicit Wallerstein's conceptualisation of universalism plus racism-sexism as a primary driver of neo-dependent capitalist culture. Methodologically, a comparative-historical approach to CCTs as a contributing factor in generating relative deprivation explores how these coup-coalitions emerged at the same time. Moreover, because CCTs redistribute resources, create historical displacements, and generate impacts on civil society, Gramscian analysis suggests how Duterte's manipulation of Philippine CCT constitutes a war of position through tactical accommodations while Temer/Bolsonaro's assaults on Bolsa Familia constitute a war of manoeuvre to effect beneficiary capitulation to regime change. The implications for democracy, poverty reduction, equality, and social inclusion are critical.

RC09-116.2

CURRY, MARK* (National University of Ireland in Galway, Ireland)

How Conditional Cash Transfers Contribute to Social Cleavage, Widening Inequalities, and Crises for Developing World Democracy: A Comparative Analysis of Brazil and the Philippines

Conditional Cash Transfer ('CCT') programmes aim to reduce extreme poverty with cash disbursements and mobilise the young for future middle-class opportunity via health and education conditionalities. Since 1997, CCTs have spread rapidly from Latin America to developing countries worldwide through World Bank and associated lenders' support, while neoliberalised centre-left and centre-right governments with close links to business elites have prioritised implementing such programmes. Research indicating positive impacts across a range of developmental indices posits CCT outcomes and hence future social mobility as a function of conditionalities manipulation, rather than as a function of political intervention. Indeed, political mobilisation has not been a functional objective or component of CCT programmes generally. The impact of CCTs on political processes and outcomes is thus relatively underserved in the literature. Although evidence exists of clientelistic relations between CCT beneficiaries and local incumbent politicians, this has not necessarily translated into electoral success in national polls. This research undertakes a comparative-historical analysis of CCT in Brazil and the

Philippines to show that CCT is a contributing factor in the irruption of neo-populist authoritarianism in both countries since 2016. Specifically, the CCT impact on political outcomes is a function of sociological cleavages: programme beneficiaries are selected by means testing (income level, spending, savings) or proxy means testing (assets, living conditions), which effectively homogenises poor people into two groups, the included and the excluded. Furthermore, the dynamics of contemporary class formation and conflict among varieties of contending or competing classes are excluded from the CCT programme imaginary. Digitally adept, economically precarious, having no purchase among the middle classes, and mobilised in online communities the excluded find political succour in extreme populist rhetoric and contribute to unexpected political outcomes as represented by Rodrigo Duterte and Jair Bolsonaro.

CUSTODIO, LORENA* (Facultad de Ciencias Sociales, Uruguay)

Los Asistidos Del Nuevo Estado Social En Uruguay (2005-2018)

Las cifras de la pobreza y la indigencia en Uruguay vienen disminuyendo desde que el Frente Amplio ganó las elecciones nacionales en 2005. Hoy, las personas en situación de pobreza representan el 8% de la población y la indigencia prácticamente no tiene registro en las estadísticas nacionales (0,1%), (INE, 2004, 2018). En 2004, estas cifras representaban al 40% y al 5% de la población, respectivamente. A esto se suma una evolución favorable de los principales indicadores socioeconómicos que "miden" el estado de bienestar de la población (DINEM, 2015). Sin embargo, es posible distinguir otra cara de la evolución social del país: existen indicios del aumento de la fragmentación social, de personas viviendo en situación de calle y usuarias de los refugios sociales, de problemas de violencia y medios de vida ilegal en territorios específicos; aumento de personas viviendo en asentamientos irregulares, así como también el aumento de la sensación de inseguridad por parte de la población en general.

Nos preguntamos entonces: ¿cómo les ha llegado las "transformaciones" del gobierno progresista del Frente Amplio a las clases populares en Uruguay? A partir de las trayectorias biográficas de los beneficiarios de la asistencia analizaremos como aparecen en sus experiencias vividas los avances en el derecho y la regulación en el mundo del trabajo y qué sucede con la asistencia (Castel, 2004, 2013. Merklen, 2010). Intentaremos caracterizar las situaciones de desafiliación durante el transcurso de la implementación de las nuevas políticas sociales instrumentadas, así como de caracterizar a los beneficiarios, sus experiencias y trayectorias de vida. Se analizará la relación entre distintos tipos de trayectorias y las situaciones de desafiliación, indagando posibles factores de ruptura o reproducción de tales situaciones en relación con el mercado de trabajo, las formas de relacionamiento y el hacer del Estado (Bourdieu, 2012).

Transnational Labour Solidarity in Retreat? Freedom of Movement in the Shadow of Brexit

The regulation of labour migration in the European Union is by definition a policy domain that transcends national boundaries, involving social actors across geographic scales. Yet 'Europeanisation' and unfettered access to foreign labour tend to be associated with the domination of firms' flexiblisation strategies and lower labour costs (Lillie, Wagner & Berntsen, 2014; Meardi 2012). Despite the emergence of forms of EU level institutions of social dialogue, scepticism has prevailed over the capacity of transnational union activities to regulate labour markets in general and labour mobility in particular.

This paper focuses on the relationship between EU institutions promoting freedom of movement of EU workers and the positioning around FOM by labour unions and other social actors in the context of Brexit. In the three years after the Referendum vote, the UK government developed policy proposals to control EU immigration and initiated quasi-social dialogue processes with stakeholders. Drawing on literature on new and old actors in industrial relations and transnational migration studies, we discuss the findings of qualitative research conducted with key stakeholders engaged in these processes.

Using innovative Roundtable sessions (2017-19) supplemented with expert interviews and analysis of position documents we trace responses to the challenges of Brexit by unions, migrant organisations, employers and statutory bodies operating at different geographic scales. We show that "old IR" actors have little awareness of the workings of migration policy and its effects on employment relations and a pre-occupation with national scale interests. We argue that transnational action and strategies of *re-regulation and bargaining* are underdeveloped compared to the challenges that EU integration (and dis-integration) pose for labour. The crisis of institutional transnationalism and labour solidarity in the case of Brexit may however disclose an opportunity for social and institutional transformation, if the voices of newly organized constituencies at multi-scalar level are given prominence.

CUVI, JACINTO* (University of Neuchatel, Switzerland)

From Hope to Anger: The Roots of Populist Support Among Disenfranchised Workers

Left-wing populism in Latin America as exemplified by leaders such as Peron or Chavez was traditionally interpreted as a form of political incorporation of the disenfranchised. From this perspective, informal workers were a prime constituency of populist mobilization, and hope or the prospect of social redemption was a motive force behind their support for charismatic leaders. The political leaders that are now sweeping elections from Brazil to India to the Philippines and other countries do not put forward the same promises of redistribution and social justice. Instead, they take violent stances against other, marginalized, and especially foreign groups. And yet many informal workers rally behind them. Using secondary sources and exploratory research findings, I seek to understand the underlying visions and emotions that lead marginalized workers in Brazil and elsewhere to vote for and support right-wing populist actors. I also draw some theoretical implications for the thinking of populism in our time.

CZARNECKI, LUKASZ* (, Mexico)

Social Construction of VIH/AIDS in Africa: Latin American Theory and Multivariate Analysis

This paper presents an analysis of the social construction of HIV/AIDS. Unlike the biomedical approach, the disease is socially shaped (Breilh, 1986; Tetelboin-Henrion, 2015). To do the analysis, the database with socio-demographic indicators for 54 African countries was constructed with the objective of carrying out a multivariate analysis.

The results show that HIV/AIDS is a phenomenon correlated with inequalities. This disease is heterogeneous across the African continent, in that sense some countries, especially southern ones, experience real challenges as HIV/AIDS grows constantly. Hence, a new paradigm of public health policy should be implemented based on a new understanding of social medicine, taking up socio-cultural and socio-economic analyzes of illness.

Venezolanidad y Sujetos Emigrantes: Invisibilizaciones En El Discurso Oficial Venezolano

Este artículo se propone analizar operaciones discursivas sobre la emigración en Venezuela que han sido el centro del discurso oficial en los últimos años. A partir del análisis de tres piezas comunicacionales representativas de este discurso, producidas en el ámbito del Estado entre los años 2012 y 2018, mostramos las formas de invisibilización de la migración contemporánea a través de la configuración de sujetos de emigración y de venezolanidad. Nos valemos de una reconstrucción de los procesos migratorios venezolanos, para dar cuenta del cambio de país receptor a emisor de migrantes, para comprender el contexto y las justificaciones que sobre ese fenómeno se han elaborado y cómo se expresan en el discurso oficial. Esto, partiendo del entendimiento de que la disputa por la existencia y magnitud de la emigración es una manera de representación política y mediática que da cuenta de las razones de ese proceso, pero también del fracaso de las políticas nacionales. Lo que vuelve a la emigración y a los emigrantes en elementos disputados discursivamente dentro de Venezuela. En función de esto, mostramos cómo, desde el discurso oficial, se ha contrapuesto un discurso de invisibilización del cambio del patrón migratorio que, a través de diversas operaciones de exclusión, particularmente, de discriminación racial, por origen nacional o identidad personal o cultural, tiene como efecto la despatriación y desciudadanización de los venezolanos que han emigrado, la construcción/interpelación de un sujeto nacional, una raza venezolana, funcional a la reproducción del poder político y a la negación, no sólo de la diversidad, sino de las condiciones de existencia de la población venezolana.

Work and Employment in New Productive Configurations: Beyond the Division between "Standard" and "Non-Standard"

Over the last 30 years, the casualization of workers has increased because of the fragmentation of wage labour into a multitude of atypical statuses, and the fragmentation of productive processes within the network enterprise, the value chain or any other configuration combining productive decentralization and the centralization of control and power. To understand the realities of work and employment in organizational forms that are transversal to firms (such as the value chain or the network firm), binary conceptualizations of salaried/self-employed, standard/nonstandard, insiders/outsiders, are inadequate.

In this contribution we put forward a broader conception of the employment relationship and of the frontiers of the firm, which allows for a better understanding of the capital-labour relations in contemporary productive organizations. We develop the notion of the "work social relationship", defined as "reconceptualization of the wage nexus (employment relationship), to include various configurations of "work mobilization" (Dupuy et Larré, 1998, D'Amours, 2014). This reconceptualization allows for a double enlargement: of the concept of the worker (not just an employee, in an employment relationship, which binds him to a single employer, but also as a self-employed worker, a franchisee, a worker through platforms and other workers of "gray areas") and the concept of the employer (not only the legal employer, but all the entities that organize, control or benefit from the work and power relations between them). In addition, it lets the analysis of various work configurations with the same analytical tools.

We will illustrate this concept from multiple case studies (agri-food processing, IT services to businesses, taxi services via platforms) in various countries (Canada, France and Mexico), which allowed us to document the coexistence, at the level of the value chain or the network, of various configurations of work social relationships, with differentiated impact on work, employment and collective capacity of workers.

D'ANDREA, FABIO* (University of Perugia, Italy)

Simmel's Wechselwirkung As a Figure of Quantum Interconnectedness

Simmel's sociology has been explored and exploited from perspectives largely belonging to a homogeneous culture that "translated" his insights in its own terms. Ground-breaking ideas - such as *Wechselwirkung*, "reciprocal action" - have thus been interpreted as rational and instrumental, losing sight of their innovative potential. Not only the relational network that *Wechselwirkung* creates between people forms the humus from which stem social structures and institutions; it also works on multiple levels that are qualitative and emotional, as well as rational and calculating, and most of all simultaneous, as Morin would have it. *Wechselwirkung* establishes a complex bond between persons and institutions and allows for a deeper understanding of reality in its processual essence, as revealed by Oriental mysticism and Western Quantum Theory (Capra). The idea of a qualitative, intuitive component of knowledge was highlighted in Goethe's work, in his *Anschauung*, "vision", as a multidimensional approach to reality that could go beyond the subject-object dichotomy and reveal and make understandable the fundamental interconnectedness of all things. Simmel built on that and put this constant exchange at the heart of society, as the core dynamics that allows humanity to create its world. His sharp criticism of quantitative science and measurability, of the ideas themselves of "concept" and "object" is easier to understand today, in the light of Quantum Mechanics and of the little-known insights of its founders, from Heisenberg, who speaks in favour of Goethe's view on science, to Bohm, who stresses the need for creativity and metaphorical thinking to set a new, different, paradigm. In Simmel we could easily find seminal ideas perfectly fitting for this challenging purpose. This paper is meant as a first step on the road to mending our divided knowledge and creating new tools for a better understanding of reality.

TG04-745.3

D'ANDREA, FABIO* (University of Perugia, Italy)

The Spatial Fragmentation of the Metropolis: Division at the Core of Reality

Recently metropolises and urban areas have been undergoing a dividing process that goes far beyond the centre/periphery model. Each district and neighbourhood seems to implode, while the whole loses its "organic" quality to become a loosely connected set of estranged areas, often at war with one another. This is a significant instance of a more general trend, an increasingly divisive attitude that spreads into every process and province of life, as it shows how "abstract" dynamics have in fact the most concrete consequences. As Morin points out, at the core of our paradigm is a choice in favour of "certain logical operations to the detriment of others, such as disjunction to the detriment of conjunction", that has been balanced by other factors in a dynamic alternating process until the advent of Modernity, when rationalization and individualization led to a unilateral affirmation of what Durand calls *Spaltung*, a dividing need that turns obsessive and pathological. Dichotomization has then become the one and only strategy in coping with a world that is less and less understandable, while people are called to foot the bill of former certainties and unyielding convictions and to try and make sense out of it. In this reference frame uncertainty, that should be understood as an unavoidable condition to be mitigated but never eradicated, is seen as a malfunctioning of an otherwise perfect mechanism, for which something or someone is to be held responsible. Suspicion and mistrust characterize then the predominant mood, undermining political life, decision-making processes and the production of shared reality; it all results in a deep crisis of consensus and a growing inability to live and think together. This poses a serious threat to our system and should be addressed on multiple levels, starting with a renewed attention to living space and its quality.

DA CONCEIÇÃO, THAYLA* (UFRJ, Brazil)

The Federal Military Intervention in Rio De Janeiro (Brazil): What's That about and What's Next?

The city of Rio de Janeiro, becoming, in the contemporary, place of several Great Events, was presented as "Rio2016", a brand whose official slogan is "A New World", which reveals the option for the globalized world, the "global north", that establishes cities as commodities (Vainer, 2000; Simoni Santos, 2006). This guideline is opposed to the "Quilombada City" (Neder, 1997), or the "Black City" (Chalhoub, 2011), the popular counter-model of the city, which reminds the historical heritage of colonization and slavery. In this so-called "new world", the idea of integration between different security and control forces emerges as one of the greatest legacies, and is embodied in the new huge Center for Integrated Command and Control (Centro Integrado de Comando e Controle - CICC) (Cardoso, 2014), a high-tech building made with local and international efforts for the artic-

ulation of the security forces that were responsible for ensuring the Great Events in question and also for a desired revolution in the though and management of public security.

After the events, a new major security crisis is announced in Rio in 2018, with a large increase in the number of homicides (ISP, 2017), and a federal military intervention was the political-institutional solution adopted for the said crisis. The CICC was chosen as the intervention office. What was the intervention worthy for? What's next?

In this paper we will mobilize the CICC as a symbol to think about urban space management in the city of Rio de Janeiro, considering the actual challenge of a extremely conservative management. For this purpose, we will think together with Stephen Graham (2016) and the "new military urbanism", Bruno Cardoso (2014) and his reflections on the CICC itself, and Vera Malaguti on demands for order (2012) and political sentiments, especially fear, in the city of Rio de Janeiro (2003).

DA COSTA, ISABEL* (CNRS-IDHES, France)

Independent Contractors or Employees? Changing Employment Relations in the Gig Economy

The Gig Economy generally refers to forms of employment relations characterized by non-permanent or short-term contracts with few benefits, such as contingent work, self-employment, temporary agencies, and platform work. In the technologically advanced societies of the 21st century precarious forms of work are increasingly replacing traditional employment relations, posing organizational, social, and legal challenges. Not all workers in the gig economy are underpaid drivers, however, or food delivery riders, controlled through app-based companies. According to certain estimates, professional workers account for almost a third of the contingent workforce in the United States. Many of these professionals are highly skilled and educated, and sometimes have comfortable incomes, but are (by choice or not) in non-permanent employment relations lacking job security and its fringe benefits and protections. Furthermore, many of these workers are considered as self-employed and not as employees, thus making it difficult for several of these labor force participants to join labor unions and organize collective actions to improve their conditions.

My communication proposers to address the evolution of employment relations in the United States gig economy by studying professional workers and focusing on the legal definition of "employee" and the challenges it poses for their participation and collective representation. I will also study how trade unions adjust to the new composition and varied status of the labor force, and whether they have new strategies to organize these workers. I will conclude with an analysis of the context leading to the enactment in California of the landmark AB5 Bill (California Assembly Bill 5), in September 2019, that is viewed as having the potential to reshape the gig economy by forcing app-based companies to treat independent contractors as "employees" which the attached rights and labor protections, such as job benefits and pay guarantees, which do not apply to independent contractors.

RC10-124.3

DA COSTA, ISABEL* (CNRS-IDHES, France)

Transnational Worker Representation and Participation

Democracy at work and workers' participation and involvement at various levels are essential issues to tackle global challenges, including increasing income inequality and the erosion of wages, not to mention they are crucial for the development of decent work that respects fundamental rights. However, in many countries freedom of association is not guaranteed and at the global level worker representation is still in its inception. My communication will address the development of transnational worker representation and participation. It will use the EU database, the Global Unions database and my own database to map Transnational Company Agreements (TCAs) and their evolution for the past two decades. The difference between the TCAs at the European and Global levels will be related to the strategies of the actors (TNC management, Global Unions, EWCs, European Trade Union Federations, and national trade unions). These strategies can evolve and differ according, for example, to the main topics of the TCAs: health and safety, restructuring, and freedom of association, to mention a few, often have different implications and expected outcomes that might account for the choice of the level of negotiation. Because they are trans-national, the negotiation and implementation of TCAs entail a coordination and an articulation of the national and cross-national levels which require innovative and autonomous practices, particularly as regards mandates to negotiate, sign and follow-up on the employee side. My analysis will outline the importance of the strategies of the social partners, and the institutional characteristics of the predominant national systems of industrial relations.

Binge-Watching: Self-Care or Self-Harm? Understanding the Health Subjectivities of Binge-Watchers within a Neoliberal Context

Neoliberalism has given rise to Canada's current culture of healthism, whereby "indulgent" activities like binge-watching are presumed to be unhealthy and thus stigmatized. Despite this, however, binge-watching is still commonly practiced throughout Canadian society. This means that Canadians are increasingly engaging in a television viewing practice that the dominant culture considers to be reprehensible. Little research has examined how this tension effects Canadian binge-watchers' perceptions and interpretations about their health. Using a discourse analysis of in-depth interviews with 15 self-identified binge-watchers, I examine how the health subjectivities of binge-watchers are constituted in and through healthism discourses that position binge-watching as a form of self-harm, while also animating self-care technologies that allow binge-watchers to reposition the practice as a means of self-care. I find that most respondents develop health subjectivities that both challenge and reinforce neoliberal ideology.

The "New" White Feminism: Trans-Exclusionary Radical Feminism and the Problem of Biological Determinism in Western Feminist Theory

This article argues that the Eurocentric, racist ideologies that plagued the second-wave Western feminist movement have taken on a new form in trans-exclusionary radical feminist (TERF) discourses. Building on postcolonial feminist Oyeronke Oyewumi's notion of "biological determinism," I reveal how TERFs are rearticulating the same essentialist, Eurocentric logic of a particular flattened gender identity that white-Western feminists have long used to subjugate non-white and third world women to now actively exclude and marginalize transwomen. I argue that the operation of biological determinism in TERF theory functions to the benefit of a small sect of privileged women, particularly white, Western, middle-class, cis-straight women, and closes off a critical analysis of gender as a social construct. I conclude by arguing that the emergence of TERF ultimately signals the ongoing failure of the mainstream Western feminist movement to foster an inclusive and beloved gender and sex community and a subsequent need to rethink the ways in which feminism is practiced in the West.

Comparing Mariana and Brumadinho in the Light of the Law of Disasters. Can We Better Prepare for the Next Such Disaster?

Based on the 'coding case study approach' by Creswell and Poth (2017), we look at the two mining disasters of Mariana and Brumadinho, seeking to identify how the regulation of disasters, commonly referred to as 'Disaster Law', may help us better prepare for the next such disaster.

Our analysis will take into account particularly the media coverage of both disasters, as well as official reports published on them. Furthermore, we shall reflect upon the legal framework applicable to such disasters, particularly what nationally exists in terms of disaster law. We will also look at the ecological and the human impact of both disasters. Moving to a cross-case theme analysis, we shall draw similarities and differences arising from the analysis of the two case studies. Finally, we shall propose assertions and generalizations relating to the two disasters, with a view of learning how to better prepare for a similar future disaster, teasing out the added value disaster law may have.

Criticism of Progress and Commitment to History? Critical Theory and the Idea of Progress.

In recent years many authors within the tradition of Critical Social Theory have debated the concept of progress. Not only those who made progress a central theme of reflection, like Amy Allen, but also those who discussed the idea of progress within a larger framework, like Jürgen Habermas and Axel Honneth. All of the contributions, however, are united in that they criticize the influence that the idea of progress has had over the critical stance of Critical Theory over society, as well as over its own self-critical instance. The general view is that progress is a concept that obstruct Critical Theory on the level of diagnosis, for in accepting the facts of progress, as Allen has put it, Critical Theory sinks in a sort of self-inflicted bindness to the widespread conflicts of our time.

As distinct as they are, Allen's and Honneth's visions undertake the challenge of rescuing the normative basis of a tradition of thought, respectively Critical Theory and Socialism, trough a critique of the uncritically accepted notion of progresss. Both try to accomplish the task of rescuing critical thinking either through a decolonization of its normative foundations (Allen) or through a renewal of its original intent (Honneth). Neither Allen nor Honneth, however, endeavour to associate the criticism of progress with the criticism of the normative commitment of Critical Theory with a philosophy of History which reconstructs the history of human societies as a series of gradual, yet contradictory, movements in the direction of the realization of reason.

In discussing Allen's and Honneth's accounts this paper will try to show how a sociological Critical Theory might contribute to understand both the critique of progress and the critique of a conceptually guided account of History.

Precarious Work and Individual Recognition? on the Relation Work and Recognition in the Digital Economy

In this talk I will try to establish a connection between the ideas of work, identification, recognition and achievement. My aim is to discuss if Axel Honneth's theory of recognition offers a conceptually rich account of the thesis of the division of labour. According to Honneth, there is a normative dimension within the labour market, which is expressed in the socially recognizable achievements of workers as well as in the possibilities to struggle for recognition within capitalist markets. Such achievements include a personal level of identification with one's own job and also a functional level of identification with society's necessities. Accordingly, the entanglement of work, identification and recognition has been used within recognition theories as a central standard of justice.

In the context of widespread change in the forms of work influenced by digital and platform capitalism, it is possible to claim that the mentioned connection of work, individual perceptions of merit and of functional contribution also undergo a change. In this sense, taking Robert Castel's historical account of wage society as a point of departure, I propose to discuss the effects of the the new digital economy upon the normative standards that could guide a critique of society, when it's core relation, that of work being sold in a labour market, is altered. For that, Honneth's account will provide the framework to theoretically discuss changes within the labour market and it's normative standards, but also to present the view that new forms of work are also changing the standards through which worker's in these new work relations perceptions evaluate their own achievements and the social recognition they can claim through it (for the latter some excerpts of an empirical research will be presented).

DA SILVA, LEONARDO* (IESP/UERJ, Brazil)

The Political Polarization in Brazil and the New Right´s Publishing Strategy

The election of far-right leaders and the consolidation of a number of groups identified with this line of thought in different spheres of activities all around the world are elements that have attracted the attention of various analyzes. Another fundamental face of materialization of these dynamics, less visible and, therefore, less analyzed - although of fundamental importance - is the publishing market.

The present paper aims to analyze the emergence of the publication of authors related to the New Right and its participation in the contemporary political scenario in Brazil. This proposal analyzes the trajectory and practices of selection, production and distribution of the main publishers that have a focus in themes and authors related with libertarianism and conservative thought so as to understand how book publishing has become a key element to understand the expansion of the New Right in the political dynamics. It becomes difficult to understand how the various movements build their repertoires of action and establish mechanisms of political action without these dimensions.

I will argue that the publication of right-wing books was a strategy adopted since before the political polarization process in the early 2000s, although their commercial success coincides with the political dynamics of 2010 onwards. The identification and analysis of the New Right's best sellers presents fundamental elements for understanding the dynamics of linkage between protesters and the organization of collective movements in this new political cycle in Brazil.

La Disputa Por La Hegemonía En La Defensoría Pública De Río De Janeiro

En Brasil, la Defensoría Pública asume constitucionalmente la tarea de proporcionar acceso a la justicia a las poblaciones vulnerables. Sin embargo, su dinámica política interna determina la elección de prioridades y estrategias de acción. En una institución donde los miembros votan para elegir a su jefe, se forman diferentes grupos políticos para competir por la hegemonía. Cada uno con su propio proyecto sobre el papel que debe desempeñar la institución y sus grupos sociales aliados, que pueden incluir movimientos sociales por un lado, el gobierno, la élite judicial y el mercado por el otro.

A partir del uso extensivo de entrevistas, documentos y observación directa, esta investigación rastrea la historia reciente de disputas políticas en la Defensoría Público del Estado de Río de Janeiro entre 2009 y 2015. Se describe como una agrupación llamada Defensores Públicos en Movimiento (DPMov), que incorporó el papel de partido político interno y pretendía defender demandas populares históricas y la participación de los movimientos sociales en la política de la institución, fue capaz de construir una hegemonía progresista.

La investigación muestra que el grupo necesitó renunciar a una postura idealista y sectaria para adoptar tácticas que aumentaran la competitividad en el ámbito político interno y superaran la etiqueta de radicales de izquierda. Para esto, el grupo incorporó demandas corporativistas moderadas, se alió con otro grupo político visto como moderado; calculó su relación con los movimientos sociales sobre la base de las consecuencias electorales imaginadas. Al mismo tiempo, promovió la denuncia sistemática del grupo que anteriormente estaba en el poder, acusado de vincular la institución con los intereses del gobierno y los intereses personales del ex jefe. Al conquistar el liderazgo, el grupo pone en práctica su proyecto político teniendo que equilibrar las demandas más radicales de la sociedad con las barreras del elitismo jurídico.

Political Action for the Implementation of the Ombudsman's Office within Brazilian Public Defender's Offices

The mobilization of rights by social movements before the justice system in Brazil is characterized by a variety of strategies. They can focus on lawsuits on the one hand or political action on the other, with a gray zone in between. These strategies differ depending on the type of decision and the type of effect targeted. The first aims for a judicial decision by a magistrate with immediate enforceable effect, while the second aims for a political decision by the direction of a legal institution to produce a policy or a change in the institutional design itself. The first is based on legal procedure while the second is based on the production of hegemony.

This study, based on the action research methodology, analyses the results of the political actions carried out over in 2016, 2017 and 2018, for the implementation of the Ombudsman's Office within the Public Defenders' Office (PDO) in three Brazilian states: Pará, Minas Gerais and Pernambuco. The actions were carried out by Justice Forum, an organization aimed at an integrative justice system. The Ombudsman represents a permanent channel for the participation of social movements in the PDO's politics and it is perceived as a threat to the corporate hegemony that believes legal institutions should only operate in accordance with the logic of the lawsuit. The strategy involved advocacy in alliance with the National College of Ombudsmen, the mobilization of local social movements, and the network of public defenders and lawyers interested in the outcome. Despite the success in the State of Pará and the better knowledge by the interested groups of the role of the Ombudsman, the results also show that the lack of budget is used as the main justification for not installing the Ombudsman, thus avoiding the politicization of the public debate on the subject.

Desafíos y Posibilidades De Entrevistas Biográficas Virtuales En Un Estudio Con Mujeres Docentes De La Ciudad De Buenos Aires

En el marco de una investigación sobre las identidades laborales y de género de docentes de escuelas técnicas de la Ciudad de Buenos Aires, a inicios del 2020 el equipo tenía planificado hacer entrevistas biográficas para estudiar las trayectorias educativo-laborales de mujeres docentes que trabajaban en las asignaturas prácticas dictadas en el espacio de taller.

Apenas iniciado el ciclo lectivo irrumpió la pandemia y el 16 de marzo las clases presenciales se suspendieron en todas las escuelas de Argentina. Los docentes continuaron trabajando desde sus hogares en una situación que revolucionó su trabajo y sus vidas, pero también las nuestras. Desde este confinamiento de investigación, decidimos avanzar con el trabajo de campo consistente en foto-entrevistas biográficas y realizarlas a través de medios virtuales en este nuevo escenario.

El pasaje de una entrevista cara a cara a una remota implicó desafíos éticos, metodológicos y operativos, con consecuencias en el proceso de investigación. En esta presentación se discuten límites y posibilidades de la realización de entrevistas biográficas no presenciales en esta investigación, considerando la complejidad adicional de haber utilizado fotografías como estímulo para analizar los puntos de inflexión de sus trayectorias. En particular, nos interesa tematizar cómo la realización de entrevistas remotas redefine y plantea nuevos desafíos en la construcción del vínculo con entrevistados (consentimiento informado), en la selección de casos (ante condicionamientos objetivos para acceder a ciertos perfiles de casos en contexto de pandemia), a la vez que hace necesario repensar el dispositivo metodológico inicial. En cuanto a las investigadoras, será una oportunidad para discutir reflexivamente las habilidades que demandan las entrevistas virtuales, los efectos de intensificación de nuestras condiciones de trabajo y la necesidad de extremar la flexibilidad propia de los diseños de investigación cualitativa para una mayor apertura ante los emergentes de un trabajo de campo inédito.

#Weekendformobilization. Contradictions and Un-Predictable Consequences in Mobilizing Ideas

Ethics is a very complex and multifaceted concept indissolubly linked to contemporary times. In front of this unprecedented diffusion, its enduring presence in the scientific and public debate has weakened its semantic domain because everything, in present times, seems to be "a question of ethics." From and analytical point of view the ethics of sustainability refers to human believes and behaviour in relation to environmental conservation and the quality of Earth ecosystems. Ethics of sustainability, as a broader version of the ethics of care, answers to humanity needs in terms of respect, equity and protection assuring well-being to the present and future generations. But episodic mobilizations do not automatically translate a subjective disposition into societal change.

Bearing in mind these premises, the aim of this work is to explore the associations networks working beneath the protests and demonstrative acts linked to the ethics of sustainability. In particular, we will take into account the Italian cases of three global protests: Friday for future, No-buy day and Saturday for future.

Starting from the subjective ethics the presented exploratory fieldwork unveils the contradiction in mobilizing ideas and implementing sustainable behavior and habits.

Prosocial Disobedience: A New Conceptual Framework to Study Social Protests

Over the time, protests have changed as well the reasons of mobilizations. The concept of civil disobedience, defined by Thoreau (1849) as the active and declared dissent of a citizen toward public rules and regulations, systems of laws, and government directions, can no longer be an exhaustive model through which analyse several collective behaviour expressions of the nowadays global society.

Pro-immigrants and immigrants protests as well as several global movements, whose attitude is to advocate human rights and needs of certain social categories, demand social change through mobilisations, demonstrations, petitions but even through occupations and illegal actions. They can be seen and analyse through a model of *pro-social* disobedience, describing collective actions which aim to produce a positive social change to benefit the whole civil society, *not only* and *not necessary* involving the participants needs, looming a kind of collective action *in favor of* and not only *against*.

The new framework, not fully implemented in sociology, would examine this kind of collective action as a right granted to the citizen within democratic systems and/or duty imposed in the interest of society (human rights defence and tendency to equalization) and as a dynamic of alternative construction, often symbolic, of reality. Disobedience is seen as an action of protest moving within the

denotes a presenting author. Abstracts are organized by first presenting author's last name.

boundaries of issues related to solidarity and cooperation, also in a moral, ideal, and sometime Utopian direction, therefore oriented towards projects that are not always feasible.

The concept can only move from a cross-disciplinary perspective and focus on identity issues.

This paper aims to develop the above framework and highlight how it could be useful in the analysis of recent form of solidarity social protests.

Access to Administrative Justice and Perceptions of Procedural Justice: Findings from a Survey Among Ombuds Users in Austria

Whereas the access to civil law institutions represents a traditional area of socio-legal research, the access to administrative justice constitutes an under researched field (Adler 2003; Albiston & Sandefur 2013). With this paper we aim to make an empirical contribution in this regard by adding to the growing number of survey research on experiences of legal problems and access to justice (Cominelli 2004, Milatovic/UNDP 2017, World Justice Project 2019). We discuss the findings from our survey among users of the Austrian Ombudsman Board (AOB), an alternative dispute resolution mechanism and the national institution monitoring the public administration. Our survey, conducted in 2018, was online and paper-based (n=8,274) and part of a larger mixed-methods study. In the first part, we explore the socio-economic characteristics of AOB users and their implications concerning access to justice. In the second part, we discuss our findings regarding ombuds users' perceptions on procedural and outcome justice. The survey results show that the inequalities in access to ombuds services discussed in the recent literature are also present in the Austrian context. Also in line with existing research (Creutzfeldt & Bradford 2016; Hertogh 2013), we see that the procedure's outcome is experienced as more just when the treatment of the claim as well as the result meet the users' expectations.

Contested Decisions, Constitutive for the Organization: Negotiating Legal Competence in Public Encounters

This paper deals with decisions made by the Austrian Ombudsman Board, the national ombuds institution monitoring public administration which is addressed by individuals who claim their right to good administration. Understanding decisions in organizations as social practices (Villar et al. 2018) and performative processes (Villar & Roglio 2019), the paper is based on an analysis of negotiations taking place between ombuds person, caseworker and claimant in public encounters (Goodsell 1982), so-called consultation days, held regularly in all Austrian provinces. In these negotiations the vital decision is made whether the AOB is competent for the case and will consider it in more detail or not. We explore how these decisions are socially constructed (Abend 2018) in and through the encounter, how they produce social order (Ahrne & Brunsson 2011) and contribute to the overall organizational strategy (Villar et al. 2018). While competence seems to be a clear-cut legal rule, in fact it needs to be examined on a case-by-case basis; this often leads to a negotiation in which the different actors follow clear (sometimes opposing) strategies and draw on different kinds of resources, including material resources (such as photographs, private notes, official letters). Part of a larger mixed-methods case study, in this paper we focus primarily on our participant observation of consultation days. The analysis shows the contested nature of such decisions, which are at the same time constitutive for the organization.

DAKKA, FADIA* (Birmingham City University, United Kingdom)

Hope As a Tactical Possibility: Mobilising Subversive Rhythms and 'Anticipatory Presence' in the Contemporary Academy

Introducing *Rhythmanalysis* as an alternative method and a radical pedagogy for cultural-educational research, this paper revisits the findings of an experimental project conducted in a post-1992 HEI of the West Midlands (2018). Whilst capturing the contradictory rhythms of teaching in learning through a range of different methods, the project emphasised the affective, aesthetic and political dimensions of our everyday practices, highlighting the opportunities and struggles inherent to the production and appropriation of time-space in higher education.

From this point of departure, the paper argues that a lot more can be achieved, methodologically and theoretically, by unveiling and exploring the anticipatory and subversive potential inherent to *rhythm*.

Looking at teaching and learning in contemporary higher education as not only rhythmic activities, but fundamentally and increasingly future-facing and future-oriented, the paper considers the university as a 'microcosm' within which it is possible to ascertain and interrogate the rhythmic nature and political urgency of contestation, hope and anticipation.

It will be argued that now, more than ever, the existential crisis of the university must be turned into an opportunity for imagination: political, cultural and educational shifts are crucial to bring out the anticipatory potential intrinsic to higher education as a rhythmic, inclusive and open-ended system. To this end, the paper will put in fruitful dialogue Lefebvre's notions of 'presence' (1991) and 'theory of moments' (1959) with Ernst Bloch's 'Not-Yet' and 'Unbecome' (1986), to start imagining the education of the future as a suspended, yet disclosive time-space shelter, attuned to forms of 'anticipatory presence' and capable of nurturing and cultivating 'traces of expressionist hope' (Hammond 2017), within or without the university.

Comparación De Políticas De Becas y Créditos Educativos De Universidades Públicas y Privadas Para Acceder a La Educación Superior En Argentina, Chile y Uruguay (2015-2018)

Esta ponencia procura describir las diferentes políticas de becas y créditos educativos de la Argentina, de Chile y de Uruguay que se han implementado en los últimos años, tanto a nivel estatal como privado, con el objeto de democratizar el acceso a la educación superior y permitir la inclusión de sectores con escasos recursos económicos. En los últimos años en América Latina prevalece una tendencia a la privatización de la educación superior. En ese sentido, en esta ponencia se busca comparar las políticas adoptadas en los tres países analizando los diferentes criterios de justicia en el otorgamiento de becas y créditos educativos. Se busca visibilizar las lógicas meritocráticas que se entretejen en la obtención y mantenimiento de becas y de créditos educativos. A su vez, se describen los diferentes tipos de becas que se otorgan en universidades privadas de las capitales de los respectivos países. Este trabajo tendrá un abordaje descriptivo- comparativo.

Migration and Social Mobility: Climbing the Social Hierarchy in the Transnational Space

Despite the important progress of social mobility studies, thanks to the use of sophisticated statistical analysis techniques (social mobility tables, path and long-linear analysis) (Cuin, 1993), there is scant research about the link of social and spatial mobility. This chapter analyses the relationship between migration and social mobility from two approaches. The first uses quantitative analysis techniques to study the impact of immigration on the class structure of host societies, on inter-generational social mobility rates and the degree of social mobility, which also sheds light on the openness of the class structure. It includes a comparative study of how external immigration impacts on the class structure and social mobility patterns in Argentina and Spain. The second approach uses qualitative research methods to consider the transnational social mobility strategies of the migrant population and their impact on the social mobility trajectories of transnational families. The chapter aims to contribute to the debate on migration and social mobility with a theoretical-methodological proposal that goes beyond previous research, whose scope was limited to inter and intra generational social mobility of the migrants in the host countries. Our work analyses social mobility strategies and trajectories from a transnational perspective, considering not only the impact migration has on the position held by migrant families in the class system, but also on the host countries. Our research includes both quantitative and qualitative techniques, namely the statistical analysis of stratification and social mobility surveys, that will be benchmarked against previous studies conducted in Argentina (Germani, 1963; Dalle, 2016) and Spain (Fachelli and López Roldán, 2017). In turn, the qualitative analysis is based on 40 biographical interviews with migrant families (migrants, their children or grandchildren) of Galician origin who have moved through the Atlantic transnational space (bidirectional migrations between Galicia and Argentina).

The Italian Feminist Movement and the Challenge of Intersectionality

This paper aims to study the application of the concept of intersectionality in the contemporary Italian feminist movement. In the last three years, a new wave of feminist demonstrations has been taking place across the world: from the Argentinian movement Ni Una Menos, to the US #MeToo, from the referendum on abortion in Ireland to the protests of female workers in India. In the contest of southern Europe, even Italian feminism has experienced a new renaissance with the movement, "Non Una Di Meno", marking a radical gap with the historical Italian feminism, which focused for a long time on sexual difference theory and on the neutral "woman" subject. Faced with the neoliberal restructuring of the work and the advancing of right-wing parties at a global level, the combined reading of gender, race and class as interconnected categories - building and enforcing each other - seemed far-sighted and necessary. While social movements have long focused only on the class issue, Western white feminism has been criticized by Black, Chicana, decolonial and postcolonial feminists of focusing only on the gender dimension. Differently, Non Una Di Meno is claiming struggles' intersectionality as one of the fundamental components of its activism and points out the structural dimension of gender-based violence. On those bases, this paper aims to understand, how has the concept of intersectionality entered the vocabulary and imaginary of Italian feminists. In the light of the criticisms of the so-called "white feminism", how does the Italian feminist movement theorize its belonging to a transnational movement without falling into the false myth of "universal sisterhood"? Through the lens of Intersectional Feminism, Postcolonial Critique and Public Sociology, this paper questions the possible theoretical and practical contribution that a non-Eurocentric Sociology can offer to what appears to be one of the strongest contemporary social movements.

DAMBROSIO CLEMENTELLI, ALINA* (University of Genua, Italy)

The Unsafe City. the Effects of Safety Technologies through an Intersectional Perspective.

In recent years, new feminist demonstrations have taken place in the streets at a global level and have made the struggle against gender-based violence a central part of the political agenda. Although the most of the violence takes place in the home, episodes such as that of the so-called "Manada" in Spain require us to rethink new strategies to contrast male violence against women. Previous research has shown that urban space is not neutral but marked by hierarchies of power. Specifically, a different perception of security between women and men emerges, which is due to a sexual vulnerability and a different socialization for women. For this purpose, security policies are implemented, such as the installation of video surveillance, street militarization, to prevent the risk of rape and harassment in public space. However, these techniques do not contrast power relations, but rather raise symbolic and material boundaries. Moreover, the passing from a welfare system to a neoliberal system has implied a shift from oppression to victimization framework where security becomes an individual responsibility. In this context, safety apps are developed to suggest women the safest streets to cross. At this regard, safety apps for women could be considered an individualized security dispositive or are a tool for livability of women? The aim of my contribution will be to investigate how urban security technologies influenced the production of urban space, stressing the relationship between urban space and subjects' positions within it. In order to avoid the risk to consider women as h homogeneous group, I will adopt an intersectional perspective, specifically looking into the effects according to class, gender and race.

How Institutional and Economic Similarities Structure the Labor Market Success of Immigrants

We investigate how economic and institutional similarities between the country of origin and the host country affect the labor market success of foreign-trained immigrants (FTI) on the German labor market. First, we assume that human capital quality acts as a proxy for the transferability of skills as well as for the quality of the educational system in the country of origin. Second, we test whether the institutional structure of the educational system in the country of origin affects the labor market opportunities of FTIs in Germany arguing that institutional similarities improve the overall job matching process. Consequently, we expect both – human capital quality and institutional similarity – having a positive effect on the labor market opportunities of FTIs.

In order to evaluate our hypotheses, we use pooled data from the German Microcensus from the waves 2012 to 2014. The sample units are foreign-trained immigrants from seven European countries. We use the gross domestic product as proxy for the human capital quality and the share of upper secondary vocational educational that is in a dual system as proxy for the institutional structure of the home country.

Results from a linear probability model and an interval regression show that the institutional structure of the home country affect the employment chances of FTIs in Germany. We find no significant effect of the human capital quality on employment chances when controlling for the institutional structure. Additionally, we find positive and significant effects of both indicators on the wages of FTIs. These findings indicate that the institutional structure of the country of origin affects the labor market success of FTIs. However, human capital quality on seems to affect wages but not the employment chances.

Entrepreneurship and Female Empowerment: An Analysis from the Group Empreendedoras Da Restinga

This communication is part of an ongoing dissertation in the Graduate Program in Sociology at UFRGS. From the tension between the concepts of empowerment and entrepreneurship, we seek to discuss how the organization of women entrepreneurs in a collective has produced changes in their personal and professional trajectories. As a theoretical framework we start from the problematization that feminist authors linked to critical theory have made in recent decades about the appropriations of the concept of female empowerment by entrepreneurial discourse - discourse that is the product and producer of a neoliberal social order - and what functions it assumes in a context of increasing flexibilization of work and unemployment. This work are situated in a context of flexibility, unemployment and social reforms that have led more and more men and women to seek entrepreneurship as a solution to unemployment, giving new meanings to the historical concept of "entrepreneur".

In order to analyze such questions, we look at the experience of the collective "Empreendedoras da Restinga" created on the city of Porto Alegre, focusing on the trajectory of some of the women in the group analyze what relationship the empowerment experienced by the group has with the professional activity as an entrepreneur.

The hypothesis that guides this work is that the empowerment felt by women in the studied group, contrary to what the entrepreneurial discourse propagates, is the result of the collective form of organization that they practice as a way of exchanging knowledge to strengthen their small businesses.

The methodology for carrying out this work took place this with an online questionnaire sent to the entire group, from which we obtained 31 responses. From this, we selected 15 women entrepreneurs, using an heterogeneity criterion, to conduct semi-structured interviews. We hope to present the first research results in this communication.

A New Wave of Environmental Movements? Fridays for Future and Their Struggle for Climate Justice

The "Fridays for Future" climate movement started with the protest of Greta Thunberg in front of the Swedish parliament and grew to a global movement, which was able to mobilise more than 1.6 million people around the globe in March 2019. Under the banner "Fridays for Future" millions of schoolchildren and students worldwide are mobilising for climate justice. Never before so many young people were on the streets by using school strike as a form of civil disobedience. Public and political attention has been substantial in European countries and Greta Thunberg became the movement's icon. A new generation has became political, representing a historical turn in climate activism. This wave of climate protest mobilisation is unique in its tactics, appeals to pupils and students and refers to a generational conflict. Based on a mixed-method approach, including qualitative and quantitative data from the climate strikes, we would like to discuss our research on the participants, the mobilisation processes and the organisation of "Fridays for Future". With focus on the Austrian context, we would like to explain the relevance, impact and features of this new wave of global environmental activism.

Intersectionality and Protest: The Students' Struggles in South Africa

Why are South African universities sites of struggle? How do we make sense of student protests which emerged in the year 2015? This paper considers the uprising student protests "Fees must Fall" and "Rhodes must Fall" and how they achieved free education at South African universities in the year 2017. Students are protesting nationwide against the economization of education and the discrimination of *black* students under the notion of decoloniality and intersectionality. The notion of decoloniality and intesectionality is related to the historical experiences of racism against *black* people and the particular history of the South African universities. By considering the student protests we are witnessing a shift from the colonial/apartheid "idea of South Africa" to the decolonial "South African idea" within a context where education is only accessible to the middle and upper classes. The student protests became a symbol for a *decolonial* and *intersectional* practice and strategy which claims for free education for everybody.

Based on a qualitative research on the student protests at University of Cape Town the paper analyses the students' movement from an intersectional perspective. I will argue that an intersectional lens in social movement studies is able to dismantle hierarchies in protest actions. By considering social movements through an intersectional lens of *race*, class or gender power dynamics and reinforcing social categories of inequality become visible. Therefore, the paper investigates the movement through an intersectional lens and will show how this approach can help to understand and to identify the challenges that a lack of heterogeneity poses to the accountability and representational functions of social movement politics. Likewise, with regard to students' struggles intersectionality is not only a tool for understanding social movements rather a strategy and claim of the student movement.

Immigration and Islam in French Culture: Specific Moral Attitudes and Their Evolution

The recent emergence of a Muslim minority in France is essentially the result of immigration - mainly from Maghreb, Africa and Turkey (Dargent, 2010). However, this minority already presents very specific cultural attitudes. It is characterized by a weak liberalism of morals according to their family and sexuality values. In this regard, it joins the Catholics of France: these two religious groups are thus opposed to the non-believers, many more liberal in this field.

How have these characters evolved over the past ten years? Do these cultural specificities of French Muslims decrease, joining the national averages, as the current of analysis initiated by R. Dahl postulates? Or on the contrary, do they persist in time?

On the other hand, if they have «right» moral values, the Muslims of France show «left» political attitudes. This contrasts them with Catholics, who came from a previous immigration (of Italian, Polish, Spanish, Portuguese, etc.) or not. How to explain this contradiction? Is the Muslim religion here an artifact, concealing a lower social status linked to recent immigration (Brouard & Tiberj, 2005) which alone can explain their political progressivism? Or does religion still have an effect on their political attitudes, even after taking account of their migratory origin? And why?

This communication will try to answer these various questions using in particular the European Values Survey of 2008 and 2018

Religion, Spirituality and Cultural Attitudes in France and Europe Today

Religion, spirituality and cultural attitudes in France and Europe today

The 2018 French sample of the European Values Survey reveals a considerable chiasm. On the one hand, indicators of religious affiliation and practice are falling again. On the other hand, beliefs in life after death, paradise, hell and reincarnation increase. And the previous surveys show that these developments are part of an old trend that can be observed at least since 1990. Better: these antagonistic evolutions are not only true but even accentuated in the 18-29 age group. Here we have one index of the transition to a post-secular age marked by the expression of a "spiritual need" which does not find its satisfaction in the ecclesial institutions.

To what extent do these believers without religious affiliation or practice differ from Catholics, Protestants and Muslims? What about the liberalism of morals (family and sexuality)? Ethno-authoritarianism (attitude towards authority and immigration)? Economic liberalism (attitudes towards the market and the welfare state)? Political opinions (left-right position and partisan proximity)? The Values Survey makes it possible to construct scales of attitudes in these different fields. The situation of Europe as a whole will also be considered in counterpoint to the French example.

Culture and Communication in the Age of New Technology: A Study of Kongthong Village

Proliferation of communication technologies is the driving force of globalisation resulting in the formation of today's global village.This technological boon has made the interaction from different points along a global network .This access to the remotest corner of the world brought tremendous changes to our culture and societies. There is a village oblivious to the world until recently its unique tradition of communicating with each other drew people's attention from all over the world. Thanks to the blessings of new communication technologies. Kongthong is a small village dwelling in the remote Khasi hills of Meghalaya in India. While the words, meanings, languages hold a key concern in today's society, this village follows a remarkable method of communication which makes this unknown village renowned in the world. The members of this village do not use words to communicate with each other; instead, each member has an assigned tune unique to him or her by which they are identified. Because of this tradition Kongthong village is popularly known as "Whistling village" or "Singing village". Inhabited by a few hundred families.Communicating through tunes gives them an edge over words in their hunting activities. Another interesting fact about this tradition is that---behind every single tune there is a woman. During her pregnancy, a woman thinks of a particular tune, mostly inspired by a birdcall, which later becomes the name of the newborn. While the new communication technologies provide us so much of edge but, practicing this primitive mode of communication makes the case of Kongthong village sociologically very significant. This study is an attempt to present the various aspects of this whistling culture and changes

DAS, MANOMITA* (Birla Institute of Technology and Sciences, Pilani, Hyderabad Campus, India)

Exploring Disaster Induced Internal Displacement in Indian Sundarbans: A Study of Sagar, Mousuni and Ghoramara Islands

Over the past six decades, the number of people displaced due to disasters and environmental degradation has increased at a rapid rate. Contemporary studies estimate that roughly one person is displaced every second due to disasters. This rate is predicted to shoot upwards overwhelmingly in the near future. The condition is particularly concerning in developing nations, which are hazard

prone and are home to a large number of vulnerable population. However academic research examining disaster induced displacement and the needs of the displaced people is limited, especially in the developing nation context. In this backdrop, the paper studies internal displacement caused by disasters in the Indian Sundarbans and its implications. Specifically, the paper explores the following themes, a) the characteristics and form of disaster induced internal displacement; b) its socio-economic and environmental implications both in short and long terms; and c) the exiting social and institutional approaches to address the needs of the internally displaced and where they are falling short. For the purpose of the study, a qualitative method was utilized and 24 in-depth interviews were conducted with internally displaced people spread across the three islands selected for the study, Sagar, Mousuni and Ghoramara. The major findings of the research indicate that internal displacement in the study area is a continuous process and a major challenge. Such displacement disrupts regular patterns of life of the displaced people, challenges their socioeconomic well-being and often triggers environmental stress and degradation in the areas of relocation, creating newer forms of vulnerabilities and risks. The paper concludes by positioning disaster induced internal displacement as a major impediment towards attaining sustainable development and calls for social justice based approaches to address the needs of the internally displaced people.

Dealing with Student "Failure How Sociology Teachers Adjust Their Pedagogical Practices

Alors que le débat public en France se focalise sur la question de l'échec étudiant, comment les enseignants universitaires perçoivent-ils ces difficultés et comment y réagissent-ils ? La question de l'échec est habituellement examinée en regardant les étudiants, leur travail et leurs parcours. Je propose ici de déplacer le regard vers les enseignants universitaires : comment perçoivent-ils ces difficultés et comment y réagissent-ils ? Il s'agit d'étudier la façon dont les enseignants de licence perçoivent les capacités et les difficultés de leurs étudiants (difficultés de compréhension, absence aux cours, mauvaises notes aux examens) et comment ils y répondent en pratique. J'examine cette question comme un problème de sociologie du travail. Le contexte dans lequel les enseignants travaillent, les étudiants qu'ils ont en cours, les points de vue de leurs collègues forment le cadre de leurs interactions. Le public étudiant leur pose des problèmes de travail, ce qui engendre des discussions et des ajustements de pratiques.

L'exposé s'appuie sur une enquête de terrain réalisée entre 2012 et 2014 dans une université pluridisciplinaire d'une grande ville de l'ouest de la France, qui a consisté à observer le travail des enseignants et des étudiants de groupes de première année de licence de sociologie. Les pratiques quotidiennes de travail des étudiants et de leurs enseignants ainsi que les discussions informelles ont été observées au quotidien. Ce dispositif a été complété par des entretiens enregistrés avec les enseignants et j'ai participé à des réunions pédagogiques.

Je propose donc dans cet exposé d'analyser le débat entre les enseignants sur l'adaptation aux étudiants, dans le contexte renouvelé de l'enseignement universitaire de la sociologie, et montre l'éventail des ajustements opérés par les enseignants.

Sociology of Science and Technology in Brazil: Current Themes and Theoretical Perspectives

The field of Sociology of Science and Technology in Brazil has grown significantly in the last few years. The aim of this paper is to map and review research in Sociology of Science and Technology in Brazil, between 2010 and 2018, drawing upon a research previously done on Brazilian Anthropology of Science and Technology (ROHDEN; MONTEIRO, 2019). In order to do so, we map and review the following: articles published in scientific journals classified as A1 – the highest in rank by Brazilian research funding agency CAPES (Coordenação de Aperfeiçoamento de Pessoal de Nível Superior) for the 2013-2016 quadrennial, as well as article collections published in Brazil; annals of scientific events in Sociology and Sociology of Science that took place in the country; and data from the CAPES thesis and dissertation database. Our keywords to trace publications in scientific journals and article collections were "sociology of science", "science", "technoscience", "technology" and "sociotechnical", whereas for annals of scientific events, thesis and dissertations (CAPES database) we used "sociology of science", "sociology of science and technology" and "sociology of science and technique". We seek to an-

alyze the consolidation of Sociology of Science and Technology as a fully formed field in Brazil, pointing out its most current themes and theoretical perspectives and situating such scholarship in the general circuit of Brazilian sociology.

Examining the Stories Experts Tell about Emerging Technologies: A Study of Researchers Engaged in Genomic Selection in Forestry

Technology innovations, including those touted for their environmental and climate benefits, are characterized by speculation about future benefit and harm. We examine the stories that experts tell about genomic selection in forestry, an emerging novel technology that advocates claim will assist in climate adaptation, in the context of interviews with researchers engaged in the development of this technology. A diverse range of promises, expectations, and concerns were present, particularly pertaining to perspectives on scientific uncertainty and controllability of unintended effects. Several common themes also emerged, however, including support for implementation, and a public deficit model of citizen engagement in decision-making regarding novel technologies.

Creating Emotional Spaces in Biographical Interviews

Most biographical researchers are familiar with the difficulties of talking about intensely painful or traumatic experiences with their interview partners. Many of us will also recognize the sensation of leaving an interview with a feeling that the most important part of our interview partner's experiences has been left unsaid. In this paper, I will explore ways in which otherwise neglected feelings about intensely emotional biographical experiences involving loss, loneliness and exclusion can be expressed, embodied, and, ultimately, narrated. Drawing examples from biographical interviews with passionate tango dancers, a case will be made for exploring less conventional ways of doing biographical research, ways in which researchers and their interview partners together create spaces for sharing and making sense of emotional experiences which are biographically relevant, but difficult to put into words.

Making It Happen: A Study of First Generation Learners of Marginalized Communties

India is a diverse country. It consists of people coming from various cultures. Every culture has their own set of norms and values. Not all the groups understand the need to get educated. There are group which doesn't have any educational background. Government of India is working towards educating people coming from various sections of society. Many policies have been implemented and Right to education was enacted to achieve this goal. However, we are still not able to reach it as it does not understand the cultural references and view-point of people coming from all groups. There is substantial gender and social class differences in enrollment, retention, dropout and educational achievements at all levels of learning. This paper focused on marginalized communities of India, with special reference to sex workers and denotified tribes. Children coming from these communities have to face discrimination made by teachers, peer group and society at large. Paper is based on ethnographic study conducted in rural areas of Rajasthan in India. It explores the complex issues which surround marginalized communities. It shed light on how an education model based on creativity can engage children in schools and develops their interest in education. It discusses how community participation and NGOs can work together to bring social transformation in the society. The research employed reflexive ethnographic methods. Specifically, the method included observation of participation and in-depth interviews. Data is collected from 22 hamlets of marginalized communities.

Contrôle Social Répressif Et Mobilisations Dans Les Favelas De La Ville Du Rio De Janeiro

Le travail intègre une partie de la recherche doctorale et se concentre sur les relations entre le contrôle social répressif et les mobilisations développées par les mouvements des mères et des membres des familles des victimes de la violence d'État dans les favelas et les banlieues de la ville du Rio de Janeiro. Il a été

observé comment des cadres spécifiques sont constitués concernant les lieux des «marges» et la dynamique répressive qui ne se limitent pas à l'action des forces de l'ordre, mais incluent également l'action des agents du système de justice criminel. Il analyse aussi la manière dont les mouvements de mères et des familles de victimes de la violence d'État sont organisés, imbriquant des formes de résistance dans un réseau de solidarité et de soutien mutuel qui reflète l'intense caractère symbolique et politique de leurs actions collectives. Ainsi, d'un côté, il retrace les expériences des habitants dans un contexte de la scène urbaine conçu à partir d'une logique militarisée et marquée par des aspects autoritaires touchant notamment une partie de la population perçue en tant que membres des «classes dangereuses», de l'autre côté le travail développé par les acteurs collectifs autour de la revendication publique et de l'élaboration politique du deuil pour la perte d'un membre de la famille. Dans un processus marqué par des conflits au sein de la société, la lutte des mères et des membres des familles des victimes ne se limite pas à la recherche de la justice et à la lutte contre l'impunité des agents d'État par le biais de batailles judiciaires. En ce sens, le réseau de mères se lie à un processus de construction plus large, comprenant un ensemble de répertoires conçus pour la construction de la défense des droits humains et pour opposer les pratiques de contrôle social répressif.

Mobilisations Et Contrôle Social Répressif Entre Lieux De Lutte Dans La Ville Du Rio De Janeiro

Le travail intègre une partie de la recherche doctorale et se concentre sur les relations entre le contrôle social répressif et les mobilisations basée sur les manifestations qui se sont propagées dans la ville du Rio de Janeiro en 2013. Il est le résultat d'une expérience empirique dans laquelle il était possible de suivre directement les dynamiques répressives développée lors des manifestations de 2013 et au cours d'un processus pénal accusant 23 manifestants des crimes lors des mobilizations. Il a été observé la dynamique répressive mise en place dans une perspective sociale et spatiale, en tenant compte non seulement l'action des forces de l'ordre, mais aussi les formes de contrôle social exercées par le système de justice criminale. Dans un contexte de profondes transformations de la ville, le cycle de 2013 émerge dans le cadre d'une reconfiguration des actions collectives dans le pays, une période d'insurrection diffuse et hétérogène, avec ses multiples dimensions, demandes et acteurs sociaux. Dans ce scénario de conflit croissant dans l'espace public, les mobilisations et les participants ont été soumis à d'intenses violences policières, surveillance, arrestations arbitraires et atteintes à l'intégrité physique et aux libertés fondamentales, ainsi qu'à des poursuites pénales contre des manifestants visant à criminaliser les mobilisations populaires, les acteurs collectifs et délégitimer les actions collectives. En outre, les dynamiques répressives et le processus de criminalisation sont analysés lors des manifestations des rues et des actions collectives contre les violences policières dans les favelas qui ont pris la scène publique et avaient beaucoup d'expressivité au cours de cette période, conduisant à réfléchir aux relations entre répression et mobilisation dans les espaces des «marges» de la ville. En ce sens, l'analyse identifie le processus, les événements, les acteurs, les dimensions et les effets du contrôle social répressif et de la criminalisation au cours du cycle.

DE ALMEIDA SILVA, GUSTAVO* (Dartmouth College, USA)

Domestic Labor, Unionization, and Consolidation of Rights in São Paulo

This study explores the role of unionization in the consolidation of labor rights among domestic workers in the metropolitan area of São Paulo, Brazil. In 2013, Brazil sanctioned the 72nd Constitutional Amendment (CA 72), which aimed at expanding labor rights of domestic workers and mitigating inequalities between these and other workers. This amendment has been considered a historical achievement for the category by politicians, activists, unions, and academics because it filled major gaps left by the Constitution of 1988, which ensured domestic laborers only 9 out of the 34 rights determined to other rural and urban workers. Nonetheless, the legislation catered only to workers who work at the same household for three or more days in a week (mensalistas), excluding workers who work in multiple houses but less than three days in the same residence in a given week (diaristas), who constitute 30% of all people performing paid domestic work in Brazil 2011 according to the International Organization of Labor. In addition to the legally-instituted exclusions, other challenges have hampered the changes the law intended, such as, on one hand, Brazil's economic recession and growing inequality and, on the other, the permanence of abusive work conditions that stem from Brazil's history of slavery and race relations. Yet, little has been theorized about the participation of labor organizations in the outcome of the law. I argue that understanding workers' access to unions and their ability to unionized is central to interpreting the results of the CA 72. Have unionized workers benefited differently from the law than non-unionized workers? Has low unionization among domestic workers limited the reach of the law?

DE ANGELO, CATHARINA* (Universidade Estadual de Campinas,)

Korean Softpower through Cultural Centers

Globalization allows not only economic flows to be deterritorialized, but cultural ones as well. A large amount of symbolic goods cross our daily lives, being present in advertisements, international travels, or even a common lunch in a Korean restaurant, for example. The spaces where the flows of globalization, both cultural, political and economic, become more intense are in cities defined as being global. These are also responsible for receiving a large migratory flow, causing daily life in a global city to be permeated by multiculturalism.

Approaching the city of São Paulo, which has received a large amount of migratory flows, including the Korean migration that comes from the 1960s, in this city there is a set of institutions where it is possible to ritualize this identity, being in these spaces where they are spread. cultural and consumer goods, having here authenticity linked to nationality as a differential value. Thus, this communication seeks to deepen the question of how the transnational production of national representations is taking place in the Korean case, and how this deterritorialization is territorialized in Brazil, in a 'global city' such as São Paulo, by closely analyzing the functioning The Korean Cultural Center in Brazil is part of the international network of centers that currently have 32 units around the world. The unit located in São Paulo is the focus of the analysis and it is from this that I seek to explore which discourse offered in Brazil about Korean culture, what are the cultural goods that circulate in this space and how this environment is used to promote the declared softpower in the editorial materials of the South Korean government.

Only-Child Families in the Context of Fertility Decline: A Global Perspective

This paper describes the changes in the proportion of women with an only-child across 98 countries and across a total of 487 10-year birth cohorts throughout the 20th century. We combine data from different demographic censuses and country-level surveys and examine whether or not these trends can be explained simply as a consequence of fertility decline. The results show that women with an only child have become more prevalent in all regions of the world, despite a few country exceptions. Europe has the highest prevalence, but all regions have showed upward trends since mid-20th century. However, Europe also presents the greatest variation among its countries: despite all countries presenting from low to very low fertility, the proportion of women with only-children varies from 6.4% (Albania) to 39.6% (Russia) in the most recent cohort. We also show that while fertility is strongly correlated to the proportion of women with an only-child in above-replacement fertility contexts (overall correlation coefficient of-0.77, for all cohorts combined), as fertility reaches two children per women or below, this association becomes less strong (coefficient of -0.33 for all cohorts, reaching 0.09 in the 1950-59 cohort). These results, coupled with the evidence and discussion in the literature, lead us to believe that there are other, socioeconomic and cultural factors that become more important in determining the prevalence of only-children in societies with low fertility. There are plenty of studies that focus on understanding how medical, economic and cultural changes have led to the adoption of the two-child norm in most developed nations, however, not much attention has been given to the rise in only-children in these same contexts. This paper was a first step in mapping out this phenomenon.

Maternity, City and Law: The Interaction of Mothers and Constituted Powers in Rio De Janeiro

The present proposal aims to investigate, due to public sociology, the occupation of public space by mothers in Rio de Janeiro, from 2015 to 2019, claiming for rights. Maternity is not a guarantee under Brazilian capitalism – it is a duty or a prohibition. The abortion is legal only when mothers' life is at risk, when pregnancy occurs after a rape or when the fetus is anencephalic. Last capitalist crises, associated with mega events that took place in Brazil, shows its effects in the deeply increase of urban violence numbers, as well as unemployment rates (from June to August 2019, 12.6 million people have no job in the country). In that

context, state attention once the baby is born is decreasing. According to Rio de Janeiro Public Security Institute (PSI), from January 2016 to March 2017, 9 in each 10 victims of police violence were black. Mothers from peripheries that tries to find answers about their kids' deaths receive no answer, what is another human rights violation. Mothers from middle classes, that have material conditions to raise their children without state help, also demand rights (the possibility of a future to all kids) and political participation. When those women appear in public space demanding justice access, memory and human rights, they are all claiming for more than mere life, they are requiring dignified life: public security, health, habitation. The effects of necropolitics are analyzed observing the numbers of Brazilian Institute of Geography and Statistics (BIGS) about life costs and unemployment; the statistics of police violence of PSI and the protests organized by mothers' groups, according to the method of militant research. Legislation, public policy and jurisprudence tend to absorb differently this demand. The hypothesis under investigation is that those social movements change political decisions even in a conservative government.

Legal Roles for Trade Unions in Procedures with Regard to Well Being at Work in Belgium and the Netherlands

Trade unions play a role in the set-up of the regulatory framework in Belgium and the Netherlands. They play a role in the proactive and the repressive elements. In Belgium, trade unions can conclude collective bargaining agreements with regard to the topic with a very large scope (because they also bind non-members). Furthermore, trade unions can represent their members in a court case. Belgium moreover knows a possibility for trade unions to represent their members in litigation. It seems that these proceedings are not sufficient and that a role for trade unions in the formal or informal procedure might help to come to better solutions. The assets of the Belgian procedure might be interesting for the Dutch case as collective bargaining agreements are not binding for non-trade union members and the representation of staff members by trade unions is more limited. However, the informal role of the trade unions in the negotiations on well-being at work is far higher in the Netherlands than in Belgium. The so-called Poldermodel includes that in the Netherlands the whole context is based on bilateral contacts leading to good relations between employers and trade unions. In both countries, the role of trade unions is questioned. In Belgium by the right wing government indicating that the role of trade unions (with high density) should be refrained in their power while in the Netherlands trade unions received criticism because they are acting to political. The proposed solution is to adapt in both countries the regulation in order to make the procedures a continuous interplay between employers and trade unions in both countries.

The Institutionalization of Women's, Gender and Feminist Studies in Brazilian Social Sciences

This work discuss the institutionalization of Women's, Gender and Feminist Studies in Brazilian Social Sciences. It focus on strategies and narratives used to legitimate the field in the restrictive citizenship scenario of the military dictatorship and how this scenario helped to shape the way the field has taken. The development of Women's, Gender and Feminist Studies in Brazil had a different trajectory from it's two major influences, the American and the French experiences. It is a point of agreement among scholars in Brazil that the context of the military dictatorship and the struggle for democracy are defining moments for the Brazilian feminist movement. However, this does not seem to be just a contextual unfolding, an active and conscious refusal of the academic institutional direction outlines the trajectory of this field. One of the markers of the Brazilian case is that academic research on the theme did not lead to a process of diciplinarization, that is, it did not become a discipline with regular courses in the national higher education. The research developed despite the non-implementation of teaching and systematic training of professionals. What I propose is to describe how this trajectory happened; while I expose the main factors that I consider explanatory for this configuration. Institutionalization in the academy focused on the formation of study centers or research institutions, with funding established by international agencies, building networks that manifested institutionally from study centers, scholarships, congresses and academic journals. This has to do with the dictatorship context of restricted citizenship, with the regime's university reform and with the alliances build to resist the military regime. All those factors have set priorities and styles of action that where more or less successful in the construction of a epistemic status for Women's, Gender and Feminist Studies.

Yo! MTV and Its Importance to the First Generation of Brazilian Rappers

This presentation explores the importance of Yo! MTV Raps, a program that was aired in Brazil from 1990 to 2013. It focuses on the importance of broadcasting the music videos from American rappers (such as Run D.M.C. and Public Enemy) to the first generation of rappers in Sao Paulo.

One of the interesting things about the exportation of Yo! MTV is that the company, in the United States, forced all its subsidiaries to broadcast this show. In Brazil, the program had the biggest audience from all of the MTV's programs in Brazil in the 1990s. But as it was very different from the public targeted by the marketing strategies – middle class, that was ranked classes A and B by the publicity companies – Yo! MTV didn't get any attention from the executives of the company, as one of the VJs that presented the show told me.

Besides from the marketing, the show also were exhibited in slots of time that had little prestige – in the early morning, for example. On the other hand, these music videos were very important as a way to get young black people from Sao Paulo to be interested and understand the imaginary of hip-hop culture in the United States. By analysing the particularities of the importation of Yo! MTV, this work frames differences between Brazil and United States related to race and the symbolic representations of hip-hop music.

Islam in Minas Gerais: Adaptations and Choices in a Bastion of Brazilian Traditionalism

This paper aims to sociologically analyse the adaptations and negotiations involved in the expression of Islamic religiosity in Brazilian minority communities—specifically in the barely explored scenario of Minas Gerais. Minas Gerais is considered to be one of the most traditional states of Brazil and a bastion of Catholicism.

Islamic religiosity in Belo Horizonte faces peculiar challenges to which answers are sought not only from leaders but also from common practitioners of the religion. To understand the consequences of the cultural negotiation process in the practise of a religion that is considered by the inhabitants of Minas Gerais to be "foreign" and to what extent this process is guided and intermediated by Muslim leaders (Amir-Moazami & Salvatore, 2003) or defined by "individual" decisions of believers (Césari, 1994), I analyse four important points addressed by Islamic normativity: female Islamic clothing, prayers, halal (permissible) food, and marriage.

The methodology that I employ in this study is based on participant observation and interviews conducted with leaders and other members of the Islamic Centre of Minas Gerais. The community is ethnically diverse, including immigrants from countries such as Pakistan, Morocco, Syria, and Senegal who have come to Brazil to work in multinational corporations, trade, or study. In addition to immigrants, converted Brazilians comprise the local Islamic scene. This research, which has been in progress since August 2018, shows a revived and rigorous practise of religion by members of the community, sometimes exceeding the demands of the sheikh. Intermediary prayers reported by some members, in addition to the five mandatory daily prayers, are an example. I defend that there is an elective affinity between the conservatism of Minas Gerais and traditional Islamic values concerning family and gender, although it is necessary to deal with islamophobia and its consequences in personal and professional life.

DE DIOS HERNÁNDEZ, DAGOBERTO* (Universidad Federal de Rio Grande del Sur, Brazil)
MADERA PACHECO, JESUS ANTONIO (Universidad Autonoma de Nayarit, Mexico)

Alimentos En Disputa: Alimentar La Ciudad Desde Un Campo Con Hambre

La Organización de las Naciones Unidas para la Agricultura y la Alimentación (FAO), ha venido manifestándose recientemente sobre los desafíos existentes para alimentar a una población creciente que en las próximas tres décadas aumentará en un 35% llegando a 9.000 millones de habitantes. Sin embargo, el crecimiento poblacional estará concentrado sobretodo en el medio urbano pues según el Departamento de Asuntos Económicos y Sociales de la ONU ha anunciado que el 68% de la población vivirá en zonas urbanas en 2050.

Aunado a ello, desde diversos espacios académicos y de investigación también se han venido discutiendo temáticas agroalimentarias sobre cómo producir ali-

mentos saludables para el campo y la ciudad. A pesar que aproximadamente 25% de los alimentos producidos en el mundo son desperdiciados, para algunos actores político-empresariales es necesario aumentar la producción, y por ende para alimentar a esa población creciente mayormente urbana sería necesario duplicar la producción agrícola. No obstante, actualmente el 11% de la población mundial equivalente a 800 millones de personas viven en una situación de inseguridad alimentaria que les lleva a vivir con hambre.

México no es la excepción, ya que 27 millones de personas (23,3%) viven en pobreza alimentaria y de ellas el 12,5% sufre desnutrición crónica. Además, el 80% de los hogares rurales padecen algún grado de inseguridad alimentaria, tanto que entre los años 2012 y 2016 fallecieron 37,827 personas por desnutrición, aunadas a las 532,147 personas que en 2018 fueron atendidas por problemas de obesidad.

Por lo tanto, ¿Porque las responsabilidades de alimentar lo urbano se colocan sobre lo rural, cuando éste aún tiene hambre? ¿Cuáles estrategias de producción y abastecimiento alimentarias diseñadas para alimentar una población creciente pueden primeramente resolver el hambre y pobreza que padecen sociedades rurales campesinas? ¿Cómo desde México pueden extrapolarse propuestas y soluciones a la temática agroalimentaria?

DE FRANÇA, MATEUS* (, Brazil)

Irregularity and Social Norms: The Impact of Land Regularization in Community Life

In Latin America and specifically in Brazil, the quick process of urbanization that took place during the 20th century caused many problems specially in big cities. This is the so-called urban crisis, which comprehend, among many other issues, a housing deficit and the growth, both in number and size, of irregular settlements inhabited by low-income population that can't afford to live in the "regular city". In many countries, land regularization norms and programs were thus created by governments in order to guarantee better life and housing quality to irregular settlement's residents and to solve some of the issues related to these areas. Much has been researched about the impacts of land regularization process in houses and private buildings in general. However, little has been studied about its impacts in public space and services and community buildings. Regarding this issue, this paper intends to answer the following question: "how does the land regularization process impact social norms regarding community life in consolidated irregular settlements?". Answering it allows to perceive tools that can be helpful to analyze the effects of urban transformations provoked by land regularization processes. Thus, an empirical research was done in two irregular settlements located in Porto Alegre, both right next to each other: one still irregular, but demanding its land regularization, and the second already regularized. By direct observation, interviews, documental research and focus groups, both cases were compared, in order to point out how social norms regarding community life can be affected by a state-conducted process.

Public and Patient Involvement in the Digitalization of Healthcare

The personalization of healthcare relies on data-intensive research, which requires access to large sets of digital data. Involving patients and other members of the public in health data collection is key to assembling such large-scale datasets. However, empirical research about lay people's positionings concerning the generation of their own health data is scarce. There is also limited evidence about the role of digital technologies on self-generating data practices connected to personalized care. This presentation focuses on public and patient preferences for involvement in the digitalization of healthcare through health data self-generation and on the use of technology to collect health information. Our findings derive from a multi-methods study drawing on 574 structured questionnaires and 41 semi-structured interviews with rare diseases patients and informal carers in Porto, Portugal. Questionnaire results show that 43% of participants are willing to collect their own health data and almost one-quarter does not want to be involved. Less educated participants, with blue colour occupations, unsatisfied with their own health and with lower social trust are less likely to get involved in health data collection. Reasons underpinning interviewees' unwillingness to engage in self-data generation include increased daily burden, lack of time, perceived incapacity to undertake data registration tasks and concerns with data security. While most participants favour the use of digital technologies to collect health data, reluctance to use them is explained by limited digital literacy, lack of access to digital devices and distrust concerning digital data safety. Public and patient preferences

for involvement in self-generation of digital health data appear to reproduce the socioeconomic, able-bodiness and digital inequalities that constrain the inclusion of disadvantaged groups in health research more generally. A similar pattern of exclusion may come to emerge in data-intensive research, risking to produce gaps in the inclusiveness of and access to personalized care.

The Incentive of Research and Teaching Practices and Their Influence on Student Performance in the Evaluation of the Social Sciences Course.

This paper aims to analyze factors that influence the grade of Bachelor Degree students of Social Sciences in Brazil. For this purpose, we use the database of the latest National Student Performance Exam (Enade), the exam does not evaluate student`s performance, but it checks the quality of the courses and the performance of their students in relation to the syllabus and their skills. Results were obtained using multivariate linear regression in which the dependent variable is the weighted average of the general (25%) and specific (75%) knowledge test scores. The statistically relevant independent variables were Income, Mother's schooling, high school, whether the student received some type of academic scholarship during graduation, good experience of undergraduate project for professional formation, use of technology as a teaching strategy, and activity opportunity within and outside the classroom that encourages respect for diversity. It is noted that the increase in income and in the mother's education results in the increase of the student's grade. Receiving an academic scholarship increases the student's grade by 17.6 points. The grade of students who studied in private schools presents 3.8 points increase when compared to those who studied in public schools. If the student considers that his or her undergraduate project has been a positive experience for professional qualification, their grade increases 6.7 points compared to those who disagree with the statement. If students agree that academic activities that encourage respect and diversity have been developed, student performance is increased by 4.5 points. Surprisingly, if technology equipment were used in the classes, the students' grades decreases by 6,4 points. Given the current scenario, in which scholarships are being cut, it is important to research and study to evaluate the importance of this mechanism for the improvement of our higher education.

Gender and Sexual Identity from Ney Matogrosso `s Work of Scenic Performance

This article approaches the art of Ney Matogrosso, thinking about his scenic performativity as symbolic tensors of the esthetic and behavioral heteronormative patterns in brazilian society. This artistic expression is treated in time frame of Military Dictatorship (1964 - 1985), period of notoriety from him with the Secos & Molhados and of great importance to artist`s fans, today in the age of 50 to 66 years. Based on data obtained from semi-structured interviews with eleven people, the artist himself and articles from three newspapers, the article reflects on the specificities of his art, which were significant in order to circumvent and negotiate with authoritarian structures of power averse to their presentation and aesthetic presence. In special, is discussed and analyzed how his body on stage in the shows could become an instrument of symbolic coalition with the hegemonic structures of gender and sexualities, at the same time that it agglutinated admirers of diverse social groups, including men more in tune with stereotypes of masculinity. Thus, it develops an approach to art from the perspective of the Social Sciences, attentive to its ability to disturb and break with traditional sociocultural paradigms, in addition to strengthening human rights and citizenship of LGBTs.

Social Acceleration and Ideal Types on the Temporalization of Lifestyles

This communication aims to present results obtained from the author's doctoral thesis project, awarded by the Ministry of Science, Innovation and Universities of Spain. The objective presented is intended to describe and analyze the concep-

tual definition of being accelerated by the population under study. For this, two activities have been carried out in Spain during the years 2018 and 2019. On the one hand, a query with 125 students of the Complutense University of Madrid and the Miguel Hernández University. On the other hand, a survey has been carried out on a sample of 599 students of the University of Alicante, proportional by sex and branches of knowledge (confidence level: 95%; error: ± 3.95%). The main results suggest that the people interviewed produce a certain homogeneity in the definition of the ideal "be-accelerated" type while, on the contrary, the ideal "be-non-accelerated" type is nourished by heterogeneous expressions and senses. This data, together with the results of the survey, indicate the existence of contradictions between what the population associates with their person (what they say they are) and what they say they do. These contradictions, in addition, have an inverse character with respect to the ideal "be-accelerated" and "be-non-accelerated" types, concluding that there is a generalized incoherence between the imaginary and collective definition of the being-accelerated, the self-positioning between both types, and the action.

Sociología Aplicada Al Diseño y Ejecución De Políticas Públicas De Juventud En Ontinyent (España)

En la presente comunicación se exponen los resultados metodológicos de un proyecto de investigación que nace como respuesta a una demanda del equipo de gobierno local de Ontinyent, municipio ubicado en Comunidad Valenciana (España). El propósito era diseñar un plan estratégico de políticas públicas destinadas a la juventud residente en la ciudad y donde se constituyese una hoja de ruta para mejorar la calidad de vida de dicho colectivo. Siguiendo los postulados de la investigación social aplicada y participada, se estimó oportuna y necesaria la adopción de un enfoque que cediera el protagonismo al principal actor clave para el proyecto: la juventud del municipio. A la hora de definir la metodología, los métodos de investigación, las técnicas para recopilar datos e información, así como cualquier actividad relacionada con el proyecto, se realizó un trabajo reflexivo previo que asentase los principios éticos, académicos y profesionales que dieran soporte a todo el proceso de planificación estratégica. Para ello se hizo acopio de los siguientes cuatro principios epistemológicos, interrelacionados entre sí: el criterio científico, el enfoque participativo, la perspectiva transversal y territorial y, por último, el prisma de género. Mediante estos principios epistémicos, se ha obtenido un diagnóstico de la situación de la juventud del municipio, a través del análisis de fuentes secundarias y el diseño de talleres participativos que han dado lugar a un proceso de deliberación, reflexión y organización del Plan de Juventud de Ontinyent; a través de una radiografía sociológica de esta población. Todo ello ha contribuido a que se refuerce el desarrollo del conocimiento colectivo a través de la interacción entre los promotores de la investigación, los investigadores y la comunidad, con el propósito de emplear los diferentes saberes para la transformación de circunstancias consideradas por la comunidad como problemáticas, en contextos favorables para esta.

MEDEIROS, DAMIÃO* (Núcleo de Estudos da Violência da USP - NEVUSP, Brazil)

Control Interno Del Poder Judicial, Legitimidad y Auto Legitimidad.

El control interno del sistema judicial ha sido objeto de investigación en el NEV-USP sobre la legitimidad de las instituciones e es un aspecto clave. El objetivo de esta investigación fue saber en qué medida los dispositivos de control interno afectan la legitimidad de los magistrados. Este aspecto contempla la creencia de los agentes en el derecho a ejercer su autoridad, aspecto que ha sido poco explorado en el poder judicial. Para contribuir a este debate, analizamos cómo las relaciones jerárquicas del poder judicial afectan la percepción de los jueces sobre su propia autoridad y legitimidad. Posteriormente, analizaremos el Departamento de Investigaciones Policiales (DIPO), una agencia de la capital del Estado de Sao Paulo responsable de las audiencias de custodia, establecidos en 2015 para garantizar la pronta presentación del preso ante un juez para analizar la legalidad de la prisión, la adecuación de la continuación de la prisión o la posible concesión de libertad, así como también para evaluar posibles actos de malos tratos. Los jueces de la DIPO son nombrados por el juez corrector de ese departamento, quien también es nombrado por indicación política. El desempeño de la agencia es híbrido (administrativo y jurisdiccional), lo cual permite que los jueces sean nombrados y transferidos en cualquier momento. El poder judicial es un actor decisivo para comprender este encarcelamiento, especialmente para controlar la legalidad de las acciones policiales y ratificar los arrestos realizados. Por lo tanto, el cambio en el perfil de un juez corrector de DIPO puede significar cambios en la orientación de las decisiones de los jueces. Por lo tanto, destacamos las experiencias del trabajo de campo en este organismo en las trayectorias de investigación, ya realizadas y en progreso, especialmente en relación con los obstáculos para la observación de las audiencias de custodia.

Expansión de los Doctorados en Educación e Inserción de Graduados en Argentina, Brasil y México

El trabajo analiza la configuración actual de los programas doctorales en el área de educación en Argentina, Brasil y México. Se indaga la conformación y expansión de la oferta, su categorización y distribución regional en cada escenario nacional, como también la evolución de becas de formación, movilidad académica internacional y producción de tesis en esa área. Por otra parte, se explora la agenda de temas de tesis y sus contribuciones específicas al campo de la sociología de la educación. Como telón de fondo, se examina la incidencia de las políticas científicas de formación doctoral y su interrelación con los sistemas universitarios nacionales y el campo del posgrado. El marco teórico se beneficia de los estudios sobre educación superior y en particular, los de posgrado. El abordaje metodológico recupera en un primer planteo más panorámico los estudios comparados internacionales y en un segundo momento, hace foco en un estudio de caso múltiple en programas doctorales mejor evaluados en cada uno de los países seleccionados. Los resultados encontrados revelan la trayectoria disímil de las políticas de ciencia y de posgrado en cada país, la formación diferenciada hacia ámbitos académicos y/o profesionales y el desacople entre la expansión de doctorados y la inserción ocupacional de los graduados, problemática identificada a nivel internacional que en el caso de los países latinoamericanos emergentes adopta rasgos específicos.

México: Dos Reformas Laborales Comparadas, la Neoliberal y la del Nuevo Gobierno

La polémica acerca de la necesidad de una Reforma Laboral se inició en México desde los años ochenta del siglo XX. El debate estuvo lidereado por la perspectiva flexibilizadora de las relaciones laborales, encabezada por el gran empresariado. En este debate, hubo proyectos completos de cambio integral en la Ley Laboral desde finales de los años noventa e inicios del siglo XXI. Sin embargo, no hasta finales de 2012 se produjo la primera reforma, con un gobierno del Partido Revolucionario Institucional con fuerte contenido flexibilizador. Sin embargo, en pleno gobierno priista, impulsado por la cercanía a la revisión del NAFTA y la firma del Tratado Transpacífico, las fuerzas políticas del partido demócrata y los sindicatos en los Estados Unidos, así como algunos países signantes del transpacífico presionaron para incluir cláusulas en dichos tratados de compromisos del gobierno mexicano para democratizar la vida y la firma de contratos colectivos de trabajo. Lo anterior originó una segunda reforma, aunque centrada en lo sindical a inicios de 2017. El nuevo gobierno tomó posesión el primero de diciembre de 2018 y en el primer semestre de 2019 se aprobó otra reforma laboral que buscó profundizar la democratización de la vida sindical. En esta ponencia se compararán las reformas neoliberales de 2012 y 2017 con la del gobierno actual de 2019. Se discutirá sí la última reforma ha logrado revertir las tendencias flexibilizadoras de la primera o bien ha profundizado la democratización de los sindicatos y cuales son los retos pendientes, así como los primeros efectos de esta última reforma durante 2019 y primer semestre de 2010

The Multi-Method Approach in Interpretive Empirical Research As a Way to Ensure Interviewer Safety.

In the empirical research of the doctoral dissertation about the role of the magistrates in the struggles for the occupation of the urban space of Porto Alegre, several obstacles were faced to realize biographical interviews, the main one being the superior position of the magistrates in the social and economic structure of Brazil. This fact prevented the realization of interviews and the deeper understanding of sensitive issues related to the interviewees' biography.

In the biographical interviews with black movement activists and the defenders of Porto Alegre's historical heritage, the relationship between interviewee and interviewer flowed and it was possible to develop questions about controversial topics. However, this scenario changed when respondents were magistrates. In the current political context of polarization, when you are interviewing someone with power, any action, gesture, or speech, misinterpreted by the interviewee can have negative consequences for the interviewer. The problems faced in interviewing the magistrates were diverse, refusal to grant the interview, distrust, nervousness, noncompliance with schedules, cancellations, and veiled threats regarding the analysis of the interview.

To work around this problem, multi-methods were used to locate biographies in the historical context. The benefit of this research strategy has enabled the researcher to delve into delicate topics in the judges' biography without putting himself at risk. Among the methodologies employed are content analysis, analysis of historical documents, analysis of court minutes and judgments, and the use of academic magistrates, sensitive to the demands of scientific research, as informants from the research field. The main benefit of using multiple methods was the interviewer's security in working with topics sensitive to those at the top of the power hierarchy in Brazil.

LEAL, SAYONARA DE AMORIM (University of Brasilia, Brazil)

Emotion and Social Mobilization in Favor of the Resettlement of Residents in a District Affected By the Mining Activity in the Brazilian State of Maranhão.

This paper approaches the social mobilization mechanisms activated in the context of public experience of residents in a district of the countryside of the Brazilian state of Maranhão affected by the polution generated by the mining activity around. Those people fight for a resettlement in a location free from the contamination. In what concerns this, we elicit the concept of "environmentalization of the social conflicts" to reflect about the context of conception of a public problem which relies on the double moral register of an both environmental and social unfairness. The problematization comes from the impacts caused by the polution which affects diferente social groups and creates collective actions which use the environmental issues as base to reinforce social claims. We emphasize the "work with emotions" developed by the residents as pathway to the rational management of the anger and to the proposition of effective actions. We question ourselves wheter or not the situations in which the abilities of expression of the social actors damaged by the contamination are favored or constrained during the negotiations among residentes, mining companies and public power. We are based on data collected from qualitative research involvind interviews with residentes of the district Piquiá de Baixo and with leaders of non-profit organizations involved in the organization of the social mobilization in favor of the resettlement of that population. We are also based on participatory observation of meetings during which social actors involved with the formulation of the public problem debate forwardings to its solution. We infer that the critical capacity and justifications of the active actors is demonstrated when they act based on a recognition gramar symbolizing the disrespect experienced and mobilizing public opinion leaders from the public action domain in what concerns the law to the juxtaposition between habitation and health.

Self-Evaluation Report & Adult Education: A Research Reflexive Process for Making Transformative Communities of Practice

How is it possible to rethink adult education practices with an emancipatory approach aimed at all people (Freire, 1970)? In Italy the transition to lifelong learning and the institutional dimension of the process, brings together INVAL-SI Institute and universities in a community of practice (Wenger, 1997) with the adult education centres, link between education and vocational training (De Luca Picione, Landri and Vatrella, 2017).The implementation of these centres is an opportunity for all the actors involved, called to promote learning and knowledge for a particularly heterogeneous audience which differs by age and geographical origin, considered at risk of social exclusion.

In this regard, we present a new monitoring system, which gives us more articulate readings of reality and reliable evaluations of policies and experiences, and the development of models that are able to understand the school improvement, giving the right consideration to the actors' and learners' voices to exploring relations between education, work experiences and life trajectories. The aim is not only to increase teachers' performance and students' employability, but also to encourage active participation in society and to promote a sense of autonomy. This especially in the sense of placing in a comprehensive action of lifelong learning closer to citizens, organized according to a model that is able to understand the specificity of the 'demand' of each territory and provide an 'offer' aimed to acquire additional skills and real capabilities (Sen, 1997).

The first empirical evidence of our research shows how the different organizational contexts determines in the facts different levels of agency that are transformed into prearranged pathways and divergent strategies of the educational institutions (Pitzalis, 2018). The aim is to contribute to the discussion about the results of the evaluation process in the public sphere, by sharing the elements of the produced analysis with the scientific community.

TREZZA, DOMENICO* (University of Naples 'Federico II', Italy)

Towards Basic Income Experiences in Italy. Exploring the Transition from Reddito Di Inclusione to Reddito Di Cittadinanza: The Case of the Campania Region

The contribute focuses on the relationship about the recent income support policies in Italy, *Reddito di Inclusione* and *Reddito di Cittadinanza*, with a focus on the Campania Region. ReI and RdC are not a basic income traditional form (Van Parijs, 1992, 2018; Saraceno, 2018) but they represent the first attempt in Italy of a universalistic basic support measure, although with important differences. ReI was implemented after several national and local experiments of income supports and it provides a socio-economic support to poor Italian households (Agostini, 2018). In March 2019, it was replaced by Rdc seeming to limit poverty concept only to no-work (Sgritta 2019), so job research become a very important strategy.

This perspective change implicates some effects on the program management (from services integration to services work-centered), implementation (from the personal project to the job and inclusion pact) and goals (from social inclusion to employability). It suggested that there are new access conditions, but also a new governance and beneficiary experiences in terms of social representation, opinion and perception of their life-trajectories.

In order to explore these dimensions, we adopted a mixed research design: the first phase defined the context by secondary data analysis. It is useful to mapping most concentrated areas and understand the participant and the project distribution. In the second phase, we sampled different territorial areas to involve the job centers and to interview participating households. This two research moments mixed a methodological model into quali-quantitative instruments: it is an approach increasingly used in the social research (Amaturo and Punziano 2016).

This work wants to represent an important source of knowledge for studying the implementation and the effect of income support forms. Moreover, it could become a model of support for institutions in the struggle versus poverty.

Will I Get This Job? Digital Inequality and Online Job Search

Since the early stages of the spread of the internet, academics have been concerned about digital exclusion and its impact on social stratification. Internet users' material and educational resources, as well as their digital proficiency, are of vital importance when it comes to beneficial internet use. The higher the level of resources, the higher the level of digital skills, and the higher the probability that advantageous uses of the internet will be adopted. Digital skills, in turn, make it easier to obtain tangible benefits from the advantageous use of the internet.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Thus, advanced uses of the Internet like, for example, online job search, would only be beneficial to those internet users who have higher levels of material resources and, consequently, of digital skills.

In this paper we use Spain as a case study to explore this third type of digital divide, and more specifically the relationship between digital skills and the positive outcomes derived from online job search. Building upon the preliminary analysis of 90 semi-structured interviews with recruiters and job seekers from both high skilled and low skilled labor markets, we show that "digital communication skills" are particularly important across markets characterized by limited job opportunities and have positive implications for finding a job online.

FACHINETTO, ROCHELE (Federal University of Rio Grande do Sul, Brazil)

Women in Brazilian Police: Violence and Gender Relations within Police Institutions

This research focuses on gender relations within Brazilian Police institutions and the power relations between men and women that emerge in the various forms of violence that policewomen suffer as public security workers. The research was developed by the Violence and Citizenship Research Group at the Universidade Federal do Rio Grande do Sul on the working conditions of Brazilian policewomen. The data originally obtained revealed a myriad of violence situations to which these professionals are exposed to and pointed to the importance of deepening our understanding of gender relations within Police institutions. Although women have been incorporated in Brazilian Police institutions decades ago, few changes in their infrastructure have been made in order to include them in police work. Women need to adapt themselves to the Police and not the opposite, especially when considering conditions and work regimes, individual protection equipment, routines and daily interactions. How power relations between men and women derive into symbolic, psychological and physical forms of violence? The study is based on a gender relation approach, understanding gender as an element that organizes social relations and signifies power relations between men and women (SCOTT, 1995). It aims to explore the very working conditions of these women, as well as aspects related to career ascension and recognition. We understand that these questions can also be understood within the scope of the inequality of gender relations, which are asymmetric inside Police institutions, and because of the hierarchical organization of the Police and the differences in power observed between men and women in our culture.

DE MELLO, LUIZ GUILHERME* (Pontifical University Catholic of Parana, Brazil)

Movilidad Humana, Desastres Naturales y Visas: El Caso De Los Haitianos Hacia Brasil

Frente a un contexto de desastres naturales y vulnerabilidad social, donde los riesgos (según el concepto establecido por Ulrich Beck) tienen el poder de globalizar y afectar a todos, en 2010, Haití fue golpeado por un terremoto de magnitud. 7.0 MW, un desastre natural que empeoró la situación socioeconómica ya vulnerable en el país. Paralelamente, en el mismo año, la economía brasileña creció un 7,5%, convirtiendo a Brasil en un país de destino para muchos haitianos interesados en mejorar la calidad de vida. Sin embargo, desde 2010, el gobierno brasileño ha enfrentado un problema legislativo: ¿Qué visa dar a los haitianos? ¿Debería el gobierno brasileño recibirlos como inmigrantes o refugiados (cada uno bajo la protección de diferentes legislaciones)? ¿Es posible admitirlos en el país como inmigrantes ambientales o refugiados del cambio climático? Para responder a estas preguntas, esta investigación se basa en el método deductivo que utiliza datos geográficos para mostrar por qué Haití es propenso a los desastres naturales (como terremotos y huracanes), así como el análisis de datos estadísticos gubernamentales de Brasil para medir el flujo de inmigración hacia Brasil de 2010 a 2019. Los resultados indican que la inmigración haitiana es un fenómeno histórico, pero antes de 2010 los haitianos no consideraron a Brasil como una opción para inmigrar. Con todo, el sólido crecimiento económico, las oportunidades de empleo en la construcción civil motivadas por la Copa Mundial de Fútbol de 2014 y los Juegos Olímpicos de 2016 hicieron de Brasil un destino atractivo para los inmigrantes haitianos. Por ahora, el gobierno brasileño da la bienvenida a los haitianos como inmigrantes, creando una visa específica llamada *visto humanitário* para satisfacer la alta demanda. Por otro lado, el gobierno brasileño no ha cambiado la legislación para acomodar a las personas que se mudan específicamente debido a desastres naturales.

DE MELLO, LUIZ GUILHERME* (Pontifical University Catholic of Parana, Brazil)

Rural-Urban Migration, Natural Disasters and Social Vulnerability: The Case of Environmentally Displaced Migrants in the Philippines

In 2013, Typhoon Haiyan struck the Philippines and the Visayas Island was one of the hardest hit by this natural disaster. Being a rural region whose economic pillar was agriculture, this catastrophe resulted in human trafficking and migration flows to regions such as Metro Manila. Thus, this study arises from the need to investigate the intersection of rural-urban migration, natural disasters and social vulnerability. The presentation will focus on Haiyan Typhoon and migration flows to Metro Manila (one of the country's main urban regions). Through an interdisciplinary analysis, this research conducts a quantitative survey to collect data from key institutions (especially the Government of the Philippines, Asian Development Bank and International Organization for Migration) to show how natural disasters affect the Philippines and rural-urban migration flows. The results manifest that after Typhoon Haiyan there were cases of human trafficking (mainly affecting women from Leyte and Samar) and rural-urban migration flows to Manila and Cebu. However, the study also found that livelihoods were diversified (in addition to agriculture, many dwellers from Visayas began to ensure household income through construction and fishing). Finally, Metro Manila is a region that historically receives rural migrants who give up on planting (especially crops) due to environmental as well as economic factors. However, the lack of housing policies makes former rural dwellers to live in slums. Growing urbanization and population density are also factors that make Metro Manila prone to natural disasters. In this context, the study concludes that there should be a joint effort between cities and the Government of the Philippines to find ways to integrate rural migrants into the urban area, but mainly to expand infrastructure and socioeconomic development investments in rural regions, which often face problems which regards to poverty and are more prone to natural disasters.

DE MELO RESENDE, VIVIANE* (University of Brasilia, Brazil)
MARTINELLI, YARA (Universidade de Brasília, Brazil)
SARAIVA, ERNANI (Universidade Federal Fluminense, Brazil)

La Universidad Como Objeto Del Ódio Bolsonarista: Análisis Crítico Del Discurso En Facebook

El odio bolsonarista está dirigido a um amplio espectro social. Están bajo ataques mujeres y movimientos feministas, poblaciones racializadas, pueblos indígenas, pueblos tradicionales, grupos LGBTQ+, poblaciones empobrecidas en territorios vulnerados etc. La comunidad académica y las instituciones de educación superior también son objetos del odio, ya que son identificadas como polos de resistencia democrática. La persecución a las universidades sucede en el campo de financiamiento y autonomía, pero también por las disputas discursivas, especialmente en las redes sociales. El presidente se comunica con su electorado por mensajes en Twitter, y la defensa de ideologías conservadoras se dá especialmente en Facebook. En este ejercicio analítico, nos fijamos en el grupo bolsonarista más grande de Facebook, que reúne 317,000 miembros. Analizamos el discurso memético en la página, tomando categorías de estrategia discursiva, intertextualidad, prominencia y tema. Los datos recopilados se analizaron con el apoyo de un software. El discurso de criminalización de la política y de la izquierda, el discurso misógino y el discurso conservador son los principales recursos para la construcción de la universidad como enemiga. La ampliación del alcance semántico del "anticomunismo" se convierte en una fuerza vinculante, que se asocia en cadenas de significado con otros significados, contrários al feminismo y a los derechos de la población LGBTQ+. El análisis de los memes recopilados muestra la descalificación de las instituciones universitarias y sus actores, a través de ironías, asociaciones negativas que incluyen estereotipos, simplificación del debate político, reducido a la polarización izquierda-derecha, con la criminalización de la izquierda y la ficción de la amenaza comunista tomadas como estrategias de construcción del enemigo.

Considerations on the Ecological Modernization Theory in the Light of the Environmental Licensing Arena of Wind Power Projects in Brazil.

The theory taken as the starting point for this analysis is the so-called Ecological Modernization Theory, developed in the ambit of Environmental Sociology. Such theory presents an optimistic view on development, believing that it implies technological innovations, optimization of productivity without increasing

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

the use of resources, adequacy in the role of institutions and promotion of ecological rationality. Such "ecological rationality" would lead greater environmental regulation by the government and control of environmentally harmful industrial practices. As a result, different social actors would turn to environmentally responsible practices and policies that would stimulate a relationship that would combine natural sustainability, improved social indices and economic warming.

The ecological modernization theory, despite all the criticism, remains at the center of many debates about the possibility of a positive tradeoff between economic development and environmental sustainability, posing relevant issues, whether seeking to refute or to prove the theory.

It is in this context that this work is inserted, which from the analysis of specificities present in the environmental licensing of wind power projects in Brazil, presented as sustainable and efficient energy generation projects, intends to raise some questions about the ecological modernization theory.

The environmental licensing process is configured as a privileged space for analysis, highlighting the interests and strategies of each social actor involved in development actions (the company, the state, environmental agencies, consultancies, the local population, civil associations etc.). Thus, it allows both the identification of the forms taken by the collective action of confrontation performed by the impacted or potentially impacted groups, as well as the economic and political strategies of corporate power and institutional power. This is a critical moment that enables the observation of discourses and practices regarding the enjoyment and appropriation of environmental resources, which are sometimes contradictory and conflicting, highlighting an intricate game of interests.

Hegemonia, Geopolítica y Seguridad En Las Américas: Apuntes Desde Los Estudios Latinoamericanos

La presente propuesta de ponencia busca presentar articulo de mi autoria: *Hegemonía, Geopolítica y Seguridad en las Américas: Apuntes desde los Estudios Latino-americanos.* Publicado en el libro Hacer Ciencias Sociales desde América Latina: Desafíos y Experiencias de Investigación, organizado por Rebecca Igreja, Odile Hoffmann e Simone Rodrigues Pinto. Coleção Estudos Globais. FLACSO-Brasil. 2019.

Este articulo, recién publicado, busca presentar una mirada específica sobre el proceso de construcción de la hegemonía, sus definiciones e intereses geopolíticos, y de las doctrinas y políticas de seguridad implementadas en el continente americano. Para ello, estos apuntes son construidos con base en las propuestas metodológicas de los Estudios Latinoamericanos, la cual ofrece una fundamentación teórica, de ideas y conceptos, utilizada para dialogar sobre una historicidad propia del continente americano, el cual presenta momentos distintos, con periodos específicos, con particularidades espaciales y temporales propias, que interfiere de distintas formas en realidades diversas del continente.

Las ideas centrales del presente articulo dialogan con las preocupaciones centrales propuestas por este Grupo Internacional de Investigación. Primero en la presentación de las cuatro proposiciones metodológicas de los Estudios Latinoamericanos y su contribución de formulación de múltiples perspectivas. En segundo lugar, sea en lo conceptual, sea en lo teórico, sea en la observación de la realidad, los conceptos de *Hegemonía* y *Geopolítica* están relacionados proximamente a los conceptos de *Territorio* y *Espacio*. De la *Lebensraum* y *Heartland*, al mito de la *Desterritorialización* y el *Desarrollo Geográfico Desigual,* se dialoga con esos conceptos en esta ponencia. Y en tercero, la importancia del cambio reciente del concepto de *Seguridad*, que también se relacionan a la multidimensionalidad perceptibles en los conceptos anteriores. Por fim, se pretende presentar nuevos elementos y avances de investigación.

Collective Formations, International Agencies and State Actions on Porto Alegre's Master Plan Revision

Neoliberalism and competition between cities worldwide has change the fashion of urban planning. Practices such as urban entrepreneurialism (Harvey, 1989), urban marketing and managerialism has emerged along the past 30 years. At global cities these practices are well known, but at the peripheral cities of the global south it is still emerging. At most Brazilian peripheral cities, it is no different, such as the case of Porto Alegre. The city is an international symbol of democracy and people's organization over policies of Participatory Budgeting (PB), although for the past decade, the production of space is being led by innovative practices such as creative cities, smart cities and financialization. Therefore, peoples voice, their local needs and desires related to everyday life are not under consideration.

The year of 2020 is the Municipality due to deliver the revision of the city Master Plan that, according to *The City Statute*, it must be developed under people's

participation. Although, the process of revision has nearly begun, so far, an international consultation of UN – Habitat is to be hired by the Municipality with investments from the Inter-American Development Bank (IDB). The public servants are working under difficult conditions, since the public realm has been stripped out along this past few years. On the other hand, community leaders, institutions and activists are mobilized to have their voices heard, and to struggle for the right to the city trough out this process.

The paper will display whom are these actors (public servants, UN-Habitat, politicians, university, institutions, communities, grassroots movements, and, so on), how they are organized and what represents an international interference at this local process.

DE OLIVEIRA SOARES, ROBERTA* (,)

Primary and Secondary Adjustments at the Brazilian Psychosocial Care Centre

The Brazilian Psychiatric Reform advocates non-asylum treatment for individuals diagnosed with severe or persistent mental disorders, mainly through the Psychosocial Care Centres. The research aimed to understand how this institution differs from a total institution and what this change produces and, specifically, demonstrate how the dynamic of primary and secondary adjustments happened at the institution. For that, it was considered the social interactions and the discourses produced at the institution, using the technique of participant observation. The main theoretical dialogue was with the production of Erving Goffman and it was taken as a counterpoint the work of Michel Foucault. It was verified that the participation of the users modifies the way in which the social relations happen at the institution. The social control imposed by the institution generates on the part of the users the necessity of defending themselves of these violations, although they can be considered subtler in comparison with the reality of a psychiatric hospital. I argue that the boundary between primary and secondary adjustments has become more conflicting and that these issues have been reformulated due to the participation of the users at the institution, which leads the institution to constantly make agreements with the patients to maintain control of the institution.

Paths of Racial Categories in Brazilian National Censuses

This presentation addresses the significances of racial classification in Brazilian national censuses. As some scholars have put forward, census taking in Latin America has been oriented towards two political projects: a descriptive one that helped to define the cultural boundaries of the imagined community, and a prescriptive one that regards racial miscegenation as a positive singularity within the international system of states (Loveman, 2014). In the United States, the census has played a major role both as a laboratory for racial theory and as an objective device for attaching legal implications to ethno-racial divides (Anderson, 1988, Schor, 2003). In Brazil, on the other hand, racial classification has not been attached to the production of legal restraints against the black population. Race remains the basic grid for social distinction, however it has never constituted a clear line that is isolable by blood and progeny. Instead, race is combined with other visual signs of social standing, such as family networks, wealth and cultural capital. In this scenario, we compare the different ways by which racial classification is encoded and presented in the national censuses. Most of the literature on the subject focuses on the excluding construction of a symbolic space for national identity made of a homogeneous and progressively whitened population (Nobles, 2000). We also shed light on the debate, favouring two variables as a grid analysis: 1) the formation of a statistical field and its active role in defining categories and in interpreting and classifying data; 2) the slow transition from a segmented and slave society to a class-based, industrial, and urban society that has given way to a growing association between race, labour and mobility since the 1950 census, when statistical tools began shifting towards internal migrations and occupational structure.

Youth Justice and the Tensions between Social and Civil Rights: Comparing the Cases of Brazil and England and Wales

This paper presents a comparative study of the youth justice systems in Brazil and in England and Wales, focusing on the tensions these systems can produce on the access of young offenders to their civil and social rights. In these countries, the development of youth justice system occurred throughout the 20th century, together with the development of a concept of youth as a specific period of life

denotes a presenting author. Abstracts are organized by first presenting author's last name.

that needed special protection. On the one hand, the separation and specialization of youth justice meant the focus on the promotion of social rights for young offenders. On the other hand, they have created a tension between social rights and the civil rights commonly associated to the criminal justice system. This paper seeks to comprehend these tensions by using a comparative approach, and it also tries to understand how the recent approximation between the youth justice systems and the criminal justice system can produce new tensions, related to the restriction of social rights that can occur without the counterpart of the strengthen of civil rights for young offenders.

DE PAULA, LIANA* (Universidade Federal de Sao Paulo, Brazil)

Youth Justice, Rehabilitation and Tutelage: The Emergence of Youth Justice in Brazil

Youth justice was established in Brazil in the beginning of the 20th century to separate young offenders from adults and prevent adult criminality by means of a specific intervention on young people. Similar to what occurred in other countries of the European and American continents, the creation of youth justice in Brazil was a result of the double emergence and convergence of a new conception of youth and a new conception of poverty, related to the social question. That is to say that many empirical cases of youth justice share on their ideological basis the idea of rehabilitation of young offenders as a way to promote social inclusion for poor young persons and prevent them from becoming criminals. Also, in the first half of the 20th century, the idea of rehabilitation meant mostly the formation (or training) and (moral) conformation of the children of the poorest urban working-class families. This led to the creation of institutions and practices such as the Borstal training, in the United Kingdom, and the Disciplinary Institute, in the city of Sao Paulo, Brazil. However, despite the similarities, the Brazilian case has some important particularities when compared to the British case. In this paper, I aim to analyse the similarities and, mostly, the particularities of the Brazilian youth justice, focusing on two concepts of intervention on young offenders, tutelage and welfare. I will discuss that the prevalence of tutelage in the Brazilian case is a result not only of our civil law tradition, but also of our colonial position, which set a specific outcome for the social question and, therefore, for dealing with young offenders.

DE QUEIROZ STEIN, GUILHERME* (University of Münster, Germany)

Does Democracy Matter? Exploring the Influence of the Political Regime in Energy Transitions.

In the last decade, the decrease in investment costs associated with renewable energy sectors indicates that, in addition to economic and technological factors, others variables will be needed to explain energy transitions. In the international literature, there is a growing interest in the conflictive aspects underlying energy policies, becoming central the role of political institutions in processing the conflict.

Actually, we can observe a faster advance in energy transitions in democratic nations, like Spain, Germany, Japan, Brazil and India, just to name a few more successful cases. However, it is in China, a recognized authoritarian country, where we can find the largest volumes of installed capacity in areas such as solar energy, as well significant technological advances and the structuring of productive chains. This research investigates the role of political regime in promoting energy transitions. Is there any reason to believe that democratic regimes have advantages in accelerating their transitions? Or authoritarian states, with concentrated power, will be the central actors in this process, aiming energetic security and the resolution of environmental problems?

To answer these questions we constructed a database, collecting data to 150 countries, from International Energy Agency, International Renewable Energy Agency, World Bank Database, Institutional Profile Database and The Economist Democracy Index. We applied econometrics method aiming to explain why some countries developed more capacity in generating electricity from solar PV sources. The initial tests point out that, when controlling economic factors like *per capta* income and investment levels, the level of democracy has statistically significance in explaining the development of solar PV sector.

Feminist Movements Networks in Minas Gerais, State and Democracy

Feminist theoreticians that criticize generalized perspectives from the global North pointed to the need to construct a new feminist practice and to transform the academic production of the field. Dealing with the trajectory of feminism from a generalized discourse is a way that does not contemplate the different contexts of women's lives and, therefore, undermines the ability to analyse and synthesize past political transformations and future possibilities. In this sense, Mohanty (1984; 2003) points to the need for materialist analyses by feminism, which should consider both the micropolitics of context and the macropolitics of transnational economic and political structures. At this point, one must consider the specificities that come from the intersection of race, class, gender, sexuality and generation prejudices on women's lives, and seek the "shared differences" for the construction of a transnational and anti-capitalist feminist solidarity. Given that Latin American feminisms have their own historical vicissitudes and idiosyncrasies, Matos (2010) argues about a "fourth wave" of ongoing feminism in the region, which would correspond to Mohanty's considerations. Understanding that both the construction of bonds between different movements and the capillary action at different territorial scales become central in this new moment, stronger social networks should be seen. This being said, this paper aims to answer if the way in which the feminist movements acting in the State of Minas Gerais have sought to organize their practice meets the ideas around this new moment of feminism. Also, this paper proposes to comprehend how the Minas Gerais State section for women's policy has influenced the networks in which are inserted the feminist movements. For this objectives, interviews with actresses linked to movements and actresses linked to state bureaucracy were made. In addition, it discusses these themes in the light of theories that relate associativism to the deepening of democracy.

Social Sciences and Migration Studies in Argentina and Brazil: A Comparison

This project aims to compare how the Social Sciences in Brazil and Argentina dealt with the migratory issue, amidst a moment of institutionalization of the field (post World War II). To this end, it proposes an analysis of the publications on various social researchers, in order to observe the concepts and research methods used, and the study agendas, with emphasis on themes that are silenced and / or ignored. For that, I focus mainly on the fieldwork and studies of the sociologist Gino Germani, in the Argentine case, and the anthropologist Emilio Willems, in the Brazilian case, both immigrants in their countries of residence. Argentina had a massive immigration process from the mid-nineteenth century that profoundly changed its economic, social and cultural structure. A similar but milder process also occurred in Brazil. Comparing migration studies in these countries shows us the different goals and concerns of governments and intellectuals in encouraging immigration, as well as the impact on recipient societies. This research also helps in understanding the process of institutionalization and legitimation of Social Sciences as generating fields of scientific knowledge in both countries. At a time when undergraduate and postgraduate courses were being created, the research carried out by their professors and students was greatly influenced by the international academic world, with the concern that field research would be fundamental to the generation of public knowledge. Analyzing migratory studies in this context helps us better understand the development of the field of Social Sciences because of the involvement of leading researchers and institutions in these researches.

Buddhist Religiosity in Urban Sri Lanka: Role of a Charismatic Monk at the Newly Established Temple

Sadaham Ashramaya temple is a place of making news from time to time about Orthodox Buddhism and the new religiosity of Sri Lankan urban Buddhists. Rev. SiriDhamma who is the chief abbot of the temple is a controversial character in the Sri Lankan religious arena who at one time questions the orthodoxy, and the religiosity is now claimed to be an enlighten one preaching Buddhism in his own style and interpretation.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Sadaham Ashramaya has been attracting thousands of devotees from different backgrounds for the past few years particularly very popular place of urban middle class. SiriDhamma claims, worshiping deities cannot be permitted in Buddhism. But, what contradicts his preaching is the fact that the temple is full of statues of deities adopted from Hindu pantheon. He has been promoting the cult of next Buddha, Maithri Bosath and has explicated that no deity is above him in heavenly realms. He promotes the cult through Television channels to attract more devotees from newly emerging urban middle class even from Sri Lankan diaspora and earned a reputation as one of the controversial preachers in the popular Television Channels in Sri Lanka. It was a pretty money generating business for SiriDhamma and the Sadaham Ashramaya. It seems SiriDhamma decided himself to stop deceiving devotees in the name of cult of next Buddha worshiping and proclaimed himself that a new understanding arisen within him and pronounce himself as an 'enlighten one' with a new name of 'Samantha Bhadra'

This paper is based on Sadaham Ashramaya which explore its true existence in the religious and religiosity in Sri Lankan context while a considerable attention is focused on the role of its founder monk, Rev. SiriDhamma and religiosity of its devotees.

"A Holiday in Soweto": Community Empowerment at KYP as an invitation to Clinical Sociology

This abstract comes from a personal experience of the applicant occurred on June 16, 2019 at the headquarters of the social project called Kliptown Youth Program (KYP), located in the Kliptown area, Soweto, Johannesburg, South Africa (https: //www.kliptownyouthprogram.org.za/). Youth Day is celebrated on June 16 in the country, in the memory of the massacre caused by the police/government on June 16, 1976 against young black protesters in Soweto. In the context of apartheid these protesters were fighting against the imposition of the Afrikaans language on the South African schools. On June 16, 2019, KYP hosted a vibrant community party with singing, dancing and parade-centric activities at its own headquarters for the big Mr and Miss KYP 2019 contest. Joining this festive day at KYP with over five hundred people mostly from Kliptown , as an Afro-Brazilian woman and sociologist, enabled me to: 1. celebrate a transnational black identity grounded in the meeting between Mother Africa and African Diaspora; 2. begin to look at KYP's potent community policy mobilization of young adults through Clinical Sociology, as it is an area of study that integrates human coexistence, practical political engagement and scientific know-how, simultaneously, challenging the classic separation between " research subject "on the one hand and" research object "on the other. At the IV ISA Forum 2020 we aim to discuss how the development of Clinical Sociology as a multidisciplinary humanistic field of science and action (Fritz, JM - several publications) is helping us to build a project focused on: 1. understanding the history of community empowerment of KYP; 2. the elaboration of partnerships among universities and institutions in South Africa and Brazil to improve the living conditions of the community served by KYP.

CAVALCANTI, ANA* (Federal University of Pernambuco, Brazil)

The Slumification of Favelas in ZEIS Areas in Recife, Brazil.

Slums were stereotypes that misrepresented the reality of being poor living in disadvantaged neighbourhoods and mostly in intolerable living conditions in the past, but that still persist today. In general terms, *favelas* are mostly known in Brazil to relate to housing for the urban poor and will be used in this work as a synonym to the term slum. An essential policy instrument concerning the different degrees of legitimacy that *favelas* are afforded in the eyes of local authorities in Recife is the ZEIS declaration. It is a part of a programme in which the municipality of Recife aims at urbanizing invaded land (through the implementation of slum-upgrading programmes and regularizing land tenure) in an attempt to integrate such settlements within the urban area. In total, 66 areas were declared ZEIS. The last one, Coqueiral, was declared a ZEIS in 1998, but there are only five where the process of urban and land regularization has been concluded, or is in its final stages: Coronel Fabriciano, João de Barros, Greve Geral, Vila Vintém and Vila União. The other ZEIS face the delay in of the legal process and the interference of political interests. It was observed that years after the intense intervention policies of the State of direct provision of housing and infrastructure to support the consolidation of settlement areas, there is a deterioration process of the physical conditions of the ZEIS areas that varies in many degrees, also that there has occurred new demands related to inheritance and succession over time. This paper concludes that *favelas* may have being upgraded and may have being le-

gally integrated in the city, but social integration has being largely unsuccessful. In addition, physical integration has being neglected over time and need to be revisited by authorities, academics and communities.

Aracaju Beach Bars As Contested Markets: Conflicts and Overlaps between Market and Nature

The premise for this paper is that the almost 50 beach bars built on the beaches along the Expansion Urban Zone of the city of Aracaju, in the Northeast of Brazil, constitute a form of commerce on the beach that has become a contested market. This has become more evident since 2014, after a lawsuit was fled by the Brazilian Federal Public Ministry to demolish all the beach bars in Aracaju's Expansion Urban Zone, based on environmental and operational claims. In this paper, we used the data from the ongoing, more than 3,000 page lawsuit process, as well as from in-depth interviews with beach bar owners, to frame the beach bars of Aracaju as a contested market, characterized by having disputed moral issues, and involving vulnerable populations and devices. The research shows how (1) the contestation can be mainly framed between two opposed ideas: restricted and paid access to the beach, connected with the idea of sustainability; versus unrestricted and free access to the beach, connected to the idea of wilderness and conservation; (2) The modus operandi to change and to reconcile these opposite views is presented in the form of "new" revitalization projects, conceptualized as "new" designs having consequences both on the identity of beach bar owners and on the very concept of beach bars.

Barriers and Facilitators: A Research - Intervention Project to Prevent the Dropout of University from a Clinical Sociology Perspective

When carrying out research and interventions from the point of view of clinical sociology, we face a diversity of obstacles and delays, related to the perceived boundaries in the field of social action, knowledge, and professional scope. Among these boundaries I would like to point out three in particular we have experienced when implementing a recent clinical sociology research-intervention. The objective of this research-intervention was to prevent (further) dropout of university. Such boundaries mark how social reality, and its knowledge, are approached from the differente disciplines; they also mark the capacity and the entitlement of the diverse professionals to take action in society. In sum, we are talking about professional legitimacy.

These barriers, along with others that are conventionally found when carrying out interventions, can become a real problem to investigate independently: they pose a risk for the implementation of the intended interventional design, and jeopardise achieving success in its realization.

There are also facilitating elements and circumstances that help the intervention progress. In this case, it benefited from the type of complex organization that a University is, one of whose main goals is the generation of new knowledge, while one of the most important challenges for its good development is to fight against the (current) dropout.

In this paper, we shall reflect on the impact of the barrier factors, as well as those facilitating. We will also see how we managed to overcome some barriers and how we took advantage of the facilitating aspects. All this arises from the need to carry out an analysis on our own work and of a process as complicated as starting off, and completing, research – intervention projects.

The Introduction of Clinical Sociology in Colombia and Spain: A Positive Academic Experience, Not without Difficulties.

The clinical sociology perspective is being introduced in the academic field of many countries. This perspective is very developed in countries like France, the USA or Canada, while not yet present in others.

Fernando de Yzaguirre was invited to talk at a conference on clinical sociology held in El Escorial (Spain) in 2007. Since then, He had witnessed, experienced, and participated in the introduction of this perspective in Spain and Colombia, as much academically as professionally. This was a shared process with his students, now graduates, who created a research seedbed in clinical sociology called SOCLIP.

This experience, unfolding in two radically different countries, has taken us to appreciate certain common elements, while also important and surprising differences, when facing the problems and dynamics that developing the specific brand of sociology with which we are most identified.

The universities featuring our analysis are the Complutense University in Madrid (Spain) and the University of the Atlantic in Barranquilla (Colombia). Such academic and disciplinary systems impact dynamically on the process. Another influence owes to sociology's history originating in a context driven towards identifying it as a science, on the same terms as the natural sciences, which was the concern of the Vienna Circle and its "hard" science approach.

This means that the introduction of such a comprehensive, qualitative and applied sociology as clinical sociology is, with its emphasis not only on theorising but also professional practice, is bound to encounter great challenges when seeking a place for itself within the university realm.

In this paper, we aim at deepening our understanding of some of the realities we face when teaching sociology from the angle of clinical sociology, in countries where the approach is not yet consolidated.

DEAGE, MARGOT* (PhD candidate, France)

Sexual Reputations in the Connected Middle Schools: Pupils Shaming Peers' Bodies Off and Online.

The reputation is the synthesis of the judgments shared on someone. Everyone has a reputation that could be either good or bad (Chauvin, 2013). This social image spread through gossips and rumors that are particularly intense during teenage years, while constructing social norms (Fine, 1986).

For my Ph.D thesis on (cyber)bullying, I have been investigating for three years in four Parisian secondary schools greeting pupils from different social backgrounds. I have observed pupils' behaviors in the whole schoolyard, among themselves and with their supervisors. I have made more than a hundred on interviews with them about friendship and reputation offline and online, rumors, how did they feel about that and what they were thinking about adult's reactions. I have followed them online on Instagram and on Snapchat. I shared a Google Form on the four school websites to which around 15% of the pupils have voluntary answered.

Most of the time, when I asked them if they have heard of someone's reputation, they were thinking about a bad reputation. Each school had its scapegoat who always was a girl, second or third generation of migrant from Northern Africa, accused of having had sex. They all had difficulties of integration with their schoolmates. Although they had no real evidence of it, pupils were thinking the bad reputation was true. They knew it because some friends they trust told them, and, above all, because her appearance off and online showed a certain number of clues of her easy virtue. I will show how the body of these girls become a proof of they low respectability (Skeggs, 1997) comparing shaming speeches in the schoolyard and on social media. I will explain how the educational institution unintendedly reinforce these negative reputations.

RC04-JS-33.3

grounds. I have observed pupils' behaviors in the whole schoolyard, among themselves and with their supervisors. DEAGE, MARGOT* (PhD candidate, France)

The Snapchat Effect: From Deeper Copresences to Higher Reputational Risks Among Pupils

For my Ph.D thesis on (cyber)bullying, I have been investigating for three years in four Parisian secondary schools greeting pupils from different social backgrounds. I have observed pupils' behaviors in the whole schoolyard, among themselves and with their supervisors. I have made more than a hundred on interviews with them about friendship and reputation offline and online, rumors, how did they feel about that and what they were thinking about adult's reactions. I have followed them online on Instagram and on Snapchat. I shared a Google Form on the four school websites to which around 15% of the pupils have voluntary answered.

In the schoolyard, pupils are subjected to several prohibitions such as showing themselves with a teenager of the opposite sex or with younger one. If they do, they risk to be targeted by peers' mockeries, insults, rumors, even physical attacks. Outside the school, they are constraints by parental control. Hence, they use social media to create mixed and intergenerational connections, away from prying eyes. The social media they use the most is Snapchat because of its ephemeral and capture control features. On one hand, they feel like they could share anything without fearing streaks as if it were a face to face interaction; on the other hand, they have many tries before sending a text, a recorded voice or a video. Thus, they can share deeper and reflexive intimacies with anyone. However, Snapchat is not completely free of peer control: teenagers share their password to maintain their snap streaks, they look at the snaps collectively, they use fake identities to obtain information, they have strategies to watch and save contents anonymously, *etc.* I will show how online confidences can become a threat for young people's reputation.

DEBERGH, MARLYSE* (, Switzerland)

"Have You Taken an Important Risk?" - a Sociological Reflexion on the Classification of Sexual Health'risks.

"Have you taken an important risk?" - A sociological reflexion on the classification of sexual health' risks

This communication aims at presenting and discussing the classification of risks through the case of an ethnographic research on sexual health. Furthermore, I intend to bring an epistemological reflexion on feminist intersectional approaches in the analysis of risks.

Methodologically, I make use of a comparative ethnographic setting. I conducted a fieldwork in two sexual health institutions in the Western part of Switzerland: 1) a family planning clinic and 2) a health community centre for men who have sex with men (MSM). In 2018, I conducted observations during six months in the two institutions and in-depth interviews with sexual health professionals (physicians, nurses, sexual health counsellors) and patients (N=30).

In my ethnographic fieldwork, I notice that local politics of sexual health reveal a process of risks' classification between "high" risks and "lower" risk. Furthermore, I argue that this classification is based on different criterias related to sex/gender, race, class, age, and sexual orientation.

As part of the theoretical grounding, this communication make use of the feminist concept of intersectionality that was first developed by Kimberlé Crenshaw (1991) through her work on racist and sexist violences displayed against women of colour. In her research, she demonstrated that those persons presented intersectional identities within discourses because they were marginalized as both women *and* of color (Crenshaw, 1991: 1244).

By making use of an intersectional perspective, I argue that risks' classifications can be analysed in terms of a greater medicalization and control of certain social groups, especially of young women, women who gave birth and of gay men.

Reference: Crenshaw, Kimberlé (1991). Mapping the Margins: Intersectionality, Identity Politics, and Violence against Women of Color. *Standford Law Review*, Vol 43(6), pp. 1241-1299.

DECOL, JOCIELI* (-, Brazil)

The Centrality of Feminist Epistemologies to Rethink Knowledge in the 21st Century

The right to know and produce scientific knowledge have been denied to women throughout history . Modern science, as the form of knowledge with greater social prestige and cognitive authority, has contributed to numerous scientific advances, but also to the perpetuation of oppressions such as sexism. The construction of this science, which is intended to be neutral, is the result of years of exclusion and subjugation of women (SCHIEBINGER, 2001). Its androcentric character and its veiled machismo impose barriers to women in the process of building scientific knowledge. This structure is questioned by feminist movements in their theoretical formulations and practical actions. Feminist Epistemologies, more specifically, analyze the influences of gender on how we interpret knowledge, on research activities and on the subject-object relationship. Therefore, identifies how dominant conceptions and practices of justification, attribution, and acquirement of knowledge have placed women and other historically marginalized groups at a disadvantage situation, seeking alternatives to overcome it (ANDERSON, 2017). Since the 1980s, Feminist Epistemologies have been proposing modifications in the way we build and evaluate scientific knowledge, highlighting the influence of gender biases in these processes (KETZER, 2017). Considering Epistemology as the area that defines what counts as valid knowledge and the steps to achieve it, Feminist Epistemologies are perceived in this study as a central instrument to rethink knowledge in the 21st century, as they bring important questions and new alternatives to the way we produce science.

Mapping the Online Discourse about Future Perspectives Among Young Brazilian Migrants

Brazilian migration is categorized as economic driven. However recent studies suggest that this approach might be too narrow, as it tends to leave aside aspects of individual's aspirations (e.g. Fürstenau, 2019). Studies conducted among young Brazilian women from underprivileged backgrounds who migrated to Germany point out to the centrality of education both as a strategy and a goal of migration. While financial hardship is still a reason to leave towards Europe, interviewees claim that their chances of accessing education in Germany, "gathering general knowledge" (*Bildung*, in German) and "being offered better perspectives" are key reasons to stay in the country. This backdrop raises the question of how these migrants construct their perception of future perspectives in deep mediatized times (Couldry & Hepp, 2017), when information about both countries is vastly available.

In a first round, in order to assess that question with the least interference possible, perceptions shared on messages posted on *Facebook* groups in which specific topics of migration to Germany are discussed by young Brazilian women were randomly collected. The randomness also allows to measure the relevance of the topic in such online forums. This *corpus* is then quantitatively analysed with the software *AntConc* using a *corpus* linguistics approach. The conclusions from this quantitative analysis serve as a starting point to the development of a second round, based on qualitative interviews. Such mixed methods' complementarity allows to map how media use among young Brazilian migrants might be shaping their assessment of future perspectives both in Brazil and in Germany in an age of internet ubiquity.

Sexual Harassment of Men By Other Men: Legal Versus Social Justice Constructions

This research is on men who are sexually harassed by other men in U.S. workplaces, and who have filed lawsuits. The data are documents related to 90+ lawsuits. The analysis focuses on the performative hetero-masculinity that the court cases reveal, and, especially, how institutional actors such as judges, attorneys, the EEOC (anti-discrimination federal agency), and employers, construct sexualities and masculinity. I argue that social justice movements have resulted in legal changes that make it more possible for men targeted by harassment from other men to come forward and make claims, but at the same time legal discourse and processes tend to reinforce narrow legal constructions of masculinity and sexuality.

Most of the cases involve working class or lower income jobs. Some illuminate intersections with race, ethnicity, nationality, or disability based harassment. In almost all cases, the harasser identified as heterosexual and the harassment involved homophobic and/or homoerotic behavior and language. This was true whether the target of harassment identified as lgbtq, was perceived as potentially not heterosexual or not sufficiently heterosexual, or was identified as unambiguously heterosexual. In many of the cases, the harassment included sexualized physical contact. In most cases, the employer did not deny that the alleged behavior occurred, but rather, denied that it fit current legal definitions of sexual harassment. Response by courts has been inconsistent.

Recent theoretical work by Jane Ward (*Not Gay* 2015) and Linda Alcoff (*Rape and Resistance* 2019) as well as the broader literature on hegemonic masculinity (e.g. Connell) inform my analysis. This paper addresses the session themes by analyzing: how sexual harassment becomes embedded in systems of workplace inequality and job insecurity; and how legal redress processes paradoxically promote both hegemonic and counter-hegemonic discourses of sexuality and masculinity.

Pandemic Restrictions to Worship: Reactions, Discourses and Tensions in Spain

Health responses to the COVID pandemic affected the exercise of public worship for all religious groups in the world. Although, in general terms, religious communities have complied with the regulations and accepted the scientific arguments that support them, this has not been without tension. This paper presents the reactions of religious communities and worship ministers to these restrictions in Spain, reviewing with special interest the tensions and changes around the validation or questioning of scientific / health arguments based on the monitoring of press releases in national and local media in Spain, as well as digital media identified with religious organizations between March and December 2020.

The findings show the difference between the expressions derived in official and national communications, in contrast to the most internal media and at the local level. In addition, the transformation of the speeches is observed when comparing different moments: the beginning of the pandemic, with the increase in cases and restrictions, those associated with important religious holidays in some religious communities (Holy Week, Ramadan, Pesach) and the new restrictions derived from the second wave towards the end of the year. Given the conjunctural nature, the analysis presents an exploratory approach based on the methodology of structural content analysis whose objective is to analyze the meaning assigned to the health / scientific arguments in relation to religious worship in the context of the pandemic.

DELMAS, CORINNE* (University of Nantes - CENS, France)

Entre Authentification Et Pédagogie: Le Langage, Part Centrale Du Travail Notarial

La question du langage est au coeur de l'activité notariale. Sur la base de données quantitatives et qualitatives, en particulier issues d'observations de manifestations diverses et d'une trentaine de séquences de travail, et d'entretiens avec une centaine de professionnels (notaires et salariés du notariat), la communication éclairera cette importance accordée au langage, en lien avec le modèle professionnel dominant, dont le rôle de "pédagogue" du droit que mettent en avant ces praticiens se présentant comme des juristes de proximité. Elle ciblera les tensions perceptibles, en situation, notamment dans le cadre d'interactions avec la clientèle, entre le souci affiché de clarté et les particularités d'un langage juridique pouvant être appréhendé comme hermétique voire archaïque. Evoquer la question du langage implique ainsi revenir sur les ambiguïtés d'une relation de service juridique, entre proximité et distance. La communication soulignera les rapports contrastés au langage, selon les professionnels, les situations, les offices, les types de dossiers et de clientèles; il s'agira de souligner la dimension à la fois normalisée et contrastée des langages - dont le supposé "langage du droit" - mobilisé, leur dimension collective également, liée notamment à la dimension collective du travail réalisé en office et au rôle joué par les éditeurs de "formules" et logiciels. Cette tension entre normalisation et diversification des langages, au coeur de la communication, doit être appréhendée en lien avec les dynamiques actuelles de la profession et du travail notarial, marqués aujourd'hui par l'essor du numérique et de certaines formes d'externalisation de l'activité.

Vulnerabilidad y Resiliencia. Las Relaciones De Género Antes, Durante y Después Del Terremoto De Lorca (España)

La presente comunicación analiza desde la perspectiva de género cuáles son las vivencias, el impacto y la asunción de roles por parte de mujeres y hombres afectados por una catástrofe de origen natural, estudiando para ello las experiencias y percepciones de las personas damnificadas por el terremoto ocurrido en 2011 en la localidad de Lorca (Murcia-España). Los testimonios derivan de dos grupos focales realizados en el seno del Proyecto de I+D+i GENDER (Género, Desastres y Riesgos)[1], uno de ellos compuesto por mujeres y otro por varones que tuvieron que recibir ayuda institucional por haber perdido su vivienda tras el seísmo y carecer de alternativa habitacional propia.

A través de sus narraciones, hemos podido averiguar cuáles son las vivencias de las personas afectadas por la catástrofe y en qué medida el género condiciona tales experiencias. Hemos analizado la situación de vulnerabilidad de mujeres y hombres antes, durante y tras el terremoto, centrándonos en las pérdidas materiales, así como en los problemas de salud (física y emocional) identificados por las personas informantes, entre otros factores. Hemos prestado atención asimismo a las transformaciones que se generan en el orden social tras un desastre de origen natural, como es el deterioro o el fortalecimiento de los lazos comunitarios. Nos hemos fijado también en la respuesta institucional y en las críticas de la población a la forma de gestión del riesgo puesta en práctica. Y, por último, hemos analizado las estrategias adoptadas por las personas afectadas a la hora de afrontar el posdesastre, identificando la forma en la que operan los roles de género en todo el proceso.

Brazilians in Angola after 1975: Activities in Social Intervention

This paper analyses oral reports obtained through *life histories* in a study carried out about displacements occurred between São Paulo (Brazil) and Angola after its independence in 1975. As at that time many Brazilians went to Africa, we focused this study on respondents who had gone to Angola after 1975, people with different backgrounds and careers: militants, specialized professionals, as well as catholic and protestant missionaries. The stories of their trajectories showed us that all had a "predisposition" to meet new challenges, as they wanted to participate in situations where they could contribute to overcoming difficulties faced by other companies. At that time in Brazil the government was a strong dictatorship that imposed drastic sanctions on social movements. So it seems that this must have influenced the desire to leave the country. They saw in Angola the chance of any social intervention. To discuss their motivations for the trip and the process involved, as well as the activities they developed in Africa and the representations of the difficult post-independence period, we selected the narratives of three persons: one catholic missionary, one protestant missionary and other one specialized in training and human resources. The interviewees describe the difficult situations they experienced in Angola when they arrived, which was in the middle of a violent war between opposed political groups. Some of the narratives are very eloquent, and the interviewees were thrilled to remind them. The work as professional and as missionaries managed to achieve in stocks and bonds more durable and allows them to expand the exchange of work and study between Brazil and Angola to the present day. After more than thirty years of independence, the missionaries continue to work in Angola as social reformers and entrepreneurs.

Narratives of the Youth about Their Experiences in Africa and in São

Paulo - 21st Century

This paper addresses the narratives of african immigrants in São Paulo about their experiences as children and young people living in Africa and their life projects. The oral reports of the interviewees refers both to starting and adoption contexts. The paper approaches the new migratory waves from African countries to the São Paulo context, an "alternative immigration", as opposed to the usual routes to Europe. These people came from contexts of European colonization in the twentieth century. wich suffered very distinct colonization processes exercised by Portugal and France that had left marks on the institutions and the populations under their control. In the cases of Portuguese colonization the immigrants came from Angola, Mozambique, Cape Verde and Guinea Bissau; in cases of French colonization: Niger, Cameroon, Chad, Togo, Ivory Coast, Democratic Republic of the Congo, Benin and Egypt. The situations experienced were very diverse, the socialization processes of children and youth involved different ethnic-religious identities, economic situation of the families and family structures. We can stablish a disctinction between those who came from the French colonized countries and those who came from the Portuguese ones: those who were children and young people in the first group seems to have had access to formal levels of education in a less discriminatory way, even when their families were less resourceful. Normally, French speakers (with one exception), came with a background that seems to have allowed them to be quickly inserted into the city context and was also more useful in the achieving of their goals. Under Portuguese colonization, few natives were able to pursue their studies to the highest levels. Through the analysis of the experiences of children and youth, it was possible to observe some dimensions of the migratory processes that are not always considered when the focus is on adult experiences.

DEMARTINI BRITO, JULIANA* (University of Cambridge,)

Imagining the Future with the Tropicalists

To this day, Tropicália is a widely contested movement. Amongst many complexities at stake in the movement was its success to reinforce to a younger generation that cultural production must be imbued with political contestation, during a moment marked by hardline repression, torture and exile. The group mixed bossa nova, samba, rock and roll, presented themselves in parodic tropical settings, at times cross-dressing and wearing androgynous outfits, drawing from earlier Brazilian modernist philosophical influences of anthropophagy (Brazil's devouring of cultures in order to produce something new) and contemporary international influences. I therefore analyze in this text the vast material and legacy of practices by selected Tropicalist artists to question the movement's engagement with transnationalism, modernization and its alternative modes of enacting the past to produce new visions of the future. Through a queer utopian theoretical framework, I locate in the movement new ways of understanding processes of modernization and the future at times of political repression, a topic increasingly relevant to the current phobic landscape of Brazilian society. I argue that some of the work produced by Tropicália artists indicate a mode of living through and resisting to authoritarian ruling that extends beyond a narrative suffering, one which is located in the overlapping of identities and the parodical allegorization of Brazilian history. In sewing unharmonious elements together, creating a circulation and literal consumption of the past through their use of anthropophagic ideology, dissolving traditional imagery back into mobile practices to call for the crafting of a new future, these artists' works embodied of a number of anachronisms that provided a different reading of political contestation and identity for the epoch.

Transnational Indigeneity: Reconnecting Routes and Roots of Indigenous Lifeworlds

My paper will attempt to conceptualise indigeneity by unpacking the relationship between transnationalism and indigeneity and thus expanding our understanding of indigenous peoples' contemporary realities and lifeworlds. In particular I will expand upon what I call 'transnational indigeneity'. Transnational indigeneity is at first sight an oxymoron. Transnationalism is associated with up-rootedness, crossing boundaries, flows, routes and hybridity. Indigeneity, on the other hand, is typically associated with rootedness, authenticity and connection

with a particular land, strong identity, cultural and linguistic bonds. The works of Appiah (1997), Forte (2010), Clifford (2013), Sampson and Gigoux (2015), Malreddy (2015), Walter & Suina (2018) have questioned narrow understandings of indigeneity. I aim to take the field further by defending transnational indigeneity conceptually and also by providing a case study of how Kurds are an interesting example of how indigenous groups gain influence and entrench their *roots* via transnational *routes* (a la Clifford) in contemporary times. The paper will expand our understanding of indigenous lifeworlds through a focus on the Middle East, an area not typically examined in indigeneity studies.

Ethnicity, Stereotypes and Segregation in the British Neighbourhood

Preference for living in largely intra-ethnic communities can reflect upon behavioural patterns of reaction to the exogenous shock of migration or upon manifested tensions between ethnic groups, including a majority and well-established minorities. Why does segregation persevere – a fact that seems incongruous with the rates of growing diversity in modern day Western societies? Can segregation strangely enough be the consequence of spreading diversity; that is to say, the reaction of ethnic groups trying to maintain *social distance* in the most obvious way in which distance can be maintained by moving out or relocating? This is the question that the present paper will try to address using data from the Managing Cultural Diversity Study 2010. Through series of multilevel models that account for the neighbourhood contexts in which the respondents currently reside, we explore the motivation behind dynamic forms of segregation such as White flight and initial forms of tension: discomfort with otgroupers. Unlike previous research which has focused on white respondents only (Farley et al. 1994), we consider the experience of minority respondents and the influence of religious affiliation as well. The paper shows that white respondents report growing discomfort with outgroupers and desire to leave a diverse scenario if currently they live in primarily homogeneous intra-ethnic neighbourhoods in which they experience little diversity. In contrast, minority respondents show greater tolerance in general; and strong preference for living with co-ethnics increases with the strength of their religious conviction and high exposure to diversity and deprivation.

DEMIREVA, NELI* (University of Essex, United Kingdom)

Understanding the Ecology of Disadvantage: Betting Agents, Crime and the British Neighbourhood

Neighbourhoods change dramatically in times of crisis with disadvantage often becoming more pronounced and debilitating. Particularly, neighbourhoods with high levels of socio-economic deprivation are blighted by higher levels of crime and general anti-social behaviour. Important 'social buffers' such as voluntary and cultural groups disappear replaced by opportunistic organizations such as betting agents, money lenders and pawn shops. Among the determinants of a neighbourhood social vulnerability, the rise of gambling agents as an important macroeconomic factor that is related to crime and deprivation and can be potentially causally linked to the latter needs further scientific enquiry. In this study, we focus on the 2016 Ordnance Survey Point of Interest Data together with postcode liked data on crime behaviour and examine the question of whether an exponential growth in betting agents is related to risk-orientated behaviour and violent and property crime, above and beyond the contiguity of other detrimental factors such as unemployment rate in the local area and welfare dependence. We also explore possible contagion mechanisms; that is to say, we comment on whether the detrimental patterns observed in one neighbourhood can spread to other neighbourhood as well, and create conditions of sustained disadvantage.

DEMIRHISAR, DENIZ GÜNCE* (Institut Français d'Etudes Anatoliennes, Turkey)

Gezi Park Protest Camp : Expansion of Imaginable Futures in a Liminal Space

At particular moments of mobilizations and at certain places where collective action goes beyond the political habitus of the social actors, the horizons of imaginable futures expand. Protest camps are good examples of transformative experiences. Indeed my research on Gezi Movement in Turkey in 2013, sheds light on the conditions that realize such a shift of political imaginary and agency. First, I will describe the conditions under which collective representations about future tended to be utopian despite brutal repression. I will argue that one can observe the public performance of utopia under particular circumstances that I call "conditions of liminality" e.g. coexistence of differences in a restricted space-time interval ; shared protest emotions such as indignation, enthusiasm, hope ; shared vulnerability

against the same opponent ; non-violent resistance ; turning daily life activities into prefigurative practices (ritualization, mise-en-scène of egalitarian social bonds) ; heterogeneity of protesters in terms of class, age, gender and political opinions... Second, I will insist upon the boundary work in order to question the possibility to sustain over time the transgression of symbolic boundaries. What happens when protesters go back to social boundaries after the protest camp ? A protest camp's time is a time outside the social time. In our case study, after Gezi movement, the horizon of imaginable futures continued to expand with the creation of counter-institutions until the intense repression wave and criminalization of dissent. Finally, I will argue that the question of imaginable futures requires twofold analysis : 1) a close ethnographic gaze to the interactions and emotions during protests 2) the political processes and factors external to the movement. Finally, I will defend that "utopian practices" are still a relevant concept for us to understand collective action, even though prefigurative politics and imaginable futures replaced the discredited term utopia.

Advances in Gender Research (Volumes 27 and 28)

In Gender and Practice: Insights from the Field (Vol. 27), twelve chapters contribute to the creation of an accessible body of knowledge that looks to provide gender practitioners with examples of what works, and what doesn't, in the attainment of gender equality. This volume demonstrates the depth and breadth of gender and practice. Looking across countries including Cambodia, India, Kazakhstan, Tanzania, Uganda, Vietnam, and the United States, the chapters explore global perspectives and global ramifications. Contributors examine issues and activities related to infusing gender in education, training and practice, and many chapters specifically address one or more of the UN Sustainable Development Goals. Including chapters on medical treatment, climate change, non-profit and community organizing, and agriculture, this volume is useful to all those looking to explore current gender research.

In Gender and Practice: *Knowledge, Policy, Organizations (Vol. 28)*, expert contributors demonstrate the depth and breadth of gender and practice. Including examples from Brazil, Cameroon, Ecuador, Nigeria, Sao Tome and Principe, the USA, and Vietnam, as well as chapters that take a global perspective, the research here looks at issues and activities relating to infusing gender in knowledge management, training, and practice. Including subjects such as education, agricultural production, and tourism, this volume offers a variety of perspectives that will appeal to any researcher in gender.

Disasters and Women's Rights: Prioritizing and Expanding Women Voice in Disasters' Management in Brazil

Based on Brazilian constitutional provision on disaster and women's rights, the article demonstrates the importance of creating policies that promote women's prioritization in the guidelines of the National Policy for Civil Protection and Defense (PNPDEC). To comply with constitutional obligations, the Brazilian government needs to prioritize women regarding prevention and mitigation phases and invest in representative mechanisms for their participation in disaster management and decision-making.

Data shows that women suffer more severe effects from disasters, making them a vulnerable group. The COVID-19 pandemic sparse data registers increased mortality, morbidity, sexual violence, and overload violence against women. Statistics also reveal that economic impacts tend to be more critical and more prolonged for women. According to General Recommendation No. 37 of the CEDAW Committee (Committee for the Elimination of All Forms of Discrimination against Women), countries have obligations under the Convention to promote equal opportunities for women to mitigate and adapt their life after a disaster.

The article concluded that women's rights should guide all stages of the disaster cycle. Brazilian federal government as local and state authorities must legislate and exert concrete, targeted and measurable actions to eliminate all forms of discrimination against women and ensure consideration of women's reality in times of need. The paper also addresses Brazilian legislation design to respond to disaster and how it misses procedure to create policies and take action on women's issues.

Criminalization of Land Defenders in Guatemala: Linking Genocidal Violence to Contemporary Neoliberal Oppression

Violence is intrinsically linked to Guatemalan politics. Since early colonization, State violence has always been a tool used by the most powerful to rule over the country and ensure the perpetuation of power hierarchies (Touraine, 1988). Hence, Indigenous people have resisted state oppression for centuries. More recently, during the 36-year Guatemalan armed conflict (1960-1996), the violence deployed by the military was so intense and racialized that it was recognized as a genocide (CEH, 1999). Throughout the conflict, massacres have led to the displacement of many people trying to flee State violence. Ultimately, the military destroyed 626 Indigenous villages, forcing many communities to leave their lands behind in order to survive (CEH, 1999). As a result, through State violence, the elite in support of the military government gained control of an important amount of lands. Since the armed conflict was brought to an end, the neoliberal inequalities have not ceased to grow. Private companies have taken control of the massacre locations and turned the land into large-scale resource exploration and extraction projects. In response, the Indigenous communities have organized in order to resist this contemporary form of oppression. However, the movement leaders have been criminalized, many of them standing accused of different crimes, such as death threats, coercion or kidnapping. For the ISA call for abstracts, we offer to shed some light on the links between genocidal violence and the current criminalization of Indigenous leaders trying to fight for justice and to regain control of their lands.

Professions and Co-Production: The Organisational Politics of User Involvement

One of the key characteristics of the professions has been their claim to autonomy and self-governance; they have been free to manage themselves collectively and individually within their work practice. This autonomy, however, has been systematically eroded in the wake of New Public Management (NPM) especially for the public sector professions. The focus shifted from implicit trust to distrust and the managerial emphasis was increasingly on performativity and accountability, in part, to inform consumer *choice*. In more recent years this approach has begun to give way to a subtler method of professional discipline, one of governance – particularly New Public Governance (NPG). Here the emphasis is more on self-regulation but one ostensibly validated by public and user involvement, or in the current parlance co-production and similar synonyms.

In this paper, I will review current literature on the degree that NPG is driven or 'shaped' by 'co-production', and whether this reflects a *deliberative* or a *manipulative* process for the clients/users or, alternatively, simply a rebadging of the *consumerism*. In particular, I question whether it is the patients/clients who are the key players working with the professionals in delivery high quality services – or whether they are simply 'pawns' within organisational politics?

This paper will principally be concerned with the medical profession within the UK, but will include some comparative material within the European context. It will examine how far co-production has become the arena within which the professions redefine their clients so as to reconfigure their own status and autonomy within this post-NPM era.

Values As the Social Fabric of the Modern Social Welfare System in China

The rural social welfare system in China is an important component of the overall social security system. The social fabric, in the words of K.Polanyi, of the social services system of any modern society, as well as the basis of its socio-cultural space are the values of people. Since the beginning of economic reforms, the values of the traditional family in China have faced a number of problems associated with older relatives who have reached retirement age. Demographic and social changes have begun to affect both the ability and willingness of families to care for the elderly. The Chinese government, aware of the importance

of the family for the well-being of its citizens, has adopted a number of laws and regulations prescribing family responsibilities. On the other hand, in China as a society with a traditional way of life has always been strong family-related support, children always take care of their older relatives. Thus, the main purpose of the report is to analyze the value attitudes of the population in China, in their comparative perspective between urban and rural areas. The network approach is used as the main research method. The results of the study are summarized and presented both from the content and from the methodological aspects of the implementation of such diagnostics. The network analysis of values allows to compare values not only within one society, but also, for example, between the Russian and Chinese respondents; identify those characteristics that will allow to predict the unity and conflicts of values, including in the development of measures of social support for the elderly living in rural areas.

Baatein Aman Ki (Conversations of Peace): A Feminist Response to Hindu Nationalist Politics in India

Like feminists everywhere, feminists in India have also had to confront the right ward shift in politics. In India, the right ward shift is also marked by Hindu nationalism. I begin with a brief history of Hindu nationalism along with a history of feminist responses to this nationalism, which have included a range of strategies from protest to petitions. In the face of increasing violence and threats to democracy itself, feminists along with other radical movements have initiated a new politics of love in opposition to the politics of hate that underlies the right wing politics. Baatein Aman Ki, is one such campaign that took place in India from Sept to October 2018. Organized as five yatras or pilgrimages that began from five different directions in the country and converged in the national capital, it brought together activists of diverse caste, religion, and region who travelled across the country to engage in conversations of peace with local communities. These conversations focused on local efforts to build a just, peaceful and non-violent society in the context of increasing assault on women's constitutional rights and shared stories of similar struggles along their journeys. I show that its collaborative and radical praxis based not on opposition but an articulation of an alternative episteme offers insights for feminist solidarities across borders.

Emprunter Le Nom, Accès Au Crédit Et La Production Des Obligations Sociaux Dans Les Communautés Rurales Au Brésil

Cet article vise à réfléchir sur le acte de prêter le nom en tant que dispositif utilisé par les entrepreneurs ruraux pour accéder à des crédits afin de créer, maintenir ou développer leurs petites entreprises. En mobilisant des données ethnographiques de recherches menées dans des communautés rurales du nord-est, du nord et du centre-ouest du Brésil entre 2009 et 2017, on veut examiner le «nom» comme l'un des «objets» donnés, échangés, empruntés ou appropriés dans des interactions entre les individus en tant que produit et producteur d'obligations sociales. Les donnés montrent, à la lumière de l'anthropologie et de la sociologie économiques, des cas d'agriculteurs ou d'entrepreneurs ruraux qui ont prêté (ou emprunté) leur nom dans le but d'obtenir des financements, d'enregistrer des opérations commerciales, de posséder des biens ou même d'effectuer des registres civils, fiscaux ou comptables pour développer leurs activités économiques. Ces opérations deviennent plus complexes car elles tentent de maintenir des relations personnelles, mais de construire des scénarios de relations interpersonnelles, déclenchées ou intervenant dans des circonstances spécifiques, notamment lorsqu'il s'agit de relations avec des agents de l'État, des notaires, des ONG, des entreprises ou des sociétés. prêteurs divers.

DEY SARKAR, ADITI* (Indian Institute of Technology Bombay, India)

Welfare to Workfare Economy: A Study of Self Help Groups in Kerala, India

Microfinance is a burgeoning area across the globe creating complex relations between Global North and South, not least in terms of financial relations but also impacting the micro realities of women in the form of 'unintended consequences.' The State Poverty Eradication Mission of Kerala, established in 1997, comprises of a federation of Self Help Groups (SHGs) of women. The cornerstone of the movement was the microfinance activities conducted by members of the SHGs. In recent times, the Kerala model of microfinance has been hailed as an exemplary one by the National Rural Livelihood Mission (NRLM) in India. This resulted in the creation of new job opportunities for rural women who were identified as

skilled workers due to their years of experience in SHGs. Opportunity to move to rural villages in other parts of India, for establishing SHGs under the aegis of NRLM and earning high income (in comparison to their earlier income through microenterprises) to do so, resulted in a flow of outward bound movement of SHG women from Kerala. In this backdrop, questions on the intensity of labor work done by the women and the impact on gender equations in the household due to the (controlled) migration of SHG women emerge. Through this paper, I would explore and discuss the engagement of the State in the daily lived realities of the SHG women to understand the power structures that it generates within the family and the rural community. Thus, using relevant case studies, I will be exploring the complex web of relationship that the SHG women share with the State (as citizens) and the market (as consumers and entrepreneurs) and its impact on the family as the project is helmed by the State but has its roots in the neo-liberal political economy of development.

Infant Feeding in Emergencies: A New Theoretical Model for Humanitarian Aid & Research Convergence

Humanitarian organizations and public health experts indicate that breastfeeding promotion is optimal for maternal and infant health, and that breastfeeding can reduce long-term health disparities. During and after disasters, breastfeeding and can provide vital protection from infection and sustained nutrition for infants. Despite the known value of breastfeeding and safe infant feeding in crises, after disasters groups organize to send donations to communities impacted by disasters—and among these donated supplies are breastmilk substitutes (BMS) (infant formula). While uncontrolled donations of BMS can lead to malnutrition, illness, and death, confusion and misinformation persists surrounding the issue of infant feeding in emergencies. Moreover, the cultural and geographic context of infant feeding in emergencies can exacerbate confusion, myths, or rumors about infant feeding in emergencies. For example, viewing "breastmilk as spoiled", "cursed" or "bad" after a disaster can inhibit caregivers from continuing to breastfeed. Additionally, in high income contexts, ideas or norms regarding formula feeding as an individual choice can complicate the consistency in messaging for health promotion. Protocols for sheltering that fail to consider the needs of families with infants is linked to breastfeeding cessation after disaster evacuations. Using aggregate data and findings from three separate disasters—the Fort McMurray Wildfire (Canada), the Gorkha Earthquake (Nepal), and Hurricane Florence (United States), I present a theoretical framework for research for expanding research on infant feeding in emergencies. This framework includes the individual, community, and broader social factors that influence decisions, resources, and policies regarding infant feeding in emergencies. Finally, this framework offers a potential path for other complex problems in which developing solutions requires an intersection of humanitarian agencies and research initiatives.

DHRUVA, SHAILAJA* (S.L.U Arts and Commerce College for Women.Ahmedabad, India)

Benefits and Risks of Social Media (A Case Study of Girl Students of SLU College)

Social media is the relationship among networks of people. It has grown tremendously, ultimately becoming an important part of young lives. In India and particularly in lower–middle strata, the culture of use of social media for women is still not accepted.

This study perceived benefits and risks of social media among girls of S.L.U. College in Ahmadabad. From about 1500 Students of Arts and Commerce faculties of the college, those three hundred students were selected who used social media. Questionnaire is used for data collection. The main objectives of the study are to know the socio- economic profile of the respondents, to know how much time and money they spend for social media and what are personal and social benefits and risks of social media in their lives.

The study explores various concepts and sociological theories i.e. education, social media, caste, etc. stratification and change theories etc. The study focuses that these girls have recently got the smart phones and social media. They used Whats-App, YouTube and Facebook only. They had family control on the use of social media. They used social media for entertainment and communication with friends rather than academic purpose. Most of them know that it is useful for saving cost and time and easy to send fast messages. But on the other side, they feel some risks, particularly family and peer influence on their behavior and social relations, personal risk to disclose information and reputation. These girls are not social media addicts and not so much aware regarding social benefits and risks of social media because they have not so much exposure. This college provides them free internet in college campus for the academic purpose and tries to introduce more and more digital media literacy.

The paper concludes with some important remarks and suggestions.

DI MARCO, MARTÍN* (CONICET/IIGG, Argentina)
SCHWARZE, HENRIK (Georg-August-Universität Göttingen, Germany)

In the Eye of the Beholder: A Narrative Study of Homicide Perpetrators

Academic literature on homicide has a long tradition of focusing on socio-demographic and criminological data of both perpetrators and victims. Critical hermeneutic studies have stressed the need to link homicide trends with in-depth knowledge of perpetrators and their social contexts. However, little attention has been paid to emic interpretations of homicide itself. In the context of a research project on life stories of young men who have committed intentional homicide in marginalised neighbourhoods in the outskirts of Buenos Aires City (Argentina), the objective of this paper is to analyse how homicide perpetrators give meaning to the homicide(s) and provide narrative explanations. A hermeneutic biographical approach was employed, conducting open-ended interviews which were carried out in prisons, juvenile centres and residential houses. For this paper, 15 cases were reconstructed and analysed using an inter-testimonial approach. Special attention was given to the identification of indexes and turning-points in life stories, and to "lay theories" of violence. Firstly, comprehensive analysis of their narratives shows that, while homicide itself appeared as an index in life stories, it does not always represent a major turning-point. This is comprehensible due to prior experiences with violent deaths, daily contact with firearms and the fact that physical violence was seen as a legitimate means to deal with conflict and negotiations. Secondly, three main explanations of their homicides could be typified according to where they narratively positioned the locus of responsibility and intelligibility: *contextual explanations* (the action is linked to macro-economic processes and related situations), *network explanations* (the locus is positioned on the relationships, usually peers which are referred as "bad company") and *individual explanations* (interviewees explain homicide as a consequence of individual aspects, whether moral, psychological or other sort).

DI MARCO, MARTÍN* (CONICET/IIGG, Argentina)

Locked up in the Slums: Violence, Biography and Neighbourhood in Buenos Aires

In Latin America, qualitative research on violence has traditionally been focused on marginalised and criminalised populations. Within Social Sciences, studies on gang violence, criminality and police abuse have shown a thorough understanding of how violence is produced and reproduced in the context of secluded neighbourhoods, shantytowns and informal settlements. Nonetheless, the urban settings themselves have been predominantly considered as mere scenarios where crime and violence occur. In the field of homicides, the links between urban life, marginalisation and violence has been equally neglected as a key component in the configuration of this phenomenon. From a biographical perspective, the main objective of this paper is to enquire how neighbourhood dynamics and biographies of homicide perpetrators intertwine in shantytowns and poor neighbourhoods in the outskirts of Buenos Aires Capital City, Argentina. A narrative study was developed, focused on the life stories of young male perpetrators of intentional homicide. Open-ended interviews were carried out and participant observations were conducted in the neighbourhoods (parks, schools, hospitals, homes, etc.). In this paper, three main dimensions are analysed: a. how neighbourhoods are described and signified, b. how neighbourhood dynamics (residential changes, located practices, gang activities, etc.) are narrated as interwoven aspects in their life stories, c. how the infrastructural setting is experienced by these men. Two main aspects can be highlighted from the narratives. Firstly, the actual physical and infrastructural configuration of shantytowns and poor neighbourhoods has an impact on the accessibility of public and private institutions, and this is experienced as a major conditioning factor in their lives. Secondly, feeling locked up in the neighbourhood and its physical arrangement ("*encerrado en el tatetí de la villa*") was a common experience in the interviewees and this was narratively used to give meaning to their life trajectories.

Labor Movements in the Flexible and Digital Economy: Workers' Subjectivity and Adaptive Networks of Trade Union Action

Digitalization is a long-term phenomenon strictly associated with the emergence of the network economy and of the flexible paradigms of production that have characterized the transformation of work at global level in the last fifty years, with an overcoming of the fordist model. Digitalization increases flexibility at any level of the work organizations, considering the internal and external relations as well as the working conditions with paradigmatic impacts for the subjective affir-

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

mation and for trade union actions. Atomization, precariousness, fragmentation, subordination and control are opposed to the workers' opportunities for self-realization, knowledge sharing, participation, cooperation, with not univocal paths of subjectivation and de-subjectivation. Trade unions are facing many renewal processes to cope with these transformations, considering the organizational logics of action, contents of bargaining and cultural orientations. In particular, individualism and cohesion of the collective actions are two complementary processes, under tension, in a high fragmented and diversified world of work. They led the trade unions to operate by increasingly adaptive organizations based on personal involvement. The paper presents the results of a long-term research (in Italy and at European level) on trade union actions and subjective affirmation in relation to technological and organizational innovation processes led by digitalization and flexibility. Research methodology adopted a qualitative approach with in-depth interviews, case studies, focus groups and workshops, considering high and low skilled workers.

Workers' Participation and Trade Union Actions for OSH Prevention in the Digital and Network Economy: The Case of Italy between Institutionalization and Innovation

Digitalization, flexibility and network organization are relevant factors in the definition of the contemporary working process with an impact on the working conditions, on trade union actions as well as on the Occupational Safety and Health (OSH) prevention systems. Workers' participation and workers' representatives play a relevant role for the institutionalization of an efficient and modern culture of OSH and they are forced to face a changing world of work characterized by high risks of atomization, exclusion, fragmentation as well as emerging risks led by new technologies and activities. However, on the other side, there are new opportunities for protections, involvement and cooperation. This paper presents a research on the role of workers' participation and trade union actions for OSH prevention in Italy, with a European perspective, considering both the long-term evolution of the flexible organization models as the new digital paradigms of the platform and GIG economy. Analysis presents: a) new risks, limits and opportunities for the workers' OSH protection in the present age; b) organizational logics of action, contents of bargaining and cultural orientations of the contemporary prevention systems promoted by workers and trade unions. In particular, analysis is focused on the role of OSH representative at company, productive site and territorial level (three figures established by the Italian Law and enforced by the social partners' agreements) and their relations with all the actors of the prevention systems. The multiple relations between formal and informal paths creates prevention systems, participative procedures and trade union organizations oriented towards a continuous change and an extension of their actions. Research try to underline also the limits of trade unions and preventive agents to change their organizations in front of the present challenges. Research methodology adopted a qualitative approach with in-depth interviews, case studies, focus groups and workshops.

MOULLET, STEPHANIE* (Aix-Marseille Univ, France)

Women's Disadvantage in Holding Leadership Positions and Gender Segregation:

A Comparison of France, United Kingdom, Sweden and Switzerland

Occupational gender segregation is generally considered as a generic indicator of women's economic disadvantage. Hence, the European Commission urges member countries to reduce gendered occupational segregation in order to dampen gender inequalities in the labour market (European Pact for Gender Equality 2011-2020). While the horizontal gender segregation seems interrelated with the vertical one, few studies have yet explored this link. In an attempt to fill the gap, we will study the likelihood of holding managerial or professional occupations with supervisory duties regarding the occupational sex composition.

Considering 26 European countries, Dämmrich and Blossfeld (2017) show that women face lower disadvantages when working in male-dominated occupations, this disadvantage varying from one country to another, suggesting that national contexts play an important role (Yaish and Stier, 2009; Smyth and Steinmetz, 2008). Here we will focus on 4 countries emblematic of different societal contexts: Sweden belonging to the substantive egalitarian regime (Chang, 2000), United-Kingdom associated with the liberal welfare regime (Esping Andersen, 1990), Switzerland where the male breadwinner model resists and France representing a hybrid regime. We intend to measure the country relative performances in terms of gender equality for holding leadership positions.

Using an econometric analysis, based on the EU-LFS 2015, our contribution then addresses three issues: First, how does women's disadvantage in holding leadership positions differ from country to country? Second, how does women's disadvantage vary when working in male, female or mixed dominated occupations in the different countries? Third, how does women's disadvantage vary from country to country, given that the occupation is male, female or mixed dominated?

Our study will therefore help to highlight whether and how horizontal occupational segregation is potentially detrimental to women's leadership positions, referring to four different societal contexts.

Work-Life Balance in Labour Intensive Occupations:

The Case of Women Managers in the Corporate and Investment Banking Industry - France, Sweden, Switzerland and United-Kingdom Compared

Work intensification is likely to hinder the work-life balance and exacerbate the risk of work-family conflict, particularly for women. Many contextual dimensions have been put forward as factors influencing the work-life balance-relationship: the type of Welfare-State and the gender division of social roles (Lewis 1992; Esping-Andersen, 2009), social provision and family policies (Korpi & al., 2013), the degree of national gender equality (Lyness, Kropf, 2005),organizational norms (Guillaume, Pochic, 2009) as well as the gender division of housework and care within couples (Dupray, Epiphane 2018).

Here, we will consider these levels of influence for women holding managerial occupations within the sector of corporate and investment banking in Sweden, Switzerland, United-Kingdom and France.

We propose to show how different institutional settings act as more or less supportive environments for the balance between time demanding supervisory positions and family life.

Applying a mix-method framework, our research is based partly on EU-LFS 2015 statistics and partly on interviews with about 60 employees of a French multinational company with offices in each country.

Focusing on the bank and insurance industry, the quantitative analysis will provide gendered statistics for each country on earnings and access to supervisory positions, set in relation to the fact of having children in different age-nospans. The probability of becoming executive with managerial responsibilities will then be estimated for women and men, testing the actual impact of being a parent in each case. .The qualitative analysis will refine the statistical findings, providing insights on the range of career consequences of having children in management positions. The narratives of employees also permit to identify different sets of resources mobilized by managers, reflecting national institutional and organisational settings.

Our contribution thus highlights the interplay between individual determinants and institutional contexts, attempting to identify family friendly provisions at the national, organizational and individual levels.

DI PIERO, EMILIA* (CONICET- UNLP, Argentina)

Escuela Secundaria, Universidad y Desigualdad En Argentina: Aspiraciones De Estudiantes Sobre El Nivel Superior

Este estudio analiza las dinámicas de las desigualdades sociales y educativas en lo que respecta a la articulación entre las escuelas secundarias y las universidades mediante una investigación comparativa en distintos establecimientos secundarios de la Provincia de Buenos Aires, Argentina. Se indaga sobre las aspiraciones de estudiantes del último año de la escuela **secundaria** respecto de la continuación de estudios.

Siguiendo la tendencia de los países del Cono Sur y de México, al sancionar en 2006 una nueva Ley Nacional de Educación, Argentina estableció la obligatoriedad del nivel secundario. En el país, la escolarización se amplía al tiempo que se diferencia la oferta interpelando a los estudiantes según el sector social de origen. En ese sentido, se conforman comunidades que se diferencian en cuanto a la propuesta pedagógica, la modalidad, los modos de regular el comportamiento o la existencia de espacios de participación.

Partiendo de dicho escenario de fragmentación educativa se abordan las transiciones intervinel en los casos de cinco establecimientos educativos específicos. La pregunta que guió la investigación fue: ¿cómo se configuran las expectativas de los estudiantes respecto de la continuidad de estudios universitarios?

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

El enfoque metodológico se centra en un **estudio de caso múltiple** (Stake, 1995) e implica el uso de herramientas de la metodología cualitativa a través de la triangulación de técnicas: 50 entrevistas a alumnos en el último año del nivel secundario y análisis de fuentes documentales.

Se concluye que las aspiraciones estudiantiles con respecto a la continuidad de los estudios se configuran de modo desigual dependiendo de las trayectorias educativas familiares de los estudiantes y de las políticas institucionales impulsadas desde las escuelas secundarias y desde las universidades.

Luces y Sombras De Los Procesos De Reurbanización De Villas En La Ciudad De Buenos Aires. Entre La Emergencia Habitacional y La Transformación De Los Barrios Populares

Recientemente, el Gobierno de la Ciudad de Buenos Aires encaró un proceso de reurbanización de villas. El programa prevé la integración social y urbanística de los barrios a la ciudad un plan de "reurbanización" combinando, según se lee en el proyecto, un eje habitacional, uno de empleabilidad, educación y factores culturales y otro de conectividad y transporte. En la actualidad, está presente en siete asentamientos porteños: Barrio 20, Rodrigo Bueno, Playón de Chacarita, Lamadrid, Camino de Sirga, Carrillo y el Barrio 1-11-14 y la villa 31 y 31 bis que, dada su magnitud, tiene una unidad ejecutora propia. Se trata de un conjunto de barrios muy heterogéneos: algunos son viejas villas de la CABA, conformadas entre las décadas de 1930 y 1940 (entre ellas Villa 31, Villa 20, etc.), mientras otros son asentamientos de reciente organización (Rodrigo Buenos, Playón de Chacharita). Unos son de gran escala y otros mucho más pequeños. Asimismo, varios de estos barrios están ubicados en áreas fuertemente tensionadas por procesos de gentrificación. En este marco, el trabajo realiza un balance de los avances del programa en los barrios de la CABA, pasando revista a las tensiones que enfrenta según las características y dinámicas poblacionales de los barrios. Asimismo explora, particularmente, las tensiones de las cuales son objeto los barrios cuya reurbanización se produce en un contexto más amplio de gentrificación.

The Struggle for Environmentally-Friendly Urbanization and Class Relationship in Vargem Grande

Vargem Grande is a neighborhood located in the western region of Rio de Janeiro. This area remains a rural aesthetics and most of the houses are auto-constructed. A group of middle-class people, many of them moved there between 1990 and 2000, criticizes attempts to change environmental laws that prohibit the construction of tall buildings due to the fragile local ecosystem. Based on a pragmatic approach and in-depth interviews with middle-class inhabitants planners, this paper aims to analyze the urbanization Project defended by these actors and the devices mobilized by them to prove the negative effects of the radical change of the local ecosystem and their position as spokespersons for this cause. Vargem Grande has one of the lowest Social Development Index in Rio de Janeiro's city. Despite a large number of poor people, they do not actively participate in the ecosystem defense movements in the region. The middle-class planners claim to defend the interests of the "native population" formed by peasants, many of them are descendants of slavery. However, they criticize the creation of favelas by new migrants. The displacement of these people is a result of improved road links between Vargem Grande and other parts of the city. The credibility of middle-class residents as leaders relates to transforming the environmental debate as non-political in the sense of a non-conflict issue. This mechanism promotes the idea of sustainable urbanization that hides the high level of existing inequalities.

RIBEIRO, NATÁLIA (Universidade Federal do ABC, Brazil)

Brazilian Criminal Networks: A Comparative Analysis of the Role of Prison in the Documents of Three Parliamentary Committees of Inquiry (CPIs)

This article analyzes the changes criminal dynamics have undergone in the last two decades in Brazil, drawing on the findings of three Congressional Investigative Committees (CPI, in Portuguese) on topics related to the matter: Drug Trafficking (1999-2000), Weapons Trafficking (2005-2006), and Prison System (2007-2008). We argue that the evolution of the 3 CPI's coincides with the dynamics of how prisons became criminal hubs in Brazil. The emergence and expansion of prison-based criminal groups - which have transcended prison walls and have taken the center stage in the public security debate - are noticeable in the evolu-

tion of the debate through the three CPIs: the core of the inquiries shifts from the illicit drug markets to prison dynamics, putting the criminal networks formed in prison on the spotlight.

Feminist Strikes in Spain: Alliances and Ongoing Disputes for Social Change

In March 8, 2018, at least 400,000 people took to the streets in more than a hundred cities across Spain, and around 5 million people went on partial or 24-hour strikes. For March 8, 2019, feminist activists called again for a strike in Latin America and Spain, also in Germany, Portugal, Belgium and France among others. Over the last years women's and feminists groups called for strikes to denounce multiple oppressions, such as violence against women, to fight for reproductive rights, but also to challenge the political and economic status quo. For instance, in 2018 the Catalonian feminist strike committee stated: 'without us there is no production or reproduction'. They stand against not only patriarchy and machismo, but racism, capitalism, heteronormativity and the institutions that reproduce such logics. Their demands include alternative and egalitarian modes of production and use of resources, non-violent approaches to migration and State frontiers, and a radical change of justice and educational systems. The strikes in Spain were divided into four fronts: labor, student, care and consumption strike. Women's and feminist groups engaged in contentious discursive practices to dispute and (re)define what striking is, why they stop and what for, joining forces but also struggling over multiple political projects as they build a coalitional and oppositional field for social change. This paper will analyze how the 2018 and 2019 feminist strikes unfolded in Spain and Barcelona, where mobilization was diverse and multitudinous. What contentious discursive practices did activists enact as they prepared the strikes? Which contradictions, dilemmas or conflicts emerged from disputes among different feminist practices and political projects? Which are the achievements and limits of the alliances among diversity in this field? To answer these questions I will conduct discourse analysis of participant observation notes, interviews and social media data from Twitter, Telegram and Facebook.

Word Embeddings and Neural Networks. Tools to Show Hidden Bias in Big Data

Human actions become big data, and big data becomes reality. Big data analysis usually takes big data as reality or a good representation of it. We argue that big data can be bias. In particular, gender bias. In order to analyse big data from a sociocybernetic and gender perspective we use word embeddings technique.

Word embeddings are mathematical representations of text generated by a neural network iterating through a corpus of data. The resulting vectors can be operated upon in order to extract semantic relationships between words, according to how those relationships were recorded and implied in the original data.

We use the neural network to explore the possibility of directly using these embeddings as a potential social analysis tool to assist in the detection of three different kinds of gender biases present in the data.

We are interested in testing the procedure with data in Spanish language, since, on the best of our knowledge, it has not been tested in another language but English. As a proof of concept, the neural net was fed with half of the 2006 Spanish Wikipedia, a corpus of data available in markup language. This technique is able to expose, among others, the implicit gender biases of the Wikipedia hidden under the legible text, thanks to the results of operating the word embeddings. The analysis does not only produce the most obvious gender biases, but subtler and more nuanced ones, harder to pick up in traditional text scrutiny. This is where the potential of neural network analysis shines the brightest.

We describe the techniques and the specialized knowledge needed to be able to discern the biases. Then, we asses where is it possible to divide the analysis work into microtasks and externalized it.

DIAZ, PAOLA* (Centre for Social Conflict and Cohesion Studies, Chile)

Dehumanization and Commodification of Forced Migrants at the Borders (Mexico-United States)

I will present the first results of sociological research based on an ethnographic study carried out in 2019, in the Sonora desert in Mexico, on violence, especially death and disappearance of Central American and Mexican migrants. I will focus on the transformation of the person into an "illegal" and the "illegal" into a commodity; the point at which political and economic-financial regimes converge. As

they say in Sonora, "here when they see a migrant they see a *$ sign* ". This means that migrants are not only economically exploited (mainly in the farmlands), but that the more they are dehumanized, the more they increase in mercantile value: their labor force, but also their bodies and very existence, become commodities. The migration regime and militarization of borders contribute to the illegalization of (poor) migrants. Such illegalization takes place in post-extractive and drug-trafficking economies, where the illegalized migrant becomes a highly lucrative commodity. The migrant's body itself becomes the site of an eco-bio-power. His/her body condenses an extensive global chain of economic, ecological and social extractions (Gago & Mezzadra, 2017), and a predation productive system (Naepels, 2018) inserted in a neoliberal governance of capitalist societies.

Caracterizando La Desconfianza Con La Alimentación En España

Las deficiencias del sistema alimentario global han generado un amplio malestar con la alimentación en la sociedad española, al igual que en la europea. Se han visto respuestas de descontento hacia el sistema convencional de alimentos entre los productores agroalimentarios, que buscan una agricultura más sostenible. La participación política a través del consumo alimentario va en aumento. Se ha confirmado una creciente desconfianza de los consumidores hacia las instituciones encargadas de proteger al consumidor. La demanda de alimentos con características propias (la mirada hacia lo local, lo ecológico, los realfoders, los veganos, el comercio justo, el vegetarianismo o el sanismo) están mostrando cambios en el consumo que sugieren una reflexión de la ciudadanía sobre lo que se come y cómo se produce. En esta presentación repasamos los estudios que muestran estos comportamientos para determinar si estamos ante una respuesta critica con los alimentos o si se trata de una desconfianza hacia el sistema alimentario que los sustenta.

Gobernanza Alimentaria Para Una Dieta Saludable y Sostenible

Instituciones gubernamentales nacionales e internacionales, la ciencia y la ciudadanía más comprometida han puesto de relieve las contradicciones del actual sistema alimentario: no ha conseguido resolver los problemas de malnutrición (obesidad y desnutrición), ejerce un impacto elevado sobre el medio ambiente, genera unos riesgos que se repiten reiteradamente y que ponen en peligro la seguridad de los ciudadanos, presenta un elevado grado de opacidad y se organiza en torno a un marco de gobernanza complejo que hace difícil llegar a acuerdos para lograr una alimentación adecuada. La constatación de estos impactos, la difícil gobernanza y la atención a nuevas demandas sociales ha propiciado que la transición hacia Sistemas Alimentarios Sostenibles, Saludables e Inclusivos se haya convertido en el objeto de estudio de muchos investigadores y el horizonte de buena parte de los organismos internacionales que ven en ello una vía para para alcanzar los Objetivos de Desarrollo Sostenible. En esta presentación se repasan las propuestas institucionales realizadas en torno a la intersección medio ambiente, salud y alimentación para concluir que estamos ante una definición de sistema alimentario parcial, que no visibiliza adecuadamente las interrelaciones y las sinergias generadas entre el medio ambiente, la alimentación, la actividad agraria, la salud y la sociedad. La utilización del concepto "sistema alimentario sostenible, saludable e inclusivo" (que podríamos denominar SASSI), requiere, no solo de la introducción de un cambio conceptual sobre el sistema alimentario, sino también de un enfoque holístico sobre el mismo que ya han comenzado a desarrollar algunos investigadores.

The School Routine: The Citizenship in the Formation of High School Students

This study aimed at analyzing the unfolding of citizenship in the school routine in the development of high school students of a public and a private school in a city located in Vale dos Sinos/RS, understanding the citizenship as a daily practice. It is a qualitative descriptive and interpretive study, having as selection criterion the schools with the largest number of students registered in high school in 2018, in the above-mentioned city. The immersion in the empirical field was performed through observations, which occurred from March to June of 2018 and interviews with the directive team and teachers (6 interviewees), using the tool snowball. In relation to the school routine, we realized that the public school follows the pattern of school created by the society, characterized by a rooted school culture, through its functioning and conduct rules which are well defined and strict, directed more to the duty than to the interaction, marked by behavioral conduct obligation and by duty of social behavior framework, limiting the full citizenship. On the other hand, the private school changed this culture when it modified its organization by using active and collaborative methodologies, with flexibility, dialogue, construction, questionings and autonomy of students so they can express themselves inside school, widening their protagonism and the possibility of social development, having voice and space in the decision-making processes.

DIETRICH, HANS* (Institute for Employment Research, Germany)

From Aspirations to Attainment - Class Background, Mental Health and the Labor Market Integration of Young Syrian Refugees in Germany

Young people from Syrian are a mayor group of refugees, who arrived in Germany in 2015. A remarkable share of these young Syrian refugees left their home country before completion of general education or vocational training. Thus, most of the young Syrian refuges were less prepared for the German labor market. Even if the young refugees reported high aspiration regarding educational and labor market attainment when arriving in German, additionally education, training and language proficiency is required to enter the German labor market. Already in 2018, a majority of young Syrian could document high levels of German language proficiency and started to take up regular employment.

We address the effect of social origin on individuals' labor market attainment in Germany. From a theoretical perspective, labor market attainment is affected both by direct and indirect effects (educational attainment) of social origin. Migration related factors such as mode of migration, duration of migration, temporary residence in a third country, or exposure to violence might work as possible moderator. Additionally, we consider health conditions (especially mental health and Post-Traumatic Stress) as moderator for labor market access.

Data are supplied by a prospective panel design of the WELLCOME study, which follows the life course of young Syrian refugees. In 2016, we interviewed a representative sample of young Syrian refugees out of the age group of 18-24. Data from 2.732 interviews are available from the first wave. Around 70% of the initial respondents also participated at wave two and three.

First results confirm both class related labor market aspirations and attainment. Further on the experience of migration counts. Financial obligations motivate respondents to accept easy accessible and low paid jobs, whilst respondents with mental health diagnosis or Post Traumatic Stress symptoms tend to delay labor market integration and favor educational options.

DIETRICH, HANS* (Institute for Employment Research, Germany)

The Gender Wage Gap in the Nursing Occupations- a Cohort Study

The gender wage gap in nursing occupations is well documented (Munch/Dietrich 2019). Less addressed is the question, which mechanisms contribute to the occurrence and persistence of the gender wage gap. This paper follows graduates from nursing training in Germany, who finished their education in 2006. Data form the Integrated Employment Biographies allow us to follow up the employment history of these graduates till end of 2015. In this period the gender wage gap increased from an initial wage gap of 2% immediately after graduation to 12% in 2015. We employ register data from the social security system, which cover the whole employment career and deliver daily precise information on income.

We test two mechanism. A first one is the mechanism of selection of nurses into different institutions (type of hospital, region, occupational specialty). A second mechanism refers to mobility of nurses within the nursing occupation.

***denotes a presenting author.** Abstracts are organized by first presenting author's last name.

A third one addresses exit options (e.g. to health management), which improves bargaining power of nurses. These mechanisms shape the gender specific distribution of wages. The paper presents empirical evidence and discusses possible theoretical explanations.

DIEZ GARCIA, RUBEN* (Complutense University of Madrid, Spain)

The (new) Intelectual Technology and Its Impacts

In his "The Coming of Post-industrial Society" Daniel Bell emphasized the centrality that certain principles acquire in the conformation and development dynamics of the techno-economic order in advanced industrial societies. In the structure of these societies, i) the regulatory mode is to economize ("efficiency, lower costs, greater benefits, maximization, optimization", 1977: 24), ii) the use of technologies is instrumental, and iii) functional rationality It is its axial principle. Understanding functional rationality as i) an economic principle of "organization of production by the ordering of things, including men among things" (op. cit .: 48) and ii) a growing bureaucratization process that entails a greater functional and role specialization (op. cit .: 97).

Technology as an application of scientific knowledge - as applied science - gave rise to a 'new intellectual technology' (Bell, 1976) in post-industrial societies consisting of the 'substitution of intuitive judgments by mathematical algorithms and decision procedures on which these same algorithms are based '. A set of procedures that allows things to be done more rationally and based on a series of previously established standards (Laraña, 1988). This approach is not exempt, however, from being criticized and nuanced if we stick to the most recent theoretical revisions about the unintended consequences and effects of modernity and technological development.

The '(new) intellectual technology' referred by Bell has had a major impact on the economy, our lives and the political democratic sphere since the last third of the last century, given the complexity and uncertainty regarding the future that characterizes contemporary societies (Giddens, 1991; Beck, Giddens and Lash, 1997; Beck, 1992, 2002; Sennet, 2000; Bauman, 2006, 2008). I will deal with some of these impacts in this communication.

Wedding Ceremonies after Leaving the State Church in Iceland

In 1996, Iceland created a civil union law (*staðfest samvist*) for same sex- couples presented as an equivalent to marriage but deprived of major rights concerning filiation and access to church wedding. In 2010, a gender-neutral marriage law was adopted. The gap between the two laws shows a long fight for equal rights and access to wedding ceremonies by the State Church. Iceland is a highly secularised country but still has a State Church. People who chose to marry, marry in church. That's why claims for equal rights included from the beginning access to church wedding and not a mere civil union. However, different Churches started very soon to perform wedding ceremonies for same-sex couples. In reaction, the State Church adopted a blessing ceremony but for same-sex couples only. Since 1996, people started to leave the State Church whom they belong by birth.

The communication explores the meaning of equal rights (civil union vs marriage) from a symbolic point of view. The research is drawing from semi-directive interviews conducted in 2005, 2009 and 2015. For most of the respondents, the Church ceremony had no religious meaning per se but a symbolic and practical one, it was attached to the church as a "beautiful place" for a special day or the "beautiful singing" by the Church choir during the ceremony. It also meant they would marry like any other members of the family or relatives. In the 2015 interviews, people started to talk about how they organise this special day in different ways after leaving the State Church and how they wish or invent all sort of ceremonies, attached to religious or secular beliefs. It ranges from heathen ceremonies to secular vows.

Media Technology & Mgnrega: The Way to Mobilize Rural Indian Folk

Mobilization and awareness are among the key components for successful implementation of any welfare intervention especially in rural areas, where literacy and exposure to media is often less as compared to the urban areas. Well laid guidelines should always be backed up by continuous mobilization and creating awareness among the local masses. Thus, creating awareness among the rural masses about any of the development programmes has been a major concern among the policy makers in developing countries (Upasak Das, Ashish Singh, Nitya Mahnto, 2012). MGNREGA is a potential tool of empowerment of the rural households in general and the labourers in particular.

Mass Media Technology play a catalytic role in changing the mindset/ behavior of the people , thus, this paper discuss about the role of media played in awareness generation to mobilize the folk to accept the MGNREGA. The present paper is based on the empirical study which was designed to be descriptive, to demonstrate the impact of MGNREGA in reducing poverty in rural areas in Harda district of Madhya Pradesh. To income generation, MGNREGA have the potential to contribute in many ways to improve living conditions of rural people.

Transitioning from Extractive to Sustainable Growth: The Reinvention of Single-Resource Communities.

More than five decades have passed since President Lyndon Johnson ``called for a national war on poverty" from a porch in Martin County, Kentucky. Located deep in the heart of Appalachia, this coal mining region was emblematic of the pockets of poverty and powerlessness that constituted much of rural America; the President's call to arms drew national attention to the great number of peripheral places with enduring economic, social, and political disadvantages.

While poverty has remained a persistent feature of America's rural communities - nearly 1 in 6 rural residents live below the poverty line today - the challenges have been particularly dire in single-resource towns since the 1980s; i.e., those places with economies oriented around the extraction and export of a raw commodity. As a consequence of automation, globalization, and environmental regulation, coal towns in Appalachia and lumber towns in the Pacific Northwest have, for example, witnessed rising unemployment, declining wages, lagging investments in infrastructure, and a leaking of human capital. Remarkably, some of these communities have transitioned to a new set of arrangements that underpin economic and social well-being. Looking at post-extractive communities in the United States, this paper explores the following broad research questions: Why are some single-resource communities able to re-new themselves, while others remain locked in decline? How do these communities shift from extractive to attractive growth?

On What Level Do Ming-Qing Social Policies and Social Rules Contribute to Theoretical Poverty Risk for Women in China

----a Hypothetical Evaluation Research Towards Income Benefits of Ming-Qing Chinese Women

This article explores how do social policies and social rules towards income benefits different in their impact on preventing theoretical poverty risk for women in Chinese Ming-Qing dynasty. In the theoretical debate over women's living situation in Ming-Qing China, they are often considered as appendant attached to the family. Women's living condition was directly connected with financial situation of original family before marriage or with husbands' household financial situation after marriage in which the society only approvals "male-dominated" living pattern. We argue that social policy and social rules towards different income benefits help to change women's living condition in Ming-Qing China, which represent substantially impact on theoretical poverty risk.

In order to evaluate this theoretical assumption, this article investigates generosity of different income benefits from two perspectives, one is defined as "outside marriage benefits" which include owning assets from original family, dowry, assistance benefit from public property in the Clan and government assistance and "job income". Another defined as "inside marriage benefit" which include widow's inheritance benefit and family support. This article introduces a multi-dimensional approach to measuring generosity of different income benefit of women in Ming-Qing China. It also explores how far these social policies and social rules leave gaps or help to avoid poverty risks of women.

The empirical study is based on historical data and institutional regulations. The finding supports the argument that different social policy and social rules towards different income sources differ in framing theoretical poverty risks of women in Ming-Qing China. The inner relationship between different income benefits has impact on women's living conditions.

The paper makes its innovation by combining sociological measurement with originally historical records and materials. It helps to clarify how the theoretical poverty risk for Ming-Qing women can be understood and inner relationship between income benefits poverty risks.

DIOGO, ELISETE* (CRC-W Católica Research Centre for Psychological, Familiy and Social Wellbeing (Catholic University of Portugal), Portugal)

BRANCO, FRANCISCO (CRC-W Católica Research Centre for Psychological, Familiy and Social Wellbeing, Portugal)

Living As a Foster Family: A Challenges and Rewards System

Gradually the concept of family has been less and less characterized simply by the 'blood ties'. The term family comprises the group in which there are relationships based on trust, mutual support, and a common destiny. In this mixedness, a foster family establishes itself as a family, like any other family. Studies on foster care and foster family life, as well as children placed in family-based care, remain in the shade of the Portuguese child protection system. In 2017, it comprised only 3% of children in out-of-home care.

Giving voice to the foster families, this qualitative research intends to contribute to the foster families' life experiences and sense of family understanding. The empirical data were gathered throw semi-structured interviews with professionals from two support teams (a public organization and an NGO), and narratives interviews with ten foster families. An in-depth analysis was conducted inspired by Grounded Theory and Charmaz's work, supported by MaxQDA 12 software.

The findings of this study show that life as a foster family can be felt as a challenges and rewards system. There is satisfaction with the development of the foster child and with the recognition from the family network and the society. The foster child is treated as if it were a real member of the family. The main challenge appears to be the child behaviour management. Reviewing the foster experience, it has a positive final answer.

The implications for practice emphasize the importance of the extension of foster care in Portugal, and that the quality of services and professional performance are a key element for placement success.

DIONISIO, JOSEPHINE* (University of the Philippines Diliman, Philippines)

Engaged Ecological Citizenship

The concept of 'citizenship' has become more complex and contested due to the worsening environmental crisis that blur traditional boundaries of the nation-state. The changed context of mainstream institutional politics has forced a redefinition of 'social citizenship' to include ecological claims and a rethinking of the role of environmental movements in forging a new social imaginary for engaged citizenship.

This presentation examines the discursive opportunities created by two environmental coalitions in the Philippines, the Green Thumb Coalition (GTC) and the Philippine Movement for Climate Justice (PMCJ), which have become spaces for the performance of active ecological citizenship. The GTC positioned itself as a green electorate during the highly contested national elections in 2016 and 2019 while the PMCJ built a constituency for climate justice through nationwide protests against coal. These two cases reveal how local indignations become frames for contentious politics on broader environmental issues at the national and transnational levels. It discusses how collaborative action across several movement entrepreneurs of different ideologies eventually generated mechanisms for claim-taking during elections and against corporate interests. It is argued that political action becomes a performance of ecological citizenship that goes beyond the narrow confines of liberal democratic practices, and creates a space for the articulation of a new social imaginary that is based on ecological rights and responsibilities.

Law and Democracy: In Search of Legitimacy in Light of the Politics of Recognition

In archaic societies, social cohesion was guaranteed by tradition, mainly related to a metaphysical or religious worldview. In modern society, to the contrary, with the onslaught of rationalization and its concomitant secularization where tradition gradually loses its grip on society, law comes to replace the role formerly played by tradition. Law thus plays a decisive role in the maintenance of social cohesion. However, law is recognized not only for its usefulness, but above all for its legitimacy. Now, in so far as the ground for legal legitimacy is no longer anchored in any metaphysical or religious belief due to the impact of secularization process, it needs a new anchoring. The new foundation for the legitimacy of legal system is in the democratic process itself. It is the citizens' own democratic will formation that lays the ground for legal legitimacy. There is thus a kind of reciprocity between law and democracy. In as much as the legitimacy of the legal system is to be grounded on the democratic process which leads to the elaboration of a legal system, democracy itself is accepted as legitimate to the extent that it is guided by the principle of the rule of law, arrived at democratically. Law and democracy, therefore, presupposes each other. This paper aims at fleshing out the intricate relation between the legitimacy of law and democracy by way of Habermas' theory of deliberative democracy, as well as attempting to show how the current wave of identity-related demands for recognition can find an appropriate channel of articulation within a democratic regime conceptualized as such. The quality of democracy is, in this sense, to be judged according to the regime's aptitude in attending to the different voices coming from a plural civil society.

Disaster Management, Civil Protection and Humanitarian Aid the Context of Displacement in Europe

The influx of hundreds of thousands of refugees and migrants into Europe overwhelmed the capacities of responsible services in several European countries, resulting in multiple humanitarian and political crises. In many European countries domestic disaster management organizations carried out their largest operations ever by providing food, shelter and logistics. The EU Civil Protection mechanism (UCPM) was activated in many countries along the Balkan route. With the Emergency Support Instrument (ESI) a novel European instrument to deliver international humanitarian aid within the EU came into play as a complement to existing EU instruments. Thus, the overall political and humanitarian crisis became a trigger point for a still ongoing process of restructuring the European humanitarian aid and civil protection landscape. The paper is looking at different processes, actors, challenges and instruments that emerged during the refugee and migrant crisis in 2015/16 on the European level as well as national levels. It is asked which lessons have been learned and how the interplay of disaster management and civil protection on the different organizational levels might evolve in the future. The paper is based on an extensive document analysis, more than 50 qualitative interviews with actors of disaster management and civil protection organization in Europe.

DIXON, A.L. SINIKKA* (Burman University, Canada)

Life-Cycle Theory of Aging

The metaphor of hand-weaving is a starting point for a life-cycle theory of aging.

We all are weavers. The warp is our lifenospan. The "aging process" starts at birth, ends at death. Aging is not simply chronological; we are what we do in time and space.

As individuals, we vary. We inherit different types of looms that limit the scope of patterns. Regardless, we can weave beautiful fabric by the choice of colours and textures of yarns. Similarly, we are all born with certain limitations, even handicaps, and yet we can have a meaningful life course.

We don't choose the social location we are born into. Our life course is made up of engagements in the age-related "life cycles" of family, education, work and leisure. Chances for geographic and social mobility are restricted by age-related norms and laws and the functional ties we enter, voluntarily or involuntarily.

Therefore, the theoretical frame of reference needs to include those we are functionally and/or emotionally connected with, whether the unit of analysis is an individual, family, or society. Throughout life our "life cycle" engagements are constrained by our functional ties. E.g. family members impinge on each other's freedoms of choice.

Few of us today spend our entire life in the same location.

Specification of "life-cycle" engagements as well as the opportunity structures within which they take place makes a cross-cultural theory of aging possible. The family, education, work and leisure perform a universally important function despite some cultural differences.

The earlier we realise that what we did in the past, impacts on what we can do today, and what we do in time and space today impacts the future, the more meaningful will a societal plan for aging be.

How Social Workers Engage with Carers during Adult Safeguarding Work: The Use of 'Formal' and 'Informal' Risk Management Strategies.

Risk has been viewed as a key organising principle within social work practice, which may be used to ration resources, prioritise service provision or prevent

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

harm. These principles operate within legal and policy boundaries but rely on interpretation by workers, who must decide how to apply them. This paper draws on interviews with 31 social workers in England to consider how they assessed and managed risk to adults. The paper identifies how social workers engaged with family carers and paid carers during adult safeguarding work, where concern had been expressed that an adult was at risk of harm.

Drawing on work by Horlick-Jones, I identify forms of 'practical reasoning' employed by social workers when conducting risk work; specifically 'formal' and 'informal' methods of risk management. Several strategies were used when engaging with carers, often simultaneously. Workers highlighted their formal powers to safeguard adults to encourage carers to engage with the safeguarding process. In addition, workers informed carers of law and policy in order to persuade them to become compliant with these. Several informal strategies were also used. Workers provided emotional support to carers in order to prevent risk. They also sought to build shared understanding of carers' moral duties through individual or group interactions. Social workers' use of these strategies was influenced by their view of the adequacy of welfare policies within a climate of austerity. The study identifies the need to examine how workers' perspectives on social justice affects risk-work.

'Push on through': Children's Perceptions of Mental Health Education, Risk and Resilience in

Schools.

It is well established that living in poverty increases one's risk of developing a mental health problem. The World Health organisation has argued that governments should adopt programmes which protect children from such risks, increasing their chances of experiencing positive mental health. Schools have become a key site of such interventions, with new programmes aimed at promoting 're-silience', through which children may maintain or regain mental health during adversity. This paper adopts a governmentality approach to consider the logic and techniques of such programmes with a specific focus on England. An innovative visual methodology was used to focus on child perceptions of mental health interventions in school. Students' photo representations of mental health were collected and were used to stimulate focus group discussions with 65 young people aged 12-14 across seven schools. Children in focus groups gave preference to their own descriptors of mental health problems over diagnostic labels. 'Resilience' was seen to be the key organising concept for mental health interventions in schools. The concept was viewed as narrowly focussed on attitude to and performance in school-work, with individuals being encouraged to 'push-on-through' difficulties to achieve success. Children were critical of this approach suggesting several alternatives. These included increased access to independent mental health professionals, safe spaces within schools and mental health education that addressed the social and affective dimensions of mental health difficulties.

DOANE, ASHLEY* (, USA)
O'BRIEN, EILEEN (Saint Leo University, USA)

The "New" Right-Wing Nationalism, the Same Old Racist Logic

A recent global trend is the rise of right-wing, populist nationalist movements. This includes the Trump presidency, Brexit, and right-wing governments/movements in Europe, Latin America, and elsewhere. This phenomenon represents both a reaction to the post-Cold War neoliberal world order and a continuation of the centuries-old project of racial/ethnic nationalism. It is also an increasing source of national/international conflict and an obstacle to social justice.

We undertake a two-pronged approach to the analysis of right-wing nationalist movements. First, we develop a theory of nationalism as grounded in European epistemology and racialized colonial projects. Building upon this base, we theorize nationality as a socially constructed and contested group identity that is connected both to the nation-state and the interstate system. National identities involve processes of inclusion/exclusion (who is American, Brazilian, etc.?) and the assertion of material interests of the dominant racial/ethnic group within the nation. Historically, nationalist identities and political programs are activated and resurface when dominant group interests are threatened by internal/external challenges. Nationalism is continually evolving, but certain dynamics persist over time.

Second, we provide an empirical comparative analysis of contemporary public nationalist discourses as reflected in the media, seeking to identify common and context-specific processes. Analytical categories include responses to globalization, location of the nation in the international system, identification of racialized others, and construction of internal/external enemies. Guiding questions for our

analysis revolve around the reproduction of racialized nationalisms and the ideo-logical/discursive strategies that shape contemporary politics, particularly strategies that deny the racist components of racialized nationalism.

Finally, we consider right-wing nationalism on a global scale. Do right-wing movements adopt discursive/political strategies from other groups? What shared interests exist among right-wing groups? What is the scope of interaction between nationalist movements in various nation-states? Our goal is to broaden understanding of reactionary nationalisms beyond individual nation-states.

RC15-188.4

DOBLYTE, SIGITA* (University of Oviedo,)

'the Almighty Pill and the Blessed Healthcare Provider': Medicalisation of Mental Distress in Spain

The evidence of epidemiological studies signals substantial treatment gap and delay in common mental disorders. Other scholars, however, argue that such research is based solely on de-contextualised symptoms and, therefore, overestimates unmet needs for mental healthcare, which may encourage medicalisation of mental distress that is a response to stressful but normal life situations. While accepting suffering caused by intense distress or certain benefits of its treatments, they discuss the threats and losses of such medicalisation. Yet, the analysis of factors and actors driving this process is generally focused on the healthcare field (the medical profession, in particular) or other related fields (the pharmaceutical industry, the media or governments, among others). In this paper, I in turn examine how and which processes in a society as a whole might drive to unpleasant emotions of everyday life being managed through medical and, particularly, pharmaceutical solutions, rather than employing other resources.

Using reflexive thematic analysis and drawing on Elias's process sociology, I present the analysis of 21 in-depth interviews with healthcare providers and users of services who are or have been treated for depression or anxiety disorders in Spain. It is concluded that the trends of scientisation and individualisation, coupled with demands for emotional self-control, might result in growing medicalisation of emotions. Professional help seeking represents rationalisation whereas suffering unpleasant (yet normal) emotions is viewed as irrational. The paper contributes to the literature addressing medicalisation of mental distress and suggests that it can be understood as an unintended consequence of civilising processes with a shift in certain tension balances serving as one of the possible explanations.

DOLINAR, MAJA* (University of Ljubljana, Faculty of Social Sciences,)

Emotional Experiencing and Analyzing the Field through Drawings

Emotions are believed to be linked to irrationality in scientific research, therefore it is no surprise that researchers tend to underreport emotions in their experiences of the field. While carrying out fieldwork on the influences of popular television content on everyday lives of Moroccan women, auto-ethnography through art proved to be a good catalyst to express personal emotions in dealing with everyday life events, such as conjugal disputes, births, deaths, religious celebrations, marriages and gender violence. Ellis (2007) writes that the close and emotional study of others requires, "that the researcher turns the same scrutiny on herself as on others". Drawing proved to be an excellent tool for dealing with ethical issues and positive or negative emotions arising from my experiences. The main argument that I will follow in my paper is that there are benefits when a researcher becomes emotionally and personally involved in the research issues and the people under study, especially when turning the gaze on himself/herself, not only for ethical and moral reasons but also to use additional productive and unexploited sources of insight that can complement more traditional methods of anthropological research. Ellis and Bochner (1996) call this "evocative autoethnography" and "emotional sociology" (1997) to pinpoint that personal emotion, and the connotations they can trigger can be allowed to appear as relevant observations. In the paper, I wish to show how art, particularly drawings, can be used as a fieldwork diary to function as a personal catalyst for experiencing the field and serve as an unexploited source of analysis.

Ensuring Transparency and Reproducibility of Sociological Research: Usability of Open Source Tools for Teaching and Research

An ecosystem of free open source tools for improving the rigour and reproducibility of research is thriving. Teachers of sociology at research institutions must stay informed about the availability of tools, their use and ideally, their possi-

bilities of incorporating them in developing quality curriculum to train students about research transparency and reproducibility. Open science refers to the free availability of data, software and methods developed by researchers to share knowledge and tools, whereas computational reproducibility refers to the ability of researchers to duplicate the results of previous studies (by using the same data, software and methods). By applying the principles of openness and reproducibility, the researchers can assess the accuracy of findings, build on the work of other researchers with confidence and efficiency (i.e. without "reinventing the wheel") (Rule et al., 2018) and collaborate to improve and expand the research workflows to accelerate discoveries. Ideally, teachers of sociology can also onboard researchers to support the adoption of these tools. However, developing quality curriculum to train students or researchers on new tools requires expertise in the tool itself, which leaves many teachers without training on tools that may benefit their research. This paper aims to present four free open source tools for teachers of sociology and researchers in general, that is Binder for sharing the computational environment, code and research notebooks, Renku for documenting and sharing the analysis pipelines, the Open Science Framework for creating a centralized, structured workspace for the research materials and KnitR for knitting the R code with the analysis narrative in one executable research notebook, capturing the dependencies to help sociology educators choose the right tool for their needs.

Social Mobility and Stratification of Cultural Tastes: New Dimensions in Poland

A large part of current research in cultural sociology highlights "new" aspects of cultural inequalities. The sociological discussion suggests that lifestyle practices were once structured by a highbrow-lowbrow distinction, whereas today cultural omnivorism, broad engagement, or cosmopolitanism should be prevalent. Based on nationally representative survey from Poland on musical tastes, this paper first argues that the highbrow/lowbrow divide remains highly pertinent in contemporary Poland. Second, by applying diagonal reference models to our data, we show that both parents' and respondent's social class position affect so-called omnivorousness and cosmopolitanism in musical genres, with the weight of the former being much less in magnitude as the latter. This is in odds with the view that reproduction of the class distinctions is largely determined by primary socialization and family background. We also show that there is no difference in the relative weights of origin and destination between the upwardly mobile and the downwardly mobile. Finally, upwardly mobile individuals are less omnivorous and cosmopolitan than those who are intergenerationally stable in higher educational levels. These results challenge various views which attribute the emergence of the new cultural patterns in contemporary society to social mobility. Finally we identify an "inactive", an "intense highbrow" consumption pattern.

DOMEN, TAKAHIRO* (Hitotsubashi University, Japan)

Why Do Municipal Governments Restrict Ball Games in the Park?

The park is a typical public facility which is opened to all at any time. Moreover, it should be hoped that everyone can freely use in the park. Nevertheless, we frequently see many prohibition sign and icon there. Previous researches have mainly focused on only freedom which is restricted by the national government in order to ensure human rights. In contrast, there is freedom restricted by municipal governments. Moreover, it is regarded that the freedom restricted by municipal government is based on not only human rights but also other reason. However, there is very little research on the reason which municipal governments restrict our freedom. Therefore, we focus on ball games in the municipal park regarded as a typical case that our freedom is restricted by municipal governments and investigate the reason why ball games in the municipal park are prohibited in Japanese context. In this study, questionnaires were sent to all municipal government office from August to October 2018 in Japan, the number of valid responses was 1,063, and the ratio of valid responses was 58.4%. Moreover, 843 data without missing values was used by the logistic regression. The results suggest that the more officials of municipal governments do not expect that users of ball games have good manners, the officials evaluate their ability to coordinate users, and the officials recognise that mayors have negative attitude toward ball games, the more ball games in municipal park are prohibited by municipal governments. Based on the above, in order to permit users to play ball games in municipal parks

in Japanese context, we can find the following reason: 1) officials' expectations for users which have good manners as community governance, 2) officials' evaluation of little their abilities to coordinate users, and 3) officials' recognition of mayors' positive attitude toward ball games.

Political Sociology, Political Modernity and, Once Again, the Relation between Capitalism and Democracy

The relation between capitalism and democracy has always been a contested one. While in liberalism the compatibility, and at times even the mutual necessity between the two was presupposed, Marxist denied that there is a positive link between them, at times stating their incompatibility. More recently, with the increase of power of global capital an especially its financial branch, the relation has been brought to the fore once again, after the euphoria following the demise of 'real socialism'. This paper will revisit this discussion and, through a discussion of political regimes, will delineate the connections and contradictions between capitalism and (liberal democracy) as well as departures from the relationship, especially in terms of what may be defined today as liberal advanced oligarchy.

La Debilidad De Las Aproximaciones Microsociales En El Análisis Comparativo De Las Desigualdades Sociales. Factores Explicativos De Los Tiempos De Trabajo y Las Brechas De Género Entre España, Argentina, Chile y Uruguay

Esta comunicación, mediante un análisis comparativo en Argentina, Chile, Uruguay y España, países que comparten elementos de desarrollo, pero que también presentan diferencias en sus arreglos de bienestar, valores de género y niveles de desigualdad, pretende estudiar el tiempo total de trabajo (remunerado y no remunerado), dedicado a satisfacer las necesidades de cuidados, identificando los principales factores que, tanto a nivel individual como contextual, pueden estar relacionados a la distribución dentro de los hogares del trabajo no remunerado.

El trabajo empírico se desarrolla a partir de las encuestas de usos del tiempo (España, INE 2010; Argentina, INDEC 2013; Chile, INE 2015; Uruguay, INE 2015). El análisis incidirá en el reparto del trabajo doméstico y de cuidados entre los dos miembros principales de las parejas de doble ingreso.

Los resultados muestran que, aunque en los tres países se mantienen pautas similares, emergen importantes variaciones en los factores explicativos de la distribución de los trabajos, mostrando como las nuevas condiciones sociales han modificado las estrategias de las mujeres para dar respuestas a las necesidades de cuidados. Además, el bajo poder explicativo de los factores microsociales, muestra la relevancia de la construcción de género, las normas y valores culturales. Tanto el mantenimiento de los roles tradicionales de género como la implementación de políticas públicas son elementos fundamentales en explicar como el trabajo de cuidados se distribuye entre mujeres y hombres en los países analizados.

DOMINGUEZ, MARIO* (Dpt. Sociologia. Universitat de Barcelona, Spain)

Linking the MICRO and MACRO Indicators of Social Inequalities in Comparative Analysis Among Countries: Provision of Care and Gender Inequality

The transformations in contemporary western societies since the impact of the economic crisis have led to changes in the model of social organization and, specifically, in the forms of provision of care. The weakening of the welfare state, with structural adjustment policies that affect the supply of public services, and the inaccessibility of families to the services offered by the market, has increased family unpaid care work.

The results of recent research show the explanatory weakness of the variables related to microsocial approaches and confirm the need to incorporate the perspective of gender roles and macrosocial factors (structural, institutional and cultural) in the analysis of gender gaps in care work.

How the institutional and cultural factors may influence unpaid work in different directions: how affectthe meaning and magnitude of the effects of individual characteristics in the sexual division of labour; and the incidence of change social policies that affect the structure of employment and provision of public social assistance services.

The objective of the communication is to present the operationalization of a system of social indicators used in the analysis of the impact of these forms of social organization of care and well-being, which increase gender inequalities. The

proposal of social indicators can be used in comparative analyses between different countries taking into account the social dynamics, specificity and comparability of sociohistorical and cultural contexts.

At an empirical level, time use surveys are used comparatively in countries in Europe (Spain) and Latin America (Argentina, Chile and Uruguay).

"Y lo tremendo es llegar a Chile e ir a un cementerio y ver en una lápida el nombre de tu mamá". Visitas temporales de exiliados a Chile.

Abstract

Centro esta presentación en un aspecto menos estudiado del proceso del exilio chileno: los recuerdos y reflexiones de las visitas temporales de estos exiliados a Chile en los últimos años de la dictadura y los primeros de la transición a la democracia. El estudio de las vidas de los exiliados chilenos desde la perspectiva de las ciencias sociales ha ido en crecimiento en la última década, aunque comienza ya a fines de la dictadura, con numerosas y relevantes publicaciones. A diferencia de muchos de estos estudios que centran en retornos definitivos o en aspectos políticos del exilio, acá analizo los aspectos cotidianos del regreso temporal a Chile. Me interesa particularmente las construcciones del reencuentro con el país no desde una perspectiva política, sino desde experiencias diarias y de lo que significó el exilio en la pérdida de participación en estas actividades cotidianas. Comienzo presentando los conceptos centrales de "vuelta al hogar" de estos exiliados desde una perspectiva basada en los conceptos de "peregrinaje secular" de Baldassar y de nostalgia de Haage. Luego me centro en la descripción que hacen los exiliados de los cambios cotidianos que ven en Chile con relación al impacto de las políticas impuestas por la dictadura a partir del concepto "paradojas de la modernización" propuesto por el Programa de Naciones Unidas para el Desarrollo de 1998 y el argumento de Garretón sobre el "tupido velo". Concluyo reflexionando sobre la necesidad de estudiar el exilio como un proceso permanente de quienes decidieron quedarse fuera de Chile o simplemente no pudieron volver al país.

Presentation can be in English if needed.

DONATO, STELLAMARINA* (LUMSA University of Rome, Italy)

Mapping Public Policies on Gender-Based Violence Against Women within Diverse Theoretical Approaches. the Cases of Italy and Spain.

Laws and polices aiming at preventing and fighting violence against women (VAW) have populated the daily debate of nation-states. Whether dealing with new elections, as the recent conundrum in Spain, or to economic expenditures, violence is ubiquitous in framing state's political life, citizens' expectations and, broadly, societies in modern times.

Diverse theoretical approaches on gender-based violence fill the narrative of specific actors and help towards the social construction of reality on specific matters.

By exploring diverse theories on gender-based violence, this paper aims to shed light on the development of the terms, laws and policies adopted by Italy and Spain from 1993 to 2015. Starting with the consequences and the resonance of the UN/GA resolution 48/104 of 1993, categorizing VAW in international law (Walby et al., 2017), the study ends with the evolution of the Sustainable Development Goals (SDGs) on the issue of women, violence, gender and equality. The paper centers on national sources of law and the respective implementations in the national public policy systems on gender-based violence against women (GB-VAW) in the two Mediterranean countries. Bearing in mind the socio-historical paths of the two nation-states, the final goal of the paper is to investigate why Italy and Spain, two countries with similar contexts, histories and models of public policies in the European area, have developed different public policies and lexical adaptations on GBVAW.

The paper employs a mixed-method approach with a prevalence for qualitative methodology. The final objective is to identify the main theoretical models, critically observing the socio-cultural factors that have given rise to variegated, dissimilar processes of tackling gender-based violence in the two European countries. In conclusion, to evaluate nation states' public policies on the phenomenon, and to compare them, the study uses the index on government response to VAW, created by Weldon and Htun (2013).

Movilidad Social Desde Las Clases Populares

La estratificación y la movilidad social son indicadores que nos permiten conocer cómo y bajo qué criterios se distribuyen las oportunidades, bienes y recursos entre los miembros de una determinada sociedad. En las últimas décadas, la sociedad chilena ha experimentado importantes cambios que han supuesto una mejora en las condiciones de vida de los chilenos, aunque en el marco de una persistente desigualdad social. En este contexto, nos interesaba indagar las características actuales de la estructura social chilena actual y, más específicamente, el nivel de movilidad social experimentada por las clases populares. A partir del uso de datos derivados de la encuesta longitudinal desarrollada por el Centro de Estudios de la Cohesión y Conflicto Social (COES) encontramos que las clases populares han experimentado una movilidad educacional ascendente que, en el mejor de los casos, se ha traducido en movilidad de corto alcance.

New Modes of Youth Political Action and Democracy in the Americas: Chile, México, Colombia, Québec

In the space of barely one year, the Americas underwent no less than four major popular protest movements spearheaded by students. Beginning in June 2011 in Chile with a series of strikes and occupations of universities and secondary schools that generated the largest social protest movement since the 1973 coup, Colombia followed in October with a national university strike and succeeded in derailing a neoliberal plan to reform the education system. In Quebec, the movement followed practically the same course as in its "southern twin" Chile: faced with government intransigence in refusing to recognise student organisations and the legitimacy of the street as a mode of popular participation, the conflict expanded beyond its educational framework to encompass a broad spectrum of the public in transgressive protest movements Finally, to round off that year of student-catalyzed popular revolt the *Yo soy 132* movement erupted in Mexico in May 2012, and denounced the "mass manipulation" of the collusion between politicians and giant media corporations, demanding "free, reasoned and informed" vote. Since then, and for almost a decade, students and youth organizations in these 4 countries have been protagonists of innovative mobilisations for justice, democracy, and more recently against climate, with a cycle of unprecedented high school strikes against climate change that lead to the most massive mobilisation of Quebec's history on September 27 2019. Despite strong criminalisation of their civic action, students nevertheless succeeded in enduringly marking public space and in lending a transnational and transgenerational dimension to new forms of political action and media strategies. Our comparative analysis of these cases aims to show that, despite criminalization, these mobilisations gave birth to a new form of political subjectivation based on a shared fundamental wrong in which important segments of populations identified themselves to the social imaginaries proposed by youth and students.

Mapping the Dimensions of the Governance of Natural Resources Using a Text-Mining Approach

The way the governance of natural resources – actions to improve the sustainable management of resources, mitigate social and environmental impacts and improve relations with the community – is exercised has implications for sustainability. This research develops a thematic map of this area using a systematic literature review that covers Sociology, Economics, Administration, and Political Science.

The corpus in the systematic literature review is based on the publications indexed on the Web of Science (WoS). Using the keywords Natural Resource* and ((Governance and Corporat *) or CSR it was possible to extract 308 articles. A careful analysis of their titles, keywords and abstracts (e.g., not written in English; CSR with a different meaning than the one used here) led to the final corpus of 162 articles used as input to text mining and topic algorithms.

The results show that this research area is quite heterogeneous, with 9 themes identified: (1) Socially responsible practices; (2) Conflicts between communities and companies/State; (3) Extractive sector, its practices and consequences; (4) Sustainable development actions; (5) Forest management and biodiversity; (6)

Transparency, public participation and consumption; (7) Rights of traditional communities, socioeconomic impacts; (8) Public governance of resources; and (9) Sustainable strategies to improve corporate performance.

Therefore, the article maps the research carried out in the area of natural resource governance, showing that the topics are diverse, but organized around a set of main axes with different weights according to the main research area (e.g., Sociology, Economics). This conclusion allows identifying paths for future research, borderline areas to be explored or synergies between different topics. The conceptual framework of the area allows the future positioning of research in this field, as it reveals the benefits of green practices and the main challenges faced by the State, companies and communities to manage and preserve natural resources.

Notes on Social Representations of Online Intellectuals and Its Methodological Challenges

This abstract aims at discussing methodological difficulties when investigating homologies between intellectual and media fields by its potential 'capital conversion'. Thus, the term "online intellectuals" refers specifically to "media intellectuals" on digital platforms – Twitter, Facebook, Instagram and others – considering the sociology of culture by the social representation of being "media intellectual".

Digital platforms as a field highlights two different methodological aspects: firstly, the selections of relevant time frame to be analyzed. Secondly, relating different specialized and no-specialized vehicles of publications, such as newspapers, magazines, books and digital platforms taken from the limits of a social and relational context which it has been produced.

At same time, digital platforms implies an uninterrupted data production via self-publications and public reactions. For example: an article published by a no-specialized magazine (media pole) may impact on the specialized academic atmosphere (intellectual pole), creating a circle of debates between those zones. In other words: reinforcing intellectual representations of agents who are closer to media in the social space.

Taking these representations objectively requires a crossing of data in order to measure volumes of specific capitals by the social structure which produces social trajectory – thought here in Bourdieu's terms – while controlling the exogenous factors that may justify the position of those agents within the field.

Finally, the methodological tools need to frame structural analysis within the limits of a reflexive sociology, which allows investigating correspondences between intellectual and media on digital platforms.

Catholic Environmental Movements and Its Opponents in Brazil

This paper aims to investigate the mobilization of the Catholic Church in Brazil around the environmental issues and the organized counter-offensive (also coming from the Catholic milieu) that this engagement has been raising in the current national scenario, marked by the conservative rise.

Three main axes ground this analysis: 1) The official Catholic milieu in Brazil; 2) The unofficial catholic actors sympathetic to the environmental agenda; and 3) The catholic countermovements that aim to break the "green wave". The first one is represented by the activism of Brazilian priests and bishops who, based mainly on the guidelines of *Laudato Si*, the Pope Francis' encyclical, seek to theologically encourage the eco-activism. The second one acts outside the institutional influence sphere of the Catholic Church in Brazil and is represented here by the activism of Leonardo Boff. Finally, the third one has as its exponent in the national scenario the famous Plínio de Oliveira Institute (IPCO), a kind of think tank of Brazilian Catholic conservatism.

It is the aim of this discussion: a) to examine the symbolic resources mobilized in each religious circle to motivate environmental awareness; b) to analyze whether the focus is on the theological repertoire or on secular categories; c) to identify the connections between religious identity and environmentalism; d) to recognize the meaning given to the concept "ecologically correct" in each case; e) to explore what conception of "nature" is at stake when it is said that it must be protected; f) to identify the structures and networks mobilized both by ecotheological initiatives and by the countermovements which intend to bar the advance of the green agenda in the religious milieu.

RC22-JS-62.2

DOS SANTOS, RENAN WILLIAM* (University of São Paulo, Brazil)

The Articulation between Liberation Christianity and Environmentalism in Leonardo Boff and His Current Religious Opponents in Brazil

Leonardo Boff was one of the founders of liberation theology. His leading role in the Basic ecclesial communities in Brazil and his exhortations that confronted not only social injustice but also the hierarchy of the Catholic church itself, have elevated him to the position of political and religious icon.

His departure from the Catholic clergy in 1992, on the eve of ECO-92, happened at the same time as the ecological agenda was being incorporated into his theological repertoire. Since then, the liberation Christianity which he has been advocated has also increasingly become a Christian environmentalism of liberation.

However, with the current conservative turn of the Brazilian government, groups and movements averse to ecological agendas have gained prominence. Among them is the controversial IPCO - Plinio Correia de Oliveira Institute, an even more conservative dissent from the well-known integralist movement TFP - Tradition, Family and Property.

In its activism, IPCO claims that environmentalism is a Trojan horse hiding communist agents and supporters of liberation theology who want to subvert both political and religious order in Brazil and in the world. Due to his prominence in these themes, Leonardo Boff was chosen by IPCO as one of the main agents to be fought.

The aim of this paper is to analyze the functioning of these anti-environmental and anti-liberation theology networks based on IPCO. Its various publications, public demonstrations, marches, YouTube channels and petitions are the subject of this analysis. Through this data, the main concepts and the connections that IPCO's members draw between different instances of the political and religious arena will be mapped.

DOUHAN, HAYAT* (GIGA, Germany)

Framing Mohsen Fikri's Death:

A Comparative Analysis of Mainstream & Alternative Media

On the 28th October 2016, Al Hoceima has witnessed a horrific incident as a fish-seller was crushed to death by a garbage compactor while trying to retrieve his confiscated merchandise. Given the incident and the specificities of the region, this incident has sparked a set of protests in the Rif region, which became known as the "Hirak". This latter has attracted the attention of different media outlets at the national and international level. This thesis tends to look at the dialectics of Moroccan online mainstream and alternative media representations of Mohsen Fikri's death and, therefore, the Hirak. It examines how each media formation, mainstream and alternative, have framed the target incident. Drawing on the comparison between the two media representations, the paper also evaluates the nature of the relationship between online mainstream and alternative media in terms of their framings of the incident. Based on a comparative framing analysis, it is surprisingly found that online mainstream and alternative media converged in using a set of similar frames namely, state visibility, call for accountability and attribution of responsibility. However, they diverged in using various framing strategies and, therefore, providing different representations of the target incident. Mainstream media have used the episodic framing of Mohsen Fikri to de-dramatize the incident, mitigate the public outrage and disclaim the responsibility of the state apparatuses. By contrast, citizen journalists made the best use of thematic framing to contextualize the incident within the 'troubled' history between the region and the central state with the aim of mobilizing people and making the state accountable for the incident.

The Institutional (Dis)Arrangement in the Case of Rio Doce Technological Disaster

The out-of-court agreement between the Brazilian State and the companies responsible for the burst of the Fundão mineral tailings dam in the city of Mariana in November 2015, which caused one of the world's largest technological disasters, resulted in an innovative governance arrangement in charge of action s to compensate violated rights and rebuild communities and environment along . A body composed of public entities (Interfederative Committee - CIF) was created to deliberate and monitor the 42 socioeconomic and socio-environmental programs. Their implementation would be carried out by the Renova Foundation, a private organization created especially for this purpose by the companies responsible for the disaster . Despite the strong Brazilian tradition of community participation, the initial arrangement did not involve affected and their organizations. This paper aims to describe, on the one hand, what were the results of this arrangement in terms of programs implementation, and on the other illuminate the mechanisms that facilitate and hinder the products and services delivery to the affected population. From the theoretical-analytical point of view, it seeks to contribute to the debate on governance patterns with attention to interactions with those that are not institutionalized in the institutional arrangements. The study is based on the analysis of Renova's reports, documents' analysis and interviews with the actors involved in CIF, Renova Foundation and civil society actors. The results suggest that compensation measures have not been implemented, as most of Renova's actions focused on the phase which the public policy literature calls policy formulation, locked by institutional and legal mechanisms of the arrangement.

¿Qué Hacen Los Movimientos Sociales Cuando Dejan La Escena? Una Contribución Analítica Sobre Latencia y Trabajo Desde El Sur e La Economía Solidaria

Por un lado, las teorías delos movimientos sociales tienen su núcleo gravitacional en el Norte geopolítico y sociológico y, por otro, el Sur es el lugar de la producción de conocimiento sobre la Economía Solidaria (ES). Las teorías de los movimientos sociales centradas en las interacciones de los actores con el Estado, y más específicamente la del Proceso Político, crearon enfoques poderosos para analizar el carácter de confrontación y extrainstitucional; y más recientemente incorporaron acciones cooperativas a través de diversas formas de institucionalización. La robustez teórico-analítica de la fase visible de los movimientos no estuvo acompañada por el desarrollo concomitante de la fase de sus latencias. La pregunta "¿qué hacen los movimientos cuando dejan la escena?" quedó a la deriva en las dimensiones teórico-analítica y empírica. Planteamos que la acción política de varios actores y la construcción teóricade la ES pueden fertilizar el análisis de los movimientos y, en particular, resignificar la fase de latencia de dos maneras. Primero, puede enseñar el potencial políticamente transformador de esta fase de supuesta invisibilidad y, en este sentido, percibirlo como una política cotidiana a partir del trabajo asociado, la solidaridad comunitaria y la integración con la esfera doméstica. En segundo lugar, la fertilización de la ES puede hacerse desde la perspectiva del Sur. Desde la deconstrucción de monoculturas de producción, conocimiento y escala, la sociología de las emergencias permite comprender la ES en su riqueza y diversidad, en la que la solidaridad social no es inferior a la delEstado, lo local no es inferior a lo global, el conocimiento práctico no es inferior al científico. Para demostrar tal fertilización, se revisará la literatura latinoamericana sobre ES, trayendo así categorías, conceptos, mecanismos y procesos para comprender qué hacen los movimientos cuando no se movilizan directamente en interacciones con el Estado.

RODRÍGUEZ SÁNCHEZ, ALEJANDRA (Berlin Graduate School of Social Sciences, Germany)

The Role of Missing or Wrong Knowledge for Social Stratification at the Transition to Secondary School in Germany

In this paper, we assess 1) whether knowledge about the transition rules to secondary school tracks in Germany is socially stratified and 2) whether this stratification of knowledge contributes to social stratification in the transition rates. The rules for the transition vary by federal state. Among other things, the track recommendation is binding in some federal states, while only an orientation for parents in others. Moreover, the requirements to get a recommendation for the academic track vary.

We argue that lacking knowledge or wrong beliefs about these rules may result in a primary or secondary effect of social origin, depending on the institutional context. In federal states where recommendations are binding, mistaken information may result in primary effects of social origin because parents may put too little effort or may be discouraged by erroneously over-estimating requirements. In states where recommendations are non-binding, mistaken information may result in secondary effects of social origin because parents may interpret the difference between the performance of their child and their expected requirements as an indicator of their child's probability to succeed.

We make use of the German National Educational Panel Study to test these hypotheses. Parents with low education are more likely to have mistaken information on whether recommendations are binding and over-estimate requirements. We find that children of parents who have mistaken information about the rules for transition are less likely to get a recommendation for the academic track and are less likely to attend the academic track after elementary school in all federal states. Children of parents who over-estimate requirements are less likely to attend a more ambitious track than recommended in federal states where recommendations are non-binding. Yet, while differences in knowledge contribute to social stratification in the transition to secondary school, they play only a minor role.

DRAEGER, JASCHA* (GESIS, Germany)

The Role of Parental Wealth in Adolescents' Educational Pathways in Germany

In this paper, I trace educational pathways and school-to-work transitions of German adolescents from their teenage years to their early twenties and evaluate how these pathways are stratified by their parents' wealth. Social stratification by parental wealth may occur at several stages in adolescents' educational pathways, even though almost all educational pathways are free of tuition fees in Germany.

The attendance of the different secondary school tracks (first stage) may be stratified because parental wealth may foster educational achievement through additional investments and parents may anticipate later costs of education. For adolescents pathways through secondary school and their highest secondary school graduation (second stage) and their transitions after graduation from secondary school (third stage), parental wealth may become even more important because alternatives outside of the educational system become feasible. The *purchasing function* of wealth may relieve adolescents from the burden to earn their living instead of continuing education. The *insurance function* of wealth may allow them to make riskier decisions.

I use data of the German National Educational Panel Study and apply sequence analysis to adolescents' educational pathways to test these hypotheses. I find stratification by parents' wealth at all three stages:

Adolescents with wealthy parents are more likely to attend the highest secondary school track.

They are more likely to get a higher secondary school qualification and are less likely to get a lower qualification than their initial school track would result in.

The few remaining adolescents with wealthy parents and a low secondary school qualification are more likely to start vocational training and finish it successfully than their less wealthy peers. Adolescents with wealthy parents and a high secondary school qualification are more likely to enter university than their less wealthy peers with the same qualification.

DREHER, JOCHEN* (University of Konstanz, Germany)

Towards a Phenomenology of Power

Against frequent criticisms towards the phenomenological paradigm in the social sciences with respect to an alleged "oblivion of power" (Zygmund Bauman, Jürgen Habermas, Pierre Bourdieu), this paper presents reflections on a new phenomenology of power. I will reject this criticism by demonstrating the specific potential specifically of Alfred Schutz's theory of the life-world including his the-

ory of relevance, also following Peter L. Berger's and Thomas Luckmann's social constructivism to conceptualize the phenomenon of power with reference to the subjectivity of the individual actor. In my presentation, I will disable this accusation and demonstrate that the pragmatic theory of the life-world, and in this context that especially the theory of relevance has the potential to explain processes of power constitution within the tension between subjective experience and objective construction of the social world. I will show how the phenomenological concept of relevance functions as a regulative principle for the construction of reality, as it structures and organizes the correlation of objectified knowledge and the experience of the individual actor. Accordingly, I will argue that a theoretical concept of power based on the definition of relevance can capture the unique dynamic and process of power constitution within the relation of the objective world and the subjectivity of the individual actor.

DRUGOVA, ELENA* (Tyumen State University, Russian Federation)

Human Resources Management in Leading Russian Universities:

Rise, Fall... and Rise Again?

In 2013, the Russian national higher education excellence program "Project 5-100" was launched. It is aimed to promote Russian universities to get into the first hundred positions of the global universities' rankings. As a part of the road-maps of the universities - members of excellence program, Human Resources Development (HRD) Units establishment became a governmental requirement. It became a novel and unusual experience for Russian universities. This requirement is in line with the trend of universities corporatization and academic managerialism. Such governmental influence toward the universities internal policies is seen as a part of the processes of performance-based funding increase and universities freedom decrease. This research answers the question about main trends of development of the human resource management in leading Russian universities, the stages that were passed since 2013, the problems that were faced, and the new directions that emerged in the last years in this new area of university management. To answer this question, the survey of the members of the HRD departments in 10 leading Russian universities was conducted, and interviews with the heads of this HRD departments were held. The universities that were chosen are all members of the "Project 5-100" excellence program. Fieldwork is still in progress, but for now results show that: 1) HRD departments were mostly created as a part of the excellence program roadmaps, they served its needs and have a low level of independence; 2) dominating part of universities still doesn't have they own articulated HR policy and strategy; 3) after the change of the governmental requirements, three groups of HRD departments in universities can be observed: a) units in a rudimentary imitation state; b) units that try to find new goals and directions; c) strong units with articulated HR strategy and diverse range of activities.

At Your Service Madam: A Sociological Investigation into the Rise of the Gig-Economy and the Need for on-Demand Domestic Service in South Africa

The growth of an on-demand gig-economy, where digital connectivity and tech-savvy individuals increasingly purchase goods and services online, have influenced the rise in online domestic service platforms. Through online apps, clients can access and buy all types of domestic services such as housecleaning, cooking, caring and laundry services that offer accessible, affordable and flexible domestic services to maintain a healthy work-family balance. It is easy, convenient and service quality control occurs through ratings and review systems. These on-demand domestic services are especially popular among the rising middle-class in developing nations such as Kenya, India, and Mexico. In South Africa, SweepSouth and Domestly provide domestic cleaning services to clients in affluent suburbs. Launched in 2013 and 2015 respectively, SweepSouth and Domestly are considered to be the Uber of housecleaning, where clients are connected to thousands of registered trained domestic workers, mostly black African women. In a step-by-step process, clients specify the location of their dwelling, and specific cleaning duties required. These specification are linked to an estimated number of hours and price, of which the firm extracts some profit. Dates and time-slots are selected, after which a domestic worker is linked to a client and a short biography with past reviews from former clients of the domestic worker appears. Cleaning sessions can be booked again, rescheduled or cancelled on the go with safe and cashless payment. Why people are using these on-demand domestic services in a country where domestic workers are the norm is not fully understood. Based on qualitative interviews with clients using these services, several factors contribute to its usage. Among others, are unpredictable work or travel schedules, the flexibility in choosing duties and payment options, and the avoidance of any contractual commitments that come with traditional domestic service.

Análisis De Los Condicionantes Electorales De La Expansión Del Programa Tekoporã En Paraguay

Los programas de transferencias monetarias condicionadas (TMC) vigentes en América Latina han sido analizados ampliamente en términos de sus vínculos con las dinámicas electorales nacionales y subnacionales, si bien la literatura no alcanza conclusiones consensuadas acerca de la dirección que tienen esos efectos o el peso de los condicionantes. Por otra parte, la amplia literatura desarrollada se ha centrado en el estudio de los casos de mayor visibilidad en el continente, donde la extensión y duración de sus programas de TMC ha hecho factible sus análisis. El presente trabajo contribuye a la comprensión acerca de los condicionantes electorales para la expansión de estos programas a través del análisis del programa Tekoporã en Paraguay a nivel municipal, caso que no ha sido estudiado desde esa perspectiva. Se pondrá a prueba las diversas hipótesis planteadas en la literatura existente para el continente a partir de la observación de los patrones de difusión de Tekoporã en el territorio paraguayo hasta alcanzar presencia en la totalidad de los distritos en el año 2017, apuntando a identificar particularidades de este sistema político como condiciones de alcance para la elaboración teórica acerca de patrones de implementación de programas TMC en el continente.

Online Communities As a Platform for Discussing Stigma and Discrimination of People Living with HIV/AIDS in Healthcare Settings

HIV is a highly stigmatized disease in many countries, including Russia. In the Russian-language Internet, there are many online communities where people living with HIV (PLHIV) can discuss their problems anonymously with their peers. The purpose of our research was to reveal how online platforms shape the discussions of stigma and discrimination of PLHIV in healthcare settings. Through the application of qualitative research methods to online discussion forums, we focused on different aspects of discussions of hiding one's HIV status in healthcare settings in order to understand the cultural contexts of stigmatization and discrimination. Data were collected through Russian-language web forums for PLHIV. We found that the concealment of HIV status is the most often discussed aspect of stigma and discrimination. Concealing HIV-status in healthcare settings is connected with the fear of healthcare providers' disclosure of patients' HIV diagnosis, fear of being denied or receiving lower quality medical care and fear of direct stigmatization from healthcare providers. We revealed several typical discursive strategies of PLHIV dealing with stigma. Discussions around concealing one's HIV status show that some users normalize the concealment of HIV status and discrimination practices, which indicates the high level of internalized stigma. Other users treat the concealment of HIV status from healthcare providers as inappropriate behavior and discuss different forms of resistance and advocacy. We showed that online health communities play an important role in the discussions of stigma and discrimination. Research of online discussions can facilitate the study of populations vulnerable to stigmatization and makes it possible to identify hidden aspects of discrimination practices and discourse. The research was supported by RFBR, project number 18-013-00726.

DUDINA, VICTORIA* (St. Petersburg State University, Russia)

Self-Management of Stress at Work and in Everyday Life in the Context of Pharmaceuticalization

Self-management of stress in a modern society increasingly relies on the use of pharmaceuticals. Pharmaceuticalization of stress is closely connected with the widespread of online communities and internet resources where people can discuss health problems, health care, and different medications. The purpose of our research was to describe how internet users discuss stress and stress-related health problems at work and in everyday life, how they justify the need for taking medications including sedatives and what role professional medical knowledge and peer-generated health information play in this process. We analyzed Russian-language internet resources dedicated to the discussion of stress and sedatives; we sampled 13 online resources (thematic forums and online discussions) and then sampled about 800 comments for deeper analysis. As a result of inductive and deductive coding of these texts, we identified some patterns of taking pharmaceuticals in the workplace and in everyday life: self-prescription of pharmaceuticals; taking pharmaceuticals as an additional way to non-pharmacological methods of getting rid of stress; taking pharmaceuticals prescribed by health care provider; taking pharmaceuticals advised by peers. These patterns differ in ways of self-medication and with respect to professional medical help. We revealed that some users take pharmaceuticals not for medical purposes but

as a means to meet rigorous standards of performance imposed by labor market or by household duties. Online discussions provide these users not only information about pharmaceuticals for stress management but also information about personal medication experiences of others and support form users experiencing similar problems. Our research has some limitations. We did not estimate how the identified patterns of taking pharmaceuticals are associated with broad social context and with the characteristics of the users themselves, and also we did not estimate the prevalence of identified patterns. The research was supported by RFBR, project number 18-013-00726.

DUEÑAS RELLO, ERIK* (,)
SANTIAGO, JOSE (,)

Alienación y Absurdo En La Juventud Española En Tiempos De Crisis. De La Teoría a La Investigación Empírica.

La obra de Hartmurt Rosa ha renovado el interés de la sociología por la alienación y ha abierto el horizonte para desarrollar una sociología de la relación con el mundo que ha sido orillada por la sociología dominante. Este alegato por una sociología de la relación con el mundo posibilita extender el análisis sociológico al estudio de cuestiones socio-existenciales otrora poco atendidas. Con esta comunicación, queremos profundizar en esta línea de investigación con un planteamiento en el que retomamos la categoría del absurdo para acceder al extrañamiento que experimentan los individuos en tiempos de crisis.

La idea del absurdo permite indagar en la cualidad y los efectos de las relaciones entre mundo e individuo, al poner el foco en la interrelación entre las contradicciones estructurales y los procesos de extrañamiento vividos por sujetos que imputarían una carencia de sentido a estas contradicciones, experimentándolas como episodios absurdos. La ausencia de un sentido percibido por el sujeto en su relación con el mundo supondría un *extrañamiento* en el que se experimentarían procesos de cuestionamiento del mundo y de sí mismo, derivando en problemas socioemocionales de angustia o retraimiento.

Ilustraremos nuestro planteamiento teórico gracias a una investigación empírica realizada en España en 2019 mediante entrevistas en profundidad individuales y grupales a un total de 43 jóvenes en situación de precariedad económica, con edades entre 25 y 35 años, hombres y mujeres y procedentes de diversas clases sociales. Esta investigación se realizó en el marco del Proyecto de investigación VULSOCU financiado por el Ministerio de Economía, industria y competitividad de España.

DUENAS-CID, DAVID* (Kozminski University, Poland)

Internet Voting and Trust, an Open Debate

The growing popularity of ICT use for government purposes brings along certain threats (Zhao and Zhao, 2010) that are affecting the social perception on its suitability (Alzahrani et al., 2017), putting trust as the cornerstone of the social development of e-government (Gefen, 2000; Gefen et al., 2005). According to Rieder and Simon (2016), trust has always played a key role in building and maintaining social order (Hacking and Shapin, 1995) but its very definition is subject to changes. Systems of trust are not fixed and the conceptions of whom to trust, what to trust or under which circumstances, are mutable in time.

Even if there are many countries where citizens do not trust in the use of online services and e-Government applications, others (e.g. Estonia) have high degrees of trust in e-Government. For Governments, aiming to improve the quality of the services provided, increasing the trust of citizens in their interaction systems is of significant interest. For citizens, being able to trust in the systems provided by the Governments plays a central role on their keenness to its use. In this interaction there is still a gap that will be explored in this presentation: namely, why do people trust or distrust in voting technologies?

¿Descentrando Lo Material? El Contenido Espiritual En Los Discursos Latinoamericanos De Transición Civilizatoria Como Semánticas Emergentes Para La Construcción Del Orden Social Deseado

En el marco de la exploración de nuevas formas de 'pensar, sentir y actuar' para la superación de dinámicas reproductoras de insustentabilidad, esta ponencia presenta un análisis del contenido espiritual detectado en los discursos latinoamericanos de transición civilizatoria (Escobar, 2016; Beling et al, 2017), reflexionado sobre su capacidad para convertirse en dinamizador de movimientos de transición. Este análisis se basa en un estudio de las estructuras narrativas y argumentativas en una muestra de discursos intelectuales latinoamericanos, identificando los tipos de articulación emergente entre contenidos espirituales y

materiales, relevando innovaciones semánticas que buscan (o reclaman) nuevos 'referentes de certidumbre' para la construcción del 'orden social deseado'. En este proceso se analizan las tensiones ente dinámicas de resistencia, reacción y resonancia, en cuanto discursos de transición societal y su carácter 'emergente', mapeando el contenido de acuerdo con su grado de coherencia material/espiritual y su nivel de 'resonancia' mutua (Rosa, 2015). Este análisis sirve luego de base para una discusión acerca de las implicancias para procesos de transformación socio-ecológica de la nueva semántica detectada, y los grados en que permitiría superar la dicotomía entre lo moderno y lo tradicional en que se entramparía la discusión latinoamericana sobre cambio social, destacando el potencial 'transformativo' que posibilitaría la conexión creativa que estos discursos explorarían y promoverían entre un contenido espiritual y el proceso de construcción de civilización. En este sentido, si en la crisis contemporánea se presentan dinámicas de aceleración de procesos desestabilizadores, un proceso contrario y más intenso de aceleración de dinámicas constructivas parecería ser necesario para revertirlo, en la cual un contenido espiritual podría tener un rol creativo y dinamizador. ¿Pero qué tipos de contenido espiritual generarían esta dinámica? ¿De qué formas se acoplarían con un contenido material? ¿Cómo y dónde se podrían observar? Estas son algunas preguntas que la ponencia buscaría explorar.

Neoliberal or Niche?: The Role of Non-Profit Actors in Afns

Community Farms, Food Policy Organizations and other food non-profits have emerged as major actors in the creation and management of alternative food networks. Through interviews and examination of publicly-available data, I explore the missions of these organizations, whether they are meeting those missions, and how they could more effectively fulfill their missions. In particular, I will focus on the current transition of these organizations to further a more socially just and inclusive alternative food system, asking whether non-profit structure is intrinsically "neoliberal" or can play a strong transformative "niche" role toward a more socially just alternative food system.

Consecuencias Del Estrés Sociocultural En El Sistema Psico-Neuro-Inmuno-Endocrinológico (SPNIE) En El Proceso De Envejecimiento De Las Mujeres y Los Hombres

El objetivo de esta investigación está dirigido a que mujeres y hombres en proceso de envejecimiento conozcan las importantes repercusiones que tiene la generación de estrés crónico (presente en la mayoría de relaciones interpersonales disfuncionales que ellas y ellos establecen) en los diferentes órganos y sistemas del organismo humano y entenderlo de esta manera como una problemática compleja, que puede estar presente en las diferentes etapas del ciclo vital y afectar el bienestar y la calidad de vida en dicha población.

Metodología compleja -postulados de la Sociocibernética y la Cibercultur@- en la investigación de un fenómeno sistémico *biopsicosociocultural* como lo es el proceso de envejecimiento de las mujeres y los hombres. Tres talleres de Investigación-Acción-Participativa (IAP). La población observada es un grupo de 106 participantes, edades 20-39 y 40-60 años.

Conclusiones: Las y los participantes del trabajo de campo grupal IAP, reflexionaron, entendieron y conocieron acerca de que mente y cuerpo son una estructura física unitaria, en la cual, el organismo funciona como una red de sistemas en interacción dinámica continua con el entorno que le rodea, la cual, se ve afectada por la generación de estrés crónico (sociocultural) con importantes repercusiones en el proceso salud-enfermedad de mujeres y hombres en proceso de envejecimiento, esto hace extremadamente complejo el enfoque tanto desde la biología, la psicología, la sociología y la medicina. Para que la salud de la persona se mantenga con una buena calidad de vida, tal proceso deberá ser valorado como un fenómeno Socio-*psico-neuro-inmuno-endocrinológico (SPNIE)* e interdisciplinar.

DURAN MATUTE, INES* (Benemerita Universidad Autonoma de Puebla, Mexico)

Re-Thinking Democracy from below and to the Left

What is 'democracy'? The rise of authoritarian capitalism and reactionary populism is revealing that democracy is merely a rhetoric set by neoliberal governance. 'Democracy' acts as an epistemological frame reinforcing social, economic, political and cultural structures transnationally while shaping lives and territories locally. Racism, in this way, is being perpetuated and renewed from the global to the local, deceptively enmeshing peoples' lives deeply into structures of power, meanings and representations. However, people more than ever are challenging such a maneuver that sustains a racist, classist, and patriarchal capitalist system. In Mexico, once again, indigenous peoples are showing us why liberal democracy

is a hoax and how can we build other forms of governance. In the context of the Mexican presidential elections of 2018, the *Congreso Nacional Indígena (CNI)* and *Ejército Zapatista de Liberación Nacional (EZLN)* established the *Concejo Indígena de Gobierno (CIG)* to build new social relations that will renew democratic paths and promote self-government. Since then, they have been asking people, organizations and social movements to join them and organize; they are establishing networks of resistance and rebellion with the Mexican civil society, but also they are weaving transnational networks to dialogue and start paths of collaboration that could dismantle capitalism and spread *another* democratization worldwide. From a scholar-activist position, in this paper I reflect on the kind of 'democracy' the CNI/CIG/EZLN is promoting; are they talking about a 'democracy from below', or a subaltern, radical or confederated democracy? How does it differ from the rhetoric of democracy set by neoliberal governance? What are the potential and limits of their global proposal? The aim is to ponder the prior knowledge of the field and underline the theoretical contributions that indigenous peoples and their networks are doing to construct a real democracy without hierarchies.

HEJZLAROVA, EVA (Charles University, Czech Republic)

Producing Expertise on Birth: Analyzing the Emotional Context of the Ignorance- Knowledge Nexus.

We analyzed the recent debate on a 'midwife assisted home birth' in the Czech Republic through analysis of media coverage from 2002 onward and the analysis of all official statements released on the topic of birth between 2002 and 2019. We chose the Czech debate for a number of reasons: first, the debate over this health care choice elevated to a highly tensed public controversy, having a prominent position in the media. Second, we argue that the debate among experts raise interesting questions about whether and how expertise relates to emotional experiences, individual assessment of situation, and the area of birth seems to be ideal site to study this.

There are in general two views on the choice over where to give birth. The first view is that this is a choice managed by the obstetricians, having support in professional codes of conduct supported by science as well as a long-term quality of the obstetrics in the country. The second view is that birth is a highly personal, emotion-loaded practice where the bodily and emotional integrity of women should be both supported and followed as the primary indicator of the birthing process. This indicator is at the same time seen as the core of the expertise. This second view is advanced by midwives homebirth activists grouped in various nonprofits as well as by some legal advisory. In a nutshell, we see interplays of science and ignorance on both sides of the debate and we are interested in the specific relations between both concepts. Both groups see their proposition as science-based and we focus on the way science is interrelated with individual experience. We argue through this case for a need of furthering the concept of expertise as a dynamic area where fact-based information interacts with emotional context of these facts.

Breaking the Patriarchal Hegemony and a Shift to 'Gender-Neutral Language' in Indian Advertisements- a Real Bold Step?

Language in India as both a 'cultural practice' and 'cultural representation' not only mediates our knowledge of the world and carries on our lives and relationships but also is central in crafting our identities including gendered identity. It has long been noted that gender is continually constructed, reconstructed and represented in diverse forms of media such as advertising, women's magazines, films and soap operas primarily through language. Moreover, language used in Indian media has often portrayed gender stereotypes and supported gender violence, which is not identified and addressed offensive because of the prevailing 'culture of silence' ideology. Commercial advertisements have mostly portrayed women and girls as objects or more specifically 'sex objects', which is further accentuated by the use of gendered language, found in the captions and jingles of these ads. However, with recent developments of gender-neutral language and behaviour, the attitudes of the ad makers have questioned the hegemony of patriarchal thoughts. Language is nowadays used not for projecting and promoting gender bias but also for resisting actions and behaviours that support gender violence. Given this backdrop, this paper attempts to focus linguistically on ten television advertisements of recent times that portray society's changing attitude to the normative expectations of women and men. Thus with the help of in-depth content analysis of advertisements of Ariel detergent, Nirma washing powder, Airtel mobile network, Tanishq jewellery, Vogue Empower, Havells Home Appliances, Horlicks health drink, Reebok shoes, Nihar Hair Oil, Hamam Body soap the researcher has aimed to bring into light how language is now upholding the essence of 'degendering'. Hence, detailed discussion regarding the transformation

in the world of advertisements in today's fast-paced globalized era will emphasize how media in general and advertisements in particular serve as a tool to prevent gender violence in 21st century India.

Parenting, Language Development & Everyday Life Experiences of Children: An Account of Intersectional Inequality in Kolkata

The age-old proverb that a whole community is required to raise a child is somehow best reflected and supported by the practice of parenting. Parent-child relationship is not only the most beautiful and intense one, but it also confers upon the parents the everyday responsibility of ensuring a healthy and favourable environment for the child's overall development. It is commonly believed that linguistic development of children is as much important as sensory awareness and fine motor skills are. Learning language during the early years not only facilitate a child to communicate and socialize but also enable them to participate in cultural learning as well as in crafting their identity. What children observe and experience in everyday life from their parents, have immense impact on them throughout their life. But unfortunately, these everyday life experiences including the linguistic usage of children as well as their parents are not universal, homogeneous and identical. Among others, this particular position is also supported by Basil Bernstein (1971) notable educationist and sociolinguist. Realistically speaking, there are numerous intersectional inequalities in the experiences of children's linguistic acquisition and development. Given this backdrop, through in-depth qualitative interviewing of twenty children, ten from urban slums of Kolkata and ten from non-slum areas of Kolkata aged 8-15 years and respectively their twenty parents, this paper attempts to explore how differential and unequal socio-cultural environment of children and their parents intersect with other social forces like locality, education, occupation, income, gender etc. and influence the process of language learning and its usage in everyday life.

Environment and New Tourism

Title : ENVIRONMENT AND NEW TOURISM

Changes in lifestyles, in search for different experiences and adventures have paved way to a new kind of tourism i.e. "New Tourism". In order to meet the expectations of the 'new traveler' new frontiers which are different from the traditionally perceived are evolving these days. 'New tourists' are environmentally sensitive, respectful towards culture of the host and learn from experiences at the destination. They are no more inactive guests who are mere spectators. They equally participate in the activities involved at the tourist destinations. They resort to sustainable tourist practices that are economically viable and socially responsible. Tourism often brings with it environmental degradation and new tourism tries to overcome such challenges. New tourism aims at engaging both tourist and host promote sustainability. It aims that technologies and measures used are environmentally sounder. Need for more experienced tourists, use of ecological materials, installation of renewable sources of energy, etc. are some of the issues being addressed in this 'new' kind of tourism. Hence, my paper is an attempt to describe issues of 'new tourism' from environmental and sociological perspective.

Key words: New tourism, sustainable, new traveler, environment

Preparing for ISA'S 75TH Anniversary – Revisiting 'a Brief History of the ISA'

Jennifer Platt's 'A Brief History of the ISA 1948-1997' (1998, Montreal, ISA) provides a meticulous and detailed analysis of the organizational, administrative and geopolitical dimensions of ISA's foundation and transformations over its first half a century. Professor Platt concluded her publication: "It is not easy to evaluate ISA's success in promoting the internationalisation of sociology.... The conception of its mission has changed from the diffusion of Western sociology to one which recognizes the value of work in other traditions: concomitantly the emphasis has shifted away from the Cold War divide as one key bridge…. It remains to be seen how the ISA will develop over its second 50 years." (Platt, 1998, 56-57)

The paper will examine each area raised in Prof. Plattt's publication, observing changes and continuities with regards: organization, membership, activities, administration and finance, membership, gender, nationality, migration and identity. The empirical base to this paper will be built up by updating the ten statistical tables and two lists in the appendices of Prof. Platt's publication, supplemented by interviews and a literature review. With regards the key question left open by Platt – internationalization - the paper will detail trends, and examine policies and initiatives adopted by ISA, especially those related to opening up

space for the global South. Additionally the paper will raise questions around ISA's openness to disciplines and themes external to the sociological tradition, as well as the connection to the wider movement of ideas.

This author of this proposal has accepted current ISA president Sari Hanafi's invitation to bring up-to-date Professor Platt's report for the World Sociology Conference in Melbourne in 2022, and wagers that the final result will be much enriched through opening up a dialogue with specialists from the research committee on the history of sociology, and those present at the session.

DWYER, TOM* (University of Campinas, Brazil)

Southern Meets Northern Sociology: Contributions from the Sociology of Youth in the Brics Countries.

Rather than postulate "Southern Epistemologies" the "Handbook of the Sociology of Youth in the BRICS Countries", 2018 (Singapore, World Scientific) is the product of some new 'sociological practices' in the South. Organized by the sociological associations of Brazil, Russia, India China and South Africa, it examines 40% of the World's youth in some 1,100 pages. It provides a bridge to and a counterpoint for 'Northern sociology' based on approximately 10% of humanity. (Connell, 2007) The handbook has three objectives: to allow sociologists in the BRICS countries to develop better understanding of each others' societies and youth sociologies, to contribute to making youth sociology more universal and to theory development.

Each of the four questions posed in the timely 'call for papers' will be examined closely. First the use, throughout the handbook, of theories and methodologies originally developed in the North permits dialogue. Common issues related to development theory, or to post-industrialism - where the use of the Internet demonstrates various isomorphic features - emerge. Other notions, like school-to-work transition, or Erikson's moratorium may not. Second, sociologists in countries ruled (say) by authoritarian regimes, or involved in national liberation struggles, work under a range of constraints and taboos under-appreciated in the older democracies. Third, northern journals, publishing houses and data bases may be accused of barring scientific progress because of the way they treat issues that lie outside 'Northern perspectives'. Fourth, research projects that involve North-South collaboration may hide different objectives, e.g. to train Southern sociologists in Northern theories. Such efforts are often asymmetrical, since the South has extremely limited resources to do the reverse.

The paper concludes by suggesting the wider adoption of a model of scientific cooperation based in BRICS principles: sovereignty, equality and win-win, which lies at the base of the BRICS youth sociology handbook.

Expressions of Piety to Our Lady of Penafrancia

The Philippines is currently preparing its 500 years of Christianity in 2020. This fact is marked by various faith expressions that in the long run has intertwined with our unique Filipino culture most especially in our expression of popular piety and devotion. This paper on explores distinct expressions of popular piety to the Blessed Virgin Mary under the title Our Lady of Penafrancia. Specifically, it will look into how the devotees express their devotion through symbols that emerged in the passing of time. It also explores how their expressions of piety are able to exemplify signs of discipleship and how the original, distinct or unique traditions of this devotion preserved, enhanced and renewed through the years.

Understanding Chaplaincy in the Service of the Local Government Units in the Philippines

Chaplains are identified as a spiritual representative attached to either a religious or secular institutions. While chaplaincy has been traditionally linked with clergymen who are representative of the Christian faith, the term chaplaincy is now used for individuals from any faith, even lay. They may or may not be certified, with theological background, ordained or commissioned by particular denomination. . This paper explores the ministry of the accredited chaplains that services local government units in the Philippines and the impact it brings to the government workers who are dispensing services to the people. Here, I am hypothesizing that chaplaincy services rendered by the organization provides valuable contribution to the integrity which is understood as 'wholeness' or completeness, as consistency and coherence of principles of values in government service. In the conduct of interview, indicators derived from Republic Act No. 6713 shall be the basis for assessing the impact. FGDs to chaplains and representative of LGUs in the data gathering will also be conducted.

Relations of Paid Domestic Work in Brazil

The focus of our study (still under development) is to analyze domestic employment relationships in Brazil and Porto Alegre Metropolitan Region. The main objective is to understand how the daily relationship between employers and domestic workers occurs after the large legislative and socioeconomic changes that occurred in the last decade, trying to answer if recent changes that affected the category of domestic workers were able to produce changes in those relationships. Therefore, from an analysis of the literature on the subject, as well as the relevant legislation, we analyze the evolution of domestic work relations and how they develop in a society as hierarchical as the Brazilian one. Quantitative data (PNADs-IBGE) will be analyzed in order to understand the domestic employment situation in Brazil in the last decade; while a qualitative study, conducted through semi-structured interviews, will allow an in-depth analysis of the relationship between housemaids and domestic employers in the Porto Alegre Metropolitan Region.

The City of Porto Alegre, a Proposal for Ethnographic Research in Digital Networks

This paper presents the theoretical and methodological project developed in the research bank Image Bank and Visual Effects (BIEV), for the anthropological understanding of the spatiotemporal arrangements of the inhabitants social life in the urban context. Based on an ethnography of the duration we deal with the collective memories of the city dwellers in the context of the capital of Rio Grande

do Sul, Porto Alegre (RS, Brazil). We present the collections of ethnographic images that represent the layers of time that cross the forms of Porto Alegre urban culture.

The research aims to structure ethnographic collections on two bases: one fixed and one on the internet. Both based on the construction of internal ties between their sources of varied nature (video, photo, text and sound), according to an internal coherence between them and with access to the source collection.

The study of urban spaces brings us to the variables time and duration. At this particular point we must problematize them from the point of view of the urban narrators, the anthropologist in the figure of the narrator, and the inhabitants who are guardians of memory in their living and dynamic features.

This project https://www.ufrgs.br/biev/ is developed at the Social Anthropology Laboratory, Pos Graduate Program in Social Anthropology / UFRGS since 1997.

The procedures of documentary treatment adopted were inspired by the convergence method developed in the studies of anthropology of the imaginary (DURAND, 1984) from the adoption of figurative structuralism (DURAND, 1979), Simmelian formism (SIMMEL, 1984) and configurational sociology (ELIAS, 1990).

The consultation interface is part of a collection of images of the city of Porto Alegre at different times, activated by the user according to the choice of theme and sub-themes, which generates some possible relationships between sets of documents.

The Liberal Script Under Pressure: The Broken Promise of Meritocracy?

Findings of a Qualitative Inquire Regarding the German Middle Class

The basis of an open, liberal society can be found in the free development of the individual, which enables a free political, economic and social order. The central drive of capitalist societies is the economy; accordingly, labor is the central mode of social integration. Further assuming that Self-narratives as well es life-scripts function as individual normative justifications and imply societal shared accountings: achievement is one of the fundamental societal norms to justify social status and positions, while fulfilling the central principles of liberal market societies: autonomy and individualization (Merton 1968). Early studies by Fromm, Riesman and Marcuse, among others, have already emphasized features of an ego-focus, an inclination to narcissism and market orientation that were established from the 19th to the 20th century. Recent studies on the 'enterprising self' (Rose 1999) also show these tendencies.

The empirical investigation of this paper is based on 60 autobiographical interviews with members of the german middle class. The results showing a stability of acceptance of meritocracy and the promise of social advancement. At the same time, there are some irritations, which were discussed in two theses: First, as the new conformity and retraditionalization of the middle class. Second, as a disappointed promise of the meritocratic principle

At the same time, the study was unable to find any evidence of a de facto fear of relegation or of precariousness among German members of the middle class. What the empirical findings rather reveal is a meaningful emptying and disappointment of the social promise of performance and advancement. The biographical narratives show injuries that question the entire subject in a meaningful way. Thus far more than the health (exhaustion) of individuals is at stake, but rather the central social integration mechanism or the liberal script as a result of the change in work and economy.

The Practice, Strategies and Boundaries of Method Making in Qualitative Social Science Research on Social Inequality: A Comparative Analysis of Discourse Production in English- and German-Speaking Journals Since 1995 to 2018

The Practice, Strategies and Boundaries of method making in qualitative social science Research on Social Inequality: A Comparative Analysis of Discourse production in English- and German-speaking journals since 1995 to 2018
Falk Eckert (*falk.eckert@isf-muenchen.de*) and Laura Behrmann (*Behrmann@dzhw.eu*)

As well as cultural diversity across and beyond national borders and boundaries is researched and discussed it is to ask how qualitative research as discursive practice is presented in social science journals and how this is bound to different research cultures.

Scientific writing is a materialized discursive practice and part of a discourse-formation which (re)produces procedures as well as quality criteria of qualitative research. This paper focuses on the practices of presentation of qualitative inquiry in social science journals as social scientific practices.

We propose that the production of discourses justifying qualitative social science research is a scientific practice as such distinct independent from doing research itself. In a meta-analysis of articles in highly ranked sociological journals from 1995 to 2018 we compare the discursive practices and strategies of presenting qualitative inquiries on social inequality published in journals printed in English or German. How do researchers present their selection of studied object, research design, and their applied methods? How are techniques and procedures presented, reflected, and justified in the written publication?

Our comparison reveals specific commonalities and differences between the English- and German-speaking communities regarding the representation of qualitative research and the sociological production of knowledge: Statements and arguments in the articles offer insights into the stabilization and justification of qualitative inquiry of research practices. On the other hand, this perspective and systematized qualitative research illustrates which ideas and conceptions of inequality dominate sociological research and may contribute to their peculiar character of the unintended reproduction and strengthening of Images of Inequality, but also justify (social) Inequality.

OKOGBO, AWOLOYE* (Ambrose Alli University, Ekpoma, Edo State, Nigeria, West Africa., Nigeria)

Gender Inequality in RURAL Areas: Institutional Practices That Perpetuate Them and Their Ever Persistent Challenge.

Generally, gender inequality is a pervasive and protracted problem between sexes for ages. It is even more vicious and visible in the rural communities; it is against this background that this study wants to examine the influence of institutional practices in exacerbating gender inequality. This study is on mixed methods of data collection. From our findings we discovered that there is an unequal condition for the women realizing their full human rights and potentials. They are unable to contribute equally to national, political, economic and cultural development with results that are skewed to the advantage of men within the society which help to shape the gender roles that are peculiar to women. It is recommended that male dominance in decision-making positions should be put in check and women should be given gender roles that require more assertions rather than roles that are considered mainly supportive.

Discourses Come and Go: Methodological Reflections in Studying a Sociological Department during a 75 Years of Existence

Discourses come and go: Methodological reflections in studying a sociological department during a 75 years of existence
A history of an academic department is often written when the department is undergoing a jubilee. But how does one write such a history of a sociological department? Can it simply be a celebratory history or does the discipline in itself raise the standards as it harbours so much organizational knowledge? What does the sociological historian do with the scandals and affairs? Shall only the famous researchers, the popular courses and the successful research projects be mentioned? Can a facts-only history be a way of saving the sociological historian from taking difficult decisions on what to tell and what not to tell? Apart from that problem, what about the changes in discourses governing the research? Can a periodization of ways of thinking during different times illustrate the intellectual history of the department? Questions such as these are discussed in connection with a project to write a history of a specific sociological department.

Epidemics, Health Risks and Social Inequality;

A Sociological Approach to the Covid19 Pandemic in Moroccan Society

The health risks of the Covid 19 pandemic poses to the contemporary state a set of issues concerning citizenship and public affairs management. Also, these risks concern the repercussions on social inequalities regarding education, health and work. Human kind is facing now a new epidemic, disrupting all social, economic, political and cultural structures and institutions with different degrees.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

Although this epidemic has harmed all individuals and groups, their social system and lifestyle, their enjoyment of relationships intimacy, it has equally re-posed deep questions once again concerning coexistence.

At this stage, we seek to shed light on the Moroccan experience in its management of this epidemic, not only in terms of monitoring and description, but also in terms of the sociological approach adopted. We rethink the same experience with questions and concepts related to epidemiological analysis, social inequalities and health risks. In this regard, our article deals with the connections between the reality of poverty, fragility and social exclusion in the Moroccan society, and the consequences of the Cov19 pandemic, which redistributed health risks according to the logic of social inequality distribution.

ELALAOUI, CHARIF* (, France)

Le Rond-Point, Un Répertoire d'Action Novateur ?

L'année 2018 a été marquée par l'émergence d'un mouvement social d'une grande ampleur, renvoyant à l'histoire profonde des mobilisations collectives en France. Inédit dans ses caractéristiques sociologiques, sa radicalité, et ses répertoires d'action, le mouvement des gilets jaunes pose des défis de taille aux sciences sociales. Si le mouvement recourt à des répertoires d'action plus au moins classiques : *rassemblements, manifestations, publications de tracts* (Tilly, 2015, p.208), l'occupation des ronds-points, se révèle d'une grande originalité. Central dans la mobilisation des gilets jaunes, le rond-point est un espace géographique permettant de mener des actions de blocages, de communiquer avec les automobilistes pour les convaincre de rejoindre le mouvement, de récolter des fonds à travers des caisses de soutien, de construire des lieux de résistance *et* de rencontre, mais également un espace social de subjectivation collective dans lequel les individus se socialisent, incorporant des schèmes de perception et des dispositifs qui auront des « conséquences biographiques » (Fillieule, Mathieu, Péchu, 2009, p.90) sur leurs trajectoires de vie. Surgit dès lors quelques questionnements : comment les *gilets-jaunes* se créent-ils une identité collective, centrée autour de l'action sur le rond-point ? Comment se créent-ils ce socle commun qui permet une action déterminée, malgré les idéologies politiques opposées ? Comment les individus se socialisent et construisent une identité politique à travers ce répertoire d'action ? Et enfin, le rond-point serait-il le nom d'un nouvel espace pour désactiver la politique conventionnelle ?

Pour développer notre propos, nous nous appuierons sur des observations ethnographiques effectuées par nous-même depuis le 17 novembre dans l'aire urbaine caennaise ; mais aussi sur des questionnaires passés avec un groupe de recherche caennais en liens avec un collectif national ; et enfin des éléments issus des entretiens avec des acteurs et actrices de ce mouvement seront mobilisés pour étayer nos questions.

ELBERT, RODOLFO* (Instituto de Investigaciones Gino Germani, Universidad de Buenos Aires, Argentina)

Organizing across the Informality Frontier: Unions, Neighborhoods and Class in Buenos Aires (Argentina)

Recent Argentine history shows that since 2003 the labor movement became increasingly relevant due to protests organized by unionized formal workers. As part of the revitalization of labor, activism in some industrial enterprises of the Northern Gran Buenos Aires had been led by grassroots democratic unions: left-leaning unions developed strategies to unify the struggles of formal industrial workers with the livelihood struggles of the urban poor. This paper presents an in-depth study of some of those strategies and compares them to the exclusionary strategies of traditional unions that reinforced the divisions of the working class. This paper explores these contrasting strategies and reflects on the implications of the comparison to inform theoretical debates about the class position of informal workers.

RC02-31.3

ELBERT, RODOLFO* (Instituto de Investigaciones Gino Germani, Universidad de Buenos Aires, Argentina)

The Legacy of Erik Olin Wright´s Class Analysis for Latin America: A Marxist Explanation to the Class Location of Informal Workers.

Latin American labor markets are characterized by comparatively high levels of labor informality. Some authors consider that informality constitutes a class cleavage that separates formal and informal workers. In this paper, I use Erik Olin Wright´s legacy of class analysis to challenge the idea that the contrast between different groups of workers has the conceptual status of a class cleavage. Form Wright´s perspective, informal (and precarious) workers can be considered as significant segments of the working class, but they do not constitute a new class because they share an objective material interest with formal workers (i.e. all groups of workers are exploited and dominated in production). I use the basic class schema proposed by Wright (1997) and treat informality as adding complexity to class relations at a subsidiary level through temporal and mediated class locations. In particular, I determine the type of informality regime that exists in contemporary Argentina through the study of interconnections between formal and informal workers at the level of family formation and in the job trajectory of workers. Data shows the prevalence of a lived experience across the informality boundary among both type of workers. In addition, I explore the effect of different type of job trajectories on the class self-identification of workers. In order to answer my research questions I use data from a survey study applied to a probability sample of the population (ages 25-65) of the Metropolitan Area of Buenos Aires in 2015. The study was conducted by the research team of the "Programa de Investigación sobre Análisis de Clases Sociales", that I co-direct at the Instituto de Investigaciones Gino Germani (Universidad de Buenos Aires)

Families across Borders: Intergenerational Relations in Migrant `s Families

Considering the size of Latvia's population, which hardly reaches the two millions mark, the significant drop of population during the past decade driven by emigration poses a serious challenge. Latvia is one of the typical 'sending countries' in Europe, and since year 2000 about 10% of it's population has emigrated.

Recent trends indicate that families from Latvia are more likely to emigrate with their children. Less are families that are emigrating with their parents, even though studies have shown that the link with the relatives in Latvia is still strong. The family is not just an economic resource or emotional support; it is one of the foundations that allows us to carry on the language, the values, the cultural traditions. According to life story interviews with expatriates and their relatives in Latvia, as well as qualitative research data, relationships between family members play an important role in maintaining family ties, preserving language and traditions, and maintaining the link to the homeland.

This report will focus on the relations between migrants and their family members (more specifically, on migrant `s parents who are left behind in the Latvia) and what is the intergenerational link between family members living in different countries, transnational families.

In our research, we will combine quantitative survey and qualitative data (known in sociology as triangulation). Analysis is based on both qualitative biographical interviews collected in the Latvian National oral history collection according within the frame of Latvian Council of Science (LCS) grant "Narrative perspectives on intergenerational transmission of memory" (No. lzp-2018/1-0458) and quantitative data derived from large-scale web-based Latvian emigrants' surveys (n=14 068, European Social Fund grant "Latvian Emigrant Communities", 2014) and 2nd wave of longitudinal survey within the frame of LCS grant "Exploring Wellbeing and Social Integration in the Context of Liquid Migration" (No. lzp-2018/1-0042, 2019).

Alienation, Racism, and Democracy for Palestine

The central issue regarding the oppression and fate of Palestine and the Palestinian people is a long-standing one that is complicated by histories of western imperialism and colonialism. Ongoing debates have centered on how best to move forward. Less debated, although not always clear, are the oppressive conditions and violence the Palestinian people, particularly those residing in the Gaza strip or West Bank, face daily. Out paper interrogates both the racialization of the Palestinian people and the context in which their labor are both controlled and exploited under the guise of freedom and democracy. We argue that being racialized and alienated are central elements to controlling, exploiting, and oppressing Palestinians in a way that allows many people and institutions to turn a blind eye, similar to conditions of apartheid in South Africa.

Capitalism, Racism, and Trumpism: Whitelash and the Politics of Oppression

That the rising tide of fascism, headwinds of neoliberalism, or persistence of racism in the United States is institutional, systemic, and part of a long history of oppression towards various groups is not new news. The bigger question is how we got to a point in which overt manifestations of racism, sexism, faux democracy, and other forms of illegality and authoritarianism has once again become normalized. What does it mean when a sitting President claims that Mexican immigrants are rapists, criminals, and drug runners? What does it mean when a sitting President refuses to disclose his taxes to the American people, refuses to disclose whistleblower complaints, or tries to act (or lie) as if there was nothing wrong about asking foreign leaders to investigate political enemies? How did we get to a point where we (as a people) are not as outraged as we reasonably should be? In our paper, we argue that part of the explanation for Trumpism lies in his ability to fuel whitelash. The term "whitelash" is generally thought to be coined by CNN commentator Van Jones who, in response to the surprising result of Trump's win in the election, remarked that Trump's victory was fueled, in some part, by a backlash against the perception of a changing country that would aim to promote more diversity. We define whitelash as individual, institutional, or structural countermeasures against the dismantling of white supremacy or actions, real or imagined, that seek to remedy existing racial inequities. Whitelash, we argue, is a reaction to challenging the white status quo; it is a reaction against any progressive changes that would call out racism, question white privilege, or suggest racial equality is necessary to meet American ideals of fairness, in any of its forms.

The Deceptive Promise of the Innovation Narrative

The deceptive promise of the innovation narrative
The narration of innovation has established istself as a promise to meet the challenges of present societies. I will show how the spreading innovation imperative is based on former analyses of present societies like the „risk society" and the „knowledge society" in cultural perspective. For that I will trace the characteristics of the diagnosis of the present society as an innovation society (Knoblauch et al. 2018). Comparing the concept of knowledge implied in innovation as a narrative and cultural model of order to earlier diagnoses manifest the characteristics of an innovation society. The collective orientation towards innovation is shaped by a specific understanding of reflexivity (Reckwitz 2008: 235ff) and legitimacy of knowledge (Giddens 1984; Boltanski/Thévenot 2007).

This not only creates and enables desired solutions but simultaneously entails the same problems to be solved and overcome by innovation. Based on the example of judgements of contemporary artworks I present how the innovation narrative influences discursive legimation of art and contradictions resulting from a knowledge based decision-making-process

I argue that with an orientation towards innovation the focus on solving problems neglects the relevance of problem analysis. Further the implied concept of knowledge highlighting flexibility, versatility and processuality destabilizes reliability and validity of the knowledge. This being crucial as the production and implementation of innovations as novelties relies inevitably on ensuring their legitimacy as adäquat solutions and appropriate procedure.

Independence, Socialism, Feminism: Gendered Bodies and Affects in Catalan Pro-Independence Left

This paper explores how gender issues (feminism), are incorporated as political statements in the Catalan pro-independence left.

In doing so, their political action is connected to the social mobilizations of the 60s in United States and Europe (for civil rights, feminism, black Pride, Gay pride -now LGTB) and their scope in transforming social structures. This totalizing perspective in social action, remained stable during the Spanish Transition. In those years, public demonstrations for freedom mobilized communists, feminists, trade unions, socialists, and gay militants.

However, political gender claims and activism soon became fragmented in particular fights (feminism, LGTB...)

The case of the Catalan pro-independence far left (Esquerra Independentista EI)can be related to some Basque radical (abertzale) stances. However, the protagonism of feminism in Catalan political discourse is unique;.

They make this gender discourse visible through some strategies (communication campaigns, spokeswomen instead of spokesmen, use of the feminine genre in discourse...) that will be explored in this paper.

As in the 60s and 70s, gender, body and affects become battlefields: bodies and the way they relate to the other, knitting complicities, strategies and objectives are clearly exposed as a political tool for these groups.

ENNES, MARCELO* (Sergipe Federal University, Brazil)

The Ambivalent Character of the Immigrant Body.

The goal of this article is to reflect on the immigrant body. The study that gives origin to this article has been developed since 2013, and I have been studying immigrants in Lisbon, Madrid, and Sao Paulo City. In these cities, I have doing a direct observation on the streets of areas with a strong presence of immigrants, and I have conducted in depth interviews with immigrants from many nationalities and ethnicities. The empirical data have/has been analyzed, especially from the embodiment concept (Csordas), especially in its dialogue with the habitus and hexis notions of Bourdieu. The immigrant body are those who suffer from the immigration experience. This is the body which walks for thousands of kilometers to reach the border. It is the tired, dehydrated, creeped out and, sometimes dead body which cannot reach it's destination. The immigrant body has other dimensions. It is the visible body at the border, and at the customs and police checkpoints, or in the exit of the metro station. The Body invisible is a strategy to fight against stigma, prejudice and other forms of violence. It is also the visible, exotic and performative body that dances and parades on the fashion catwalks. The immigrant body is the one that breaks free from coercions, gender, sexuality, and aestheticism from their place of origin. However, it is also the body which must adapt to patterns of society as an attempt to become normalised.

Les Résistances à l'Accès Des Femmes Aux Postes De Pouvoir Dans Le Secteur De La Finance : Entre Spécificités Nationales Et Transversalité

Dans la plupart des pays européens, une ségrégation verticale, relative au fait que les femmes sont sous-représentées parmi les professions supérieures et d'encadrement, perdure (Eurostat 2015). Comme l'illustrent de nombreux travaux sur le « plafond de verre », les positions d'encadrement restent toujours l'apanage des hommes (Laufer 2005, Buscatto et Marry 2009). Cependant, on peut observer des variations selon les pays (Pfau-Effinger 2012, Korpi & al. 2013).

Cette communication s'appuiera sur une enquête qualitative menée dans le cadre d'un projet ANR (« Woman ») dans 4 pays européens relevant de contextes sociétaux différents (législation du marché du travail, congés parentaux, temps de travail, horaires, recours au et acceptation du temps partiel, du télétravail...) : la France, le Royaume-Uni, la Suède et la Suisse. Une centaine d'entretiens ont été menés auprès de femmes et d'hommes occupant des postes à responsabilités hiérarchiques en début de carrière, c'est-à-dire dans une période de leur vie où ils sont susceptibles de vouloir en même temps construire une carrière professionnelle et une carrière familiale et sont ainsi particulièrement exposé.es aux contraintes qui forment et perpétuent le « plafond de verre ». Nous avons ciblé le secteur de la finance où la division du travail est particulièrement prononcée, du point de vue des fonctions, des responsabilités, de la reconnaissance financière et symbolique.

Au-delà des obstacles traditionnellement évoqués pour expliquer le plafond de verre (vivier de recrutement au sein de certaines formations initiales, maternité, « auto censure » des femmes...), nous identifierons non seulement des mécanismes informels qui freinent l'avancement des carrières des femmes dans les différents contextes nationaux mais aussi des différentes stratégies individuelles adoptées pour les contourner.

Cette contribution permettra de qualifier les résistances à l'œuvre, en ce qu'elles relèvent d'un contexte sociétal spécifique, ou au contraire, dépassent les frontières et caractérisent ce segment professionnel spécifique.

EPP, ANDRÉ* (, Germany)

Triangulation of Biographical Narrative Interviews and Expert Interviews - Relations between Teachers' Biography and Their Practical Theory

In the foreground of biographical narrative interviews are especially life stories and not the acting (strategies) of pedagogies. Inverse with other interview forms information about the pedagogical acting can be captured but biographical process sequences are neglected (cf. Völter 2018). As biographical professional research operates in the conflict area between biographical and work-related (professional) sense structures it is currently discussed in what extent triangulation is able to capture biographical constitutional conditions of pedagogical professionalism.

Since it is necessary to provide information's why different research tools are combined with each other the presentation outlines the similarities and overlaps between biographical narrative interviews (cf. Schütze 1983) and expert interviews (cf. Meuser/Nagel 1991). It is justified theoretically why the combination of both interview forms makes it possible to identify biographical and work-related (professional) sense structures in practical theories.

Moreover, reasons are given how and why category and sequence analytical methods can be productive combined for analyzing the biographical constitutional conditions of pedagogical professionalism. It is illustrated and exemplary shown how with Bronfenbrenner's (1979) ecological systems theory and the narrative analysis (cf. Schütze 1983) the interview material can be analyzed. Additionally, it will be shown how methodically controlled connections between biographical and work-related (professional) sense structures can be worked out with the tools of the Grounded Theory. The methodological explanations are exemplified by a research project, which deals with the biographical genesis of practical theory structures of teachers.

Capacity Building in Asia for Resilient Education (CABARET): Engaging the Government, Academe, Business and Citizen in Early Warning System in the Philippines

The Philippines is exposed to a range of coastal hazards because of its location and nature as an archipelago. One of the major reforms of disaster risk reduction of the government tis improving its Early Warning System. The paper will dwell on the participation of the different stakeholders namely government, academe, business and citizens in gathering information, processing information and communicating information to the last mile.The paper will include review of existing policies, initiatives, and actions on EWS and coastal resilience in the country. Who are the key stakeholders and what are the factors that strengthen EWS and contribute to coastal resilience. The paper will also identify the challenges associated with these initiatives and provides recommendations on how HEIs can address some of these challenges.

The paper will present the current conditions of the EWS in a coastal city in the Philippines based on the implementation of a project entitled Capacity Building in Asia for Resilient Education (CABARET). CABARET that aims to build international and regional cooperation and partnership particularly among Higher Education Institutions in improving Early Warning System and increase resilience in selected countries in Asia.

CABARET aims to build capacity for international and regional cooperation between Higher Education Institutes (HEIs) in Asia (region 6) and Europe, and among Asian HEIs themselves, to improve Multi Hazard Early Warning (MHEW) and increase disaster resilience among coastal communities. The project is participated by five (5) countries in Asia and five (5) countries in Europe with funding support from the Erasmus +of the European Union. The project will be completed early 2020.

National Disaster Management Structure of the Philippines: Nature, Opportunities and Threats

The Philippines is one of the most disaster prone countries visited by an average of 20 typhoons, more than hundreds of volcano, experience flashfloods, earthquake and human-induced hazards. For several decades, the Philippines Disaster Risk Reduction and Management is governed by the Presidential Decree (PD) 1566 since 1976 . It was only during the year 2010 when the Philippine Government enacted Republic Act 10121 or the Philippine Disaster Risk Reduction and Management (PDRRM) Act.

The Act led to the creation of a structure from the national Disaster Risk Reduction and Management Council as the coordinating body for DRR initiatives to the local DRRM Council,. To fulfil its mandate, it developed the National DRR Framework and the National DRR Action Plan 2011 to 2018 that are largely based on the objectives of the Hyogo Framework for Action (HFA). Following the adoption of the Sendai Framework for Risk Reduction (SFDRR) in 2015, NDRRMC has conducted a number of workshops for its implementation in the country (NDRRMC, 2016). The law specifically mandates the creation of a permanent disaster risk reduction and management office in all the provinces, cities and municipalities. However, there is no present structure at the national level to oversee the operations of the local DRRMOs.

The paper will focus on the issues and challenges resulting from the implementation of the law, the creation of an DRRMOs. What are the issues resulting from this development, what are the challenges resulting from this ? How can these gaps be responded to in order to create a more resilient Philippine society. The paper will be very timely as there is a mandatory review of the national law after 10 years of implementation.

ERDAL, CIHAN* (Carleton University, Canada)

Lived Experiences, Social Imaginary, and Horizon of Expectations: Investigating Activist Youth Cultures in Europe in the 2010s

As the post-2008 movements disappeared from public view, the rise of far right, anti-democratic, racist, sexist, homophobic and climate denial politics have shaped an alternate reality in Europe towards the late 2010s (Traverso 2016; Douzinas 2017; Panitch & Gindin 2018). The relative silence of progressive youth-oriented movements as well as the rise of right-wing authoritarian politics has arguably damaged the relationship of youth with the democratic public space. My research investigates these tensions through an in-depth, qualitative study of experiences of activist youth that have been engaged in movements in the European cities of Athens, Istanbul and Paris since 2008. These cities are perceived as some of the hot-spots of youth activism contesting neoliberal and authoritarian visions in Europe in the 2010s.

Specifically, the study addresses the following questions: (i) In what ways have the rise of right-wing authoritarian politics and the ongoing ascendance of neoliberal rationalities shaped the perspectives and political subjectivities of activist youth since the 2010s? (ii) How are utopias, imaginations, expectations and desires, which carry temporal meanings within themselves, reflected in young activists' political narratives? (iii) What theoretical contributions can the concept of temporality (e.g. memory narratives and future anticipations) offer to our collective understanding of how both transnational and local characteristics have shaped activist youth identities?

The conceptual framework of this qualitative research project integrates Bourdieusian social theory (1977; 1986; 1991; 1992; 2000), hermeneutic phenomenology (Ricoeur 1984; 1992) and feminist intersectionality (May 2015). The presentation will include preliminary outcomes from my ongoing doctoral fieldwork which incorporates participant observation of youth-led activist events alongside semi-structured in-depth interviews with young activists (aged 17 to 30) in Athens, Istanbul and Paris.

The Role of European Trade Union Federations in the Access to Social Rights of Truck Drivers: The Issue of Posting in Transport Sector

European countries are facing with different problems related to mobile workers. The fragmentation of the status, profiles and experiences of mobile labour force has resulted with the necessity for trade union to adopt new strategies vis-à-vis workers' mobility. France, Germany and Belgium are the top countries that receive most cases of posting coming from Eastern Europe. Although there are rules and regulations related to posting, the problem of visas, residence and work permits and the working and living conditions of these workers remain unsolved. The social dumping becomes a crucial issue in the European Union member

states. Thus, this paper aims to study the trade unions' strategies about the issue of posting and social rights. How do the trade unions implement strategies and programs in order to assure the access of these workers on mobility to social rights and the European welfare system.

We'll analyse the strategies of European Transport Workers' Federation and its relations to the European Trade Union Confederation, the European parliament, the European Commission and the trade unions of transport sector on national levels in France, Belgium and Germany. How does posting create a new working environment, a mobile workplace? How do new digital technologies (applications to control via GPS the location of the truck driver, online systems to register working hours etc.) propose to the employers' and work inspectors new possibilities to control and regulate posting in Europe.

Based on the fieldwork (interviews, legal regulations, statistics, observations) conducted during 2018-2019 in Belgium, France and Germany, this presentation proposes a general view to the issue of posting of workers in the transport sector, mobile work by its nature.

O'NEILL, MARGARET (University College Cork, Ireland)

PAR: Challenging the Exclusion of Migrant Families in the UK

In this presentation we share research findings from our collaborative research project (http://fass.open.ac.uk/research/projects/pasar) 'PASAR: Participatory Arts and Social Action in Research' which combines participatory action research methods of participatory theatre and walking methods in order to understand the way in which racialized migrant women challenge their exclusion and subjugation in the context of the UK. The situation of migrant families in the UK is currently characterized by the 'hostile environment' policies. This policy 'is a sprawling web of immigration controls embedded in the heart of our public services and communities. The Government requires employers, landlords, private sector workers, NHS staff and other public servants to check a person's immigration status before they can offer them a job, housing, healthcare or other support.' (Liberty 2018:5). Migrant families are cast as outsiders to citizenship, challenging the social and cultural cohesion of the nation. Indeed, UK immigration policies render it difficult for migrant families to secure their social and economic reproduction. Against this backdrop, the research explores how racialized migrant families develop their subjugated knowledges to claim belonging and participate in the society they live in. In this presentation, we share the key methodological findings, challenges and benefits of working with a PAR approach for co-producing transformatory knowledge with migrant families and advocacy organizations. We reflect on the transformatory potential of these methods for research, but also how we can use these methods to develop a transformatory citizenship practice together with research participants.

Confessional Labor Ethics and Economic Activity of Migrants

M.Weber showed, making an example of the Protestantism ethic doctrine, how a religion may influence the economic activity of a human being.

In modern social science theoretical principles of the concept of Socioeconomics, the New Economic Sociology and the Path Dependence theory may serve as a methodological basis for analyzing the relationship between religion and economic activity of migrants and specifics of ethnic entrepreneurship.

Socioeconomics (Amitai Etzioni) assumes the multiplicity of economic motivation factors, which comprises not only utility components but also cultural values, faith, customs, etc.

The key idea of the New Economic Sociology (NES) is the structural embeddedness of an economic action (M. Granovetter). Representatives of the sociocultural NES branch state that there are also other types of embeddedness: political, cognitive and cultural and religious embeddedness. Culture and religion form, preserve and translate the basic values of economic activity and set limits of economic rationality.

Representatives of the contemporary institutionalism, who are developing the Path Dependence theory (D. North, P. David, B. Arthur), note the need to take into account the specifics of historical development and national cultural and religious traditions of economic activity for the analysis of economic institutions in modern societies.

In the light of these theories it seems reasonable to carry out a comparative analysis of labor ethics of key religious confessions. This matter becomes especially relevant due to the increasing migration flows from the countries of the Islamic world to the countries having a traditional Christian culture, and the need to develop a productive system of measures to introduce migrants into new economic contexts, based on Christian religious traditions. These theoretical approaches can be used also for analyzing the transformation of the business culture of the host countries under the influence of the labor ethics of Islam.

Symbolic Meaning of Money: Psychoanalytic Approach

Throughout all the history of scientific thought there were various explanations of the origin and functions of money. For instance, some researchers considered the functions of money by analogy to the biological phenomena (as blood circulation vitalises the body, so money circulation animates the economic mechanism), or compared money to human speech as a means of communication.

An original culturological explanation of money was proposed by S.Freud. In the analysis of such character trait as miserliness and related "money complex", Freud comes to conclusion that in ancient cultures, in myths, in superstitious customs, in the unconscious mind, in dreams and in psychoneuroses' conditions, there is a close association between money and sewage. Freud explains an identification of money with sewage by the psychological contrast feeling between the most precious object and devalued things considered as "wastes".

In contemporary psychoanalysis Alexander Lowen (Lowen, 1965) believes that the Freudian analysis is rooted far back in history when in agriculture human and animal excrement were the most effective fertilizer representing real wealth. That is why later on people came to identify, in their mind, excrement with gold and money. Later, some other researchers used psychoanalytical accounts of money in the tradition of Freud (e.g., Doyle, 1992; Doyle and Youn, 1999; Warner, 1989) and investigated the psychological and sociocultural fundamentals of monetary relations (e.g., Furnham, 1984, 1998, 1999; Tang, 1992; Coleman, 1992; Zelizer, 1994, 2010).

The psychoanalytic interpretation of money highlights the nature, the symbolic and axiological meaning of money and could certainly be useful to study the influence of the institution of money on other socio-economic institutions and the relationships between and within social groups in various spheres of society (politics, economics, law, religion, etc.), which in turn will expand the boundaries of sociological analysis of social networks in the modern world.

Social Roles and Psychological Distress: The Intersections of Race/Ethnicity and Gender in the U.S.

The influence of social roles (e.g., parent, employee, spouse) on psychological well-being has long been of interest to mental health scholars. Contemporary shifts in the social roles that women occupy and in the ethnic composition of the U.S. necessitate a re-examination of how social roles impact U.S. women's mental health. Guided by social role theory and the intersectionality framework, this study uses the Collaborative Psychiatric Epidemiology Surveys (CPES) (N=7370) to assess the extent to which role number and role type affect psychological distress among Non-Latina White, African American, Afro-Caribbean, Mexican, Cuban, Puerto Rican, Chinese, Filipino, and Vietnamese Americans. Results reveal variegated psychological effects of social role engagement across ethnic groups. On one hand, role accumulation is psychologically beneficial for White, African American, Puerto Rican, and Chinese women. On the other hand, the psychological benefits of social roles diminish after accumulating three social roles for Cuban, Mexican, and Filipino women. We discuss implications for research on social roles, gender, and ethnicity.

Parental Influence on Young Adults' Career Expectations: Insecure before the Occupational Career Has Even Started?

In the process of transition to adulthood, young adults face various challenges and insecurities in different life domains. In particular, the transition from school to work has to be characterized as a challenging and uncertain period. This pa-

per asks to what extent parents influence young adults' career expectations (perceived likelihood of taking a paid job, becoming unemployed, being professionally successful and getting ahead later in life).

It tests three different theoretical models. First, referring to status transmission processes the extent to which young adults worry about their occupational career is expected to depend on their parents' socioeconomic position as the latter shapes the opportunity structure for their children. The second mechanism refers to socialization processes: Parents are children's initial work role models and as shown by earlier research, vocationally relevant orientations (e.g. work values) are transmitted from parents to children. Likewise parental self-perceived job insecurity is expected to influence young adults' career expectations. Third, supportive parenting may affect children's personality (e.g. locus of control), which in turn decreases the extent to which young adults worry about their occupational career.

Using the longitudinal data of the German Socio-Economic Panel (SOEP: 2000-2017) the paper examines parents' influence on young adults' career expectations at three different time points: before, upon and after the school to work transition. This specific setup allows to test whether parents' influence diminish, maintain or increase over time as young adults enter the labor market and make their own work experiences. Preliminary results reveal that parents influence young adults' career expectations over and above status transmission processes and hence, beyond objective labor market opportunities. As expected parental self-perceived job insecurities are transmitted to their children and negatively shape their occupational prospects. Furthermore, supportive parenting foster the formation of internal locus of control, which results in more optimistic career expectations.

ESCOTO CASTILLO, ANA* (National Autonomous University of México, Mexico)

First Job Transition in Mexico: A View from Short-Term Trajectories (2005-2018)

First job transition of young people has great importance in Mexico; for several Mexicans, this is their first passage to adulthood. Although the expansion of education has delayed this transition, a large part of the working population is young, in a context of low wages and precarious working conditions. Hence, studying the insertion of young people and their evolution over time becomes essential, especially in the context of changes in the last decades of the meaning of been young.

The National Occupation and Employment Survey, since 2005 has provided information in Mexico on short-term trajectories, following individuals for five quarters. With this information, this research uses a set of 54 panels of short-term paths with five states. Previous studies have shown that Mexico has high levels of labor mobility, even when the insertion scope has such short periods. This oral presentation aims to examine how young Mexicans transit to their first job, and how short-term trajectories are built from this transition (or the lack of it).

Sequences for the five states of each individual develops from following 221,106 young people (15-29 years) that reports no experience ever in a job in the first interview since 2005Q1 to 2018Q2. Then, insertion analytical groups describe these sequences in the middle run. Comparative analysis from the groups over time allows modeling trajectories profiles, using a pooled multinomial logit regression for the probability of membership group.

Preliminary results show that the first job transition is not successful. When young persons get the first job, around 60% of the cases do it in an unstable trajectory, only about 25% do it in a stable trajectory. Unsuccess insertion trajectory had a positive year marginal effect from 2009 to 2016. Being a woman or a spouse and being attending school have associated with not-availability and unsuccess trajectories.

Spread of Hiv/Aids As a Result of the Cultural Imbalance: Women Economic Inequality

This paper aims to examine the delicate links that exist between cultural practices and beliefs and the high prevalence rate of HIV/AIDS in Benin City. It investigates the undemonstrative links that exists between cultural practices and beliefs and the high occurrence rate of HIV/AIDS in Benin City. It also examined the cultural practices that manipulate risky sexual behavior of men in Benin City that can led to women HIV/AIDS prevalence rate, that further affects their economic inequality.

The study utilized the questionnaire as the major method of data gathering instrument, along with interview as a complementary instrument to obtain more information in some cases among patients in University of Benin Teaching Hospital, Benin city, Nigeria. The study shows that cultural practice of man's philandering is often tacitly tolerated thereby making the women to be susceptible to the contraction of the virus from them. The study utilized the social action theory. The study established that it is obligatory for a woman to remain faithful to her spouse despite the man's unfaithfulness to the marital vows and his heath status, which has resulted in further economic inequalities for Nigerian women.

The study recommends Cultural traditions and practices which promote high infectivity or risky sexual partnership patterns that need to be transformed, particularly the social acceptability of multiple partnerships for men with no responsibility for health consequences. That Prevention education should always include culturally appropriate curricula and educational methods for in-school and university education.

La Elección Presidencial De 2018 y La Ruptura De Los Bloques Electorales En Yucatán

En la formación en el tiempo de la actual estructura social y política de Yucatán pueden distinguirse tres períodos de larga duración: El régimen colonial, la larga estabilidad posterior a la independencia y la confrontación política estructural a partir de la Reforma Agraria. El conjunto de las relaciones sociales locales generadas en la Colonia sobrevivió en lo fundamental las tres revoluciones en las que se fraguó el México contemporáneo, la Independencia, la Reforma y la Revolución Mexicana; sin embargo, la Reforma Agraria, rompió la relación económica básica sobre la que éstas se sostenían, la gran propiedad rural. La élite afectado, concentrada en Mérida, mantuvo en esta ciudad el control de importantes espacios económico, destacadamente el comercio, al tiempo que disponía de una amplia hegemonía social. Ésta se convertiría inmediatamente en el sustrato de su oposición política al todavía régimen de la Revolución Mexicana, y se expresaría a través del Partido Acción Nacional (PAN) en las décadas posteriores, dando lugar a la polarización social, política y eventualmente electoral que caracterizó al estado por ochenta años. En 2018, por primera vez tras esas ocho décadas, los resultados electorales acusaron la aparición de un tercer bloque en este terreno, el vinculado a Andrés Manuel López Obrador y su partido. De manera desigual entre Mérida y el resto del estado, importantes segmentos de votantes establemente vinculados al (Partido Revolucionario Institucional (PRI), principalmente, sufragaron por la coalición encabezada por MORENA (Movimiento de Regeneración Nacional), rompiendo la rutina de la larga etapa bipartidista del estado. La ponencia que se presenta analiza, con base en resultados electorales, los alcances presentes de la nueva distribución de preferencias ciudadanas y la perspectiva inmediata de su evolución.

Globalización, Cultura De Masas e Industrias Culturales: 20 Años De Producción Cultural En Chile (2000-2020)

En las últimas décadas, la producción cultural en Chile ha crecido producto de un mayor acceso a bienes y servicios culturales por parte de la población, como TV, radio, periódicos, libros y las industrias culturales y creativas en general. En el contexto latinoamericano, el país se ha convertido en un destino atractivo para la migración y a su vez, se ha visto más expuesto a las economías globales como Norteamérica, Europa y más recientemente Asia, generando procesos de hibridación cultural. El trabajo a presentar, tiene como objetivo analizar los movimientos de las industrias culturales en Chile en un periodo de 20 años, a partir de información administrativa e industrial sobre capital y trabajo en la producción cultural, así como los aspectos sociales que explican estos movimientos. Se presenta un modelo de campos y funciones en base a tres marcos de trabajo de instituciones internacionales como el marco de estadísticas culturales de UNESCO, el marco de ESSnet-CULTURE y el sistema quebequénse de clasificación (QCCACS). El trabajo se basa en investigaciones desarrolladas entre los años 2012 y 2019, apoyadas por el Ministerio de las Culturas, las Artes y el Patrimonio de Chile y busca contribuir al conocimiento sobre los procesos de producción cultural en distintos contexto de globalización.

The Stories We Tell about Flooding, Climate Patterns, and Infectious Diseases. Media Framing of a Dengue Epidemic in Peru after the Unexpected El Niño Costero of 2017

A dengue epidemic in Peru in 2017 took eighty-nine lives and directly affected about seventy thousand people. This epidemic occurred in the aftermath of an unexpected climatic event: El Niño Costero. This article examines how dengue was presented as a public health problem in two major Peruvian newspapers. It focuses on the extent to which news reporting of dengue as a matter of public concern accounted for environmental and structural factors, such as access to drinkable water, as drivers of disease and as critical areas for intervention. I coded a sample of 265 news stories on dengue as a public health issue from two major newspapers between January 1st and December 31st of 2017. In analyzing the construction of responsibility for the 2017 dengue epidemic, I find that the sample predominantly frames the flooding caused by El Niño Costero and Peru's

denotes a presenting author. Abstracts are organized by first presenting author's last name.

poorly prepared cities and public health infrastructure for this disaster as main causes for the 2017 outbreak. Yet, when differentiating frames that define the social problem from those that offer solutions, I find the management of the Aedes aegypti mosquito via fumigations and low-tech individualized solutions prevail in the frames that present solutions. In addition to this mismatch between frames, I find that those frames the target solutions ignored root causes of health inequality and environmental injustice that allow dengue to spread in the first place. This article concludes with a reflection on how the framing of solutions to the 2017 dengue epidemic speaks to the "medicalization" of public health and to a long history of disease-control programs that operated vertically, isolating health from education and social welfare.

Testing the Assumptions about Generalized Trust and Involvement in Voluntary Associations in Chile. a Cross-Cultural Perspective on Social Capital

The presentation focuses on the role of voluntary association in the production of trust and civicness. A key assumption of social capital scholars refers to the positive effect that involvement in voluntary associations has on members, politics and society. Robert Putnam stressed the role of voluntary associations on democratic outcomes in the contexts of Italy (1993) and the US (2000). Erickson (2004) argued that participation in voluntary associations is the strongest predictor of diversity in personal social networks. Also Paxton (2007) argued that membership in associations linked with another organizations strengthens the perception of generalized trust among their members. More recently, Peña-López & Sánchez-Santos (2018) found evidence that supports Paxton's hypothesis in Spain. From a cross-cultural perspective I argue that in the Latin-American context, given the pervasive influence of patron-client relations as well as the small size and social homogeneity of grassroots organizations, one should moderate the direct extrapolation of the argument to other cultural contexts. Specifically, I argue that membership or involvement in any voluntary association would have a weak if any effect on generalized trust or network diversity; positive effects would be restricted to some organizations especially those associated with causes beyond their membership. In the analysis I use data from a longitudinal survey in Chile (N=2893) to test the alleged positive effects of associations on civic life. elsoc.cl

Breaking the Cycle of Poverty: The Role of Non-Governmental Organizations in Reducing Inequalities in the Rural Eastern Cape in South Africa

The purpose of this paper is to provide insight into the role of Non-Governmental Organizations (NGOs) in uplifting the conditions of students from rural communities in the Eastern Cape in South Africa. The paper focuses on an NGO called MiVastApplication (MVA) which is an NGO that serves to reach out to matric students in the marginalized Eastern Cape so that these students can have access to post-matric opportunities. Framed within the theory of conflict and inequality, inequality is viewed as resulting from groups with power dominating less powerful groups. (Ashley Crossman, 2019). Except in this case, the legacy of the dominant groups and the continued inequalities continue to manifest. This paper asserts that one form of exploitation has replaced another and the concepts of domination as achieved through the power of ideology, thoughts, values, beliefs, worldviews, norms, and expectations (the process known as cultural hegemony) continues to dominate. Simultaneously, agency plays an equally important role in attempts to equalize the playing fields Through focused group interviews with four of the founder members, learners, teachers and members from the parent's associations, the initial study was able to provide great insight into the following aspects:
a. The contradictions between progressive policies and schooling, especially in rural areas;
b. Subtle and indirect repression;
c. The breakdown or absence of district and provincial departments;
d. The limitations of the state;
e. The role of NGOS in impacting on marginalized communities and reducing inequalities;
f. Partnerships, alliances, community involvement and the role of the elders; and
g. The use of empirical research methods.
The paper concludes by suggesting that NGOs play an important role in uplifting marginalized communities, the state has severe limitations and that members from within communities are the best agents of change.

Profiling the Development of Private Higher Education in South Africa

Around the late 1900s private higher education emerged as an "unknown" and untested area of the provision of higher education in the country. Given the dim view that the state had of the sector, it was not surprising that post 1994, the state established various sets of policy and legislative requirements to regulate the sector. Most people viewed this as largely a policing and licensing issue. In the early days, which was also a period of flux and transition, many fly-by-night institutions had fallen by the wayside for reasons of not being able to meet the requirements for registration. What emerged was a set of institutions who had been able to negotiate through the challenges and demands of the regulator, often at great expense. Currently, there are + 130 institutions, offering programmes in a range of fields and disciplines, from the Higher Certificate, the Diploma, the Degree and Postgraduate Degrees. Twenty years down the line, the private higher education sector has emerged as a strong force in the provision of higher education. Therefore, this paper aims to explore the following:
a. The policy and legislative context and its impact;
b. The number of institutions and the fields in which they dominate;
c. The student enrolment with respect to nationality, race and gender;
d. The geographical and spatial location of these institutions;
e. The typologies of institutions that can be identified; and
f. The potential contribution they make to skills development.
Having explored the above, the key issues that need further exploration relate to the relationship between the public and private higher education sector, key issues on the debate between the public good and the private good and most importantly, the role of private higher education in contributing to the developmental goals of the country.

Collaborative Governance in Socio-Ecological Systems: Procedural Justice in Artisanal Fisheries

Sustainability of the oceans requires addressing challenges of social equity. Distributive justice, which is mostly discussed, refers to the equitable distribution of benefits among the actors involved. However, mechanisms for procedural justice have been less addressed in public policy, being central to social equity. Procedural justice is understood as the structures and processes that allow actors to be included in decision-making. In Chile, as a result of the amendments made to the General Law on Fisheries and Aquaculture in 2013, the Fisheries Management Committees were established. These committees are intersectoral spaces for the administration and management of pelagic, demersal and benthic fisheries. The Fishery Management Committees provide procedures for the auto-determination of fishery management rules. Currently there are more than 30 Fisheries Management Committees located along the coast of Chile. We applied a structured decision making framework to inform the restructuring of a management plan within a committee. As a result, we identified goals, objectives and indicators, including social, economic, biological and ecological dimensions; we explored tradeoffs, assessing the relative importance of the objectives; we created scenarios and prioritized alternatives, reflecting on the interplay between self-regulation and government control. We also sutidied how participants evaluate the different components of the procedural justice, including: Selection of Agents, Setting Ground Rules, Gathering Information, Decision Structure, Appeals, Safeguards. Change Mechanisms. As a result, we found that the Management Committees are promoting an institutional transformation towards collaborative governance, strengthening the components of procedural justice in the management of socio-ecological systems. We concluded that structured decision making promotes spaces for rational analysis of alternatives costs and benefits, promoting deliberative thinking in fisheries management can improve equity, legitimacy, and sustainability of collaborative governance. Finally, this study concludes that procedural justice is a key dimension for the promotion of social equity and sustainability of fisheries

The Construction of Regional Science, Technology and Innovation Systems: Advancements and Challenges for Their Configuration in Southeast Mexico

The role of science, technology, and innovation (STI) as drivers of economic and social development is deeply rooted in contemporary societies. Consequently, developing countries are making efforts to strengthen their national STI systems. In Mexico, important progress has been made for the construction of its national STI system, which is increasingly large and diversified. Despite the advances, the development of scientific activity still shows high regional disparities that make it difficult to bring its benefits closer to local societies. To deal with this situation, the decentralization of scientific capabilities has been used as a scientific policy strategy to balance the distribution of scientific resources in the country.

In this paper, I analyze the constitution and development processes of the local STI system in Yucatan, Mexico. This state is located in the southeast region of the country, geographically far from the nerve center of Mexican scientific activity, nevertheless, it is beginning to be recognized as a regional hub of scientific and technological development. Drawing on qualitative methodology and an institutional analysis perspective, I will reconstruct the current configuration of scientific activity in Yucatan around the mechanisms that have allowed for the establishment of its scientific and technological institutions in particular disciplinary fields, and its legal frameworks and financing systems, as well as the creation of its interinstitutional coordination agencies. I will also discuss some of the challenges to achieve a balanced redistribution of scientific capabilities in developing countries, such as a suitable linkage between the local and national STI agendas, without losing sight on the global demands of the international scientific activity, and the aspiration to a scientific activity capable of identifying and meeting regional needs.

This study is part of an ongoing postdoctoral project financed by Conacyt and developed in the Faculty of Education of the Autonomous University of Yucatan.

Moral Panic, Emotions, and in-Security: The Power of Symbolic Discourse of Violence

Cohen's Moral Panic theory called attention to societal cyclical timing. Concern, hostility, consensus, disproportionality and volatility are the key features of cyclical moral panic (Goode and Ben Yehuda 1994). Additionally hate speech is a compelling feature of contemporary populism carrying persuasive symbolic violence that magnified social inequalities and exclusion. Hate speech targets with offensive labels social groups disregarded by diversity (migrants, minorities, LGBT, women) extending verbal violence to physical aggression. In light of this general frame, this contribution wishes to reflect on how the in-security is politically and socially constructed and contributes to enlarge symbolic and real violence in society. Media and social media generated waves of alarm echoed in the daily headlights, growing in number and intensity fabricating messages of urban insecurity and crime-related discourse. We wish to reflect on the habits of thinking generated by media construction of a new form of Moral Panic (Altheide, 2009; Cohen, 2002; Garland, 2008). We question how emotions develop symbolic codes, mainly cultural ways of thinking, framing emotional schemes and cognitive models that shape people's reaction to migration, diversity (sex and gender) by magnifying anxieties and fear, driving on media and social media, and constructing a public discourse of law enforcement. We address the question of why banal nationalism uses fear as a collective emotional orientation, and how, in the past 20 years, fear reflects, dominates, reshapes and reinforces different forms of national identity scapegoats. In order to highlight how routine habits are "inhabited" (Billing, 1995) in social relation we investigate how mass media information provides a context of meanings and images that prepare audiences for political decision (Altheide 2004), by adopting a pervasive communication, building symbolic awareness and expectations of danger and risk in everyday life

Istanbul's Professionals between the Local and the Global: Professional Subjectivities at Work and in Leisure

The participation of professionals in the recent wave of protests in cities like Istanbul, Cairo, Tunis, Sao Paolo and Caracas drew attention to their emergence as a social force in the Global South. How do these urban professionals form their subjectivities, what are some discourses and practices that constitute their professional selves? Studies suggest that an upper, privileged sector of professionals in these globalizing cities expresses global personalities and cosmopolitan dreams in their employment practices as well as consumption habits. My paper critically interrogates these studies by focusing on a group of professionals, who graduated from Turkey's leading universities and worked in multinational companies in Istanbul. Using participant observation and unstructured interviews with forty-five professionals, my research illustrates that this upper group of professionals occupy a paradoxical position between the local and the global as their experiences at work and in leisure distinguish them from both their fellow citizens in Turkey as well as from their counterparts in the Global North. While their work experiences structured by globalization provide these professionals with further privileges and advantages than Turkey's locally-oriented populace, my respondents also acknowledge the ways in which they suffer from worse working conditions than their counterparts in higher-income countries. Still, these professionals express global affiliations and cultural belongings to a global middle class with their everyday practices in social life. In contrast to existing studies on global personalities and cosmopolitan dreams of urban professionals in the Global South, my paper illustrates that Istanbul's professionals create new selves by balancing the tensions between their global aspirations and local identifications at work and in social life.

Politics As Imagining Future: The Political Imaginaries of Istanbul's Professionals in the Gezi Protests and Beyond

Although Erdoğan's authoritarian leadership seems to have remained intact, Turkey's 2013 Gezi protests posed challenges to the AKP regime and offered a glimpse of alternative futures. This paper addresses Gezi's alternative visions of the future by focusing on the participation and politics of Istanbul's professionals in the Gezi protests. Using semi-structured interviews with a group of highly-educated, private-sector professionals, who participated in the Gezi Park protests, I offer an analysis of how these professionals imagined alternative futures to the AKP rule. For the theoretical framework of this analysis, I connect Gramsci's notions of hegemony and conception of the world with the insights of recent works on social and political imaginaries. My analysis illustrates that this upper sector of professionals expressed political imaginaries of secular ethics, social democracy and political pluralism as alternative conceptions of the world to AKP's religious conservatism, neo-populism, and majoritarian politics, which constitute the main tenets of AKP hegemony. Moreover, these professionals supported not only individual rights and freedoms but also the institutionalization of welfare state as well as the collective rights of religious and ethnic groups in Gezi's aftermath. However, my respondents could not organize collectively to achieve these visions due to both internal dynamics and external conditions. While these professionals remained fragmented in terms of mainstream political orientations, AKP's increasing oppression caused an interruption in their political conversations and led to their disengagement from collective action.

The Construction of Disability Human Rights: The Example of the UN Convention on the Rights of Persons with Disabilities

In this presentation, we propose to shed light on how lay person in law appropriate the issues of their elaboration and reception from this example of the UN Convention on the Rights of Persons with Disabilities. This convention is emblematic by the place given to non-governmental actors in the process of drafting the text, as well as in its interpretation. How rights became mobilized by disabilities activists ? What skills do activists, citizens, lay people mobilize to justify the elaboration of a convention or its interpretation? How are service-users influenced by rights? We will show how the "language of human rights" plays a central role so that non-rights specialists can claim and participate in the development of a legal text. As a first step, we will discuss the way in which Disabled People Organizations voicing the voice of persons with disabilities have taken their place, alongside the States Parties, in the elaboration of this convention, by appropriating the language of human rights. In a second step, we will discuss how this language structures a controversy in which the question of the social function of law is more central than the question of legal legality. We will focus particularly on Article 12, on legal personality and legal capacity, which has been the subject of considerable controversy. Thirdly, in the context of an experiment carried out as part of a collaborative research program on the exercise of the rights of people with disabilities, we will show the difficulties for non-specialists in the field of law. and non-human rights activists to appropriate the language of human rights. The analyzes are based on the preparatory work of the UN convention, interviews with some actors involved, as well as a collaborative action-research experiment driven by the author.

Inequalities and Access Barriers to Health Care Services Among People Living with Disabilities in Anambra State, Nigeria

Existing evidence show that 80% of People Living with Disabilities (PLD) live in developing countries including Nigeria where more than 22 million citizens are estimated to be disabled. The high estimate of disabilities in the country is attributable to endemic preventable diseases, inadequate immunization coverage, as well as poor maternal and neo-natal care in the country. Although health care is a human right, inequalities and access barriers to health care services remain one of the major challenges among people with disabilities in Nigeria. yet, there are no known studies on inequalities and access barriers to health services care among people living with disabilities in the country. This study investigated the magnitude of social inequalities and access barriers to health care services among people living with disabilities in Anambra state, Nigeria.. This cross –sectional survey design utilized quantitative data collection instrument and multi-stage sampling technique. The sample size was 525 people living with disabilities using Cochran's sample size formula. Descriptive and inferential statistics were used to analyse the data and testing the study hypotheses. Logistic regression was used to predict the effects of the variables in the study. The findings show among others that awareness about location of health facilities was higher among the male respondents and urban dwellers have more access to health care services than rural dwellers. Furthermore, people with disabilities face barriers to health care services including physical, medical equipment, and communication. There is thus an urgent need for a comprehensive disability law in Nigeria to target expansion and free access to health care delivery services amongst people living with disabilities in Nigeria.

Rapports Aux Frontières Et Société Plurielle

Avec la mondialisation, les frontières ne e sont pas effacées comme l'a cru ses fervents défenseurs. Par contre, les rapports aussi bien aux frontières inter-étatiques qu'à celles intra-étatiques ont changé à cause de leur imperméabilité de plus en plus forte. Elles sont devenues des symboles de fracture sociale, politique, économique et culturelle tout en participant à exacerber la pluralité sociale qui commence à se développer au moment où les liens sociaux commencent à s'effilocher.

Notre analyse va essayer de repenser la construction de la solidarité sociétale (qui fait société) que les solidarités sociales contractuelles ont commencé à marginaliser. Aussi, nous allons traiter de la question de la pluralité au sein d'une société comme richesse pour cette unité garante de la solidarité sociétale, afin de relever les défis de la mondialisation et faire face aux enjeux que le populisme exacerbe.

L'objectif est de re-penser la notion de frontière comme fragilisation de cette solidarité sociétale inter-nationale qui peut répondre aux défis de la question climatiques qui reste transfrontalière et de l'arrimer à la pluralité comme diversité enrichissante afin d'échapper à la mainmise du populisme qui repose sur un savoir spontané et une mobilisation non citoyenne.

Racial Quotas in Federal Basic Education: Right to Education and Representation

Since the commitment taken up by Brazil (result of pressure and construction of social movements) upon signing the Declaration and Programme of Action of the Durban Conference (2001) against Racism, Racial Discrimination, Xenophobia and Related Intolerance, it was still a long way until the creation of one of the main affirmative actions regarding that matter: the implementation of admission quotas in the federal educational system (2012). Higher level education is a duty of the federal government. Although that law became commonly known as "Quota Law in Universities", it also comprises admission in high school (secondary school level) in the Federal Institutes of Education, Science and Technology. This bureau of the Brazilian educational system, which was originally linked to a department (Setec/MEC) separated from the department for universities (SESu/MEC), expanded widely from 2008 to 2018. It is currently made up of more than 500 units (campi) spread throughout 27 states (federal units) in various locations, which offer mainly, but not exclusively, high school level courses. Due to the Brazilian society's structural racism (ALMEIDA, 2019) and social stratification which marginalize the black population into the lower or of lesser social *status* classes (FRASER, 2006), it is a known fact that half of the black youth don't even reach secondary school education, as demonstrated in the report of the 2nd Goal Monitoring Cycle of the National Plan for Education (PNE) (2018). In that setting, this research aims to analyze how admission quotas for black people have been implemented and carried out, specifically in federal high school institutions (considered to be of excellence according to national standards), taking into account that, if black people can't have access to and succeed in high school, they risk not filling the openings available in higher education and higher *status* positions in the labour world.

FABIANI, JEAN LOUIS* (Central European University, Hungary)

A Historical s=Sociology of Teaching in the Social Sciences: The Example of the Seminar Form.

a Historical Sociology of Teaching in the Social Sciences: The Example of the Seminar Form.

Among the tools available in history of sociology, the study of pedagogical material is undoubtedly very fruitful. Today, a huge quantity of lectures are available on the Internet, allowing to develop a sociology of pedagogical styles. Resources are more limited in historical sociology, due to the predominantly oral dimension of teaching. However, there are multiple ways of grasping the most vivid aspects of pedagogical transmission, through archives, memoirs and oral history. The presentation will be based on the comparison of three legendary seminars in French intellectual history: Alexandre Kojève lecturing on Hegel during the interwar period, Raymond Aron's lectures in political sociology from the 1950s onward and Bourdieu's seminar on literary and artworks in the early 1970s. Those three examples will be confronted with an already published work on Durkheim 's lectures on pragmatism at the Sorbonne in 1913.

After having presented the main features of the seminar, i.e. the form of the pedagogical relationship, the peculiarities of oral performance and the morphology of the audience, the presentation will attempt to assess the uses of the seminar form in the development of an intellectual strategy considered as an accumulation of capital, at the national as well as the international level.

The presentation aims to shed original light on the integrative functions of the seminar as well as on the construction of an international network through invitations. The research is grounded on a preliminary analysis of the French "seminar", borrowed from German academia after the Franco-Prussian war. It shows the relative heterogeneity of seminars' attendants, mixing ambitious young Parisian scholars from elite schools and marginal individuals belonging to a lower intelligentsia, the lecturers charismatic style is analyzed as a necessary basis of group structuring and energizing.

FABIANI, JEAN LOUIS* (Central European University, Hungary)

Uneven Awareness and Climate Change

Uneven awareness and climate change

This proposal aims to explore the reasons why environmental damage and climate change are so often denied in spite of their growing evidence. The threats against natural resources and the survival of humanity are fully acknowledged. The evidence of huge risks does not necessarily lead to their identification and treatment. More than that, risks are frequently the object of pure denial. As Bruno Latour puts its "it is not as though people have not been warned, not as though the alarm systems have been angrily pulled ; no the sirens have been blazing full blast, but a virile decision has nevertheless been made not to be *inhibited* by the dangers" (*Facing Gaia*, London, Polity, 2017). Thus a majority of people choose to be *Living in Denial*, as Kari Norgaard's pioneering book title suggests (2011). Norgaard studied Norway, one of the most educated country in the world, where environmental awareness should have been higher. Paradoxically, the claims concerning the dangers of climate change come more often from the truly disadvantaged countries with the lowest level of education: the experience directly the deadly threat through their crops or cattle. This is absolutely contrary to what sociologists and political scientists said thirty years ago, when Ronald Inglehart developed his theory of post-materialist values (the least concerned are the most environmentally conscious).

However, the topic has not been sufficiently addressed in sociological terms. Although we have an array of fascinating philosophical and anthropological discussions, we lack an empirical overview of the diverse and contradictory reactions to climate change in the North and the South, but also West and East. We will try to offer a new framework for the integrated analysis of contrastive behavior about environmental risk

FABIANSSON, CHARLOTTE* (College of Arts & Education, Victoria University, Australia)

University Students' Experiences of Harassment in Teaching and Campus Settings

In this study is presented the occurrence of physical, social, and sexual harassment at university campuses and in teaching settings. The research explores how safe the university environment is for students to study and gain confidence in being young adults. The research was undertaken at an Australian university and explored violence and harassment as perceived and experienced by students (N=154) in the university environment from a societal perspective drawing from the discourses of Bourdieu, Beck, Ardent and Bauman. Contrary to expectations that the university milieu would be free from harassment and intimidation, the research shows that students had experienced severe incidents of physical, social, and sexual harassment and discrimination. Some students avoided participating in discussions and attending teaching sessions because of the harassment they had encountered. A quarter of the students reported experiencing harassment in the teaching setting at least once. A fifth of the students thought about the risk of being harassed on campuses during day time, increasing to nearly half of the students during evening time. The finding accentuates concerns among students of possible harassment, particularly when the settings change from day to evening; hence, awareness of harassment as a possible risk factor was always lingering on the students' minds.

HIV Self-Testing Among Young People in Brazil: A Qualitative Study of Acceptability and Preferences

In 2017, HIV self-testing (HIVST) was authorized in Brazil. We explore acceptability and preferences regarding HIVST among young people (16–24 years) in three Brazilian cities. Seven focus groups were conducted, with 66 participants: (1) young, heterosexual women and men, and (2) young men who have sex with other men. Acceptability was high: if offered the self-test, participants would use it. Preferences for HIVST related to perceived privacy, ease of use, and speed (compared to standard HIV tests at health facilities or laboratories). Participants preferred to obtain an HIVST kit at a pharmacy, and they would be willing to spend US$ 6.50–13.00 per kit. After self-testing, instead of being contacted by health services, participants expressed a preference to receive information on next steps and available health services through mobile apps, hotlines, and YouTube videos. The views of young people should be considered as part of HIV testing policy updates.

Social Mobility in a Comparative Perspective between Europe and Latin America

This communication presents a review of the analysis of social mobility in the international sphere (Europe and Latin America), with a particular focus on the partner countries of the INCASI network (Argentina, Brazil, Chile, Mexico, Uruguay, Spain, Italy, United Kingdom, Finland and France. To date, few studies have linked nations whose economic and social aspects are so dissimilar.

As is usual in the specialized literature, the relationship between social origin and class destination is addressed. This is done by noting the comparisons made across the geographical areas. We review the analyses that have been made of the evolution of social fluidity as well as the distance between social classes within each country and the comparisons made between them. We follow the antecedents of Ishida project (2008) and Ishida and Miwa (2011) advances of early and late industrialized countries.

We compare the main theories that have inspired the study of social mobility to date: modernization theory, which predicts an increase in relative mobility rates, and invariance theory, which postulates the constancy of social fluidity. Special attention is devoted to the role played by the family, the state and the market in the late industrialized countries.

We study the difficulties for social change, i.e. rising from one class to another, as well as the chances of reproduction in comparative terms. The advances in methodology, techniques, theory and data processing are highlighted.

RCII scores transformed according to the beta parameter results of each society indicates that relative mobility between classes in European countries is much more frequent than in Latin American countries. And especially it indicates that in societies such as Brazil, Chile and Argentina the mobility barriers are extraordinarily high.

The Museum As a Public Space of Visual Art: Transformations and Controversies in the Experience of the Actors

Discussions about the definition of the museum in the 21st century have generated a series of controversies about its mission and its social functions in contemporary societies. The museum appears today as a territory in dispute between definitions that think of it as a place of preservation of works and collections and others that have taken a radical turn to this conception, giving a capital importance to the public and the communities that constitute it. In the midst of this controversy we place the question about the experience of the actors in public and semi-public spaces of visual art, asking ourselves about the nature of the relationship between art museums and their communities, whether they are: teams of professionals, artists, public or mere passers-by urban space. For this we will take the case of two art museums in Santiago de Chile: the Museum of Fine Arts and the Museum of Contemporary Art, located in the center of the capital city, to answer the question of how the subjects experience, perceive, ignore or resist the changes that the museum institution is undergoing. Questions about the ways in which subjects experience and perceive these museums and their changes will consider both the institutional dimension, this is, the museums as spaces of legitimate and institutionalized art of the country, on one hand, as well as its architectural and monumental dimension, on the other hand. We will seek to understand how ideas of pleasure and entertainment are related or co-join with those of democratization and education, as well as with the old notions of contemplation (and even obligation or boredom), in the experiences of the public and the teams of/in these institutions. We expect to highlight the effects of museum institutional changes in the artistic experience of it's audiences in the contemporary Chile.

The Politics of Alliance in Farmers' Movement in India

On the 30th November 2018 tens of thousands of Indian farmers marched to the parliament and demanded a special session to discuss the deepening agrarian crisis which began over twenty years ago. While climate change and its effects on

Indian agriculture has played a role, activists and opponents of the government's agricultural policies see the Green Revolution and the transformation of Indian agriculture into large scale corporate industrial agriculture as the main reason behind India's agricultural crisis. The protest march to the parliament was only the latest in a series of protest marches which have been organised by an umbrella group of over two hundred farmers' organisations from all over India within the past year. Moreover, for the first time an alliance of different activist groups, oppositional political parties and students has cohered to support the farmers and their cause. Despite its political, empirical and theoretical significance, research on processes and mechanisms of the formation of alliances across classes, movements, organisations and political parties has gained scant attention in social movement studies. Based on original research this paper reflects on dynamics and implications of alliance building in contemporary farmers' movement in India.

Nature and Water Governance in the Internet of Things Era

The environment needs media to share his predictive knowledge with human beings who have actively breached the contract of peacefully exchanges for thousands of centuries before the distinction of object and subject among the unity of the world. Today, the fact that the most of what we call catastrophic failure in supply of water resources especially in developing countries has less to do with environmental issues than human faults in water governing directs us to a new conclusion; necessity of object-assumed nature presence in the circle of water governance through the technology of Internet of Things (IoT); the assumed media for the "Pundit Nature!". The notion of Internet of Things refers to the communication of things embedded with microchips, sensors and actuators that enable them to gather data and exchange them through the virtual networks established for sharing the information inside the things community and with human being which may bring about identities to the elements of nature in a way we've called it "minimized manipulation". Aiming to open a new window for healing the mega-crisis of water scarcity in the contemporary "risk societies", this paper presents an "ecological modernization" approach to the technology of IoT which has the ability of effecting the water governance as well as socioeconomic conditions of irrigation systems consumers towards a sustainable development in a "reflexive society". A comparative Analysis of water governance history and current situations of agriculture in the arid regions of Almeria, Spain and Yazd, Iran has been conducted in this study to demonstrate the requirement, methods and results of IoT utilization in the realm of water governance.

"Legimate Defense of Society": Police Officers' Perspectives on Police Violence in Salvador, Brazil

The present study analyzes, through a qualitative approach, the discourses of police officers about homicides which authorship where attributed to the Military Police of Bahia. To this end, 15 semi-structured semi-directed interviews were conducted with members of this institution (12 low-ranking officers and 3 senior officers). With the help of Atlas.ti 8.0, the data was systematized into themes and sub-themes in order to identify what was fundamental in their statements. This thematic analysis resulted in a discursive outlook from which I reconstituted the distinctions used by the police to observe reality, following a method of citation analysis based on the general theory of observation (Luhmann). The theoretical framework used in this research is based on Sutherland's theory of differential (communication) association (Pires, 2008), on the concept of police culture (Skolnick, etc.), as well as on a desubstantiation of the idea of justice seen as a medium (Luhmann) and also as a form of popular justice (Foucault). Based on these conceptual tools, the analysis identified a discourse that describes the work of the police officers as if they were in a context of civil war, therefore, in a context in which the death of the "enemy" is accepted in any case. This discourse defines police actions, in general, as "confrontation", thus imposing the idea of "legitimate defense of the society" on the legal form of self-defense. Executions, therefore, are perceived as an adequate punishment for "bandits", through a justice created by the police institution, which follows the logic of popular justice and selects blacks, poor and inhabitants of periphery as "irrecoverable" and therefore targets of executions. To sum up, I point out that the communications analyzed represent obstacles to a reform towards a police guided by democratic practices.

Towards a Posthumanist Institutional Ethnography As Theory-Methodology-Praxis: Rethinking Affect, Gender and Power Relations

The paper proposes a radical reconceptualisation of Institutional Ethnography (IE) bringing IE into contact with feminist materialist and posthumanist theory. The paper develops theory, methodology and praxis through: a) a theoretical model outlining five different dimensions of Posthumanist Institutional Ethnography (PIE); b) a feminist materialist/ posthumanist methodology to analyse how gendering processes work through intra-actional practices, and how these are enacted in, human and other-than-human institutional relations; and c) an analysis of how feminist posthumanist praxis works to account for ways in which gender is enacted and materialized in organizations. Theoretically, the argument takes off from Dorothy E. Smith's feminist post-structural sociology on IE and develops an account of what PIE might offer theoretically and enable empirically. Focusing on gendered inequalities which become reinforced within organizations, we recast Smith's premise of the importance of texts in IE expanding this to include material-discursive arrangements and practices (Barad, 2007) that influence and inform how gendered bodies materialize (Taylor and Fairchild, 2020). After outlining what is entailed in the theory, methodology and praxis of PIE, we turn specifically to affect and the role of affect in constituting gendering practices in the everyday life of educational institutions. We draw on data from two projects – one on the affective power of dirt in university spaces and the other on early childhood education and the affective resonances of care/caring work – to discuss affect as capacities, potentialities and possibilities that traverse all bodies. We consider how affect produces different insights regarding what a body can do, particularly through considerations of the intersubjective, transpersonal states of bodily being as affects circulate, flow across and infuse bodies of all kinds. We contend that PIE opens an important way of thinking about institutional life by reworking traditional sociological accounts of agency/structure and the gendered politics of institutional matterings.

Citizen Participation in the Regeneration of Deprived Areas. Insights on Marvila (Lisbon) from the H2020 Project Rock

International and transnational agencies agree that the reduction of socioeconomic inequalities is a major challenge worldwide, due to the massive growth of urban population and the exacerbation of the neoliberal financial paradigm. The European Union has recently recommended the adoption of participatory approaches in deprived areas as a key pillar of the Urban Agenda for the EU. The participation of public institutions, private agents, and local communities is expected to improve the social and physical dimensions of deprived areas. However, despite the flourishing of participatory processes in urban regeneration, little is known about whether and how these are being effective to overcome emerging inequalities.

To bridge this gap, this contribution explores key insights retrieved from the implementation of the H2020 project ROCK, which is aimed at promoting cultural heritage-led urban regeneration with locals in multiple European cities. Our aim is to understand whether, and how, participatory processes have been effective to overcome the inequalities within Marvila, a deprived area of Lisbon, as well as between the area and the rest of the city. While social and physical dimensions of this territory are fragmented and disperse, evidence shows that the massive investment of public and private capitals in the regeneration of the riverside contrasts with the few initiatives taking place in poorer parts of this area. More recently, the implementation of internationally funded urban regeneration schemes have sought to tackle some of these challenges by promoting wider participation of local communities and organisations to find effective solutions to socioeconomic inequalities. Against this backdrop, our contribution discusses the empirical knowledge collected in the last three years on these issues as co-Principal Investigator at our hosting institution of the H2020 project ROCK.

Los Estúdios Sobre La Juventud En Los Programas De Pósgrado En Educación En La Región Norte De Brasil (2007 – 2017)

Presenta un compilado de las disertaciones y tesis desarrolladas bajo los Programas de Posgrado en Educación de la región norte de 2007 a 2017 y que tienen a la juventud como su objeto de estudio. Está vinculado al proyecto "El campo

199

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

de los estudios de la juventud en Brasil y sus interfaces con la educación y el trabajo: equilibrio y perspectivas de la producción académica (2007-2017)", financiado por CNPq e involucra a investigadores de diferentes universidades públicas. La metodología de vanguardia mostró aspectos cuantitativos y cualitativos de la producción. Los datos fueron recolectados en plataformas vinculadas a CAPES y repositorios institucionales. Los resultados muestran que los desafíos de cantidad y calidad persisten en la producción juvenil en la Educación de Posgrado en la Región Norte. El bajo número de programas que operan en la región contrarresta la pequeña cantidad de investigación sobre el tema. Los trabajos muestran un esfuerzo por comprender los elementos locales involucrados en la constitución de la juventud en la región sin perder la articulación con cuestiones más generales y el contexto nacional. Cabe destacar el enfoque en las realidades y expresiones de los jóvenes en contextos sociales y culturales que reflejan la diversidad de la región, con investigaciones que abordan a los jóvenes del contexto, del campo, las comunidades indígenas y los centros urbanos.

Linchamientos En La Ciudad De Córdoba, Argentina (2013-2019): Un Análisis Desde Las Redes De Conflicto y Las Sensibilidades Sociales

El presente trabajo busca problematizar los diferentes elementos que se configuran como condición de posibilidad del fenómeno social de los linchamientos, a partir de los aportes de la teoría sobre la acción colectiva y la sociología de los cuerpos y las emociones. Se propone puntualmente indagar los episodios de linchamientos en la ciudad de Córdoba, Argentina (2013-2019) como vía para comprender los procesos de estructuración social. Esto, dada la posibilidad que brindan ciertos momentos colectivos-expresivos para interpretar los 'mensajes' a partir de los cuales la sociedad 'comunica' acerca de los procesos de re-producción social en curso. En este sentido, la relevancia de estos casos se vincula a su capacidad de poner en primer plano el estado de las relaciones sociales, configurando dinámicas afectivas, materiales y simbólicas particulares que emergen como 'pistas' para su indagación. Dada la naturaleza de la propuesta, se plantea una estrategia de aproximación a estas acciones colectivas a partir del análisis de los datos provenientes de un registro hemerográfico, de informes de organismos públicos oficiales y de la experiencia de los distintos actores involucrados en los episodios. Todo lo cual, de manera de identificar las dinámicas conflictuales, redes de conflictos y las referencias a sensibilidades sociales; en tanto que conforman la lógica de las acciones colectivas de los linchamientos.

Becoming Invisible: The (Unseen) Experiences of International Student Families

In 2016, there were 353,000 international students enrolled in Canadian universities and colleges, and the monetary investment they made towards a Canadian education translated to $9.3 billion in GDP contribution to the economy (CBIE 2016). From a financial standpoint, international students are viewed as a source of income for educational institutions, who have promoted the recruitment of international students to generate more revenue, making Canada the 7th most popular destination for this demographic. In the Survey of International Students conducted by the Canadian Bureau of International Education (2009), it was reported that 21% of international students in Canada are married or common-law, with the majority of married students living with their spouses in the country. Nevertheless, overall research on migration is primarily focused on the context of working immigrants in the United States, and some European countries.

My research explores the experiences of international graduate students and their families living in Canada. I focus on students and spouses' experiences as temporary residents who exist in a liminal space between immigrants and visitors. Little to no research explores the lives of graduate students who exist in this fragile and under looked space. Even less research has explored the experiences of family lives of graduate students. My research seeks to fill this gap in the literature by drawing on in-depth interviews with 15 international graduate students and their spouses and focusing on students and spouses' access to networks. I investigate how citizenship restrictions are linked through visa and work permit conditions.

Social Policies, Emotions and Habitat from the Perspective of Social Program's Beneficiaries

From the sociology of emotions, social policies are understood as organizers of social conflict since they establish a regime of sensitivity among their recipients. Emotions are the product of politics of sensibilities and also an important influence in such policies' setup process so that these establish the acceptable ways of being and feeling of the subjects (in this case, the beneficiaries of a social program). The purpose of this paper is to analyse which are the emotions expressed by the subjects, social programs' beneficiaries inhabiting in the municipality of La Matanza, Buenos Aires, towards their own neighborhood. The data observed has come from domiciliary surveying in the probability sampling method. The survey was conducted during the year 2018, from the Social Observatory of La Matanza National University under the investigation project "Main traits of the social issue in the beginning of 21st Century" . La Matanza 2017-2018.

Epistemic Directions of a Subdiscipline of Social Sciences:

The Sociology of Culture in Brazil in Articles (2008-2018)

In this communication, the initiative to make a bibliographic balance on the production of articles on the sociology of culture in Brazil, between 2008 and 2010, responds to the objective of reflecting on one of the facets of the institutionalization of social sciences in Brazil, namely, the epistemic differentiation of this subdiscipline. The narrative itinerary of the text is divided into three sections. In the first, the results of the bibliographic survey support the purpose of assembling a synthetic picture of this subarea of   sociology, taking into account the contemporary Brazilian academic field under increasing inflection of what has been called "internationalization". Then, the attention given to the sociology of literature aims to examine how peculiar inheritances are integrated into the formation of the sub-discipline with emergent problematizations that demand new demarcations of the aesthetic-literary object, as well as claiming attentive approaches to the context of irreducible sociofunctional interdependencies to the limits of society. nation. Finally, in the next item, the interest in searching a set of previous bibliographic balances intends to identify the lines of forces that, at the same time, impose themselves as a hermeneutic background and referential archive of the statements identified to the discourse network of the sociology of culture, which we call epistemic regionalities. By way of digression, we finally deal with the encounter and fusion between these epistemic regionalities in the contemporary production of the sociology of Brazilian culture.

New Sociological Paradigm

A new sociological paradigm has to analyze: New planetary powers that impose models on individuals and groups while, at the same time, remaining detached from their fields of existence. They are systemic powers constituted principally through: a)The development of financial flows – also fed by capital of criminal origin – that occur in a manner separate from the performance of the real economy and the world in which individuals and groups actually work. b) The allocation of investments on a global scale that accentuate the disparities between developed and non-developed areas, with direct consequences for the lives of individuals and groups in under-developed areas, where it becomes difficult or impossible to access resources required to sustain their existence.c) The emergence of new techno structures that give rise to the application of techno-scientific models aimed at modeling the evolution of individual existence (for example, in fields such as medicine and foodstuffs).

Climate Crisis, Fossil Fuel Lock-in, and Environmental Mobilizations in Bangladesh

Bangladesh, a climate vulnerable country, adopted its climate change action plan in 2008 to gradually implement carbon emission mitigation measures in the energy sector. Consequently, it set a target to increase the use of renewable en-

denotes a presenting author. Abstracts are organized by first presenting author's last name.

ergy by 2020 and beyond. However, transition towards low carbon energy has remained purely rhetorical. There is a large gap between the target and the actual achievement, and the gap is growing. With financial and technical assistance from several traditional and emerging donors, Bangladesh, instead, has moved towards a fossil fuel lock-in situation by implementing power development plans, which heavily relied on the use of furnace oil, diesel, coal, and natural gas. Although Bangladesh has the potential to harness renewable energy, especially solar power, and cost decline due to technological innovations has made solar and wind power highly cost effective and affordable energy sources, political and bureaucratic elites demonstrate apathy towards renewable energy. Civil society actors are contesting the fossil fuel lock-in energy regime for achieving a low carbon energy future. This paper will draw on two environmental sociology perspectives – political economy and ecological modernization – to analyze contesting discourses vis-à-vis Bangladesh's energy development agenda in the past decade (2010-2020). Based on in-depth interviews with policymakers, energy experts, climate change experts, and civil society actors, it will focus on the formulation of two power system master plans and the implementation of several contentious coal-based energy development projects. Avoiding a strict adherence to any of these perspectives, this paper will demonstrate how divergent actors having uneven power and capacity and divergent interests have shaped Bangladesh's energy sector.

On Transformative Aesthetics: Social and Artistic Performances of Muslim Women

The theme of the Aesthetics in the social is based on a precise sociological tradition inaugurated by George Simmel and Walter Benjamin. There are many authors who have considered the relationship that links the sociological sphere to the aesthetic one as a research path that leads to original and profound results: Simmel, Foucault, Derrida, Bourdieu, Lash (just to cite a few) identifying not only a simple analogy between the world of society and the aesthetic one, but highlighting how mutual and interacting emergencies exist between the two areas. Aesthetics has an important and profound heuristic power; supports us in understanding what kind of world we helped build, how we inhabit it and how we could transform it. The centrality attributed to aesthetic reflexivity has pushed us into a research on the *social performance* of Muslims in Italy to include the intrinsically creative, singularized and radical gaze of Muslim artists in the international circuit of contemporary art. Through the artists we present an aesthetic analysis of the tensions deriving from incorporating belonging and becoming in the increasingly interpenetrated places of the Muslim west and the Europeanized east. In these performances, the body becomes guardian and criticizes identities, explicit domains, embodies and fights them. The artistic creation shows us through the radical aesthetic, imaginative and liminal gesture the tensions that cross the manifold becoming of these women. The creativity of the social actor and the specific one of artistic creation find on the body and sexuality a land of interesting overlap.

POMPILI, GIOIA* (Department of Economical and Social Science, Italy)

The Performance of Italian Muslim Women: Methodological Implications

The research refers to a sociology that considers the embodiment and Eros analytical filters of equal importance to cognition. In the contest multi-method approaches we have carried out forty in-depth interviews, two focus groups, participated in many events, parties, various cultural occasions, social protests, artistic performances and we have analysed Islamic fairy tales placing under a magnifying glass the process of *becoming Italian Muslims* and declining in terms of performance the multiplicity of ways it happens. The term performance should be as a construct that captures the contingency, the corporeality and the affection involved in the encounter with the other. Performance is a concept that, above all, calls into question the body and non-cognitive experiences in the production of social life through daily practices. Doing research in this perspective is not just describing the world but being part of it. It is therefore a performative discipline in the sense that it produces reality as an effect and as affection (Massumi, 2015). Reality, as it is full of relationships, is also, to some extent, produced in the course of research. No method, says Haraway, is innocent, so working on some forms of the social means interfering and therefore distorting them in the sense of fictionalizing them. This source inspired our way of conducting interviews because it helped us leave the representation of Muslim women in Italy to relate to them

and experience them. Performance is a dynamic analytical tool that focuses on the intersubjectivity of the encounter (Conquergood, 2002). Performance in its theoretical and empirical implication, problematizes the concept of identity. It keeps alive a tension to offer subjects the possibility of being something else; it draws attention to the positioning of those in the field, on ethno-political sensitivity in order to problematize and reflect on the conventional hierarchies that are performed.

Learning and Innovation from Associative Strategies between Governmental Organizations and CIVIL Society Organizations

In the field of public organizations, programs for strengthening civil society organizations from various associative strategies such as training, technical assistance and money transfer for the implementation of social policies are very common.

In this paper we reflect on the innovative processes in civil society organizations that arise from these alliances and their link with the generation of organizational learning, as well as their facilitators and obstacles.

For this, we present a comparative analysis of the results of two investigations carried out in the Universities of Buenos Aires and National de La Plata. In the first investigation, a case study was carried out of three civil society organizations that implement, based on their alliance with the Ministry of Social Development, a training program for elderly caregivers. In the second one, it is a comparative case study of nine civil society organizations that participated in a training program within the framework of the University Extension of the Faculty of Economic Sciences of the National University of La Plata.

Among the findings of the study arises the difficulty of the organizations studied to state the changes produced from the application of the individual learning, in the organizational structure, and also to make the passage of individual learning instances to collective / organizational learning ones.

Discusiones Sobre Agencia Infantil: Una Propuesta Teórica y Metodológica Desde y Para América Latina.

Este trabajo intenta problematizar la producción de conocimiento sobre las infancias latinoamericanas, y cuestionar cómo se ha explicado el ser niña/o partir de un marco dominado, principalmente, por los Estados Unidos. Postulando un enfoque situado sobre las niñas y los niños como agentes sociales, se pretende colocar un acento en el campo de las infancias desde la condición estructural de subordinación del Sur y sus heterogeneidades.

Las herramientas teóricas-metodológicas aquí propuestas, interrogan sobre las condiciones de producción de las experiencias infantiles en contextos de pobreza y desigualdad, para comprender las modalidades que asume la agencia en niñas y niños, como forma de procesar el tiempo histórico y de ejercer presiones sobre la estructura social, muchas veces, de maneras inadvertidas y disposicionales.

La intencionalidad es investigar la capacidad de acción (moral, política, social y lingüística) de niñas y niños, incluso en el marco de múltiples determinaciones, desde un enfoque que toma en cuenta cómo la mirada teórica muchas veces incorpora las relaciones de poder neocoloniales.

The Mud Revisited: About the Dog without Feather of Deborah Colker

This work aims to give continuity to a sociological reflection initiated in the ISA Congress in 2018, upon the recently launched dance spectacle entitle Dog Without Feathers.

The spectacle in question, signed by renowned choreographer Deborah Colker, had its performance debut in the second semester of 2017 and is still can be seen on theaters. After a wide national tour, since 2018, the show has also been performed in other countries both in the American continent and in Europe.

As highlighted by the choreographer herself, the spectacle mixes dance, video, music and poetry based on a homonymous poem written at the beginning of the 20th century. It is this poem that provides thematic unity to the integration of the other references and elements of the spectacle.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

One of the major aesthetic references found in the costume of the dancers, in the poem, in the music and videos of the spectacle is the mud. Originally, this mud belongs to the geographical context of the poem but that, throughout the historical chronology of the other artistic references used in the composition of the spectacle, takes a different meaning.

A meaning that also dialogues with a social, geographic and national political reality that was present in the historical background when the spectacle was created and that ironically returns to be part of the current national daily life , which also reflected in the external image of the country through international media.

To retake the analysis that began in 2018 and, at the same time, to update it by emphasizing the beauty and the artistic complexity of the spectacle is in short the challenge of the present work.

FAUSTINO, JEAN* (RNP, Brazil)

Unfolding Utopia: Violada Movement

At the last ISA World Congress in Toronto, I had the opportunity to present the partial results of a research that corresponds to the first part of this new work proposal.

The research presented at the 2018 ISA Congress (The Solidarity of the Musical Utopia in Contemporary Brazil) had as its scope a group of autonomous musicians distributed throughout Brazil. Musicians who have set up a solidarity network to make small shows with the objective of promoting a type of quality music, alternative the current mainstream.

More than the promoting their songs, these small shows were also intended to bring outstanding musicians closer to local artists, thus facilitating musical exchanges and partnerships.

The presentation of this research at the 2018 ISA generated a great interest of the attendees, in particular by the details of operation of this movement that the independent Brazilian musicians creatively created to disseminate and perfect the so-called authorial music.

This new work will be concerned with the understanding and presentation of a new movement that emerged as an unfolding of the first. This is the *violada*, which gets its name from grouping musicians who play *viola caipira* - a typical Brazilian instrument.

Musical specificity is not the only element that differentiates the new movement from its origin. While retaining some structural elements of the previous movement, it has adapted and altered some of the principles to reach a wider audience.

The purpose of this work is therefore to understand the organization of this new movement, such as its organizing principles, its dynamics, the ideals and objectives of its members, and the interaction with the initial movement.

"It's Not an Issue": Does Gender Matter in the Professionalization Process of Hospital Physicians?

The proportion of women physicians has increased in recent decades. They constitute a minority in some medical specialties, and the majority in others. However, they are under-represented in senior and management positions. This may be explained by the socialization process of women physicians, and/or by structural constraints of their employing organizations. The objective of this study was to examine gender-specific barriers and opportunities in the training and employment trajectories of internal medicine and general surgery physicians.

A qualitative study was conducted including face-to-face, in-depth interviews with 63 resident physicians from four hospitals across the country. The thematic analysis of data reveals that gender was not perceived as a central issue by the residents. Despite this "non-issue", they stated that "to attain professional goals, women [physicians] work harder" than their male colleagues. The burden of tasks involved in treating ever-increasing complex patients amidst a reality of a stagnated number of physicians positions, does not allow residents to be involved in research during work hours. Thus, research is expected to be conducted during the resident's leisure time, which is particularly detrimental to women physicians, since the social expectations and/or most of the household and family chores are undertaken by them. Residents described that their training program is not sufficiently structured, that they do not receive enough feedback, nor participate in learning activities such as seminars and journal clubs. Thus, also the systematic learning during the residency is pushed to the residents' leisure time.

We conclude that attention to the challenges and the organization of both specializations detracts focus from gender issues. The perception that physicians'

professional development relies primarily on their personal characteristics, reduces the responsibility of the health system to develop fully-capable clinical personnel.

FEDOROVA, IRINA* (Saint Petersburg State University of Economics, Russia)

Gender Specificity of Integration of Migrants into Russian Society

During last 10 years socio-demographic characteristics of migrants have changed, in particular, the number of women migrants has increased. Author analyzes the problem of integration of migrants into Russian society with regards to gender aspects and specificity. The role of integration is evaluated through the analysis of theoretical concepts of structural assimilation and real practices of migrants on the example of big Russian city Saint Petersburg. The report is based on in-depth semi-structured interviews with male and female migrants with different social status. Participants were selected using the snow-ball sampling method. This methodology recognizes social relationships and specific details about the experience of migrants and their strategies of adaptation and integration.

In order to provide a system view, the methodology includes the quantitative method – a sociological survey of host society in order to examine the change of attitudes towards migrants.

Major finding of this research is the formulation of real gender differences in the process of adaptation and integration of migrants. The increasing mobility of women from developing countries with traditional societies is influencing several spheres: demographics, social, economic and cultural. Female migrants go through a different decision-making process than men in deciding whether to migrate. Female migrants feel less protected and face more cultural and ethical difficulties in the host society. In turn, host society experiences negative attitude towards growing number of migrant families in the city.

Most women suffer the traumatic experience of forced separation from family. All of interviewees mentioned the increased number of divorces caused by migration and the change of attitude towards divorce in their traditional societies. The efforts of local government are not demanded by migrants. For successful integration it is necessary to have joint efforts of the host society on the political, social and economic levels, and from the migrants themselves.

Climate Narratives and the Colonizing Mindset: Reflecting about How New Climate Pattern Has Been Teaching Us about Our Societies

Human migration has been part of world history in multiple ways and it has several reasons. Recently we have to cope with a contemporary dilemma of human displacement regarding climate change impacts. In this meaning, climate change has been causing very rapid transformations, not just regarding biophysical impacts of a warmer planet (e.g.desertification, droughts, extreme events, sea level rising), but also regarding culture, social behavior and values. This paper reflects on what this reality of new challenges and new patterns posed by climate change has been teaching us about our societies. It questions how the narratives of global knowledge about climate change and climate displaced people are influencing the way people have been interacting, behaving and establishing relations. To develop this problematization, this research was based on literature review, fieldwork with participatory observation and semi-structured interviews in Shishmaref – Alaska(USA). This exemplary case was chosen due to its historical importance on discussion about the nexus of climate change-culture. Allied to the current Environmental Sociology and Anthropology developments that have been questioning the hazard-centric vulnerability concept, this research draws attention to the fact that it is not possible to cope with climate change if we ignore that it is interconnected within a web of other ongoing dynamics that shape society. Shishmaref proves that culture and climate change are intertwined in the definition of their vulnerability, which is not just part of physical impacts, but it is also part of a historical process of cultural erosion due to a power relation caused by the colonialism mindset. This power relation defining the way people act towards climate change is not restrict to traditional communities facing colonialism process. It is also seen in global knowledge production, which is a key part of the problematic and also a key element to address this climate dilemma.

FELDMAN, DAVID* (University of California, Santa Barbara, USA)

Between Exploitation and Repression: The Immigration Industrial Complex and Militarized Migration Management

This paper analyzes the immigration industrial complex from a critical political economy perspective, arguing that it responds to the crisis of global capitalism in both its "economic" and "political" dimensions. In the former case, the immigration industrial complex mitigates a crisis of overaccumulation by opening up new profitable outlets for capital. In the latter case, it stymies migrant resistance and, through the promotion of migrant scapegoating, secures legitimacy for the system among downwardly mobile "native" citizens. Rather than argue that the complex necessarily reproduces the conditions for the long-term accumulation of capital, I draw attention to the fundamental contradiction inherent to its particular strategy of accumulation, which uses the racialized bodies of migrants as raw materials. While the detention and deportation of some migrants may serve to render the majority compliant workers, their systematic removal from the (non-prison) labor market clashes with the accumulation strategy of extracting surplus-value from the labor of migrant workers. I draw on the example of Big Tech in the United States—which is heavily dependent on migrant labor, but also responsible for much of the material infrastructure underpinning the surveillance and deportation state—to illustrate that such competing accumulation strategies may be present within the individual corporations comprising the immigration industrial complex. Consequently, the latter is internally fractured in ways not normally appreciated in the scholarship. Finally, I consider how one potential resolution to the above contradiction (from the perspective of capital in general) involves a transformation in the ways that capitalist states regulate and discipline migrant and immigrant labor. More specifically, the rise of border walls and powerful deportation machines presages a shift *away* from the production of migrant illegality, and coincides with the creation of ostensibly legal but highly vulnerable noncitizen workforces through an expansion of "guestworker" programs and temporary legal statuses for long-term immigrants.

Immigrant Latinx Mothers' Strategies to Educate and Care for Young Children

In the United States (US), there is still no widespread consensus about the relevance of Early Childhood Care and Education (ECCE), despite increased awareness about the effects of early intervention in development. Such lack of consensus seems to stem from longstanding values about family responsibility and the concurrent stigmatization of single-mothering in policy and political discourse. Currently, whereas the provision of public ECCE services is expanding, policies tend to be targeted on families in poverty, focused on 4 and 5-year-olds, being also unevenly distributed across states and communities. When LatinX immigrants are concerned, there can be further obstacles to accessing public services, from language barriers to citizenship concerns. The existing literature briefly indicates that Hinospanic families have lower enrollment in preschool; that these families might be choosing arrangements based on extended family; that the training of family providers seems to be an efficient way to expand access to preschool services within these populations. To any extent, however, there is no extensive literature focused on the strategies foreign-born LatinX mothers are employing in order to care and educated for their young children. This paper is an initial attempt to understand the networks of care created and employed by LatinX immigrant families in a context in which public and community services are available, but not for all. I will present a mapping of the concurrent strategies some families employ in the context of a city in New Jersey that had its provision expanded after the Abbot litigations, but still lacks services for certain populations and age ranges. I present the results of this pilot study and questions this analysis presented that will help me guide the data collection in a different context, where public provision is less significant—further reflecting the reality of several localities in the US.

JUKKALA, TANYA* (Malmö university, Sweden)

Alienation in Marginalized Urban Areas

As our cities are growing, so are the inequalities between both their inhabitants and different neighborhoods. Individuals, groups of individuals, and entire neighborhoods are being marginalized in terms of access to resources, opportunities, health and wellbeing, as well as power and influence in political processes, not least those that relate to urban planning. Young women in marginalized urban areas have been recognized as being particularly at a disadvantage in the urban environment and as invisible in urban planning. In an ongoing research project, we focus on the lived experiences, experienced needs, and place-making process-

es of young women living in marginalized areas of Stockholm, Sweden, as a way in which to acknowledge their experiences within the context of urban development.

Our research uncovers different processes of alienation that can be linked to the marginalized position of these women in terms of young, female inhabitants of marginalized neighborhoods. These relate to the experiences of being excluded from processes of change in their neighborhoods; feelings of being forgotten, ignored, and left aside as other more affluent parts of the city are being developed; as well as feelings of being judged in relation to their position as young female inhabitants of marginalized areas that are associated with generalized negative perceptions of their neighborhoods.

At the same time, our research reveals a potential for empowerment within the marginalized (alienated) positions of these young women in terms of a standpoint from which they define their own selves and neighborhoods and from which a critical understanding of societal power relations, as well as more effective resistance to them, can be achieved.

FERNANDES, CARLOS* (Eduardo Mondlane University, Mozambique)

Friendship, Scholarship and Epistemic Commitment in Post-Colonial Mozambique

Sarah Stroud posits that friendship involves not just affective or motivational partiality but *epistemic* partiality. Good friends, she argues, are more inclined to construct positive representations of their friend's behaviors that they would not apply to nonfriends. Differently, Scott and Kawall argues that friendship is not an epistemological obstacle. It strengthens the dialogical and collaborative dimension of scholarship. This paper engages with these three authors, in order to explore the relationship between friendship and scholarship in Mozambique. The paper has two arguments. Firstly, during the socialist period, the truth regime was based on a dualistic reasoning which divided 'friends of the revolution' from their enemies ('reactionaries' 'traitors', 'new explorers' or 'petty bourgeois'). The place for nonfriends or ideological strangers were forced silence, re-education camps, exile or death. The academy was structured in the same logic: the production and legitimization of the scholarship of the friends of the revolution. In the end of the 1980's with the disintegration of Mozambique's socialism some scholars began to discuss the epistemic limitations of friendship in knowledge production. They claimed that most of the researchers produced a teleological history due to their loyalty to the party-state's socialist ideology. Secondly, in the present context of political and economic liberalization, we witness the return of the belief that research conflicts with friendship, but also a political re-appropriation of the concept of friendship as a weapon against scholarship produced by private and state-independent research institutions. FRELIMO's definition of the enemy as opposed to friends are now articulated with metaphorical notions such as the 'apostles of disgrace' or 'anti-patriots'. Stripped off from ideology these new terms are linked to broad notions of national belonging and fatherland, rather than with the standards of epistemic responsibility and justification.

FERNANDES, JÉSSICA* (Universidade Federal de São Paulo, Brazil)

Gender and Law Schools in São Paulo

While it is true that women have won their place in the legal milieu, it is also true that this achievement has not yet been fully successful. Some contemporary studies on legal careers show, on the one hand, the opening up of these professions to women and, on the other hand, their strong presence in lower positions in the hierarchy of legal careers. the aim of this paper is to present the partial findings of a research carried out in the context of a scientific initiation scholarship, funded by FAPESP, set out to analyze the presence of women in the universe of legal training through the study of two traditional Law Schools - one public and one private - in the State of São Paulo. This research has identified the process of feminization also in legal education, either in terms of its student body and in relation to the teaching activity. Furthermore, we have observed who are the women in this two law schools, what are the most common social representations and stereotypes about them, and what place is assigned to them in terms of legal area and administrative positions.

The analysis of the students has been performed through the application of questionnaires concerning the social recruitment and the professional aspirations of the newcomers students of 2016, as well as the undergraduate monographs completed at the second semester of 2015. By doing that, we could find out which areas have been chosen by these newly graduates. The examination of the professors' profiles was done both by the analysis of their curriculum vitae and 20 interviews with professors. This combined method allowed us to look into their professional trajectories and perceptions about the legal academic field.

Legal Training in Sao Paulo: Continuities and Changes in the Age of Professionalisation

Throughout Brazilian history, legal training has always enjoyed a preeminent position thanks to its pioneering role both in higher education and in the shaping of bureaucratic and intellectual fields. Nowadays, despite the fact that legal training still reproduces, to some extent, features of the termed bacharelismo imperial - as the number of teachers who still hold other legal-related occupations besides teaching proves -, continuous professionalization of higher education compelled Law teachers to invest in the acquisition of further academic titles and actively engage with research activities. In this context, this research project seeks to comprehend the extent of a series of ongoing transformations alongside with the reproduction of specific features commonly regarded as historically constitutive of legal training. For that end, we study some of the most renowned Law colleges in the city of São Paulo in order to assess the question of their relative autonomy in relation to external interferences - from the political, economical, and juridical fields - when it comes to legal training. In terms of methodology, this study is structured in two central axes: firstly, the study of the pedagogic outlines (projetos pedagógicos) adopted by the selected Law courses, taking into account how they relate to the recommendations conveyed by the Ministry of Education and the Ordem dos Advogados do Brasil (OAB) regarding legal training; secondly, the examination of academic training, by drawing on the analysis of their CVs (Currículo Lattes).

FERNÁNDEZ, ANA BELÉN* (UM, Spain)

Segregación Ocupacional. Dificultades De Acceso Para Los Hombres Que Se Quieren Insertar En Los Empleos Más Feminizados.

Desde el Grupo de investigación Mujeres en Mundos de Hombres, creado en 2011, estudiamos ocupaciones segregadas en función del género. En los dos proyectos I+D llevados a cabo se han estudiado diferentes profesiones en las que las mujeres tienen menor representación o visibilización con respecto a los hombres. El objetivo de esta comunicación es presentar una revisión de las motivaciones, las estrategias, las barreras de acceso e inserción laboral que tienen los hombres en aquellas profesiones más feminizadas. En concreto, la ocupación seleccionada será la de auxiliares de enfermería, ya que cada vez se necesitan más profesionales que puedan realizar labores de cuidado. Es necesario realizar una revisión de las condiciones de trabajo en las que se encuentran las y los auxiliares de enfermería, así como de su evolución futura para poder orientar e insertar a futuros estudiantes y trabajadores. Debido a los estereotipos de género aprendidos desde pequeños, los cuidados a pequeños o a mayores han sido asignados tradicionalmente a las mujeres. Será interesante comprobar si las trayectorias profesionales de los hombres son similares a las de las mujeres, y si realizan las mismas tareas en los cuidados asignados. La posibilidad de conciliar la vida familiar y laboral en las instituciones públicas puede ser una de las explicaciones por las que hay más mujeres en la profesión. Sería interesante comprobar si también se trata de una motivación para los hombres. Cuando elegimos especialidad educativa o trabajo, nuestras elecciones deben tener sentido en relación con nuestra identidad de género y autoimagen. La división de trabajo por género nos ayuda a definir dicha identidad, con lo que tanto varones como mujeres pueden desear mantener la división sexual por género en el mercado de trabajo. Para ello se ha comenzado por analizar la imagen pública de la profesión.

Evaluar Para Mejorar. El Vínculo Entre El Estado y Las Organizaciones Artísticas Comunitarias a Través De Las Políticas Culturales: Tres Casos De Estudio En Argentina

El presente trabajo propone un análisis que se desprende de nuestro proyecto de investigación titulado: "Políticas culturales y proyectos de desarrollo productivo y social. Un análisis de su articulación en territorios urbanos y rurales" (2011-2017)", desarrollado en el CONICET. Allí realizamos un análisis del vínculo existente entre el Estado y las organizaciones artísticas comunitarias, a partir del modo en que dichas organizaciones participan del diseño, planificación e implementación de las políticas culturales públicas. En ese sentido, nos interesa rastrear las instancias de participación ciudadana en las distintas etapas de construcción y puesta en práctica de esas políticas, en tanto que allí se articulan los intereses de los destinatarios de dichas políticas y del Estado.

Se trabajará particularmente con tres políticas culturales y tres organizaciones destinatarias, las cuales pertenecen a ámbitos urbanos y rurales dentro de la provincia y la ciudad de Buenos Aires, en Argentina. Se trata de los grupos de teatro comunitario Circuito Cultural Barracas (Ciudad de Buenos Aires) y Cruzavías (Partido de Nueve de Julio), y la Cooperativa La Comunitaria (Partido de Rivadavia). Los tres grupos pertenecen a la Red Nacional de Teatro Comunitario, en tanto trabajan territorialmente con actividades que exceden lo artístico –aunque lo incluyen- desarrollando proyectos de desarrollo e inclusión social.

Estos grupos se vinculan con actores del ámbito político, en sus instancias municipales, provinciales y nacionales, articulando estrategias para potenciar y acrecentar los beneficios de las políticas culturales, en pos de un mayor desarrollo de sus organizaciones y beneficios para sus comunidades. En este trabajo abordaremos los avances de la investigación presentada, haciendo hincapié en el proceso de evaluación de dichas políticas, y sus implicancias teóricas y políticas en los casos específicos.

Teatro Comunitario Argentino: La Ciudad Como Escenario De Utopías

El fenómeno del teatro comunitario en Argentina tiene una historia de 37 años, y actualmente hay en el país alrededor de 50 grupos funcionando. Se trata de un teatro "de vecinos para vecinos", realizado por personas no profesionales del teatro, que se reúnen para contar la historia de su pueblo, ciudad o barrio a través de la dramaturgia. Los grupos de teatro comunitario están compuestos por personas de todas las edades, distintas condiciones socioeconómicas, ideologías y religiones. Las obras se elaboran a través de ruedas de memoria donde los vecinos aportan recuerdos, anécdotas, documentos y testimonios con los cuales se va elaborando un relato, el cual se traduce en improvisaciones primero, y en escenas después.

Los grupos de teatro comunitario están nucleados en la Red Nacional de Teatro Comunitario, a través de la cual comparten experiencias, problemáticas y soluciones. Se trabaja de manera autogestiva, buscando siempre generar procesos de transformación tanto individuales como colectivos. Existen grupos urbanos y rurales, y si bien ambos adquieren características disímiles, comparten el modo de funcionamiento respecto de la reapropiación del espacio público. En ese sentido, el estilo del teatro comunitario es ecléctico (se retoman géneros como el grotesco, el sainete, elementos de la murga, etc.), y se caracteriza por utilizar particularmente el canto colectivo.

La propuesta del presente trabajo es dar a conocer las características de este teatro, haciendo principal hincapié en las modalidades de transformación que genera en las localidades donde se practica. Incluimos en dichos cambios tanto los procesos personales que viven los vecinos-actores, como también las experiencias de grupos que han logrado exceder lo artístico para convertirse en organizaciones sociales con capacidad de disputar poder en sus territorios locales.

Youth Participation in the Recovery of Marawi, Philippines after the 2017 Armed Siege

The Sendai Framework for Disaster Risk Reduction (DRR) 2015-2030 states that DRR requires an all-of-society engagement. Everyone, regardless of their age, gender, ethnicity, religion, or socio-economic position, should be involved in thinking, planning, and deciding about DRR. Over the past few years, several studies on youth participation in disaster preparedness and emergency response had emerged. However, studies on youth participation in disaster recovery are still scarce. This current research aims to help fill the gap in existing knowledge about youth participation in disaster recovery in the Philippines and to contribute to providing the much-needed evidence base for the formulation and implementation of future policies to enable and improve youth participation in post-disaster initiatives. The study focuses on the 2017 Marawi armed siege, the longest urban battle in the modern history of the Philippines. The five-month long armed conflict left the city of Marawi in ruins, hence the need for massive reconstruction. Through interviews and focus group discussions with both youth and adult stakeholders and through policy review and analysis of recovery plans, this qualitative study examined (1) the legal mandate to participate which comes from national policies and international frameworks subscribed to by the Philippines; (2) the organizations that the youth can join and connection to other DRR stakeholders; (3) the capacity to participate through the provision of adequate resources and support; (4) the opportunities to for the youth to participate in the form of events or activities; (5) the barriers or challenges to participation and how to overcome them; and (6) the motivations for the youth to get involved. The results of the cur-

rent study in Marawi will be compared to the general tendency in the Philippines of leaving the youth out of discussions, formal planning, and actual implementation of interventions related disaster recovery.

Social Factors Related to Loneliness in Chilean Elderly

Objective: The aim of this study is to determine the prevalence of loneliness and evaluate its association with objective social networks, family functioning and perception of social support in a sample of older people from Chile.

Methods: Descriptive and multivariable analyses from data of Fifth National Survey of Quality of Life on Older People UC-Caja los Andes 2019. This survey is conducted of a representative sample of Chilean older people (60 and more), using the UCLA abbreviated scale of loneliness. Data will be controlled for socio-demographic factors, family structure and functioning, social participation and social support.

(Note: survey will be carried out between October-December of this year. Researcher is part of the technical team of the survey.)

Female Migrant Journeys, Detention and Human Rights Violations at the Southern Border of Mexico: Discourses and Practices of Disgust

Caravans fromCentral America have proved to be a strategy used by women and their families to cross Mexico in safer and more visible conditions. Since the end of 2018 the Mexican government has reacted to forced displacement with the enforcement of detention policies in the southern border. Few academic studies focus on the journeys of migrant women in the Central American–U.S. migrant corridor, especially, on how and under which conditions they undergo detention and deportation. In this article, I present some findings based on ethnographic research about the conditions, discourses and practices of disgust at the Immigration Detention Center in the southern Mexican border. The daily interaction between women and immigration officers at the Center reinforces the precariousness and vulnerabilities of female migrants, who despite the geographical proximity between their homeland and Mexico, arrive with limited resources and need to make use of complex strategies to avoid deportation. I show how structural and cultural violence determine not only migrant journeys, but are key elements in the operation of an immigration bureaucracy that dehumanize migrants and limit the possibilities for women to exercise their right to seek asylum.

La regulacion laboral en Argentina: desafios ante las nuevas formes de empleo

Desde la llegada al gobierno de la alianza Cambiemos, en diciembre de 2015, en la Argentina se instaló en el debate público la necesidad de modernizar la legislación laboral. Esta modernización ha sido habitualmente un eufemismo para referirse a la flexibilización de las relaciones laborales. En efecto, esta perspectiva se plasmó en un proyecto de reforma laboral integral presentado en 2017 por el oficialismo que, sin embargo, no logró tratarlo en el congreso. Aquella propuesta de reforma puede interpretarse a partir de tres objetivos complementarios: acotar el carácter protectorio de la ley, desresponsabilizar al empleador por las condiciones de trabajo que ofrece y flexibilizarlas. Uno de los elementos más salientes de aquel proyecto era la creación de una figura intermedia entre el asalariado y el trabajador por cuentapropia: el autónomo económicamente dependiente. En 2020, ya con un nuevo gobierno en el poder, la orientación de los cambios normativos impulsados ha tomado un carácter más protectorio. Por un lado, en julio de 2020 se aprobó la ley de teletrabajo, que habilita la modalidad pero garantizando algunos derechos novedosos en la legislación local, como el derecho a la desconexión, el derecho a la intimidad y la mención explícita del derecho a organizar la jornada laboral de modo compatible con las tareas de cuidado. Por otro lado, se ha abierto una discusión en torno a la necesidad de regular el trabajo en plataformas de reparto, que ha crecido notablemente desde 2018.

Los Roles De Género Durante y Después Del Desastre. Estudio De Caso En Dos Comunidades Chilenas.

Una de las características de las sociedades contemporáneas es la complejidad de las interacciones que se producen entre los elementos que la componen, de manera que cualquier elemento que irrumpa en ese sistema complejo puede producir caos y desequilibrios sociales. Tal es el caso de los eventos de gran magnitud como terremotos, huracanes o tsunamis, los que su sola manifestación distorsiona por completo el orden social establecido provocando un desastre.

Uno de los elementos que se ve afectado considerablemente es el orden de género. A través de un estudio cualitativo realizado en las comunidades de Coliumo y Dichato en la provincia de Concepción, se muestran los cambios producidos en las relaciones de género durante y después del terremoto y tsunami de Chile en febrero de 2010.

Las primeras conclusiones muestran que los estereotipos tradicionales de género no necesariamente se cumplen durante el evento y que el papel de las mujeres en la etapa posterior es de vital importancia para la reconstrucción, dando lugar a procesos de liderazgo y empoderamiento. De esta forma la perspectiva de género resulta una herramienta imprescindible para garantizar la reconstrucción en condiciones igualitarias, a pesar de lo cual las intervenciones de las organizaciones que forman parte del sistema de respuesta no suelen considerar su incorporación en la gestión del riesgo de desastres.

From 15 to 29. Trajectories in the University of Uruguay of Youth Evaluated By PISA 2003.

This paper constitutes a first step forward in the project "Abandonment, persistence and graduation in Higher Education between 2015 and 2018. Impacts of the decentralization of the UDELAR: Northeast, East and Montevideo regions" funded by the Research Program for the Improvement of the Quality of University Education "(PIMCEU), called 2017, of the CSE and the CSIC, of the University of the Republic.

The objective of component 3 of the project is to reconstruct the academic trajectory within the UDELAR until 2016, for young people evaluated by PISA in 2003. These young people were born between 1987 and 1988, reached the theoretical age of university admission between 2005 and 2006. Adopted the definitions made for Uruguay by the National Survey of Adolescence and Youth (ENAJ), it concludes at 29, we will observe such trajectories until 2016 and 2017 respectively.

The questions proposed to answer this paper are three: what young people have managed to enter the UDELAR? How many have managed to graduate from those young PISA 2003 who enrolled in UDELAR? What distinctive characteristics do those who have graduated and those who have not graduated, in terms of: their sociodemographic characteristics, their academic trajectory prior to entering UDELAR, the geographic area and region of study in which they completed higher education?

he data used comes from the articulation of the Second PISA 2003 Follow-up Survey carried out in 2012 (N = 2451) with four types of microdata available to the University of the Republic: (i) registration for new careers made in the System General of Bedelías; (ii) the statistical entry forms; (iii) the statistical discharge forms; and (iv) the consolidated student base developed by the Teaching Indicators System Unit (USIEN) of the UDELAR Sectorial Teaching Commission.

The Keys of the Digital Divide, Social Media and Political Participation in Latin America.

The annual studies of the Latinobarometro allow to know the public opinion of 18 countries of Latin America on different aspects. Since 2002, the questionnaire has included questions related to the Internet, such as, for example, the frequency of use, what it is used for, the place where it is connected, the social media services used, etc. The latest waves since 2013 include a question about social networks that digitally divides the population into about three thirds: not users them, users one or two, and users three or more (non-users, users and superusers respectively). This work aims, on the one hand, to carry out a descriptive analysis of the sociodemographic profile (sex, age, studies, ideology, income, subjective social class, etc.), a diachronic analysis (since the beginning of the millennium, but especially of the last 5 years), a comparative analysis between countries and, finally, an explanatory analysis of the different types of users of digital social media in Latin America. And, on the other hand, an approximation of the relations between political participation and the types of users of social media: support for democracy; opinion on the usefulness of social media to participate politically; and the practice of social activism through unconventional political actions (signing a petition, demonstrating, unauthorized protest, etc.).

POA Inquieta - a Novel Form of Collective Action for Urban Transformation

Contemporary society is marked by increasing global inequalities and disbelief in institutions, but also by the emergence of new forms of collective action. This paper aims to present the Porto Alegre Inquieta Collective (PI), from Porto Alegre (Brazil). It aims to identify how the genesis, dynamics, and characteristics of PI can germinate the expansion of sociological analysis.

PI presents itself as a collective aimed at positive urban transformation from a local, human, creative, and inclusive vision stemming from Creative Economy. The collective organizes itself through Whatsapp groups (inspired by a significant truck-driver's strike in 2018) and in-person meetings (inspired by Medellín's "dialogue circles"). It constitutes an emancipatory platform that includes human elements: people with various places of speech; social processes (collaboration, facilitation, and meetings), and technological processes (observation, monitoring, communication and conflict management); as well as diverse human resources and technological, financial and material resources provided by partnerships and members alike.

The collective has no legal identity or partisan bias but understands itself as a political agent for social change. After a year of existence, it mobilizes over 2,000 members in 27 thematic groups and 21 ongoing projects. There are articulating roles to foster the "dialogue circles" and to horizontally and openly discuss governance. The collective adopts coexistence agreements instead of norms, such as "tolerance for failure"; "just do it!"; "act lovingly"; "love small-scale-deliverables"; "the abundance principle"; "work with creativity and knowledge"; "ideologies or parties do not drive us", and "there is no creativity without diversity and sustainability".

The empirical analysis of PI will scrutinize its characteristics (such as informality, horizontality, randomness, and plurality), which seem to provide new elements for collective action epistemology and analysis. Categories from Complexity Theories and Epistemologies of the South may provide new insights on contemporary collective action and on expanding Sociology analytics.

Narratives of Organizational Success: Language and Meaning Making of Big Tech Executives

This article presents some preliminary results of a Ph.D. thesis that investigates the narratives and the meaning-making of executives - founders and CEOs - belonging to the five largest IT organizations - Alphabet (Google), Amazon, Apple, Microsoft, and Facebook - popularly known as big tech companies. We aim to understand how narratives and storytelling processes involving the success of these large organizations produce shared fictions that, ultimately, organize fundamental notions for contemporary capitalism such as "innovation" and "technological future". For that, we use a multidisciplinary set of theories that dialogues with organizational studies, literary studies, linguistics, social psychology, and computational sociology. Our method consists of a quantitative textual processing step that deals with large volumes of text (big data) for the foundation of the analytical categories; and a qualitative analysis stage that looks at the text in greater depth, seeking to identify the executives' narratives and the meaning-making processes from the previous stage. Our corpora are composed of secondary data extracted from multiple sources such as biographies, tweets, public interviews, and posts on ranking platforms. The text has been processed using Python programming language. Our preliminary results show variations of narratives that closely relate the success of the big tech companies to the individual meritocratic trajectory of these executives.

Accordion Teacher in the Project Fábrica De Gaiteiros: A Case Study

This study introduces a master's research, finished in 2019, which pursued to understand the ways in which diatonic accordion teachers working in the *Fábrica de Gaiteiros* project were formed, identifying specific characteristics present in their musico-pedagogical training. The project was created in 2009 by musician Renato Borghetti in southern Brazil. The research had the collaboration of five teachers who work on this project, and the questions of interest were: how are the teachers who work on this project chosen, how did these teachers form, when did they begin to teach diatonic accordion and where comes the knowledge necessary to teach these classes. The case study was adopted as a methodology (YIN, 1994; FONSECA, 2002, PASSERON and REVEL, 2005; GOMES, 2008). This research is aligned with the sociology of music education and has as theoretical references authors who discuss the importance of personal and professional trajectory in teacher training (ISAIA, 2008, 2009; NÓVOA, 1995, 2007, 2012, 2017). The results revealed that the beginning of the career of the diatonic accordion teacher can occur in an unpretentious way, due to different events that arise as challenges. The *Fábrica de Gaiteiros* project works in contextual terms as an umbrella under which the teachers who participate in this research develop in their interaction a pedagogy of their own that is focused on the instrument. The diatonic accordion instrument and the project modify the ways of being a music teacher. The work contributes to a broader view of the formation and performance of the accordion teacher, to understand the strategies that are used to maintain the teaching and learning of an instrument such as the diatonic accordion and to understand the ways of being teacher in the area of music and to rethink the teacher's career in the context of academic training in music.

Can the Iron Law be Broken? Network Movement Parties As a Democratic Collective Subjectivity

This work aims to reintroduce the debate of político parties as a legitimate medium between society and State in contemporaneity. The main issue is how the emergence of new modes of organization, based on networks, could break Michels' Iron Law of oligarchy. His classical study on political parties has been a paradigm that undermines radical democratic idea in mass political organization. Even the movement party can lose their ties when incorporated in institutionalized political logic. As State and parties still seem vital for contemporary political scenario, embedded in political modernity's imaginary, this paper aims to comprehend new ways in which new activism organization has modified their classical intermediary structures between politics and society like the party. The main theoretical issue is how power has been distributed in comparison between the state organized society toward today neoliberal network society. For this purpose, this work mobilizes Domingues' collective subjectivity theory applied to economic

system and Rodrigo Nunes' distributive leadership concept. The first one faces that a new modernity turn has made possible economic changes from a hierarchy/command collective subjectivity towards a more networks/volunteers one, affecting the intentionality and centralization of the collective subjectivities like parties.The second gives some powerful insights in how leadership emerges and is legitimated in network-movement subjectivity. In this regard, Podemos' rise and fall - the nospanish movement party- will be analized as a case study to rethink the processes and limits of such strategy.

FERREIRA, DANIEL* (Insituto de Estudos em Sociologia e Política - UERJ, Brazil)

Network Society's Modern Prince: How Network Structure Can Reinforce the Organization of Movement-Parties.

This work aims to reformulate the debate of parties as a legitimate medium between society demands and State in contemporaneity. The main issue is how the emergence of new modes of organization, ones that are based on networks, could break Michels' Iron Law of oligarchy. His classical study on political parties has been a paradigm that undermines radical democratic ideas in mass political organization. Even the movement-party can lose their ties when incorporated in institutionalized political logic. An exemplary case is the Bolchevique political party. As we are still embedded in political modernity's institutions and imaginary, the modern prince is still a party, because that is the main way - however not the only one - to storm into the State's gate. But Gramsci's jacobinism formula, in the present day, has to be canalized in a much more complex network-like society, based on New Information and Communication Technology - NICT. The main theoretical issue is how power has been distributed, contrasting the state-organized society with today's neoliberal network society and how it affects movement-parties legitimation. For this purpose, this work mobilizes Rodrigo Nunes' distributive leadership concept as the key to rethink leadership role in mass movement. It considers three dimensions: (i) network-movements are based on mass self-communication; (ii) it lacks a large intermediary chain, thus enforcing leadership; (iii) leadership is legitimized in their role, creating a more open system. Party organization has always lacked all of these aspects, but recent approaches have tried to embrace these more auto-organized forms. In this regard, Podemos movement-party's rise and fall and Chilean Frente Amplia arrival will be mobilized as a case studies to rethink these radical democratic processes and their limits.

Os Efeitos Diferenciados Da Segregação Social Em Recife e São Paulo

Este artigo apresenta um estudo comparativo sobre as características das estruturas sociais de dois contextos urbanos brasileiros (Recife e São Paulo), marcados pela expansão do sistema de ensino ocorrido nas últimas décadas. Com base nos dados estatísticos produzidos pelos censos do Instituto Brasileiro de Geografia e Estatística (IBGE) de 2010, o objetivo deste estudo é examinar, no espaço social dessas cidades, a distribuição dos grupos sociais em relação à escolaridade. Mesmo partindo de um conjunto relevante de indicadores objetivos, como as características sociodemográficas e de infraestrutura pública, também foram mobilizados indicadores relacionados ao sistema educacional. Consideramos um continuum que vai do abandono precoce ao investimento escolar mais forte, como o acesso ao ensino superior.

O estudo faz uso da Análise de Componentes Principais (ACP) para cada uma das duas cidades. A escolha de um conjunto de variáveis equivalentes para as duas cidades permitiu revelar as complexas relações entre as condições objetivas de vida da população e a escolarização. O primeiro eixo da análise corresponde ao desenvolvimento humano, em que a longevidade, a renda e o nível educacional da população estão fortemente correlacionados.

Tanto no caso de Recife quanto no de São Paulo, o segundo eixo é resultado da forte correlação entre a posse de um diploma do ensino médio e a presença de investimentos em infraestrutura pública. Em Recife, o segundo eixo diz respeito somente a alguns bairros da cidade. Já, em São Paulo, observavamos a mesma correlação com a peculiaridade de ter um conjunto maior dessas posições sociais intermediárias. Essa diferenciação de posições sociais entre uma cidade e outra, deverá ser objeto de um pesquisa etnográfica posterior buscando a compreensão dos mecanismos sociais em ação em cada uma das cidades.

The Unreality of Reality: The Political Uses of Virtual Social Networks in the Post-2016 Brazilian Electoral Context and Their Role in the Decline of Traditional Media and Information As Truth

The falsification of the real in the virtual contexts of social networks and social media in general over the past three years has created an environment of constant mistrust that drives individuals to hatred and beliefs that de-legitimize science, knowledge and democratic institutions. The online world of the Internet, which was born as an information and knowledge propagation mechanism, in its beginning, has changed and transformed itself into a space for the promotion of an individualism and an aggressive self. The Brazilian social reality and the mass use of smartphones (where most web accesses occur) has just been reconfigured, allowing this self to establish itself as a being, and thus becoming a *homo panopticus*. With this, the digitization of social life and the virtualization of beings, coupled with the excessive consumption of information, made a form of existence, produced gaps rather than approximations. From that moment, a cyber-voter, who personalizes his vote, going beyond a traditional militancy, was born as active in virtual social networks and new meaning the use of online. Through this standard, and the uncritical consumption of information, whatever it may be, with this cyber-electorate, came the potentiality of using false news and its consequences as political motivators. In this sense, in the last election, 2018, rumors, lies, and false news were used as truth and believed to be real. In addition, there were constant contests about what was conveyed, generating discredit, disbelief, scorn and hatred against contrary opinions, further pushing away democratic debates. With this, the traditional Brazilian media (radio, newspaper and television), the latter, which had to digitize itself, eventually generated a paradox between the virtual real, which made the truth become a belief and tool to be manipulated by political devices.

Make This PAIN Stop !: Sickle Cell Disease and the Fight for Care

One of the first genetic diseases discovered in the world was sickle cell disease. Until the 2000s in Brazil, there was little interest from the medical sciences in researching, instituting protocols related to the disease. The disease has an incidence of approximately 90% in black people. The black and black women's movement has, since the 1970s, placed sickle cell disease (SDC) as a disease of incidence in the black population and portraying racism in the country. As a result, from the 2000s onwards, public policies aimed at health care for people with SDC were claimed. Along with the mobilization of the black movement entities, there was an intensification of the protagonism of people with translated DF, mainly by the creation of associations of people with SDC. The protagonism took place through various mobilizations, but above all through participation in scientific events, institutional events and social control instances of the Brazilian health system. The analytical and theoretical proposal will be based on the Foucaultian framework, focusing on genealogy, which seeks to unveil the conditions that enable the transformation of knowledge into a strategic / political device (knowledge-power), through a historical analysis of the conditions that made possible the emergence of a discursive subjectivity. As a question, how is the fight for care focused on DF in Brazil? And how does the struggle undertaken by black movement entities that occur at the macro level enable the emergence of micropolitics by the support networks of patients with SDC? The main objective of the thesis is to realize a genealogy of the fight for care directed to the SDC. As well, to analyze the relations between the struggle initially undertaken by the black movement entities and associations in favor of health policies aimed at people with SDC, the production of discursive subjectivities.

The Climate Change Multilevel and Multistakeholders Governance Challenge in Brazil (The case of São Paulo State)

Most of the literature on climate policy is occupied by research on global and regional levels of governance, focusing on norms, rules and decision processes regarding the international climate regime (Betsill and Bulkeley, 2007; Okereke et al, 2009). Despite these necessary contributions, taking account the local dimension of the theme is also relevant, since most human activities that contribute to global climate changes take place at this level and, at the same time, this level is the most affected by the impacts of these changes . This paper will present and analyze the profile of policy responses in Brazilian national level and subnational

governments to climate change and to what extent these policies dialogue at the different levels (federal, state and municipal) and across sectors and stakeholders. To achieve this goal, in addition to the relation between National Policy and State Policy, we will analyze in depth 5 case studies in Brazilian medium cities in São Paulo State.

The paper will investigate the following questions: What are the key actors that influence position of local vis-à-vis ambition level on adaptation under the Paris Agreement (e.g. government/state bureaucracy; business; civil society; political parties; 'policy entrepreneurs'), and what are their interests/incentives and normative orientations? What domestic and international factors (e.g. price signals, membership in 'international clubs', norms, and international incentives) affect positions of the actors and what are the key levers and barriers to ratcheting national ambition? What are the implications for governance of ambition, i.e. ability of cities to take strategic decisions in respect to ratchet of ambition and to coordinate/mobilize action from other actors? What is the potential for transformative partnerships for raising ambition?

The Role of Indigenous Grassroots Organizing in Contesting Climate Change and Heteropatriarchy.

Neo-colonial practices embodied by nation-states like Canada and the United States continue to profoundly inform the displacement and dispossession of Indigenous communities throughout Abya Yala. This talk will explore the ways the government of Brazil actively participates and engages with neo-liberalism through the endorsement of resource extraction and agribusiness. From our perspectives, a displaced Amazonian queer woman living in Winnipeg, Treaty 1 territory and a queer Indigenous Boe (Bororo) from the Meruri Community located in Mato Grosso do Sul, we will discuss how colonial violence, which has escalated since President Bolsonaro inducted into power, intersect with violence against our bodies, nations, and lands. Through our lived experiences, we are interested in exploring how the interplay between the global and local colonial projects have shaped the current (chaotic) reality for Indigenous peoples in Brazil. The world turned to the Amazônia in August 2019 as the forest was in flames, but how does this physically impact the communities who rely on the land for livelihood and sustenance? We will also discuss the role of Indigenous grassroots organizing in contesting climate change and heteropatriarchy. We hope to draw parallels, buDild political alliances, and strengthen a solidarity movement beyond state borders. We believe that our collective experiences under colonial regimes can disrupt colonial narratives and allow for a more fluid understanding of Indigenous experiences across Abya Yala.

FERRER, ANA MARÍA* (Universidad de Santiago de Chile (USACH), Chile)

Diversidad Económica y Capital Social En Las Redes Apícolas Chilenas e Internacionales.

La presentación se basa en los avances de tesis doctoral que estudia la diversidad económica y el capital social en la apicultura chilena.

La polinización es una actividad de la apicultura asociada al cuidado del medio ambiente por el rol de polinización que cumplen las abejas (Bradbear, 2009). Se identifican dos tipos de práctica polinizadora: una comercial y una doméstica, lo cual sugiere que no toda la actividad apícola está enmarcada en acciones de maximización de la utilidad o beneficio y reducción de costos como la teoría del *rational choice* plantea.

El enfoque de los sistemas socio-ecológicos (Anderies et. al, 2004), (Janssen, et. al, 2006), (Ostrom E. , 2009), plantea que las interacciones se producen no sólo entre humanos, sino también entre humanos y especies. Ostrom (2000), demuestra que la acción colectiva no solo funciona con lógicas egoístas de maximización del beneficio por lo que no todos los sistemas autogestionados derivan un colapso como Hardin (1968) planteó. La autogestión de los recursos de uso común es posible gracias al capital social. Se analiza cómo funcionan la confianza, cooperación, reciprocidad e intercambio en la actividad apícola chilena. Los casos de estudio son las redes de apicultores chilenos. Se identifican además, dos organizaciones apícolas chilenas, la Federación Latinoamericana de Apicultura (FILAPI), y a la Organización Mundial APIMONDIA.

Los dos tipos de polinización, apuntan a una diversidad de relaciones entre apicultores y demás actores de la actividad apícola. El estudio de la diversidad económica apícola podría explicar, ¿cuáles y cómo son las interacciones que se producen entre subsistemas en la actividad apícola?, ¿qué tipo de resultados se producen de las interacciones en función del tipo de actividad apícola desarrol-

lada? Siendo que la polinización permite el cuidado del medio ambiente, ¿está la actividad apícola motivada hacia el mantenimiento de la biodiversidad del ecosistema natural?

Risk Work in the Field of Mortgage Lending in Denmark: An Explorative Analysis

In this paper we are presenting the findings of the analysis of work practices in the context of mortgage loan applications. Here financial risk is handled and managed in several ways, both in relation to the loan applicant and the financial organizations involved. The empirical analysis is based in three qualitative case studies of local mortgage lending practices, all of which are based in rural areas, which in this context can be characterized as "high-risk" due to property market dynamics. The latter enables specific insights on practices of risk evaluation in "problematic" locations. In particular the analysis of qualitative interviews with the two groups of professionals that are specifically involved in this particular risk work in all three cases are included; i.e. bank consultants, responsible for evaluating the risks concerning the personal economy of the loan applicant and evaluation consultants, who are evaluating risks in connection with the property in question. In the context of the institutional and organizational background we will discuss the role of new regulations after the financial crisis, quantification, digitization and financialization of evaluation for risk work in this field.

To be or Not to be Anxious: How Parents Responded to Health Risks during the COVID-19 Pandemic in Denmark

This paper investigates how parents of children in primary school dealt with anxiety in the context of pandemic health risks during early stages of the COVID-19 pandemic. In Denmark, this group found itself at the frontline of the reopening after an early lock-down. Creches, kindergartens, and primary schools were among the first societal institutions to reopen, with the youngest pupils in primary schools to return first. This had been discussed controversially among parents, and one day after the announcement of the reopening a Facebook group called "My child should not be a guinea pig for COVID-19" had emerged. In this paper, we are analyzing how these and other parents dealt with this situation, based on qualitative interviews with 30 key informants (parents and teachers) supplemented by a qualitative survey filled in by 31 parents, collected during the first re-opening phase (April – July 2020). Our findings indicate several types of strategies of dealing with anxiety and risk, namely some that involve trust (1), especially in schools and teachers, enabling the parents to overcome their anxiety related to sending their children back to school, and others, that are not primarily built on trust, but rather on ignoring the anxious "gut feeling" (2) and resisting strategies (3) either in an overt (openly criticizing the re-opening) or hidden (e.g. keeping the child home sick) way. As our sample included a group of asylum seekers, our findings also indicate that patterns of exclusion in the context of an universal welfare state and a society characterized by comparatively high equality might mean a limitation of possible strategies, as e.g. resisting strategies appeared to be out of reach for that particular group.

The Role of Religion As a Moderator of the Impact of Childcare Reforms on Maternal Employment

Over the last decades, the share of women in the workforce has increased in many developed countries (Ortiz-Ospina & Tzvetkova 2017). But still, in many of them gender employment gaps are significant, particularly among parents of preschool children (OECD 2019). One of the major solutions to low participation of mothers in employment has been the provision of formal public childcare. The impact of public childcare on maternal employment has been already widely studied (see e.g. Schober and Schmitt 2017; Haan and Wrohlich 2011; Havnes and Mogstad 2011). The effects found differ significantly across societies, but not

denotes a presenting author. Abstracts are organized by first presenting author's last name.

much of an explanation for this has been proposed so far. At the same time, there has been growing body of literature that highlights the importance of the cultural context for maternal work engagement (see e.g. Kurowska and Kocot-Górecka 2013; Pfau-Effinger 2005, 2004; Pfau-Effinger and Smidt 2011; Fernandez 2011; Matysiak 2011; Kotowska 2009; Austen 2000). Nevertheless, there is little research on the moderating role of cultural context for the effects of childcare reforms on maternal employment. In our research, we focus on the role of religiosity of the local social environment in which mothers live, for the effects of recent childcare reforms in Poland (2009 & 2011) on maternal work engagement. We discuss the theoretical causal mechanisms between the local religious context and the impact of childcare policy on women's employment. For the empirical analyses we merge Generations and Gender Survey data for Poland with religious data for all parishes in Poland, provided by the Institute for Catholic Church Statistics. We apply sharp regression discontinuity design to address the causality issues. Our preliminary results show that the more religious the local social environment is, the weaker is the effect of the childcare reform on maternal employment.

La Dialetique De La Production Du Savoir : Les Parcours Croisés Et Les Expériences Française Et Latino-Américain De La Sociologie Du Travail

Cet exposé analysera les échanges et l'importation de concepts, de catégories et de modèles théoriques de recherche survenus dans le champ de la sociologie du travail pendant les années 1950 et 1960. On passera par trois moments de la constitution de cette discipline que sont : la sociologie industrielle américaine (Elton Mayo), la sociologie du travail française (Georges Friedmann, Alain Touraine) et la sociologie du travail de l'Université de São Paulo (Juarez B. Lopes, Fernando Henrique Cardoso). On mettra l'accent sur les processus d'assimilation et sur la critique de ces derniers, notamment les dialogues et les parcours croisés entre les auteurs impliqués. On montrera aussi que la critique de la tradition structuro-funcionaliste de la sociologie américaine a été le point de départ aussi bien des sociologues français que des sociologues brésiliens. Ceux-ci ont tenté d'interpréter le monde du travail à partir de l'historicité de leurs pays et des conflits sociaux. Ces académiques ont fini par établir un dialogue intellectuel et une fructueuse réflexion sur le processus de modernisation du capitalisme occidental. A partir de l'analyse sistématique des ouvrages des auteurs impliqués et des recherches dans diverses archives en France et au Brésil seront mis en valeur les recherches et les projets en commun de ces groupes d'intellectuels. Enfin, cet exposé soutiendra que cette relation franco-latino-américaine s'est passée de forme dialectique et non pas par une simple imposition du centre à la périphérie.

Crowding out Local Initiative in the Protection of Regional Agri-Food Specialties: The Growing Hegemony of Sui Generis Geographical Indication in East Asia

The growing popularity of Geographical Indication (GI) in Asia suggests that national governments are taking more seriously the protection of their regional specialty agri-food products. Although the impetus for this most recent shift can be traced back to the binding Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS), many countries have gone beyond the basic requirements of TRIPS by adopting more strict *sui generis* (or European-style) GI policies and promoting these enthusiastically. Japan upgraded a collective trademark GI to *sui generis* GI with great fanfare in 2015 and signed a trade deal with the European Union to ensure mutual protection of GIs. China, Thailand, Cambodia and Vietnam have moved rapidly to harmonize with the European Union to enable cross-listing. Although there are notable differences in policy language and implementation, most countries have basically embraced the overall framework of GI as a primary method of protecting agri-food specialties. Have countries simply recognized GI, adapted as much as possible to local conditions, as the best way to protect and promote local products or are governments compelled to do so by the increasing soft power of the EU model? In this paper, I document how the progressive alignment with *sui generis* GI has crowded out some national standards and other comparable initiatives in East Asia, while also erecting a post-colonial discourse of agri-food protections that implies the superiority of a European model and access to European trade markets. I conclude that, while the *sui generis* GI model is malleable enough to be adapted to different agro-ecological and cultural contexts, it implies a renewal of certain hegemonic trade relations and the suppression and/or pre-emption of alternative standards.

FEUER, HART* (Kyoto University, Japan)

Educating to Navigate Food Futures: Food Literacy and the Role of Personal Agency in Agri-Food Systems

Agri-food scholars have moved away from blaming victims for poor health outcomes in contemporary food systems, but the increasing focus on structural and macro-level factors has distracted attention away from the potential of personal agency. The Covid-19 pandemic, which has witnessed a rise in home-cooking, fermentation, home gardening, and other self-sufficiency activities, is evidence that personal agency is not eradicated by oppressive food system conditions, but rather lies dormant. Food literacy scholars should see in this crisis a chance to re-assert the value of cultivating active and passive food skills *that match the challenges facing consumers in contemporary agri-food systems*. In turn, there is an opportunity for researchers of structure-side topics to let the pendulum swing back a bit and remember the pervading nature of education, particularly calibrated to prevailing structural factors. Doing so would also be a chance to integrate more fairly the experiences of peoples in less-industrialized food systems at the early stages of the agri-food transition, for whom there is a greater need to charter forward-looking agri-food pathways, rather to dismantle of existing hegemonies. Through a contrast of food education trends in Japan and Cambodia, I demonstrate that the advent of the food literacy paradigm represents a sharp break from the previous century's misogynistic and misguided attempts in food education. In Cambodia, food literacy immunizes against the most egregious elements of the modern agri-food transition but further legitimation of food skills is needed to engender imaginaries of alternative food futures. In Japan, food literacy encourages the politicization of the food system and diminishes the effectiveness of disempowering influences, such as food marketing, artificial additives, and deceptive labeling. Food education pedagogy for young children must transcend formal contexts (i.e. schools), but food literacy must be systematically benchmarked and diagnosed to identify and proactively resolve evolving food skill impediments.

FIEDLSCHUSTER, MICHA* (York University, Canada)

From Dissident Culture to Transnational Civil Society in Eastern Europe?

The dissident culture and mass protests that lead to the regime changes in 1989-1991 in Central and Eastern Europe attracted a lot of scholarly attention. Soon after, however, scholars noticed a retreat into the private, entrepreneurism, low civic organization and a professionalization of activism (NGO-ization) in many post-socialist countries. This seemed to be against the global trend of the rise of the 'movement society,' transnational social movements and global civil society in the 1990s onwards. Petrova and Tarrow (2007) have argued that the picture of low mobilization in Eastern Europe might be partly distorted by the choice of methods and research perspective (focus on the individual level and neglecting the relational dimension of activism (the ties among social movement organizations, relations to the state and other organizations)).

A related issue remains largely unstudied as well: the transnational dimension of contemporary activism in Eastern Europe, which is often reduced to international funding or the impact of EU-Europeanization.

This presentation will propose a research agenda for the study of transnationalization processes of social movements in post-socialist Eastern European countries by considering key transformations from dissident culture to contemporary transnational activism in the context of the role of the EU and EU-based transnational civil society organizations (CSOs). Going beyond the NGO-ization thesis (Saxonberg and Jacobsson 2016) this presentation asks in how far and in which (different) ways the Eastern European social movements engaged in transnationalization processes. What are the predominant modes of co-operation? Do they participate in transnational self-organized civil society spaces such as the World Social Forum? Can they influence the multilateral negotiations between the EU and their governments? The political context of post-socialist countries (recent democratization, neoliberal restructuring and hybrid authoritarianism, geopolitical location between the EU/the West and Russia) can help to renovate the conceptual apparatus of Western social movement studies.

FIEDLSCHUSTER, MICHA* (York University, Canada)

The Challenges of Democratic Political Agency in the World Social Forum

The World Social Forum (WSF), which takes place regularly since 2001, is an experiment in democratic social movement organizing in a global context of high social and political inequality and differing opportunities of collective organizing at the transnational level.

After almost two decades, scholars and activists alike are divided about the legacy and prospects of social forums. Many praise them as important schools of

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

(transnational) democracy and tools for mobilization from the local to the transnational level. Others criticize them for being mere 'talk shops', lacking concrete results and for being places of co-optation by hegemonic forces (e.g. neoliberal market norms, global governance regimes or political parties).

Like many other social movement initiatives, the WSF operates within the tension of doing prefigurative politics (i.e. organizing according to the principles advocated in the external environment) and providing an open space on the one side, and the political, economic and organizational diversity among the participants, and the need for a good working relationship with existing institutions on the other.

Based ond the empirical work of the author, the presentation will outline the multidimensional issues of political agency in the WSF: How has the relationship between the WSF, institutions, and new modes of mobilization and organization changed over time? I will critically assess the reform attempts that have been made to make the WSF more inclusive, less prone to commercialization and commodification, and more attuned to newer mobilizations (Occupy-type and climate change movements etc.). I will argue that while the WSF has been and still is an important tool of the alter-globalization movements, its organizers so far missed to adapt it to the democratic expectations of many participants; new modes of mobilization; and persistent challenges of inequality and power differences among the (old and new) participants.

RC33-JS-15.2

FIERRO, ALBERTO* (, Hungary)

A Gramscian Theoretical Framework for Activist Research

There exist a number of differences between 'traditional' and 'activist' research: first, the engaged scholar does not research *about* something, but instead *with* someone. Second, s/he lives a split identity: on the one hand, s/he conducts academic work, on the other hand, the *activist* researcher (in)directly engages in political activities. Third, s/he hopes to produce a knowledge which – by itself – is useful for activists' goals.

However, as within other paradigms (positivist and constructivist), activist researchers' suggestions on how to think ontological and epistemological problems have been mostly directed to methodology (see Hale 2008). Through an analysis of existing debates on engaged scholarship's practices, this paper shows the need of a theoretical discussion on two related issues. The first concerns the limits and possibilities of imagining *political* research, i.e. knowledge which is itself progressive. The second issue stems from the first and it tackles epistemological problems of activist research: how to develop 'scientific' political knowledge?

This paper argues that Gramsci's work orients these theoretical issues by locating the activity of intellectuals within social relations, explicitly connecting knowledge production with capitalistic socio-economic structure. Moreover, a Gramscian understanding of the political nature of knowledge – as illustrated by Kate Crehan – suggests that transformative movements and their narratives originate from the lived experiences of subaltern classes. Thus, it is possible to conceive an 'activist epistemology' according to which scholars translate those subaltern practices into critical analyses. The present article enriches current debates in the social sciences by developing a theoretical framework which looks at activist research's objectives (developing *political* knowledge) and function (supporting the struggle of subaltern classes).

Teenagers in Uruguay: Fractal Marginalization of Expenditure?

In Uruguay, 90% of Public Social Expenditure (PSE) for adolescents due to their condition of being young goes to education policies (Mides, 2018). However, access to educational centers by this population presents deep structural inequalities: while a sixth of adolescents in homes of the first income quintile do not attend educational centers, only 2% of those in the fifth quintile do not (ECH, 2016). As a counterpart, the appropriation of PSE by adolescents is also uneven. Therefore, what happens to private household spending? What proportion do teenagers receive? In which areas of economic activity is it spent? Are there structural inequalities? These are the questions that the paper addresses.

Based on the information provided by the National Survey of Household Expenditure and Income (INE, 2005/2006), the level and composition of private spending is analyzed according to: (1) the presence of adolescents in the home; (2) the household composition based on its members' ages; (3) the household income levels; and (4) the characteristics of the expenditure allocated to education.

The paper concludes about the existence of differences in expenditure's level and structure according to the household composition and income levels. In particular, the presence of adolescents in the home implies a significant increase in private spending on education. However, this increase is observable only among the wealthiest households. These findings show a double marginalization in the appropriation of spending (both public and private) of adolescents with lower incomes who do not have access to the educational system.

FILGUEIRA DE ALMEIDA, DULCE* (University of Brasilia, Brazil)

The Body on the Donald Pierson's Thesis "Negroes in Brazil"

This article aims to present results about the concept of body on the Donald Pierson's thesis "Negroes in Brazil". For this purpose, bibliographical and documentary research was developed using archives from the University of Florida, United States and the book Negroes in Brazil. Donald Pierson (1900-1995), lived in Brazil between 1937 and 1957, was responsible for a racial and man conceptions, constituting one of the first comphreension of the body in Brazil. To build the analysis we used authors from the sociology of the body, such as David Le Breton (2006) and Thomas Csordas (2010), as well as authors from the Brazilian Social Theory, who helped us to understand the historical context of the Pierson's work. With the goal of discovering points of contact between the beginning of the sociology of the body in Brazil and the presence of foreign authors there, it became evident that, the North American school of Chicago, particularly Donald Pierson, greatly influenced our formation.

FILHO, LUCAS* (LA SAPIENZA University of Rome (ITALY), Italy)

Overabounding and Social Action: The Case of Restorative Justice.

For a long time, the concept of "love" was limited to the private field of individual life and its social dimension was little analysed. The classics of Sociology (Weber, Simmel and Sorokin) have recognized love as a reality that generates, develops and revives social bonds, renewing human relations. Continuously present in the overall set of systems of action and interaction in social reality, the existence of social love, "however modest it is, is far from negligible" (Boltanski 2005). In the fundamental intent of science to produce assertiveness and links between phenomena of reality with a reasonable claim to impersonality, to discard a reality present in society, however discreet its presence could be, would mean the negation of science itself.

We propose to study social actions and interactions characterized by surplus, unconditionality, non-instrumentality, dialogue and generativity, connecting them within the conceptual umbrella of love. Starting from this conceptual basis, the aim is to analyse surplus phenomena as specific forms of public sociality and agents of social cohesion.

The theoretical framework will consist of texts by classical and recent authors from the disciplinary field. The specific primary methodological contribution will be the conduct of research focused on the case study of restorative justice. Restorative justice is based on a strongly relational approach, in addition to the formal one, and on the careful consideration of the damage done to people, involving perpetrators, victims and the community in order to find possible solutions that will reduce or resolve the conflict, as well as to build peace from dialogue and mutual recognition. Considering its constituent characteristics, it is legitimate to envisage significant links between the Restorative Justice (in its course of research) with Social Love. The survey will be carried out with a qualitative approach within the framework of the theoretical reflection on Social Love.

What Influences Immigrant Voting? Integration and Voting Practices Among Immigrants in Chile.

What are the "integration" markers that might influence an intention to vote? Using data from an online survey responded by immigrants in Chile (2017), our objective is to analyze whether there is a relation between this intention to vote and an immigrant's integration to Chilean Society. We review the most common integration theories, such as Alba and Nee, Chiswick, Portes and Zhou, among

others, to define a set of variables that are traditionally associated with immigrant integration. We explore which of these variables better explain our dependent variable of intention to vote.

The EU and Child Rights Governance: Legal Constraints, Critical Views, and Future Orientations

It is only in the last fifteen years that growing interest has developed on the role that the EU can play in promoting children's rights and interests across its Member States. After the Lisbon Treaty, there have been many changes both institutionally and legally. However, the problem is the EU as a non-state actor in international politics cannot ratify the UNCRC. Thus, the EU promotes the UNCRC values indirectly and has limited enforcement on its members. This situation limits the mainstreaming of children's rights at the EU level and unfortunately, obstruct children to reach their participation rights as whole citizens (UNCRC, Article 12). By referring to the existing actors (e.g. ENOC, Eurochild, children's councils, and parliaments, etc.), the paper aims to show the critical debate on the views of these child rights governance (CRG) mechanisms which apply the top-down processes of socialization and adult-led policy-making. Thus, the paper presents a complementary bottom-up conceptual framework which offers to integrate "children's lived citizenship" as a starting point to policy-making processes with and for children to show its importance. Such a view is focusing on the geopolitics of everyday life and considers children as capable agents acting alongside with the other members of their communities (Kallio & Häkli, 2010). For the future orientations, it is speculated that while legally the best solution would be of the accession of the EU to the UNCRC (which could ensure the Committee on the Rights of the Child to make recommendations to the EU and to establish independent monitoring mechanisms on children's rights), it is of the same importance to consider children's rights indicators (further developed Eurobarometer with qualitative and non-traditional methods) and thus children's lived citizenship in order to enhance the inclusiveness of the existing governance mechanisms.

Representations of Violence on Twitter: The Case of the Hijack in the Rio-Niterói Bridge

Researchers in the field of sociology of violence (e.g., David Garland, José Vicente Tavares dos Santos, Alex Niche Teixeira, and Enio Passiani) have addressed the theme of representations or figurations of violence in traditional media, such as literature and television. They commonly agree that there is a dramatization of the phenomenon associated with the context of late modernity. This paper seeks to understand the representations of violence on new social media by focusing on highly resonated events on Twitter. Social media now disputes popularity with traditional media and motivates new types of concerns, such as the discourses of the social actors themselves, whose, opposed to institutional dimensions, directly express their world-views in these new spaces. Given the characteristics of the object - dramatization and emotiveness - the fields of sociology and anthropology of emotions have significant potential to help the understanding of this phenomenon, especially emotions like disgust and compassion, which reveal hierarchies, boundaries, and moral rules. For analytical purposes, this paper adopts the contextualist perspective, inspired by the Foucaultian notion of discourse, focusing on the micro-political dimension of emotions, i.e., how they reveal aspects of social structure. The empirical object is the recent case of the bus hijacking at the Rio-Niterói bridge: a highly media covered event that ended up with a sniper killing the hijacker. Several terms became Twitter's Trending Topics and twelve of them were selected and collected with RStudio software, reaching about 33 thousand tweets on the day of the incident (August 20, 2019). The results of a preliminary content analysis performed with the aid of NVivo 12 software will be presented and discussed.

FISHBERG, RACHEL* (Roskilde University, Denmark)

Beyond Methodological Nationalism? Using Institutional Ethnography to Study Scholarly Practices in Transnational EU-Funded Social Science Projects

Since the launch of European "Framework Programmes' in 1984, The EU has systematically allocated increased policy attention and funding to science and research innovation (Heilbron 2014; Heilbron et al. 2018). These targeted changes in research management and ideology, in concert with national and institution-

al management demands on scholars to be 'entrepreneurial' and 'international,' contributed to transformations in modes of knowledge production for scholars in Europe (Deem 1998; Fleck and Hönig 2014; Deem 2006; Shore and Wright 1999).

In order to participate in social science knowledge production at the European level, scholars interact with a number of intersecting institutions at the transnational, national and regional scales. These institutions, in addition to cultural, linguistic, and disciplinary norms, work to coordinate scholarly practices and shape the epistemological trajectory of the European social sciences. In my PhD-research, I take an Institutional Ethnographic (IE) approach to study a transnational field of European social science knowledge production from the perspectives and practices of scholars collaborating in EU funded projects. Specifically, I explore how scholars participate in the multi-scalar social spaces (national, institutional, disciplinary) involved in transnational EU project collaboration and knowledge production.

IE is useful for highlighting the coordination of social relations, both locally and trans-locally. However, much of the work utilising IE remains within a national context. In the case of European social science research, institutional systems are complex, and working with IE involves policy, actors, and institutional and disciplinary norms that cross borders and nospan regions. With this paper, I will give insight into the potential benefits of working with transnational multi-sited IE. Additionally, I will discuss a number of ongoing methodological challenges in working with a highly geographically and politically dispersed field.

Trade Unions Under Austerity: Labour Activism in the Post-2015 Automobile Sector in Argentina

Since 2015, with the electoral victory of Mauricio Macri, Argentina has experienced deep cuts in social spending and attempts to impose a regressive – and deeply unpopular – labour reform. Wages have stagnated as inflation has skyrocketed and the private sector – particularly domestic industrial production – has entered a deep and sustained period of crisis. In this paper, we examine how these effects of austerity in Argentina have impacted the capacity of labour activists to organise and mobilise against these changes. Drawing on data from semi-structured interviews with trade union officials, union members and dissident current and former union activists, the paper assesses recent experiences of labour organising in the automotive sector. Workers in this sector are represented by powerful, well-organised trade unions (SMATA and UOM), which regained substantial political influence during the prior period of union 'revitalisation' and rapid state-supported growth, securing wage growth but worsening working conditions (Santella 2015). In recent years, however, collapsing domestic and international demand has seen production fall dramatically, with plant suspensions and closures increasingly becoming the norm. Thus, the paper analyses the extent to which the 'creativity' of capitalism – exemplified by these combined crises – has been matched by the creativity of workers to contest and confront its deleterious effects (see Flesher Fominaya & Cox 2013; Fishwick and Connolly 2018; Nowak et al. 2018). In what ways have the changes to "labour and life" (Lazar 2017) stymied or revitalised organisation and mobilisation? How far can the existing organisational structures of the trade unions respond to these new conditions? And to what extent can union activists drive new dynamics of organising and press new demands that exceed the bounds of the workplace?

FITZNER, CINDY* (Berlin Social Science Center, Germany)

The Impact of Family Life on the Educational Achievements of Children

Educational success depends on a variety of factors, most of which are deeply embedded in the families in which children grow up (Hillmert, 2010). So far, there has been little research on the influence of family form on educational outcomes, beyond the consideration of divorce (Amato, 2010; Fagan und Churchill, 2012). In general, inequality research should pay more attention to the implications of diversity and the dynamics in family forms (Bernardi et al., 2013; Kreidl et al., 2017). Also, researchers have barely investigated the association between the quality of relationships within the family (climate) and educational outcomes. It is vague to what extent differences in the family climate can explain differences in educational outcomes despite similarities in family form (Amato et al., 2015; Kreidl et al., 2017). The interaction of family form, family resources and the quality of relationships has barely been investigated, mainly due to a lack of data that allows researchers to include variables at the micro level in the analysis (Kreidl et al., 2017).

With my current project I try to contribute to closing this gap. Not only I take the family form, but also the family climate into account when looking at differences in educational outcomes (grades, competencies, educational aspiration) of students. In addition, the importance of resources within the family should not be neglected. A further aim is to investigate how the relationship changes as a result of a transition in family structure. In the session Social Stratification and Child Development at the ISA Forum of Sociology I want to present not only why

　　　　　*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

it is important to consider the interplay of different family characteristics, but also present first empirical results. In order to analyze the relationship, I am using the data of starting cohort 3 from the National Educational Panel Study (NEPS).

FLAM, HELENA* (University of Leipzig, Germany)

On Professional Organizations and Their Various Pursuits

By and large the sociology of professions has left out of its purview civil society as well as the mobilization of professionals and professions expressed in issue-related organizing. Yet as the presence of Doctors, Journalists, Chemists or Sociologists without Borders and of many other local, national and international professional organizations shows, professions have generated many associations, all apart from those representing their occupational interests. If so, they have to be conceptualized as contributors to civil society and the question about the history and nature of their contributions to civil society has to be posed. In reverse, the sociology of professions has to open up to the possibility that some "professional" questions and issues are in fact imports from civil society. We do not have to look far - the equality, gender and global justice issues constitute such imports in our own discipline, sociology. In my presentation I will propose a research program for exploring professional mobilization and the organizational forms it takes. I will also pinpoint a few strikes, demonstrations and sit-in occupations which disturb, if not fully destroy, our image of professions as neutral privileged occupational groups. Time permitting, I will speculate about how such activities affect the image and power of professions in contemporary world.

RC47-581.1

FLAM, HELENA* (University of Leipzig, Germany)

On Transgressive Court Cases, Lawyers and Social Movements

Research on social movements has ignored the role of professions, while the sociology of professions has excluded civil society from its purview. Both have focused on the interactions between their subject matter and the state or the market, but neglected the dynamic interactions between professional and movement organizations. Positing professions as "embedded" rather than as the "third societal force" and de-centering social movements establishes a theoretical ground on which to study the diversity of relationships which emerge between social movements, on the one hand, and professions - in this particular instance, lawyers and their organizations, on the other. The relationships between lawyers and social movements can entail successful cooperation, but at times social movements and lawyer firms or lawyer-led campaigns may come into conflict - as an US case will illustrate. De-centering social movements reveals that transgressive judicial case reviews were fought for and won in Hong Kong in the absence of a (strong, visible, mobilized, bottom-up) social movement support. It also allows one to see that in Japan (post-WWII generation of) lawyers took on cases leading up to judicial case reviews even when social movement mobilization subsided. In both cases one could say that lawyers rather than social movements held issues in abeyance.

FLECHA, AINHOA* (Universitat Autonoma de Barcelona, Spain)

The Experience of Mid-SES Roma Navigating the Healthcare System in the City of Barcelona.

Literature about cultural sensitiveness of the healthcare systems in Spain is still scarce, especially in relation to Roma population. The research presented here explores the barriers faced by Roma population when navigating the healthcare system through qualitative fieldwork developed in the city of Barcelona. The sample includes both end-users and professionals, all of them being mid-SES Roma individuals. Additionally, policy makers working in the field of Roma people, were also interviewed as key informants. Results point out a series of obstacles that prevent Roma population from fully accessing the healthcare system at two levels: the interaction with healthcare professionals and institutional arrangements. Regarding interaction, biased communication and mutual prejudices appear as relevant aspects, especially in the case of women, who feel they are often treated as children by professionals, limiting their access to quality information and, in consequence, compromising their capacity of making informed decisions. As for institutional arrangements, two facts appear as especially relevant. On the one hand, the need to increase cultural sensitiveness requires a better accommodation of the extended family within healthcare settings. On the other hand, the need to reconsider the institutional provisions when dealing with death. Roma community demands respect for their will of accompanying their relatives at all times during the last moments of life as well as the body during the first hours after death. These demands are being tackled by the *Integrated Plan for the Roma* in Catalonia in collaboration with healthcare and funerary authorities to foster the accommodation of Roma demands.

Uniroma: Roma University Students in Spain

Horizon 2020 Strategy of the European Commission, within the target in Education, fixes as a priority the icreasing of the youth population that completes higher education. In front of this objective, there are vulnerable groups that face greater difficulties both to accede higher studies as well as to complete them. The low proportion of Roma university graduates in Spain affects their social inclusion opportunities, hindering their access to employment, especially in qualified positions. This collective suffers from a multiple discrimination, both due to their belonging to an ethnic minority and due to their frequent non-academic background. In the case of women, they face gender discrimination in addition. In Spain, while research about the situation of Roma population in primary and secondary education has been conducted, studies focused on their experience in university are scarce. The present research analyzes the experience of Roma first-generation college students with the aim to identify the difficulties they face when studying a bachelor or master's degree and identifies measures that contribute to overcome those difficulties. The final aim is to formulate recommendations to orient policies addressed at increasing the graduation rates of Roma university students. and to improve their academic results and their graduation rates. The methodological design combines daily-life stories, discussion groups and a longitudinal study with Roma first-generation college students, paying special attention to the variation by gender and field of study. The fieldwork will be complemented with in-depth interviews to key informants. The present paper will focus on the results of the initial survey which will be administered to 200 Roma university students in Spain.

Accrediting Your Undergraduate or Graduate Program in Sociological Practice: A Workshop on Process, Benefits, and Outcomes By the Commission on the Accreditation of Programs in Applied and Clinical Sociology (CAPACS)

Professionalizing Sociology begins with the accreditation of a program in sociological practice (applied sociology, clinical sociology, engaged public sociology, translational sociology, and forensic sociology) by the Commission on the Accreditation of Programs in Applied and Clinical Sociology or *CAPACS*. Graduates of CAPACS-accredited programs complete a carefully designed curriculum, ensuring employers that they possess a full spectrum of knowledge, skills, and practice experiences that distinguish them from other job applicants. Creating a highly educated and trained pool of sociological practitioners furthers Sociology's professionalization, as these individuals possess educational qualifications, training, and field experiences to support their acquisition of association credentials in interdisciplinary fields such as behavioral health care, social service administration, criminal justice, forensic counseling, and public policy research.

Discourses on Favelas: Marielle Franco Favela Dictionary Project

Historically, the favelas have been seen from a negative and a priori point of view by public authorities, media, upper and middle classes. This prejudice shapes public policies directed at these territories in the case of security and access to infrastructure services, provided in a discontinued and insufficient manner. However, a diverse set of collective actors are each day more insisting on questioning the effects of this assumptions and its impacts on violations on the dwellers' daily lives. Our objective in this paper is to discuss the experience of the "Marielle Franco Favela Dictionary" project, created through the collaboration of a heterogeneous group of people - researchers, slum dwellers and activists. By gathering the knowledge (academic or not) produced about the favelas through ours own Wiki platform and through a collective construction, the dictionary seeks to disseminate other narratives about the favela populations, seeking to value their memories and experiences. We situate this initiative in a broader de-

bate on memory as a right to the city. Therefore, in the first session, we present a reflection on the right to the city, a polyphonic concept that, however, has been highly useful in urban struggles by social movements and organizations. In the second session, we discuss the pattern of urbanization in Latin America, in which due to the barriers to access property, the logic of necessity gives rise to the informal city, forgotten by the government and subjected to oblivion. We then deal with the history of the favelas in Rio de Janeiro, reflecting on how the meanings of identity and memory in these territories have been disputed. Finally, we present the relevance of the project, given the previous experiences of recovering the memory of the favelas, especially in a context of intensification of militarization and the increasing violence in the favelas.

La Identidad Docente y Sus Implicaciones Para La Eneñanza De Sociología En Educación Básica

Este artículo tiene como objetivo identificar y analizar la percepción de los profesores universitarios de grado de Ciencias Sociales de la Universidad Federal de Pernambuco (UFPE) sobre la identidad docente. Este profesional está preparando al maestro de sociología que trabajará en educación básica, así la cuestión de la identidad del maestro es fundamental porque es un educador el que está formando otro educador. Los ejes rectores serán: la percepción del profesor; la licenciatura en ciencias sociales; la formación de la identidad docente; La enseñanza de la sociología para la educación básica. Todos estos ejes son el resultado de las inquietudes y hallazgos derivados del proceso formativo y su correlación con la realidad brasileña y, específicamente, con la de Pernambuco. Se espera que esta investigación contribuya a la producción de conocimiento, no solo para el estudiante de la escuela secundaria, sino también para señalar los límites y el alcance de la formación del profesorado en Ciencias Sociales y así promover la democracia institucional. Se cree que el resultado de esta investigación puede responder algunas preguntas cruciales, tales como: ¿en qué medida la formación docente de la universidad prepara para el ejercicio de la profesión? Y además, ¿en qué medida esta misma educación puede explicar la realidad de los estudiantes de secundaria? ¿Cómo percibe el profesor universitario la licenciatura? Dado eso, la forma en que percibe el grado influye en su postura ética hacia la graduación. La metodología utilizada consistirá en la aplicación de un cuestionario semiestructurado para captar mejor la percepción de los encuestados. El público objetivo serán los profesores universitarios de la UFPE que enseñan para la licenciatura en Ciencias Sociales en el año escolar 2019.

La Organización Del Comité De Combate a La Megaminería En Rio Grande Do Sul

La extracción de carbón mineral para la producción de energía es considerada una actividad altamente dañosa al ambiente y a la salud. Algunos países han incluso empezado movimientos para cerrar sus minas de carbón, en una búsqueda por matrices energéticas limpias y renovables. En la región metropolitana de Porto Alegre, sin embargo, desde fines de 2018 se discute un proyecto de la que podrá ser la más grande mina de carbón mineral a cielo abierto de Brasil, la Mina Guaíba. En fase de licencia ambiental, el emprendimiento se caracteriza por ser una grave amenaza, porque se localizaría: a pocos kilómetros del centro histórico de Porto Alegre; cerca del rio Jacuí, el más limpio de la región; en una área en donde hoy existe un asentamiento de reforma agraria responsable por una importante producción de arroz orgánico; al lado de territorio indígena de la tribu Mbyá-Guarani; y cerca del Delta do Jacuí, una formación importante y estratégica para el abastecimiento y la ecología de la región. En este escenario, distintas entidades han se organizado y conformado el Comité de Combate a la Megaminería en el RS (*Comitê de Combate à Megamineração no RS*), con el objetivo de impedir la concretización del proyecto. El Comité se organiza en tres frentes: técnica/jurídica, de comunicación y de movilización. Sus principales acciones son actividades

de concientización en ferias y eventos, producción de pareceres técnicos para cuestionar el proceso de licencia ambiental, y participación y promoción de eventos como seminarios, talleres y audiencias públicas. En este sentido, el Comité se ha rápidamente convertido en el principal actor social en la movilización contraria a la Mina Guaíba. El presente artículo busca analizar la organización del Comité, considerando el proceso y el contexto de desregulación de la legislación ambiental no solo en nivel del estado como nacional.

FLORES-MÁRQUEZ, DORISMILDA* (Universidad De La Salle Bajío, Mexico)

There Is Still Hope: Activism, Activists and Digital Public Expression in Local Conservative Contexts

This paper focuses on the link between public expression and political subjectivity among activists in Guanajuato, Mexico, as a local conservative context. This Mexican state is characterized by economic and population growth, in tension with political and cultural conservative positions. The emergence of activist initiatives becomes a source of hope for some actors, and a threat for some others as well.

The study considers three main delimitations: 1) activism is not limited to protest nor institutional political ways, it also includes initiatives rooted in everyday life, in local contexts; 2) conservative contexts are especially hard for those initiatives that propose deep changes; 3) those initiatives are usually long-term projects, in which the symbolic/communicative dimension are very relevant.

The first phase of the study consisted in mapping the civic/activist groups in Guanajuato, in order to identify problems, actors and challenges. We found 612 groups: most of them are civil society organizations, some others are activist collectives; most of them started in the past ten years; most of them sustain a conservative logic and work on social assistance, but there are also initiatives that present alternative visions of the future, by working on cultural promotion, environment, gender, and human rights; most of them use digital media for public expression, that is especially relevant face to the limitations and silence in mainstream media, and pressures over activists as well.

The second phase focuses on the trajectories of activists, in order to analyse how do they constitute as political subjects through activism. The preliminary results let identify different injustices as the spark that motivates the participation in an activist group, a trend to participate in more than one group, a very high relevance of digital public expression looking for positioning themselves in the public space, and some pressures to quit activist voices as well.

Miedo Al Delito: Problematizando El Rol De Los Medios De Comunicación Como Una Dimensión Explicativa

Desde hace dos décadas, el miedo al delito se ha transformado en un tema de relevancia en el campo de investigación de la criminología y de otras ciencias sociales. Este artículo se propone, en primer lugar, conceptualizar el temor al delito, e indagar en distintas dimensiones que inciden en la configuración de este sentimiento. En segundo lugar, explorar sobre el rol de los medios de comunicación en el miedo al delito, en tanto actores de importancia que construyen relatos dramáticos con alto contenido moral. Por último, sistematiza algunos debates en torno a la incidencia de los medios de comunicación tanto en la generación de miedos como de otros sentimientos. El fin es problematizar el miedo al delito como un problema social y político con una autonomía relativa frente al delito y sus políticas en las sociedades contemporáneas.

Percepciones De La Inseguridad: Una Mirada Intergeneracional

Las percepciones de la inseguridad se mantienen altas *en la mayoría de* los países de América Latina. Así„ *es importante plantearse el sentimiento de inseguridad como un problema social con una autonomía relativa frente al delito y sus políticas. En Argentina, la alta preocupación por el tema se debe al indudable incremento de las tasas históricas de delito pero se agregan otros factores, en particular cambios en las formas de representar el delito en los medios junto al déficit que han mostrado las políticas públicas dirigidas al problema .Según datos del INDEC (2017), el 85,1% de la población del país considera a la inseguridad en su ciudad de residencia como un problema "bastante o muy grave" y el 85,4% de los hogares cuenta con alguna medida de prevención.*

Esas percepciones no son independientes, fluctúan en relación con el contexto político y las emisiones mediáticas influyen en estas configuraciones.

En esta ponencia proponemos un análisis de los modos en que diferentes grupos etarios gestionan su seguridad así como las distintas percepciones que tienen sobre el tema. A la vez se propone una mirada intergeneracional sobre los modos en que

la inseguridad se vincula de distintas maneras en el seno de los grupos familiares. En términos metodológicos, trabajamos con entrevistas en profundidad con sectores medios de la ciudad de Buenos Aires.

Migrant Rights Criminalization & a Rising Tide of Nationalist Mobilization

This paper examines attempts to criminalize humanitarian aid to migrants and refugees, and compares proposed legislation in three countries: Belgium, Germany and the US. I argue that a comparative view reveals such criminalization may represent a cross-national rightward "counter-mobilization" against solidarity and sanctuary efforts.

German nationals Pia Klemp, Carola Rackete and Claus-Peter Reisch, for example, have faced fines and time in prison for captaining volunteer-run migrant rescue ships in the Mediterranean Sea. Meanwhile, a provision of the proposed *Geordnete Rückkehr Gesetz* (Orderly Return Law) sought to impose up to three years' imprisonment for civil society actors and organizations that publicize dates of planned deportations.

In Belgium, politicians introduced a bill (*visites domiciliaires* or "home visits") to allow the homes of Belgian citizens to be searched to stem the practice of "hosting," in which Belgian citizens offer transit migrants a safe harbor in private homes. While the bill was tabled in 2018, its introduction resulted in a groundswell of citizen and municipal initiatives to oppose it; demands which have only been heightened as Belgium's federal elections (May, 2019) have once again resulted in broad gains for the right-wing and nationalist parties and politicians that initially proposed it, leading to fears that its implementation may be likely in the coming months.

Drawing from field work and interviews in Belgium and Germany, as well as years of migrant-rights activism in the United States, the presentation will explore strategies and tactics used by activists in all three countries to resist these efforts, to utilize both national and international human rights law to present legal challenges to them, and to argue that greater attention to cross-national solidarity networks are essential in stemming a wave of nationalist and right-wing gains that not only imperil migrants and refugees, but the very unpinning of democratic civil society.

FOG, AGNER* (Technical University of Denmark, Denmark)

Meta-Analysis of Published Cultural Variables Shows Reproducible Super-Factors

Many studies of cultural differences have resulted in apparently new cultural factors that got new names for every new study. A meta-study of 31 published studies shows that the factor analysis results of the different studies are more similar than previously recognized, but rotated differently. Factor rotation has obscured similarities between different studies. The unrotated solutions have one super-factor in common, reflecting the combined effects of economic, technological, institutional, social, cultural, and psychological effects that are strongly correlated with each other. These correlations were predicted from the so-called regality theory, based on evolutionary psychology. A second common factor (not predicted) reflects East-West differences.

The dominating super-factor is positively correlated with power distance, collectivism, conservatism, religiosity, regality, and tightness; and negatively correlated with development, individualism, secular values, emancipative values, egalitarianism, and sociosexuality. The fact that different variables and different sectors of society have been following parallel trajectories in the past does not mean that they will continue to develop in the same direction. For example, we have seen a recent backlash in democracy in many countries despite economic progress. This divergence can be explained by psychological reactions to scare-mongering and inequality.

The theoretical findings are useful for future cross-cultural studies. These findings are based on regality theory, which will be briefly explained.

FONROUGE, MARION* (UNLP, Argentina)

De La Subjetividad Capitalista Al Amor Como Respuesta

El objetivo de este trabajo es esbozar la producción de una subjetividad efecto del sistema capitalista y las alternativas posibles.

Desde una mirada sociológica, analizaremos cómo se viven los afectos en la actualidad, en relación a la ética del disfrute y el consumo que gobierna la sensibilidad en la actual fase de acumulación capitalista, en esta línea se estudiará la forma en que el capitalismo produce no sólo objetos de consumo, sino que es un modo de producción de sujetos, se estudia la dimensión de cosa del sujeto del

capitalismo y el advenimiento de una subjetividad capitalista, caracterizada por una combinación de narcisismo y cinismo (Colette Soler, 2015) y los modos de sujeción a un mandato al goce.

Nuestra hipótesis, basada en estudios teóricos y empíricos sobre las sensibilidades, plantea que existe una normalización de los cuerpos/ emociones en el consumo y en el disfrute inmediato (Scribano, A. 2013).

La metodología utilizada para este trabajo será el análisis bibliográfico, en torno a dos ejes:

a) La sociedad normalizada en el consumo y el disfrute inmediato Marx, K. (1844); Lacan, J. (1972); Zizek, S.(2005); Scribano, A. (2013, 2015, 2016).

b) El imperativo de ser feliz y "El malestar en la cultura" Freud, S. (1930).

Se analizan las fuentes de "Malestar en el capitalismo", se describen las "soluciones" a este malestar y se retoma la tesis de Freud que plantea el amor y el trabajo como formas de existencia.

En esta línea, y para esbozar un significado del amor, se estudia el planteo E. Fromm y el amor como respuesta al problema de la existencia humana, El Ensayo sobre el Don de M. Mauss y los aportes de Lacan para definir el amor como don simbólico y resaltar la potencia de los lazos de amor y reciprocidad.

Decolonial Feminism and the Struggle for Rights in an Intercultural Perspective

The present work seeks to reflect on the understanding of the concept of decolonial feminism as an expression of the struggle for women's rights in an intercultural perspective. The proposal of a decolonial feminism seeks to break with the colonialities of power, knowledge, being and gender, so that the voice of women have an engagement from their place of speech, but in an intercultural relationship of multiple dialogues diversity as a practice of building notions about freedom. The senses of freedom are what underlie the rights of women if we start from the concept constructed by the theoretical line "The Right found in the street" for which the Law is an expression of the social struggles for the end of realities of oppression.

El Profesor De Educación Media Superior y La Satisfacción Con El Quehacer Docente: Pilar De Su Identidad

La identidad docente es resultado de una construcción que inicia con ideas preconcebidas que se difunden socialmente acerca de lo que es un docente, para continuar sistemáticamente el proceso formativo en las escuelas normales, el cual se prolongará, enriquecerá y afianzará a lo largo de su trayectoria laboral.

No obstante, para el caso de la Educación Media Superior (EMS) en México, la situación es diferente toda vez que 85% de los docentes no atraviesan dicho trayecto, no cuentan con una formación magisterial y/o pedagógica, y la mayoría ni siquiera concibieron la posibilidad de dedicarse a la docencia, llegaron a ella de manera fortuita y en muchas ocasiones, pensando en una actividad transitoria. Son docentes que se forman en la práctica y con los años. En México, un profesionista, de cualquier campo del conocimiento, es contratado y "da clases", permisividad difícil en otros empleos profesionales.

El propósito de esta ponencia es conocer cómo asumen su identidad, docentes de dos subsistemas educativos de EMS, los cuales responden a esquemas de construcción identitaria diferentes a partir de culturas escolares particulares, generadas al interior de dichos subsistemas.

La muestra constó de 17 docentes. Se empleó la entrevista semiestructurada para recabar la información. Indagar en la identidad docente es aproximarse a su realidad desde la perspectiva del protagonista, es decir, a partir de su visión, se toma como referencia lo que cada uno expresa de sí mismo, pero que a la vez involucra el contacto con el otro y dentro de un contexto particular, en este caso: los docentes de EMS.

Entre los principales hallazgos puede mencionarse una ambivalencia entre el no asumirse nominalmente como docentes, pero sí sentirse satisfechos con el resultado de su labor como tales. En todos los entrevistados se percibe conciencia de la responsabilidad y el compromiso social de su labor.
