Based on the author's ongoing and past researches on marriage and family migration, the paper proposes a reflectionabout the discourses on "intimate citizenship" (Lister 2002; Plummer 2003) through the lens of migration. The notion of intimate citizenship concerns "public talks and action about the intimate" (Lister 2002, 199) and positions issues of gender, family choices, sexual autonomy and reproduction at the heart of citizenship. According to this concept, in fact, the private sphere – namely the 'intimate' and the 'sexual' – also underpins citizenship that is considered as an embodied and inclusive everyday practice. Citizenship, thus, is more what individuals do than what individuals have. This understanding challenges the private-public dichotomy and feeds into the capacity of individuals to act, either to change power relations or to maintain the status quo. Gender, ethnicity and social class interact to influence the relations between citizens/non-citizens and the state, the tension between their virtual and actual social identities, and – ultimately – their assertions of citizenship with personal and legal status underpin public claims. By speaking and acting in the name of their private lives and choices, migrants also affirm their intimate citizenship through its public performance. Critically drawing on this scholarship, the author aims to investigate how discourses on intimate citizenship inform and shape the sense – and the articulation – of the key elements of citizenship (rights, responsibilities, belonging and participation) when it comes to migration. In particular, how do people negotiate their intimacy at the borders of the public and private sphere according to their characteristics and socio-cultural backgrounds? In this frame, does an intersectional perspective allow to nuance the understanding of intimate citizenship's practices? What does the theoretical encounter between the language of intersectionality and the one of embodied/intimate citizenship open up?

Future African Cities and Locations of Youth

Africa has the world's youngest population, with 1.3 billion people, and huge untapped natural resources and human potential. There are regular mass migrations in and out of its countries. Such characteristics have far reaching implications. The continent is a huge geographic mass, with a rich diversity of cultures and economies. Yet Africa reels from its colonial history and its post-independence quagmire of policies and crises.

It is useful to identify cities that follow particular development forms, failed or successful, in attempts to redefine their future. Crucial is the break to redefine cities as diverse spaces, and to multiply forms of collective opportunities for work. Technology may be crucial here.

One turnkey possibility is for sustainable forms of redirecting demographic bulges and losses within the new conservative world order. Part of the demographic bulge and losses lies in big city migrations such as Johannesburg or Nigeria. Migrations add to the diversity of such countries in more than one sense. This adds value to growth and development instead of viewing such migrations narrowly with xenophobic sentiment.

This paper focuses on the east and southern African cities: Kigali (Rwanda), Johannesburg (South Africa) and Port Louis (Mauritius), as three change points along a continuum. Thus the focus on the strategic importance of youth, what is the future of African cities for development, if maximally used. Between these, though not exclusively so, lies the possibility of renewal of an authentic African existence in three particular locations.

The paper uses demographic data of three cities, their youth migration patterns, their urban spacing renewal plans and their visions of city renewal to assess what are the possible futures for such cities that could serve as lessons for other African countries.

Legislating Immigrants' Health or Inequities and Injustices? an Institutional Ethnography of the Social Organization of HIV Healthcare, Treatment and Un/Detectability for African, Caribbean and Black Immigrants (ACB) Living with HIV in Canada

Background: Biomedical advances have transformed HIV into a manageable health condition. HIV healthcare and treatment can lead to viral suppression or "undetectable" viral load. Despite the scientific advancements, ACB immigrants living with HIV in Canada continue to face severe health inequities and injustices that impact their effort to access HIV healthcare and treatment, "achieve" and/or maintain viral suppression and have quality life. This study explores the possible tensions and dilemmas existing between the everyday realities of Africans immigrants living with HIV and how access to HIV healthcare and treatment is organized, coordinated, delivered in Canada.

Methods: The study employs institutional ethnography to conduct in-depth interviews with ACB immigrants living with HIV, health care providers and policy makers involved in the delivery of HIV healthcare in Canada. Textual analysis of regulations, policies, legislations, and guiding principles connected to HIV care and healthcare in general was conducted. Mapping of institutional orders and social relations that organize and coordinate HIV healthcare and treatment was done.

Results: ACB immigrants living with HIV encounter severe inequities and injustices including precarious immigration status, inequitable healthcare system, unjust legislations and policies, food security, housing and homelessness, transnational trauma and poverty. Canada's immigration and refugee, welfare and healthcare legislations and policies intersect to structure healthcare and drug coverage. Healthcare providers lack awareness of and practical solutions to health inequities and injustices faced by ACB immigrants living with HIV.

Conclusion: Unjust, oppressive and exclusionary state legislation, policies and institutional practices coagulate to constrain ACB immigrants' health work of accessing HIV healthcare and treatment and "achieving" and/or maintaining undetectable viral load and optimal health. Social relations and institutional practices that coordinate, organize and constrain access to HIV healthcare and treatment should be understood and addressed to contribute towards meeting the global goals and targets of ending HIV/AIDS by 2030.

ODROWAZ-COATES, ANNA* (Maria Grzegorzewska University, Poland)

Discussing "Socio-Educational Factors and the Soft Power of Language: The Deluge of English in Poland and Portugal?"

The presentation will pertain to a book in which the author shows that English, as a language of European integration and communication has become an element of social status. In privileged social groups, its position has changed from a foreign language to a second language, which demonstrates a linguistic shift with long-term consequences. She presents dialectical arguments to critically examine the cultural and individual implications of this phenomenon in the context of field study in Poland and Portugal. She uses institutional ethnography with a combination of theoretical constructs, including "soft power" and "positioning theory", examining evidence of English as a new tool for social stratification and its effect on language policies, impacting people's lives and their opportunities. Whilst critical of the neoliberal, neo-colonial and imperialistic dimensions of English language hegemony, the author captures an original gender perspective on English as a language of opportunity, inclusion and empowerment. She focuses primarily on discourses that are shown to be products of, and the makers of the

material aspects of language. Using an ethical imperative not only to question, but also to participate in the existing power structures in order to change the power dynamic, the author argues that language choices are not necessarily ours but are institutionally driven.

Social Representations of Emergency Contraception in the Context of Power over Women's Sexuality – the Analysis of the Press Discussion Around the Ellaone Pill in Poland.

The subject of this research was the reconstruction of social representations of emergency contraception functioning in the Polish press discourse during the discussion around the ellaOne pill related to legal changes in its availability in 2015-2017.

An analysis was focused on the ways of using language to express opinions about the phenomenon of emergency contraception in the context of a more general discussion of women's sexuality. Rejecting transparency of the language and recognizing its strong embedding in established relations of power, I assumed that in the process of creating social representations of a phenomenon related to female sexuality, the attitude towards itself would be visible. I also assumed that it would allow to reconstruct norms concerning this issue and the scale at which it should be subject to control and power.

The study managed to identify two polemic social representations of emergency contraception on the axis of conservatism – liberalism and to reconstruct four models of female sexuality regarding the figures of the pregnant body, mother, debauched woman and victim of sexual violence. The relationship between understanding and interpreting the phenomenon and the construction of normative patterns of female sexuality was also indicated.

The theoretical basis was constructionism with an emphasis on the aspect of linguistic shaping of reality and the view of power in the perspective of Michel Foucault (bio power and power-knowledge). Taking into account the phenomenon of power in the study of ellaOne pill was used to show that social representations could reflect conflicts, tensions in the social structure and inequalities in relations of dominance and subordination and may even be a tool to consolidate them.

The analysis of the 117 articles was implemented in a qualitative paradigm using semantic field analysis and discourse analysis with categories taken from the theory of Serge Moscovici and his followers.

Corporate Democracy and Digital Leadership

The increasing complexity of the world of work requires a new form of leadership, a so-called Digital Leadership, which adapts to the circumstances of digitalization and, in addition, ties in with extended competences of executives. The discourse on digitalization concentrates very much on technical issues. If the expression is defined in terms of an overall understanding, then digitalization can be defined as a progressive transformation process of companies that brings about strategic, organizational and socio-cultural changes and is the result of technological development. It is more about sufficient changes in management approaches and business models in companies than about the physical transformation of information into data.

This paper will present a new paradigm of (diversity-) management in the hypermodernity as a process of enabling capabilitiesthat is based on systemic-relational assumptions. This paper will introduce the Capability Cycle in the context of digital leadership and is a systemic methodology based on a discourse of multiple participants to develop contextual capabilities. It is a change process and consists of eight steps and considers four levels in business organizations: diversity, social interaction, organizational structure and access to resources.

Resilient and vital organizations need multiple reservoirs of competences that are people's capabilities. Furthermore, resilient organizations in hypermodernity depend on the ability to respond to rising complexity by increasing their own inner variety and competences. The purpose of resilient systems is development that is defined as a process of enlarging people's choices and capabilities. The new research field of democratic organizations show the promotion of connected capabilities, higher participation, involvement and responsibility of employees and finally, which is to discuss, strengthen the vitality and better decisions in organizations,enlarging choices and capabilities.

RC10-128.4

OEZDEMIR, FERIHA* (University of Applied Sciences Northwestern Switzerland, Switzerland)

Diversity Becomes Capability: Towards Democratic Organizations

The economy for people needs a new diversity discourse because the right to development is an inalienable human right.

By taking the Capability Approach (CA) (Sen 2009) into account, this study presents a new paradigm of diversity in the context of ethical corporate governance. Nowadays, organizations struggle between old and new management philosophies.Resilient organizations need multiple reservoirs of competences that are people's capabilities. Development is defined as a process of enlarging people's choices and capabilities (Sen 2009) and enabling well-being. This considers a revival of ethic ideas into traditional economy (Ricoeur 2005). Management is undergoing a change towards "democratic" structures. Democratic organizations promote connected capabilities, higher participation, involvement and responsibility of employees.Through the lens of the CA, inequalities and exclusion generate deprivation of freedom and development (Sen 2009). Promoting capabilities means creating a dialog-orientated communication by an interactive corporate culture for a better relationship & connectivity of people.

Disadvantages are exposed to a lack of opportunities. Diversity Management is known as a (CSR-) strategy to promote diversity, to protect from discrimination. But it makes differences of human beings visible, too. The CA addresses the economy of well-being. Furthermore, the CA represents a critical response to the neoclassical approach and so, it restores an ethical, moral & solidarity economy dimension.

This work is a theoretical-conceptualized explorative literature study and analyzes a democratic framework for ethical corporate governance with the CA as a new diversity paradigm. Democratic organizations are suitable for enlarging choices and capabilities. A development-friendly management framework is based on issues of democratic organizations such as connectivity, flat hierarchy, free space, diversity, participation, involvement, contribution and commitment.

Social Stratification in Parents' Anti-School Attitudes, Their Involvement in School and the Relevance for Childrens' Educational Success

The role of families and their cultural capital in their children's educational success cannot be understated. A large body of qualitative and quantitative literature shows the relevance of parenting styles and parental engagement for educational achievement and attainment. Also, different sets of beliefs, cultural logics, attitudes and values associated with education and learning are important here. Yet, according to Bourdieu and Lareau these are stratified by social class and correspond to different types of habitus. In this broader context, this paper focusses on how parents differ in the value they place on education, how these different attitudes shape their involvement in their children's schooling, how this eventually relates to the children's educational success and how these relationships generally differ by parental social class and habitus.

We use quantitative data on roughly 2,800 parent-child dyads from the German National Educational Panel Study (NEPS) and structural equation modelling techniques to address the complex interrelationship. We find differences in the beliefs parents have about the value of education; parents with lower cultural capital are more likely to hold anti-school attitudes, i.e., are more averse towards education. We find a similar habitus gradient in the level of parental engagement in school, where parents with lower cultural capital are less involved. Also, more negative beliefs about education are associated with less involvement. However, we do not find evidence that the relationship between anti-school attitudes and parental school engagement depends on the parents' cultural capital; parents with lower class habitus are not further disengaging in school if they have negative beliefs about education. Finally, our analyses show that parental beliefs, involvement and cultural capital are important for the children's educational success; particular the absence of parental anti-school attitudes increases the odds of children from lower social background to obtain higher school degrees.

Variation in Variability? Country-Specific Variation in the Variability of Labor Market Success for Higher Education Graduates in Eighteen Countries.

It is common knowledge that higher education (HE) pays off in various ways. Compared to lower-educated youth, graduates enjoy higher earnings, more prestigious jobs and a lower risk of unemployment. Also, HE returns vary by country, especially by the setup and institutional characteristics of the education and labor market system.

In this paper, we analyze the relationship of various country-level differences and variability in graduates' early labor market success. Country-differences on the supply side of graduates, as the amount of tracking, degree of vocational specificity or level of standardization, are related to differences in labor market outcomes; similarly, country-differences on the demand side, like graduate unemployment rate, spending on research and development or the share of knowledge-intensive employment also shape graduate labor market outcomes. For instance, we hypothesize that in countries with less alternatives to HE (i.e., lower vocational orientation) the variability in overall returns in larger as the sorting only takes place after completing HE when graduates are matched to jobs during the search process. Higher graduate unemployment risk is assumed to be positively related to variability in returns as graduates under the threat of unemployment may also accept less adequate jobs.

We combine data from the 'Research into Employment and Professional Flexibility' (REFLEX) survey, a harmonized cross-sectional graduate survey for 18 countries and macro-level indicators from various sources (EuroStat, OECD, UNESCO). We measure early labor market success by log hourly wages and ISEI of first significant job.

Preliminary findings show no clear and systematic pattern as in higher degrees of tracking or standardization are always related to lower or higher variability. Moreover, results for the two outcome indicators show different patterns. As country-differences in outcome variation are quite substantial, we also look at country-specific compositional differences and how these relate to the overall variation and respective country characteristics.

Awakening the Ancient: Imagining Indigenous Puberty Rites in the Anglican Communion

Assumption by popular and academic thought in the 19th and 20th century has been accompanied by various competing definitions of religion from simple, confessional to more universal-sounding descriptions. Yet, more indigenous religion scholarship has shown that the term religion did not appear in the literature of non-Western cultures until after their encounters with European Christianity. As well covered by Brent Nongbri, *Before Religion*, the concept of religion and the distinction between 'the religious' and 'the secular' is a recent development in European history. This conception of religion is what complicated the Europeans' encounter with indigenous African cultures culminating to imperialistic tendencies in their missionary enterprises. For instance, the demonization of the Kikuyu ethnic group's indigenous puberty rite as 'the secular' and introduction of confirmation as 'the religious' puberty rite for full membership into the Anglican Church of Kenya. Surprisingly, as from late 20th century to present, there has been a resurgence of the indigenous puberty rite in most urban Anglican congregations in Kenya.

This research examined the reasons for this resurgence, in the form of Rites of Passage Experiences (ROPES) program in the All Saints Cathedral Anglican Church in Nairobi, Kenya. The research used ethnographic method that involves participant observation and semi-structured interviews with 28 parents, 9 clergy and 11 program facilitators. This also involved snow-ball technique in identifying some of the interviewees. To explore the research question, the research employed a correlational research in data analysis, that looked for any patterned relationships between the conception, reception and perception of the ROPES program and its impact on confirmation classes. The findings suggest that the resurgence is an act of contemporary re-imagination of indigeneity towards a meaning-making process of religio-cultural identities in the Anglican Church of Kenya.

OGAWA, REIKO* (Chiba University, Japan)

Deregulation of Migration and Care

The provision to sustain old-age care is particularly crucial for a country like Japan, where almost one in three is above 65 years old. This unprecedented level of popu-

lation aging has pressured the state to meet two conflicting goals: to cut the increasing social expenditure in long term care while ensuring an adequate care workforce to meet the growing old age population's demand. One of the solutions is to tap migrants from the neighboring countries to meet these two goals, albeit reluctantly. The presentation aims to address the shifting forms of globalization of care in Japan, especially under the neo-liberal economy. Migrants from Southeast Asia are introduced, first as an "exception" under the free trade agreement since 2008. After ten years, the "exception" became normalized with the opening up of multiple channels through privately mediated brokers. These channels are complicated, and institutional barriers lead to the stratification of migrants in the care labor market. Migrants are stratified not only through citizenship but also through the training of language and culture. The literature on migration and care has revealed how power is exercised within private households for live-in care workers that contribute to the discipline of the bodies. I argue that even before they migrate, pre-departure training in the dormitory serves as a "total institution" where migrant's body has been transformed to fit the Japanese labor market's needs. Deregulation of migration policies may meet the short-term goal to secure the care workforce. Still, it will inevitably create the hierarchy within the care labor market based on the intersectionality of different categories, including gender, ethnicity, language, and citizenship. This deliberate change made through policies has gone hand in hand with the marketization of care without proper installment of the protection mechanisms for migrants.

From Re-Integration to Re-Orientation: Experiences of Filipino Women Returnee from Japan through Two Decades of Reintegration Program of NGO

Migration from the Philippines to Japan had been characterized as feminized and exploitative phenomena since the early 1980s. Amidst of this trend, some migrant and feminist NGOs had been working on the issues of migrant entertainers and their Japanese Filipino Children (JFC) and one of their main activities is reintegration program for returned women, who are also single parent of mixed race children.

This paper focuses on the reintegration program of two NGOs in the Philippines which had been providing the reintegration program for returnee women from Japan for more than two decades and explores the different implications of reintegration program for returnee from gender perspective.

The programs which this paper examines prioritize the psycho-social reintegration as well as livelihood program. For women returnee who had difficult experiences in both at work and in their private life in Japan, reintegration in their own family and community is not easy challenge. "Unsuccessful" return of entertainers, who have been stigmatized in the Philippines due to their occupation in Japan, need the special care and it takes longer time than the other migrant returnees to solve their socio-economic problems aside from their mental recovery. Thus, those programs for former entertainers, have eventually become holistic ones and the programs themselves have become the "third place" for returnee women where they can share the same experiences with other returnees and even they reconstruct their new identities. These consequences have brought the dynamism and even changes to the program itself.

This paper will explore the various implications of reintegration program for women returnee and will try to re-conceptualize the idea of "reintegration," based on the experiences of returnee women themselves.

Understanding Training Priorities and Strengthening Civil Society Performance in the Niger Delta, Nigeria:Implications for Social Work Practice

Capacity building of civil society coalitions is a strategic requirement for the enhancement of knowledge, attitude and practice. While the impact of quality training cis plausible, trainings not properly designed or conducted in line with the priority needs of civil society coalitions are ridden with failure as they end up failing to bridge the core gap of needs of the target organizations to aid organizational effectiveness or efficiency. This research therefore was a response to identifying the priority training needs of civil society coalition members. The research was conducted amongst heads of 884 civil society organizations in the Niger Delta region. These organizations had varios intervention focal on the SDGs which they worked on. Out of which 41.1% focused on no poverty, 51.36% focused as clean water, 40.72% on sanitation, 43.67% on Industry, 48.19% on innovation, 41.4% on responsible consumption,51.36% life on land, 40.7.2% on partnership while illegal migration, Education and health had 48.19% . The oldest was founded in March 1986 while the youngest was founded in December 2018. Results showed that understanding priorities helped policy makers constrained by budget to design appropriate training programmes based on priority. The study made some policy

recommendations to strengthen the CSOs to actualize their priority needs and in particular identified some of the core implications of the priority needs of CSOs to social work practice in the Niger Delta.

Challenges of Democracy in Mongolia: Major Findings of Wvs

This chapter aims to categorize the democracy consolidation process and democratic challenges in Mongolia in due to led the current principles and fundamental values of democracy. Democratic challenges and bottlenecks are originated by the following factors, including forming of political parties, politic-business fractional interests, blockage of post-trafficking, conspiracy, and corrupt behavior such mentioned newly adhesive phenomena have stabled negatively to the democracy. Modern democracy in Mongolia has changed from the ideology and desires into daily actions and real-life needs of achievement of people. Hereof, a few of challenges, one-sided approaches and polarization have occurrence in the consolidation process of democracy as followed an inverse and failures. Prominent researchers such as Francis Fukuyama noted that democracy is a natural phenomenon. The democracy understanding has yet become orderly among to Mongolians. In accordance with general trends, people mean that's building and making the realities of national democracy such plants in our own land as followed to imitating that external approaches from the outside of Mongolia and other nationals. Regarding to a key significance of democracy expressed by mediating values of human rights, freedom, equality which prevails as excessively general and declarative pretend perception within the people such renowned scholars. The chapter argues that democracy development and promoting democratic governance in Mongolia brought specific changes, but significant difficulties and challenges as well.

Main challenges to democracy at that time included mindedness that was still powered by inertia reflecting the values of the previous society, outdated practices and weak development (still toddler) of new democratic values. However, entire processes started slowing down effective from mid-1990s, e.g. political party development decelerated, society fragmented into groups and fractions, trading of government positions, conspiracy, corruption and bribe; all new challenges emerged.

Context and Positionality in Feminist Academia

The paper discusses preliminary results from a study where students' ideals and expectations regarding academic knowledge production is studied in Ethiopia, South Africa and Finland. We focus especially on teaching regarding gender, as in feminist scholarship positionality and location have traditionally been key issues. Does context matter in gender teaching? Is a division between Northern and Southern theories helpful, from the students' point of view? When studying student's interests in expertise and knowledge in feminist academic life, the paper suggests that the universalized aspiration to academic excellence and the neo-liberal marketization of universities should be taken into consideration as local and individual practices that create a counter-force to movements towards decolonizing academia. We will suggest that the insistence of feminist epistemology on contextualizing and politicizing knowledge production processes also entails a careful reconsideration of questions of location, and destabilizing North and South as concepts.

OINAS, ELINA* (University of Helsinki, Finland)

Societal Relevance, Political Threat and Personal Empowerment

The paper discusses preliminary results from a research project where "relevance" of academic knowledge production and teaching in different fields is studied. Relevance is here not assumed, but its different meanings are explored. The project will focus on the fields of biomedicine and Gender Studies, two fields with highly different epistemic and ontological discussions and aspired societal roles. Epistemic questions are often regarded as internal debates of quality; here the questions are about future oriented affective desires for how knowledge should matter in the world. Individual, institutional and societal levels of relevance are distinguished. When feminist scholarship is contrasted to biomedicine, one could assume that its authority and legitimacy are per definition of a lesser kind. In this paper I wish to discuss the possibility that LGBQIT and queer studies are seen as dangerous and threatening exactly because they are politically relevant and powerful. The method of the paper is to tell three stories, from Ethiopia, Kenya and Finland.

Cross-Cultural Design for Measuring Protest Participation: Findings from the Survey Using Vignettes in Asia and Latin America

An impressionistic cultural image once envisioned that Latin Americans are more active than Asians in protest participation, but this has never been submitted to an empirical test with a survey. Cross-regional and most-likely cross-cultural protest research of this kind, however, needs to clear several methodological challenges. Regardless of hypothesis and theoretical assumptions, comparability is the essential task to deal with. Issues and triggers of protests, alternative choices, countering governments, and types of social network and organization culture, among others, are inarguably different. On the one hand, confounders are countless, which easily surpass the degree of freedom and invalidate cross-national regression analysis. On the other, cross-cultural variation is potentially unidentifiable and thus may work with potential impact but in an unidentifiable manner at the first surveys. Unless these challenges are overcome, cross-cultural surveys on protests will provide no meaningful findings.

In tackling this issue, this research invented a survey design with vignettes and random manipulation of phrases, simple but useful tools to assure comparability across society with a diverse background. The survey was conducted in Bolivia, Mongolia, and Cambodia, three countries in Global South, which have similarities as being low or medium-low income countries and less dependent on the manufacturing sector but numerous differences. Two have experienced democratic alternations, but one has not. Government system, religion, years since independence and democratization, and associational culture are not the same. This research shows some theoretical propositions such as the organizational capacities of individuals work equally positive in three countries, but the perception of people toward their government works in varied ways.

State-Led and Movement-Led Incorporation: A Framework from Latin American Cases

The burgeoning literature on the second wave of popular incorporation in Latin America has focused on the conditions that have produced different pathways across the region. Specifically, we now have better knowledge about the effects of democratization and post-neoliberal political economy models in explaining how and why popular protests have been contained in the region. The debate, however, remains inconclusive. Although some scholars focus on leftist ideology of leaders and the underpinning social mobilization towards incorporating the poor, other scholars place both protest-led changes and the significance of state-led social policies in targeting the poor. Our paper seeks to contribute to these debates by answering two key questions: (1) what explains the different types of popular incorporation in Latin America, across heterogeneous ideological leanings and mobilization capacities, since the late 1990s; and (2) what role do popular protests play in incorporation projects, if any? To answer them, we propose an original conceptual framework based on the assumption that the state plays a crucial role in the political incorporation process. This is not to deny the relevance of societal pressure—on the contrary, popular pressures are necessary conditions for incorporation—but our paper argues that popular incorporation hinges on policy regimes, political coalition, and state capacity. While our empirical illustration from South American countries provide reference to the state capacity argument, our framework theoretically recasts the puzzle of popular incorporation in a comparative perspective beyond the region.

Implications of Illegal Proliferation of SMALL Arms and LIGHT Weapons (SALW) on National Security in Nigeria

This paper will examine the implications of small arms and light weapons proliferation (SALW) on National Security in Nigeria. The essence is to identify the factors that encourage the proliferation of SALW in Nigeria; assess what brought about the increase in the level of insecurity in the country, examine the implications of the illegal proliferation of SALW on national security and the roles corruption have played in facilitating the illegal proliferation of SALW. Conflict theory is adopted for this study. Questionnaire and in-depth interviews were used for data collection to elicit data from a cross section of security agents in four security

agencies in Abuja. Findings revealed that factors that encourage the proliferation of SALW includes unemployment, political tension, porous border, low numbers of security agents across the border areas, the low wages paid by the government to security agents, corruption and marginalization. As regards the implications of SALW on national security, it was found that insecurity, high rate of violent crimes such as communal clashes, armed robberies, kidnapping, cultism and ritual killings all contributed to the proliferation of SALW. The paper recommends that Nigeria should champion a move in the United Nations to get the International community to enforce the global initiatives and the re invigoration of existing protocols and efforts at curbing SALW proliferation as well as clamping of sanctions on defaulter States. The Nigerian Government should tackle the causes of proliferation of SALW and violent crimes through an effective security system and good governance.

Good Governance and Social Order: A Critical Issues in Nigerian Democracy

The contemporary quest by most nations of the world for good governance and social order through democracy has continued over the years to constitute a source of concern to Nigerians. This arises from the growing disorder rooted in the nation's socio-economic and political fabrics. This paper examines the effect of social political policy on equity and sustainable development in Nigeria. This is a desk research in which documents and statistical data were examined. Findings have shown that democracy being an all inclusive political process which has been adopted as a time tested system that promotes good governance, through the spread of its dividends among the people. Unfortunately, the Nigerian case since the 1999 inception of democratic governance has defied the global standard by assuming a dimension that continues to impoverish the citizens. This attributes to bad leadership that has ossified corruption, conflict and crises, terrorism, kidnapping and other vices that hamper on development which has led to all source of protest among the youths and civil societies in Nigeria. This Paper recommends among other things that Government should create job to employ the youths as well as widen the political space that will accommodate the youth in governance as alternative strategies to good governance and social order.

The Rising Incidence of Domestic Violence in Edo State: The Role of Religion and Culture

Religion is a believe system, which provides the adherents with meaning and purpose in their lives. It is one of the major institutions in the society, with almost every human involvement in it. In Nigeria, religious bodies has given more leading roles to the men and so putting women in a subordinate position where views and opinions are not of great importance to the organization or the bodies. This is due to the fact that we are living in a patriarchal society. Patriarchy rules as in most Africa society where culture helps to embrace the belief in the inherent superiority of men over women. Marriages in Nigeria usually promote the value that gives men superior rights over the woman. It also makes these men see the women as property or item that can be violated at anytime. This paper examines the rising incidence of domestic violence in Edo State with special reference to religion and culture by concentrating only on two forms of domestic violence: physical and verbal forms of violence within the family. Data were collected using mixed methods (qualitative and quantitative). This is after obtaining verbal consent from the respondents. Two hundred and thirty one (231) respondents with men and women inclusive were used for the study. From our findings religion plays a significant role with varying degree of aggression in different denominations including African Traditional Religion. More of Christian groups were engaged in verbal violence (40.3%) as compared to Muslim (10.8%). A common factor was their cultural influence which still controls behavior amongst sexes in Africa. Arising from this challenge the following are being suggested: women should be respected within the religious and cultural sectors as their male counterpart. The religious leaders should adopt a strategy whereby women are be given leading role in the society.

The Impacts of Culture and Religion on Gender: Reflections from Women in Ogun State, South West Nigeria.

Feminism as a movement is geared towards challenging the normative and stereotype social construct that depict women as inferior and subordinate to men. Over the years, advocates of feminism in theory and practice have attributed the social construction of Gender to the effects of culture and religion in defining the status of women. Thus, stimulating the intense debate on the influence of culture and religion on gender. Concretely, it is important to examine the impacts of culture and religion on gender, but first, it is of significance to understand the complex interlinkage between culture and religion and the intricate similarities they share as to influencing societal perception of gender. This study investigates the influence of culture and religion on gender from a feminist perspective. The study adopts primary research method. Questionnaires were distributed to 500 women in 5 communities in Ogun state, South-West Nigeria. 14 of the women failed to complete the questionnaires. In total, 486 respondents participated in the survey. It was observed that both culture and religion influence gender roles, however, the effects of culture on gender is declining as a result of the transforming roles of modernisation. In contrast, religion remains dominant in influencing and reinforcing stereotype roles that define the subordinate status of women considering that religious doctrines are perceived as sacrosanct and absolute. The study recommends that Non-Governmental Organisations should prioritize in their agenda, the desensitisation of women on religious doctrines that are inimical to the full expression and realisation of their rights. In addition, the government should enact as well as implement laws to penalise religious leaders, whose parochial comments are aimed at subverting the rights of women.

Youth Movement, Social SPACE and Change: An Empirical Analysis of the END Sars Protest in Nigeria

The challenge of leadership in Nigeria has often pointed to various ineptitude in governance and the failure of the country to maximize its potentials towards achieving optimum development. A large majority of the population of Nigeria comprise of youths aged between 18-30 years, most of whom suffer from chronic poverty in a country ravaged by political quandary and economic quagmire. In October 2020, youths in various parts of Nigeria took to the streets as well as the social media for over 3 weeks, to protest against harassment, intimidation, and victimization by the police Special Anti-Robbery Squad (SARS). The protesters advocated for police reforms as well as good governance in the country. Many observers watched as the youths demanded for change across the country in what appeared a well-orchestrated and organised Movement, before the infiltration by thugs and miscreants. This study examines Youth Movement and social space in the context of resistance and advocacy for change. With focus on the End SARS Protest and its intrigues, the study attempts to assess the influence of youths in effecting social and political change. The study adopts mixed research methods, and data were gathered from 312 respondents who participated in the protest. Although, findings reveal that the protest recorded some modest success, however the unidimensional approach adopted by the Movement served as an albatross against its progress and the impact that ought to have been achieved. The study recommends that Youth Movement should adopt multidimensional approach that cuts across protest, dialogue, as well as active and direct participation in the electoral process in order to make significant impact.

Longitudinal Studies and Future Scenarios: Time Analysis Challenges in Social Sciences

This presentation addresses the description the number, speed and sense of the transitions in poverty by income in the period 2000 - 2005 in Tres de Febrero (Buenos Aires province), based on a longitudinal study of three waves (in the years 2000, 2002, and 2005). Data on the evolution of poverty are analyzed using longitudinal studies. Multilevel models and analysis of poverty transitions over time are applied. This study reflects the importance of the longitudinal perspective in the analysis of future social scenarios. Methodological issues such as the prospective in social sciences, the elements of indeterminacy in the future, the cause - effect connection over extended periods of time, irreversible processes in social sciences, and other problems are discussed at the same time. The analysis of longitudinal data is linked to different problems of the analysis of time flow in social phenomena, and to the methodological and epistemological challenges of integrating social sciences to other scientific disciplines.

Keeping the Faith in God: Emotional Wellbeing Among Migrants Stranded in the US-Mexico Border.

This paper discusses the preliminary results of a research conducted in a migrant shelter in Tijuana, México. Following a qualitative methodology, it analyzes the migrants' subjective experience of being stranded in the US-Mexico Border due to the enforcement of migration policies in both countries. While being in an uncertain situation about their future, migrants experience emotional distress. With scarce access to health care, mental health is not even perceived as a condition needing professional intervention. Migrants turn to attainable resources to deal with their emotions and keep the strength to continue or redefine their migratory project once they have arrived at the border region.

One of the objectives of this paper is to analyze the strategies developed by this population to handle emotional distress; whether apprehending, replacing or combining available therapeutic resources along their migratory journey. While some find social support from other migrants, humanitarian networks or their families, believing in God appears as a constant source of help along their migratory journey to keep the faith in a promissory future, amidst its critical and vulnerable condition.

Autoridad Docente De Escuela Secundaria: Tramas y Sentidos Del Mundo Escolar Contemporáneo

Este artículo tiene como objetivo analizar los principales cambios ocurridos en el universo escolar en el contexto de la escuela secundaria y cómo influyeron en el ejercicio de la autoridad docente en los tiempos contemporáneos. Se entiende, con Arendt (2000), la autoridad como constitutiva del acto de educar, mediante el cual los adultos son responsables de presentar a los jóvenes al mundo existente, pero al mismo tiempo abrazan la novedad que producen las nuevas generaciones. De esta manera, la autoridad se entiende aquí como fundamental para la continuidad y la renovación del mundo mismo, siendo un acto de educación y "amor mundi". Para lograr la propuesta, se realizó una investigación cualitativa con maestros de escuelas secundarias públicas de São Paulo con el fin de comprender su representación social sobre las múltiples formas de manifestación de la autoridad en el trabajo docente en la escuela cotidiana, ya sea explícita o 'invisible'. Este estudio de caso utilizó etnografía escolar y entrevistas individuales, así como la aplicación de cuestionarios para conocer el perfil de los encuestados. En términos bibliográficos, se enfatizaron los los autores de las Ciencias Sociales, especialmente en Arendt, pero también se utilizaron otras áreas de conocimiento como la Historia y las Teorías Postcoloniales para obtener un tratamiento interdisciplinario del fenómeno estudiado. Como resultado de la investigación, fue posible demostrar que existen varias representaciones sociales sobre la autoridad docente y algunas de ellas ayudan a la educación escolar, mientras que otras no tanto. Aquí buscaremos resaltar las prácticas docentes que favorecen el ejercicio responsable y comprometido de la autoridad docente en la escuela pública brasileña contemporánea como un instrumento para enfrentar las desigualdades escolares y sociales existentes.

Respeto Mutuo En Las Relaciones Educativas: Un Estudio Comparativo Entre Universidades De Brasil y Portugal.

Este documento tiene como objetivo presentar y discutir la investigación comparativa realizada en Brasil y Portugal sobre las prácticas de enseñanza destinadas a promover el respeto mutuo entre profesores y estudiantes. El objetivo de la investigación es comprender las representaciones sociales de los docentes sobre el respeto en las relaciones educativas, específicamente en el entorno universitario. Basado en Arendt, Sennett y Dubet, el respeto se entiende aquí como una condición para que la palabra del maestro sea significativa y digna de ser considerada como algo relevante para enseñar / aprender. Es la interdicción simbólica que tiene un papel regulador capaz de influir en el juicio y la acción, a través del cual se instituye el proceso educativo. Además de los autores antes mencionados, se utilizaron otras áreas de conocimiento como Historia y Filosofía para permitir una mirada interdisciplinaria sobre el tema investigado. Para lograr el objetivo propuesto, se realizó una investigación empírica cualitativa, estudio de caso comparativo con profesores de universidades de Brasil y Portugal, utilizando entrevis-

tas semiestructuradas y observación en el aula, los pasillos y la sala de profesores. Como resultado de esta investigación, se puede afirmar que hay varias maneras de entender el respeto de los maestros entrevistados, presentando diferencias significativas con respecto al país de origen, el tiempo de enseñanza, la edad y el género, y aquí las diferencias nacionales serán privilegiadas. Finalmente, se presentarán algunas concepciones de respeto y prácticas de enseñanza capaces de promover la mutualidad del respeto y, por lo tanto, nos señalarán pistas para la construcción de instituciones universitarias efectivamente democráticas.

The Fishing-Quilombola Body: A Socio-Cultural and Political Construction in a Traditional Community of Northeastern Brazil

During the fieldwork of the thesis entitled *Between Rio and the Sea: Body and Daily Practices in the Cumbe Quilombola Community*, specifically during the first immersions in the social context of the research, some questions were raised, namely: How do socio-environmental conflicts and generated by the economic projects installed in the community impacted on the body practices produced by the social group? How could we recognize the movement organized by quilombolas social actors as a mode of resistance, resignification and cultural reinvention, also as a means of denouncing violations of rights? Instigated by such questions, we saw that the first step to getting some answers would be to reflect on the process of building the fishing-quilombola body. Given the above, we seek in this paper to analyze the body practices present at the "Festa do Mangue do Cumbe" as mechanisms of resistance of the fishing-quilombola body, from the perception of the body as a social, cultural and political construction. This work is characterized as an ethnographic case study referenced by everyday sociology. In this research techniques were employed, namely: participant observation, comprehensive interview and informal conversations. While the research subjects were represented by the following social actors: the community leaders and those who know the practices. We conclude that in community rituals body practices are presented as a form of cultural resistance of the fishing-quilombola body.

Geek Identities and Consumption Practices

This study aims the understanding of how different geeks identities are developed from different consumption conditions. The theoretical basis used was Fontenelle (2017), Hall (2006), Holt (1995) and Warde (2005), with *flânerie* and deep interview as methods. The study contributions involve the original theme choice and a methodology not much used in Brazil. The field research was held from 6 to 9 September 2018, at Comic Con Experience, an event destined to pop culture fans, with 262 thousand people taking part in it. The data were collected through photographs, notes, ten brief interviews (20 to 30 minutes) and three deep interviews (one to two hours), carried out after the event. The participants were from 18 to 45 years old, different genders and from Sao Paulo, Rio de Janeiro, Ceara and Rio Grande do Sul States. The findings meet the literature as referring to the geek consumption practice being based in meanings. The speech of the interviewed participants showed matters as sexism, financial limitation and, above all, an apparently contrary but complementary relationship between material consumption and information consumption, as developing the geek identity.

"Not Only for the Job Market": Youth Experiences in Federal High School Integrated

This study aims to understand the meanings attributed by young students of integrated high school of a Brazilian federal school to the experience in this mo-

dality of education, as well as their future projects after completing this last stage of basic education. To collect the data, 191 students of the integrated high school courses in industrial automation and computer science of the 1st, 2nd and 3rd years applied a survey with open and closed questions. The analysis of results was performed using the likert scale to quantify the elements inherent to the school experience. Although the courses investigated are, at the documentary level, justified by the regional demand for worker training, we identified that the meanings these young people attribute to vocational education indicate that integrated high school goes beyond professionalization and meeting local economic demands. Although the assumptions of professionalization at the expense of general education, via "flexibility" of school curriculum, contained in the "High School Reform" proposed by Law 13.415/2017, did not materialize in the perceptions obtained with the adolescents of this research. Therefore, for both the common and professional subjects tend to increase students' interest in continuing their studies and assist in the design of future projects. When investigating the future projects of this group of young people, we realized that, in general, the expectation is to join in the higher education after the end of high school. However, a perspective based on sex / gender relations points out that the sexual division of labor present in modern society manifests in the field of possibilities of these young investigated, because while boys are looking for careers related to technical courses, girls point out greater variety and richness of professions in describing the choices of higher education courses.

The Outer Body, inside. Opening Academic Spaces for the Co-Construction of a Common Knowledge in Coastal Planning.

This paper presents a critical ethnographic research in Portugal, and the analysis of the process of affective and intellectual encounters for the co-construction and application of a teaching module - with the collaboration of different actors and knowledges of the local coastal zone, in particular an artisanal fishing community. The co-constructed module was applied to a Masters class in Sustainable Urbanism and Spatial Planning at Universidade NOVA de Lisboa and represents an essential movement for the integral sustainability of territories both by stimulating a new culture of coastal planning to present and future researchers, managers, and planners - searching more transdisciplinary, equity and justice, as by opening spaces for the dialogue of different knowledges in the academy, strengthening the transversal dimension of the education and raising awareness for socio-ecological local issues. Considerations about transdisciplinary, equity and justice are rarely formal objects of planning processes, which has contributed to the perpetuation of exclusions and injustices directed at specific communities, as is often the case with small-scale artisanal fishing communities. The insertion, in academic spaces, of local and traditional knowledge, invisible and marginalized by dominant power bodies, represents *momentum* - temporal and procedural, of change. Such multilevel transformation, based on the diversity of knowledge, leads to the construction of common knowledge – a signifier body. This accompanies the argument of the need for the emergence of a new mode of knowledge production, in which practitioners and users are actively involved in the production of knowledge. Furthermore, the own body of the fisherman – an outer body as a university educator, appears as a moment of rupture into hierarchy of knowledge, and as a bottom-up process of individual and collective intellectual emancipation.

OLIVEIRA, FABIANA* (Ufscar - Federal University of Sao Carlos, Brazil)

Brazil's Supreme Court Agenda during Transition to Democracy: Judicialization of Corporate Interests of Public Careers of Justice

The main goal of the paper is to discuss the relations of the Brazilian Supreme Court with politics during the transition to democracy in Brazil (1978-1988), analyzing judicial review cases ruled by the Court from 1978 to 1988. It investigates the analytical validity of the concepts of judicialization of politics and judicial activism in interpreting the Court's performance during that period - a decade before the promulgation of the 1988's Constitution. It seeks to describe the Brazilian Supreme Court decision-making agenda in this period, mapping the issues on which the court was called to decide in abstract control of the constitutionality of the laws, and how it effectively decided, highlighting cases dealing with policies related to the public careers of justice - which represented 6% of the demand on the period (43 in 703 cases), being the fifth most incident topic. It seeks to bring a detailed analysis of the use of the Supreme Court to arbitrate corporate interests of those careers. The discussion is made within the field of judicial behavior studies, supported by studies on the field of sociology of professions. The main conclusion is that the Supreme Court acted as a governance body, mediating conflicts related to state administration, but mainly as a privileged space for the deliberation of economic and corporate interests of public careers. The paper also compares the

　　　　　***denotes a presenting author.* Abstracts are organized by first presenting author's last name.

use of the Supreme Court for the defense or restriction of corporate interests in the careers of justice in this period, with the use of the Court in the most recent period after the 1988 Constitution (covering the period of 1989-2014).

Patterns of Police Enforcement: Adolescents' Experiences in São Paulo

Studies points that direct and vicarious experiences with police officers affects how adolescents confer legitimacy to law enforcement agencies. Frequent and/or intrusive contact tend to diminish police legitimacy (Tyler, 2017). Literature indicate that the likelihood of facing a contact with police vary accordingly to social cleavages. For example, in USA or Brazil police stop black boys more frequently than its counterparts (Trinkner et al, 2019), while in France policing may be more frequent among muslims (Roche et al, 2015). Although social profile variables such as gender, race and religion are strong predictors of police contact, to further understand patterns of police enforcement it should be considered how police officers targets specific urban areas. This study investigates patterns of adolescents' contact with police focusing on both individual social profiles and urban features from the city districts in which adolescents live. Does adolescents from the same race group experiences the same types of police contact regardless of where they live, or are certain patterns of policing more likely to happen in specific city districts? Are those patterns associated to criminal rates on those areas? Data on police contact comes from the São Paulo Legal Socialization Study (SPLSS), an ongoing longitudinal survey exploring early adolescents' legal development with a sample of students born in 2005 in the city of São Paulo, Brazil. Types of contact with police are vicarious and direct, both legal and illegal situations (i.e. "ask for help", "be beaten by an officer"). Contact variables were matched with demographic information from 2010 National Census (race composition and Índice Paulista de Vulnerabilidade Social - IPVS) and criminal records from São Paulo State Department of Public Security for each SPLSS participant city district.

Historical and Current Meanings of Sugarcane Workers' Struggles for Rights in Pernambuco-Brazil

In this presentation, we retake the memory of the strikes of the sugarcane workers of Pernambuco, from the 1960s to the present day, and the union practices associated with them, seeking to discuss their meanings for the trajectory of Brazilian unionism since then. The objective of this presentation is to rescue the threads that weave the memories of these strikes in their possible connections and mediations with the present experiences among the new rural leaders, especially their practical-discursive dispositions and how they are facing the new socioeconomic context that is presented to them with the decay of sugarcane cultivation, in contrast to a cycle of large industrial investments in areas of the former sugarcane region of Pernambuco. Among the guiding questions of this study, the following stand out: to what extent does the theme of rights become the main thread of the struggle of sugarcane workers in the Northeast and Pernambuco? How do the old and new rural leaders in Pernambuco and the region face the process of decadence of sugarcane cultivation in the region? This study is part of the Project "Crossed Movements and Specific Stories of Rural Workers. Comparative analysis of the strike cycles initiated by the metallurgical workers of São Paulo and the ABC of São Paulo and by the sugarcane workers of Pernambuco at the end of the 70s", coordinated by José Sérgio Leite Lopes (UFRJ). The analyses and reflections presented here are based on extensive bibliographic research, dozens of interviews with historical and current leaders of rural unionism in Pernambuco, as well as direct observation of union events related to the theme and occurred in the last two years in the region.

OLIVEIRA, ROBERTO* (UFPB, Brazil)

Labor Reform and the Legalization of Precarious Labor in Brazil

The purpose of this paper is to present some reflections on the recent process of changes in the pattern of labor relations in Brazil, focusing on the implications of the Labor Reform, which came into force in November 2018. Under the argument of the "modernization" of labor relations, attempts have been made since the early 1990s to deregulate and make labor legislation more flexible. Such efforts gain new momentum and contours more recently, with the approval of the Labor Reform and other similar measures. From data (collected from secondary and primary sources) systematized by the Interdisciplinary Labor Reform Monitoring Network (REMIR) - which is made up of researchers from all regions and various research institutions in the country - we will argue that the ongoing changes have fundamentally contributed to deteriorate the conditions of hiring and use of work, lowering and making wages and working hours more flexible, favoring the adoption of atypical forms of labor relations, encouraging non-compliance with labor legislation, making it difficult for workers to access Labor Justice and weakening unionism and the instrument of collective bargaining. The further the implementation of the new legislation progresses, the more it becomes evident that the arguments that were the basis of its approval in the National Congress are blatantly contested by the facts. The main promises were for the drop in unemployment, the formalization of employment contracts and the resumption of the economy. All contrary to what has been happening.

Women in Transnational Gangs.

Transnational Gangs from North and South American origin, although generally pictured as mainly male, count in their numbers with women who either participate as active members of the group or create their own "satellite" groups around them, which, in time, can become fully independent and structured youth groups. The reasons why young women and men join a youth street group tend to differ little in their first years of pertinence, but as they grow older, the motivations behind the decision of leaving or staying vary. Those women who choose to stay beyond adolescence and into adulthood seem to acquire a more important role and even to take the lead in the attempts made by the group to adapt to new times, social conditions and the groups' own necessities. This paper presents the context of women in one of these transnational gangs from North and South American origins, the ALKQN (Almighty Latin Kings and Queen Nation), their evolution over time (decades) and space (migrations), and their role as agents of mediation both within the group and between the group and other social agents.

Relational Sociology Analysis of Life Experiences of Trans Woman Actresses in Existence of Transphobia in Turkey

This research started with the question, 'How are the trans woman actresses receiving important awards in 2000's, in the area of acting, while transphobic environment has existed for years in Turkey?'. In order to answer this question, the life experiences of trans woman actresses are examined as historically from 1970's to 2000's by taking into consideration their relationships with the structures -such as family and state- and the other people. In this research, transphobic discrimination, position changes, tensions and conflicts, uncertainties that transwoman actresses in Turkey experience in different figurations, the strategies that they follow in case of uncertainties and their turning points are discussed. The main figurations in which the trans woman actresses exist, are dealed as 'acting community figuration', 'family figuration' and 'activism figuration'. Besides, the relationship and fluidity between these figurations are discussed. The theoretical frame of this study is based on figurational sociology of Norbert Elias and uncertainty theory of Harrison C. White and the data of this research are collected by in-dept interviews that were had with the trans woman actresses. In this study, methodology of case study (Creswell, 2007) and macro and micro approaches in figurational sociology methodology of Elias are followed. Among the preliminary findings of conclusions of this research, the most important finding is that, the awards which the trans woman actresses received doesn't show an essential change in transphobic environment in Turkey. Additional to all, exhibiting the uncertainities and the strategies -which are used in order to remain standing- that the trans woman actresses have is important in such a world where discrimination against LGBTİ people exist and also, it is important to realise this study in terms of making a contribution to social science literature in which there are limited research on relational sociology and also on trans woman actresses.

Differing Visibility and / or Invisibility, Addressed Identity of Children during Disaster Processes

The disasters and related processes have been defined differently as in context and number over time. Developments in disaster studies and their relevance to society brought up different conceptual framing of the disasters. Thus, inclusion or exclusion of war, climatical changes, nanotech disasters, human-made disasters, hazards, risks, management, disadvantaged groups (women, disabled, children, elderly) issues have been recent discussion points. However, recent disasters like Fukushima, Syrian war, significant migratory movements blockages movement of families in the Mexican border, bombing Yemen brought up the differing appearances of children, visibility and question of whose children are them? Besides this, discussions were ongoing about children of the nation-state, children of the international community, citizenships in other areas but rare in disaster studies.

This paper intends to bring forward comparatively children's situation in reality and the politics through addressing legal, institutional developments, approaches to child politics during disaster issues (children's situation following Fukushima, USA-Mexican border applications and Syrian war, bombing Yemen), responses of the children and civil society. The discussion bases on local, national, international level comparisons and the intersection of them. Children might (Greta Thunberg) /might not be lucky (Aylan Kurdi,) powerful enough to be recognized. What have been changing or unchanging since recent disaster examples concerning approaches to children's situations?

The Necessity of Institutionalization and Community Participation of Disaster Gathering Places for the Establishment of Public Awareness and Disaster Culture

Gathering places can differ according to the type of disaster, climate, and character of space (open-close) duration of time of the stay (short-long; temporary-permanent). Disaster studies require a sequential and holistic approach to disaster processes and institutionalization is necessary for the disaster-related agents [constructed building, relations (institutionalized- timely), spaces (open-close/combination)] concerning disaster culture and awareness. Above mentioned necessity seems closely related to the establishment of the memory and participation of the public and communities. This necessity time to time overlooked through changes in construction policies, due to attempts to avoid the trauma of past disasters (changing name of streets contains significant number collapsed houses as was the case for Adapazarı-Turkey), etc. However sometimes disaster gathering places and awareness of them especially stamped by multicultural, multiage, multi-time sequence usages were observed in some Tokyo natural parks and museums. These different approaches bring different applications and the results during the disaster processes.

This study attempts the evaluate types, usage styles and changes in disaster gathering places through time as in context, number and types examples derived through fieldworks in Taiwan, Japan, South Korea, Canada, Mexica, Argentina, and Turkey.

Zoning Queerness, Taking Our 'Rightful Place': The Experiences of Young Student Leaders on Campus Navigating an Anti-Queer Landscape

As LGBTQ students demand visibility on the University of the West Indies (UWI), Mona Campus, the response by their peers has been increasingly negative. Members of the University community who are gender non-conforming are seen as an affront to hegemonic Caribbean gender norms. The norms sanctioned in student leadership spaces, particularly on halls of residence, is one that is antithetical to queerness. This has resulted in a systemic zoning of queerness on campus. This zoning is most pronounced in student leadership and traditional halls of residences built in the 1960s where a phallocentric brand of leadership prevails, and where difference is often times violently rejected. While on the surface, learning spaces present as hospitable places, for queer students, this is but an ideal. A culture of exclusion has permeated the campus resulting in the 'landscaping' of students 'suspected' as being LGBTQ. Students have developed their own organizing principles and established rules about who lives where on campus. In this

queer landscaping, 'safe spaces' have been created for LGBTQ students, however, their safety is guaranteed only and if they stay in their 'rightful' place. Who then is the campus hospitable for? Which students have the right to navigate the campus freely, and which ones have to confine their identities to very specific spaces for fear of marginalization and exclusion? This paper explores the culture that surrounds the queering of residential and co-curricular spaces at The University of the West Indies, Mona Campus. Through an analysis of interviews with young student leaders navigating an anti-queer landscape, we highlight the bi-directional implications of zoning queerness.

OOSTERVEER, PETER* (Environmental Policy Group, Wageningen University, Netherlands)

Towards Consuming Food Sustainably Using a Food Systems Lens

The environmental impact from the consumption of food, energy, mobility, etc. cannot be ignored when aiming for more sustainable societies. Consumers have direct environmental impact when consuming and indirect environmental impact when influencing supply chain governance. Most sustainability policy interventions and social science research has aimed at changing the environmental attitude of the individual consumer but there are evident limitations in this approach in terms of effectiveness and conceptualizing consumer behavior. This paper develops a conceptual framework for analyzing sustainable food consumption as part of global and local food systems. Building on social practice approaches and transition perspectives and the results from research among poor urban consumers in Bangladesh, Ethiopia, Nigeria and Vietnam, this paper presents an innovative sociological perspective on transitioning towards more sustainable food consumption.

The Chibok Girls' Kidnapping and the Limits of Grassroots Activism

The kidnapping of 276 girls at Government Secondary School Chibok, Borno state, Nigeria on 14 April, 2014 has brought into international prominence the organization *Jama'atu Ahlis Suna Lidda'awati Wal Jihad* or Boko Haram. The incident and Boko Haram's operations have generated tremendous scholarly attention. However, the broader implications of the kidnapping incident for understanding and engaging with the limits of social movements in the global south has been largely ignored. This paper problematizes the kidnapping of the Chibok girls. It explores the functionality and consequences of the grassroots advocacy for the rescue of the girls. The paper demonstrates how kidnapping serves as an MRI of the "soul" of a state and society. The kidnapping incident was constituted by and constitutive of Nigeria's *political toxicity*. The paper argues that the exploitation of the Chibok girls has become an international business. A constellation of state and non-state actors—government officials, human rights advocates, school administrators, politicians and seemingly unsuspecting humanitarians — has become active participants in the exploitation of the kidnapped girls and the over 100 of them who have been freed. These issues have implications for the sociology of societies where kidnappings occur and the intractability of similar social problems.

Institutional Racism 2.0: Between Normalized Exceptionalism and Everyday (racist) Governmentalities. the Case of Belgium.

Institutional Racism (IR) is today rarely mentioned when studying race-based inequality. Today, other theoretical tools – e.g. ethnicity or nationalism – came to explain the marginalisation of specific populations. However, since migration became a core security issue in most affluent societies, selected – or, racialized - migrant groups are excluded from rights and services available to the rest of the population. In recent times, countless in/formal strategies were implemented by a variety of institutional actors to discriminate non-nationals. Moving from this angle, this work claims back the centrality of IR for the study of how contemporary structural racism works. For this scope, here we propose an updated version of the concept which adapts to current changes in the governance of exclusion. By concentrating on a European state – i.e. Belgium - first we incorporate Agamben's (2003) 'state of exception' to explain how, today, multiple exceptional measures regulate the lives of migrants in the country. Since these special laws and regulations often conflict with other constitutional and international commitments of the state, their implementation generates the space for increasingly arbitrary – and eventually racist - judicial decision. Second, we rely on Foucault's (2010) gov-

ernmentality to disentangle foreigners' increasingly dependent relation with the public administration. Due to the multiplication of law and regulations concerned with migrants, a growing number of domains of non-nationals' life in Belgium moved in the hands of street-level bureaucrats. As we discuss here, within the space of these frequent interactions, racist governmentalities can come to inform both bureaucrats and their migrant clients' strategies. Empirically, the paper draws on over fifty interviews conducted with migrants living in different parts of Belgium as part of a multiwave fieldwork, and a number of semi-structured interviews carried out with stakeholders from both the civil society and local/regional/national organizations.

ORSINI, GIACOMO* (Université Catholique de Louvain, Belgium)

Violent By Law. How Restrictions on Family Reunification Help (re) Producing Conjugal Violence: The Case of Belgium.

Since family reunification became one of the favourite options for non-Europeans to regularly migrate in Europe, authorities introduced increasingly restrictive laws and regulations to hinder foreigners' ability to join their partner abroad (Kofman 2007). Within such transforming scenario, Belgium is no exception: as migration turned into a top security issue, the legislator embittered multiple provisions relative to the right of family reunification in the country (Vink et al. 2013). New rules and regulations increased the reunified partner's dependency on the other member of the couple/family already present in the country. With a reform of 2011, residence permits obtained through family reunification were made subject to a probational period of five years. Consequently, during this period newcomers must remain in the household of their partners in order to keep the right to reside in Belgium (Gsir et al. 2016). As discussed here, these obligations exacerbate tensions within the couple and eventually create the conditions for domestic/conjugal violence to take place. What more, by turning the status of recently arrived migrants more precarious, restrictions to the right of family reunification concurrently hinder the possibility for institutional and non-institutional actors to effectively protect the victims – and, for the victims, to effectively protect themselves. By concentrating on the case of Belgium, the aim of this exploratory work is thus to provide a view of how (securitized) policies on family reunification can facilitate the (re)production of domestic violence within migrants' households. Empirically, the paper draws on a number of life-history interviews conducted with migrant victims of domestic violence, semi-structured interviews carried out with stakeholders from both the civil society and a number of local/regional/national organizations, and data coming from a series of observations at one of the family tribunal of one of Belgium's major towns.

Ageing Population and Retirement: Research from Social Gerontology, Relational Sociology and Mixed Methods Approach.

We live in a world where social relations are crossed with diverse inequalities, which manifest themselves over time and particularly with pensions. Chile makes a great case study, due to its status as a developing country and its high level of social inequality, being one of the unequal countries in the OECD. The year 1973 brought a military coup led by General Augusto Pinochet, and the subsequent dictatorship laid the foundations for the current neoliberal economic system. In 1980, during the dictatorship, the "Pensions Administrative Founds" pension system was launched, consisting of privately managed and individually owned retirement accounts, and became the world's first state-endorsed privatised pension system. The system reinforced the country's baseline inequality over the long-term, with differences in terms of life trajectory, characterised by inequalities relating to gender and social class. Accordingly, the main objective of this thesis is to understand the different paths taken by Chile's senior citizens in their personal lives, to deal with their pensions and all the cost of living at the same time.

The proposed framework would be the mixture between some theories of social gerontology and relational sociology. The methodology consists of the construction of personal networks with a mixed method approach, specifically social network and qualitative comparative analysis. Finally, this presentation is going to be the first results of the research, making visible how support networks contribute in the way of struggle with the current pension of each person.

Social Distrust in Divided Societies: Evidence from Factorial Survey Experiment

This paper investigates the structure of social distrust caused by social stratification. Distrust of others who are dissimilar to oneself in socioeconomic positions might foster the divided societies, which is recognized as a major problem in many countries.

In trusting people socioeconomically different from oneself, we have less experiences about how they are likely to act cooperatively than in trusting people like oneself. Thus, in trusting people socioeconomically dissimilar to oneself, our choice to trust or not might be based on moral or civic values of trusting which are beyond the rational expectation based on knowledge.

This study examines who trust (and distrust) whom, focusing socioeconomic positions, by the factorial survey experiment. The data were collected using a nationwide web survey administered on March 2019 in Japan. The respondents (N = 1,964) were individuals aged between 25 and 64 years old that were selected from a survey agent's panel with similar proportions to the 2010 census distributions of gender, age, city size, and education. The survey included questions about respondent' trust on fictitious persons described by following socioeconomic attributes: education (high school/college graduate), type of employment (non-regular/regular), and marriage (unmarried/married). We conducted the multilevel analyses (level 1 is vignette of fictitious persons and level 2 is respondents of the survey).

The findings are as follows. Respondents with college degree trust the college graduate much more than respondents without college degree. Similarly, respondents in regular employment trust the regular employee much more than respondents in non-regular employment. These findings suggest that people distrust others socioeconomically different from oneself.

Crossed Mobilities: The "New Wave" of Spanish Emigration to France

The onset of the 2008 economic crisis intensified the interest shown by both the scientific community and various institutions (the European Union, nation-states, etc.) in the migration of workers from those countries most severely affected by the recession (Portugal, Italy, Greece, Spain, Italy and Ireland) to other European countries (the United Kingdom, Germany, etc.). The majority of the studies focused on producing estimates regarding migrant numbers (Triandaflyllidou and Gropas 2014). However, very little qualitative research has been conducted into intra-European mobility from Spain. The few extant studies were carried out mainly in the United Kingdom and Germany (Glorious and Domínguez-Mujica 2017; Pumares 2017; Barbulescu, Bermúdez and Brey 2015, among others). In addition, even fewer studies have associated these "new mobilities" with earlier migratory trends such as those of the 1960s and 1970s, addressing migratory flows stemming from the economic crisis within a context of continuity with the past rather than fracture (Malheiros 201, Glynn 2014). This paper analyses the "new emigration" from Spain to France that emerged following the 2008 crisis from the perspective of crossed mobilities (Oso, Saíz and Cortés, 2017), focusing on the cross between social class, gender and generation. It considers the connection between this "new wave" and Spanish unskilled labour migration in the 1960s and 1970s (domestic service, caretaking, cleaning, building sector). It also analyses skilled migration, which stands apart from traditional emigration, revealing the key role played by social origins in labour market insertion. Finally, the article considers the crossed mobility between exiled Republicans and economic exiles who refer to themselves as the *Marea Granate* or "Maroon Wave". The analysis is based on fieldwork conducted in Paris with 20 Spanish origin migrants that arrived in the wake of the 2008 crisis and virtual ethnography (Spanish emigration's principal websites and Facebook portals).

OSORIO SOLANO, SUSANA* (Universidad de La Frontera, Chile)

Reading Populism from the Social Movements: Compared Cases of Chile, Spain and Hong Kong

In recent years, the concern about the rise of leaders and populist parties to power has been studied from different perspectives, focusing primarily on those personal and / or contextual characteristics that enable or catalyze the emergence of these forces. However, there are few studies that consider the revision of populist discourse from one of its first manifestations; that is, social movements.

Under this perspective and based on the comparative analysis of 3 cases that converge temporarily, a review is offered regarding the speeches of the student movement in Chile, 15M in Spain and that of umbrellas in Hong Kong; To reach a first conclusion: the institutional response and the capture of concerns by other political actors will be decisive in

the escalation of the movements and their transformation as a party. In this sense, the opening in a democratic system can be used to channel the disconnection between citizens and the political / technocratic class and, in the short term, solve apparent governance problems. However, in the medium and long term, these parties turn out to be an obstacle and a threat to the consolidation of liberal democracy. However, in autocratic contexts, the absence of openness and the emergence of movements can serve to make visible tensions that result in a liberalization of the political system; or, in a political recession.

Finally, we worked with a mixed methodology, creating 4 macro-categories: a) polarization, b) recurring themes and emotions, c) stressful elements and d) power-institutions; which were applied to slogans, manifestos and public statements, using the qualitative software Atlas IT and that allowed the study of populism as a longitudinal process and from a holistic perspective, being the ideational approach, the paradigm on which they were based subsequent reflections.

Attitudes Towards Guns in Latin America in the Context of the 'punitive Turn' in the Region

In face of global phenomena such as the increase in environmental, financial and labor risks; the weakening of the welfare state; the promotion of neoliberal individuation policies; the loss of citizen confidence in state institutions; and the erosion of solidarity ties, there has been a resurgence of forms of individual protection such as the use of firearms. In Latin America, where occur about four out of ten homicides worldwide (UNODC, 2019), most of them with firearms, and where also fatal accidents and suicides are committed with guns, they are highly accepted as a legitimate mean for self-protection (39% according to LAPOP, 2012).

This paradox between risks related to firearms' proliferation and their high level of approval led us to ask, from social psychology with a sociological perspective, about attitudes towards guns and their link with: crime victimization, perceptions of (in)security and confidence in the criminal justice system (instrumental hypothesis), but also with other social tensions ranging from unemployment to hegemonic masculinity and authoritarianism that are channeled through pro-gun positions as part of a "public punitiveness from below" trend (expressive hypothesis).

In this paper we will analyze preliminary results of a mixed method research project: first, a general background of public opinion trends based on the Amer-icas Barometer (LAPOP); and second, a preliminary analysis of focus groups carried out in Buenos Aires, Córdoba, Montevideo and Quito. Such findings will help us to identify the motivations behind social legitimacy of firearms and behind potential demand of guns for a larger sector of the population. This study seeks to contribute to the effectiveness of control and disarmament campaigns in the region.

Femicides, Femicides-Suicides and Guns Use in Argentina: Hegemonic Masculinity in Dispute

Gender perspective helps to understand femicides and the suicide of femicides, including by members of the security forces. These phenomena, and the preference and easy access to guns, could be explained by the mandate of hegemonic masculinity. To study this in the Argentine case, statistical analysis of secondary data from official and unofficial sources was conducted. Results suggest that in order to reduce the level of femicides and femicides-suicides, including those committed by policemen, strategies should combine disarmament and gender perspectives, by reducing the access to guns and by questioning the hegemonic masculine identity that legitimizes and motivates guns' possession and gender violence. The use and limitations of punitive laws regarding femicides is also discussed.

OTERO, GABRIEL* (University of Amsterdam, Netherlands)

Class, Culture and Social Capital

How much socioeconomic resources people have embedded in their personal networks is called social capital. Scholars have demonstrated that social capital is strongly associated with social class. Two tie-generating mechanisms are crucial in the explanation of this link between class and connections: an interplay between preferences and meeting opportunities. First, it is well known that people tend to relate to those who have the same status – the so-called "choice homophily". Second, people with similar social class are more likely to be in the same place at the same time than those with dissimilar status, because social class often determines where they live, work and recreate. Therefore, similar class people have more chances to interact. Even though these mechanisms have long been used to explain the inequality in access to social capital, little is known, about the extent to which those social forces are explicitly associated with class differences in social capital. To contribute to filling this gap in the literature, in this study, we examine the extent to which cultural/cognitive repertoires or preferences explain the access to social capital in Chile. Using representative survey data of the Chilean urban population aged 18–75 years (ELSOC, n=2,517), we have considered a set of indicators of social capital such as contacts' variety and prestige. Also, we built a relational indicator of class that combines measures of education, income, and job status. Preliminary OLS regression models show that shared cultural repertories are a clear force to understand class-based inequality in access to social capital, especially in the middle classes. These findings clarify previous evidence in the literature and support some theoretical assumptions on class divisions and social capital.

RC28-346.2

OTERO, GABRIEL* (University of Amsterdam, Netherlands)

Spatial Segregation and Inequality in Social Capital

How much socioeconomic resources people have embedded in their personal networks is generally called social capital. Scholars have demonstrated that social capital is strongly associated with other sources of inequality such as education, occupation and, income. However, what remains unclear is whether the spatial conditions of the residential environments are associated with differences in access to social capital. This is relevant because the spatialization of class, or spatial inequality across multiple forms of social ecology, including poverty, affluence, employment, and access to facilities, might play an important role in reinforcing long-standing patterns of social stratification. In this study, we contribute to the understanding and analysis of the link between socio-spatial conditions and social capital, focusing on a highly segregated and unequal context. In general, we hypothesise that the unequal access to social capital is significantly associated with spatial conditions beyond and above people's social class. We focus on Santiago, Chile, one of a group of Latin American cities marked by high levels of socio-spatial segregation. The study combines survey and georeferenced data collected in 2016 during the first wave of the Chilean Longitudinal Social Survey (ELSOC), designed by the Centre for Social Conflict and Cohesion Studies (COES). We build a multidimensional measure of the spatial conditions, focusing on the interrelation between variables, in order to clearly understand and represent the spatial structure. Preliminary results indicate that access to social capital is very unevenly distributed through urban space. In addition, we found that spatial segregation shapes network segregation.

The Sustainability of Cooperation Under Newcomer Entry: The Role of Normative Disagreements between Newcomers and Incumbents

Cooperation in groups often requires individual members to make costly contributions that benefit the group as whole. Prior research suggests that norms help to support group cooperation by prescribing common standards of how much to contribute. These common standards may be disrupted when groups undergo membership change, i.e., when new members enter and existing members leave. When new and old members disagree about how much to contribute, a normative disagreement ensues that may harm cooperation. In a laboratory experiment, we manipulate whether old and new members agree or disagree about how much to contribute in a public goods game with peer punishment. We examine whether membership change affects group cooperation differently depending on the level of disagreement. We find that normative disagreements between old and new members negatively affect the development of a shared social norm and feelings of group identification, but that this in turn does not negatively affect cooperation. Instead, old and new members adjust their behavior to each other's standards, with the new members giving in more than old members.

From Managers to Caretakers: Teenage Girls' Involvement in Illicit Drug Economies in Brazil

Early research on women's involvement in illicit drug economies has focused on women's marginalized positions in drug markets. More recent investigations have pointed to how women mobilize gendered strategies to succeed in the drug trade. Yet, little is known about young women's participation in particularly violent drug markets, such as those of South America. This paper investigates the meanings that criminalized Brazilian teenage girls attribute to the illicit drug economy. It examines how girls perceive their role in this economy and how these roles are gendered. Data comes from 21 biographical interviews with incarcerated teenage girls in Porto Alegre, Brazil. Drawing from Bourdieusian theory and narrative criminology, I analyze how the structure of the illicit drug economy informs girls' understanding of their practices. I found that girls' perceptions of their role in the drug economy were informed by their hierarchical position in the drug markets. Girls who held positions of authority within their groups believed their role was to be responsible and control men's wild emotions. Girls who dealt drugs at the street-level and had no managerial positions in their groups perceived their role to be providing emotional labour for men, be it through friendship or romance.

OWOLABI, TEMITOPE JOSHUA* (University of Lagos, Nigeria)

The Politics of Population Census, Socio-Economic Planning and Crisis of Underdevelopment in Nigeria.

Since the independence of Nigeria in 1960, researchers as well as developmental experts have sought to disclose the reasons for the nation's protracted underdevelopment. These efforts gained momentum, following the oil boom of the 1970s, in which the nation boasted of having lots of money at its disposal to the extent that its problem became what to use the money for, yet there was no visible development or its indicators in the country. Most of the studies averred that corruption, tribalism and nepotism, an established system of mediocrity cum general administrative ineptitude account so much for the nation's developmental catastrophe. This research work, though not completely denying the fact that the above mentioned issues in one way or the other contribute to the nation's developmental crisis, contend that Nigeria's developmental problems are inextricably intertwined with Census Politics as observed in the 2006 population census of the federation. Data generated from population census is amongst other things used in determining who gets what, when and why in the Nigerian federation. Consequently, there has been an unending drive towards inflation of census figures amongst Nigerian states, geared towards obtaining the advantages accruing from having higher population figures in the country. This scenario has created a situation of distributive imbalance and subsequently, injustice in the allocation of funds and other resources in the federation. It is observed from our study that the root cause of the jostle towards falsification of population census figures in Nigeria remains the inadequacies in the practices of revenue allocations in the country. This accounts so much for the manipulation of the 2006 census figures in the country. As a result of high intrusion of politics in the 2006 population counts, there has been widespread discrepancy between revenue allocation to states and the call for its rejection.

School Choice in Indigenous Families As a Conflicting Path between Lands and Cultures: The Case of Mapuche Families Choosing Secondary School Under Educational Reform in Chile

Chile has a highly segregated education system (Valenzuela, Bellei, & De los Rios, 2010), which is partly explained by a policy based on free school choice and promoting competition between schools for enrollment and academic results. From this diagnosis, the Inclusion Law (2015) reformed the school admission policy. Today we have a new centralized online School Admission System (SAS), which seeks to offer equal school access to all students, particularly those from lower socioeconomic backgrounds.

Indigenous students tend to be one of the most disadvantaged sociocultural groups in terms of educational access and academic outcomes (Treviño, Valenzuela & Villalobos, 2018), in addition to lacking an actual intercultural educational alternative. Using qualitative methods, we explored the experiences of ten Mapuche families from rural southern Chile regarding their secondary school choice processes under the new SAS. In general terms, the path from primary to secondary school in rural settings involves a change from a local small multi-grade primary school, to an urban secondary school, which in most of the cases also includes a TVET alternative. This decision presents families with diverse social and educational issues. From an intersectional theoretical approach (Brah & Phoenix, 2004), this study asks about the influence of cultural, ethnic, territorial, historical, educational and future labor related aspects of the decisions of Mapuche families regarding the educational path of their children, and to what extent the new SAS offers them equal educational opportunities.

The findings show the intersection of ethnic, territorial and social class issues affecting the families' educational definitions in relation to the aspirational expectations regarding their children. These families perceive the SAS as a fairer process, but it cannot change the structural educational inequality of the schools in the country or the context in which they are aware of their historically disadvantaged position.

Community Sharing and Sustainable Mobility in a Super-Aging Society

The paper analyses new initiatives in shared mobility for the senior citizens of Kashiwa, a satellite settlement outside Tokyo. The transport requirements of the elderly present a paradox for the transition to a sustainable mobility system. Infirmity and vulnerability promote a shift away from individual dependence on personal car ownership. At the same time these conditions make the 'first and last mile' a critical barrier as well as the demands of mass transit services. Policies which simply focus on concessionary fares for public transport reflect the limits of an economic approach and show the need instead to address multidimensional social practices.

Kashiwa has experimented with the new shared mobility services of a fixed route minibus and a flexible community taxi. Although meeting sustainability policy goals, personal car use is also discouraged through the promotion of health co-benefits. These are the reduction of injury associated with older drivers the facilitation of travel from home to heatwave risk management centres. Demand response seeks to avoid smart phone dependence which has low diffusion in this demographic group. Innovations have been made instead to use artificial intelligence for ride sequencing and management in response to conventional telephone booking customer interface.

Interviews were conducted with a range of users of these services in order to explore their utility and prospects. There remain significant challenges in designing a demand-led system to effectively match user needs, with underutilised capacity in fixed routes, and excess demand in flexible services. The different services tend to specialise in different journey types - fixed route for mass transit connectivity, flexible for point-to-point destinations. A particular social issue is the difference in acceptability of ride sharing between minibus and saloon car. Future policy development needs to pay more attention to these social practices.

Migration Her/Stories: Syrian Women's Narratives of Gendered Violence

Turkey currently hosts over 3.5 million Syrian refugees, of which more than half are women. Due to the Turkish legal code under which a refugee is only a person fleeing conflict in Europe, Syrians are not legally refugees and cannot thus claim a refugee asylum status. Instead, Syrians are classified as „foreign nationals under temporary protection" (they are seen as guests, *muhajirun*) which puts them in an insecure (precarious) legal status which further complicates their access to health, education and other services usually provided by the state and/or civil society. Given these structural circumstances, coupled with Syrian community´s gender norms and practices, my objective is to understand how Syrian women have experienced and how they have responded to gender violence. I am particularly interested in how Syrian women experienced this type of violence both as a factor which triggered their migration decision, as an experience enountered on the migration route as well as during their settlement in Turkey. While I will set their narratives in the above mentioned socio-political context of Turkey, I will also account for the Syrian community´s gendered practices and attitudes towards violence which, coupled with the former, create a context in which Syrian women struggle with, accept and/or downright reject violence and negotiate their sense of self *vis-a-vis* the Turkish state, civil society as well as their own community. While I will provide a theoretical framework based on the concept of precarity, this paper will mostly be an empirical study based on interviews with Syrian women in Turkey.

The Dialectic of Capitalist Socialisation: Revisiting Marx's Theory of Alienation in the 21st Century

The concept of alienation is one of the most well-known terms in critical theory, but is also one of the most controversial. In recent years, several attempts have been made to reconstruct and apply the concept of alienation to our present societies. While interpretations have traditionally focused on Marx's early philosophical writings, the present article draws on select passages from the Grundrisse in order to ground the concept of alienation in Marx's mature critique of capitalism. The analysis proceeds in three steps. First, I detail Marx's views on the human subject and its relation to society, and the centrality of productive activity to individual and societal development. Secondly, I show how alienation arises from the dispossession of labour and its transformation into capital, through which the results of social production is turned into an exterior and hostile force. While alienation is often regarded as a one-sidedly critical concept, I argue that Marx saw alienation as a problematic, yet necessary part of the social development and eventual transcendence of capitalism. In order to foreground this point, the final step of the analysis proposes seeing alienation as created through a dialectic of socialisation and objectification that creates a contradiction between the social power of humanity and the economic imperatives of capitalism. I contend that this interpretation resolves two of the main criticisms theories of alienation often face, namely the concept's problematic assumption of a original human essence, and the related tendency to portray alienation as an endemic feature of all forms of social organisation. The final section of the paper discusses the concept's sociological implications by drawing out some predictive hypotheses, and makes the case for why understanding capitalism's psychosocial consequences remains central to contemporary critical sociology.

Las Policías Estatales En El Proceso De Militarización De La Seguridad Pública En México

Las policías estatales en el proceso de militarización de la seguridad pública en México
Sergio Padilla Oñate

Los estudios sobre militarización de la seguridad pública en México se han concentrado, principalmente, en analizar el papel de las fuerzas armadas en tareas propias de policías. Sin embargo, poco se conoce acerca de las transformaciones y el desempeño de las policías estatales y municipales, producto de su contacto cada vez más constante con los miembros de las fuerzas armadas. En ese sentido, la ponencia discute qué tan similares son las formas de operación de las policías estatales y las fuerzas armadas, así como los procesos de transformación dentro de las policías que se generan producto de dichas interacciones.

Utilizando datos de la Encuesta Nacional de Población Privada de la Libertad, (ENPOL,2016) se realiza una medición del uso de la fuerza ejercido por miembros de las policías estatales durante el arresto. A su vez, se identifica la presencia militar en cada entidad federativa, entendida esta como el porcentaje de casos en los que miembros del ejército y la marina estuvieron involucrados detenciones de posibles delincuentes. De esta manera se pone en el centro de la discusión la cuestión contextual, identificando los estados con mayor presencia militar, así como las policías estatales que presentan tendencias similares a las fuerzas armadas en el uso de la fuerza y algunos otros aspectos operativos. Con base en los resultados obtenidos el trabajo concluye con una tipología que propone un conjunto hipótesis acerca de los procesos de militarización al interior de las policías estatales y las tensiones con la política de seguridad pública a nivel nacional.

Examining Teacher Professionalism Under Data-Based Managerial Regimes: A Realist Synthesis

Over recent decades, education reform has increasingly focused on the governance of education systems implying relevant changes for the teaching profession. Among other measures, school autonomy is being promoted to enhance decentralization and more efficient organizations at the expense of schools and teachers being held increasingly accountable at the central level through external evaluations and standardised tests. Teachers are increasingly being more and more responsible for students' performance to parents, educational authorities and society as a whole. Test-based Accountability (TBA) has become a skilful policy instrument to control, regulate and govern teachers work (re)modulating core components of the profession. The aim of this paper is to provide a better understanding about the relationships and the impacts of TBA systems and related managerial reforms on teacher professionalism. In order to do so, we develop a realist synthesis (Pawson et al, 2004) to review existing evidence to build an explanatory analysis on how and why TBA is affecting teachers' professionalism. Despite some research provide positive or mixed results, most of the papers reviewed suggest negative effects on different dimensions. Regarding pedagogy and teaching practices, most research identifies the well-known effects of teaching to the test and narrowing the curriculum. On the other hand, teachers' working conditions and professional status are also negatively affected, including impacts on the erosion of professional autonomy and expertise, bureaucratization and intensification of teachers' work and lower levels of job satisfaction. Preliminary conclusions suggest that the current reform environment is favouring a shift toward organizational teacher professionalism characterized by external forms of work regulation and implying a rational-legal orientation of teachers work as suggested by Evetts (2009). However, the effects of managerial and data-intensive policy instruments are not linear and hence more research should analyse the emergence of differentiation processes between and within the teaching profession.

School Responses to Accountability Reforms: Policy Enactments in a Quasi-Market Context.

Accountability reforms expect to make schools, teachers and principals more responsible for their students' results. At the same time, these policy instruments directly impact on the construction of knowledge and practices about notions

of "quality" and "performance". Indeed, school actors have their own agency when interpreting, decoding and translating accountability policy mandates in real school practices. The purpose of this paper is to analyze the meaning-making process and translation of accountability reforms of different school actors from divergent school settings in Madrid, where the regional government has embraced a market-oriented accountability model. The paper is grounded on a qualitative approach based on in-depth interviews with teachers and principals from different school settings and types of school providers (public and private). The selection of participants is done on the basis of survey responses according to the level of competitive pressure they experience and the schools' positions in the local education market. Pedagogical and organizational logics are identified and analyzed according to expressive and instrumental strategies of schools depending on their position in the schools' local hierarchy. This paper aims to bring new insights on understanding how and why the gap between policy design and policy implementation often persists at the school level.

Literacy, Internet Use and Development in Brazil

The complicated relationship between incentives for literacy, family income and economic development has been explored by Botticini and Eckstein. We followed suit in a recent paper on Brazilian history and continue to look at the various ways in which media and development intersect. In this paper, we investigate whether Internet access foster economic growth in Brazilian cities. The use of the internet requires literacy, although not proficiency in the language, and opens new learning and business opportunities for those who are reasonably skilled. Using IBGE (Brazilian Institute of Statistics and Geography) and ANATEL (National Telecommunications Agency) data for 2000-2016, we investigate whether previous Internet access and greater broadband coverage improve local social and economic conditions. We control for social and educational policies which might impact development, focusing our study on Internet infrastructure. This paper is part of a larger research that will look at the often neglected relationship between media and development. The Brazilian case is particularly interesting due to its very late literacy achievement and to the ambivalent role of the State towards literacy and press freedom in this large country.

Marrano Roots of Brazil: Sergio Buarque De Hollanda and the Modern Individual

We investigate the sociology of Brazilian thinker Sergio Buarque de Hollanda in the light of a complex understanding of individuality, which we relate to the Jewish and Marrano experiences. We examine Simmel's influence on the important historian Sergio Buarque de Hollanda, who wrote in the mid-20th century in the city of São Paulo, and who is said to have Marrano ancestry. We compare Buarque's thought, which shares Simmel's distanced interest in the modern individual, with two Brazilian authors who started seemingly opposed schools of thought, Gilberto Freyre and Florestan Fernandes. The former is an enthusiast of the particular Brazilian sociability forged in sugar cane plantations in Northeast Brazil, providing a description of the intimate national life that still inspires a loving narrative of the country. The latter offers a conflictual picture of both class and race relations; his critical view of Brazilian society is omnipresent in intellectual circles. Far from antipodes, we argue they fail together in seeing profound but subtle tensions in the modern individual, which demand a gaze at once attentive and generous. Buarque's thought goes hand in hand with Simmel's delicate theoretical reasoning, extremely inspiring but incapable of creating powerful schools of thought. His interest in human destiny, devoid of exaltation or condescendence, makes his thought difficult to use mechanically. His followers should start over from the same initial point: the inquiring gaze over men and women, their actions, and their follies.

Between Agency and Structure: How Human Rights Theory Helps Understand Social Movements in Brazil

This paper discusses contemporary social movements in Brazil along two dimensions. The first is structure: I will argue for the importance of new opportunities brought by re-democratization in understanding the emergence of these movements in Brazil. This analysis is analogous to the theory of political opportunities, developed by Tarrow, Tilly and McAdam, to explain the American civil rights movements. The second is the new meaning of agency that has emerged

in the past thirty years, with new collective identities understood as the result of a subjectivity process (Pleyers; McDonald). To connect both dimensions, I argue that Alain Touraine's defense of the importance of individual rights, thenegative liberty in human rights theory for the emergence of "creative freedom", which is present in contemporary social/cultural movements, helps understand the new forms of collective action that came to the fore in the Brazilian public sphere, such as the black, gay and homeless movements.

Revisiting Intersectionality : A Study of Gender Inequality Existing at Work Place in New Delhi,India

Inequality can be experienced at all the levels of the workplace as stated through the work of Acker's. The concept of 'intersectional sensibility' was henceforth introduced to understand this intersectional inequalities within any institution or organisation. Article 14 of Indian constitution and UN Declaration of Human Rights,1948 condemned inequality on the bases of gender yet the statistics portray a different picture. As per 2018 Labor data statistics from International Labour Organisation of India, the % ratio of female to male employee is 22.4%. Even after the formulation of various such policies, laws ; the issues related to 'intersectionality inequalities' at workplace still persists.
Objectives :
To analyse historical and contemporary interpretations related to intersectionality of gender equality at work place.
To assess the impact of gender inequalities with other social identities that contributes to the oppressive and prejudicial experiences faced at work place in New Delhi, India.
To study the existing laws related to gender inequality and intersectional identities.
To develop viable remedial measures towards improvement of structural gaps in achieving substantive equality.
Doctrinal as well as empirical research.The sample size of the research - 150 samples. The universe of the study - Males (50) and female (50) employees working in both the sectors (private and public),50 samples - employers working in New Delhi,India.The sampling method will be random sampling and case study method and data shall be collected using Structured interview schedule and questionnaires consisting of open and close ended questions. The data shall be interpreted using SPSS version 25.
This paper aims in discussing age old issues of gender inequality that still exist in a Democratic country like ours.To achieve this, the researcher will be revisiting the debates on 'intersectionality' that would help the readers to understand how the concept was moved forward previously by Feminists.

Monitors and Students: Cooperation between University and Society in the Fast Girls Project

The present paper analyses the performance of the Meninas Velozes (Fast Girls) Project, a group of professors and students of University of Brasília (Brazil), especially the participating college students, all women, the project monitors. Due to a historical gender dichotomy that affects the division of labor, and consequently, the graduation courses choice, there is a minor number of women in the exact sciences area. Contesting this supposed dichotomy, the Meninas Velozes encourages a group of student girls, between 14 and 17 years, of a school located in a peripheral área of Brasília (Federal District) to develop interest in such area through practical workshops. The Project is an example of action that questions the traditional gender roles, and also promotes debates upon gender and education, meeting the works of feminist authors like Neves (2005) and Haraway (1995), that point out the need of situating the knowledge in the academic production. Observations were made in 8 practical workshops and 22 preparation meetings, and also semi-structured questionnaires with the monitors and the teenagers, witch included an socio demographic profile and open questions, along a year of research. Throughout the process, the apprehension of the meanings attributed by each one to the project was noted. The experience of participating in the Project is enriching for the graduation students, building social bonds between them, promoting their autonomy and the collective construction of action around an ideal of full access to higher education. To the attended teenagers, the Project represents na opening to all studies areas, and also the opportunity to know the University and the educational and gender issues discussed. With initiatives like that one, the university achieves an exchange with the community around it, and thus meets a social function of democratizing the knowledge.

Labour Disputes and Foreign Migrant Workers in Indonesia

Indonesia is a net emigration country, and is typically seen as a sender of migrants. But in the country, there is also a much smaller and diverse population of foreign migrants who live and work in both regular and irregular situations. Amongst them are migrant workers with a complete set of paperwork and permissions from the Indonesian government. They ought to have much the same quantity and quality of legal rights as citizens, including access to the national industrial relations system for seeking enforcement of their employment rights. Generally, they are only employed in jobs that promise higher pay and better work conditions, and in this way, they are privileged. But at work, they encounter many of the same rights abuses as Indonesian workers, such as not being paid wages or granted leave. While most migrant workers cut their losses, either at work or after they change employment, a small number sue their employers through Indonesia's industrial relations system. Procedurally, the process ought to be the same for both national and foreign workers, but the actual lawsuits have distinct characteristics. This paper presents a preliminary analysis of all cases that were decided at the Industrial Relations Court (until September 2019) to provide an evidence base for a discussion about migrant workers and rights enforcement in Indonesia.

La Ética En La Inclusión Laboral De Jóvenes Con Discapacidad. Un Desafío Para La Sociedad Actual

La posibilidad de que personas con discapacidad con una formación universitaria puedan ocupar un lugar en la vida laboral en igualdad de condiciones que el resto de la población sin discapacidad no debiese tener restricción alguna, ya que pueden desempeñar las funciones para las que fueron formados y llevarlas a cabo con el profesionalismo que se requiere.

La Organización Internacional del Trabajo (1999) asoció a la ética en el trabajo con el "trabajo decente", al cual describió como aquel que brinda la oportunidad de ser productivo, generar un ingreso digno, tener seguridad laboral, protección social a la familia, desarrollo, personal, integración a la sociedad y oportunidad para participar libremente en la toma de decisiones. Por su parte, la Unión Europea de Empleo con apoyo (EUSE) señala como uno de los principios éticos para la inclusión laboral, evitar la discriminación, ofreciendo igual número de oportunidades a las personas con discapacidad.

Este trabajo es parte del resultado de un estudio más amplio que se acerca a las percepciones de los egresados universitarios con discapacidad, para analizar los factores que inciden en su inclusión social y en sus logros profesionales. El trabajo empírico consistió a profundidad realizadas a seis egresados de la Universidad Juárez Autónoma de Tabasco, México. Los resultados muestran el desánimo de los egresados, ya que en las instituciones a las que han acudido dudan de sus competencias para desenvolverse eficientemente en los empleos que solicitan, así como el que los trabajos que se ofertan no son para personas con discapacidad.

Los testimonios de los entrevistados nos permiten decir que los principios de igualdad de oportunidades, no discriminación y contratación por el mérito no se están cumpliendo en el caso de los egresados con discapacidad, lo que atenta contra su derecho a una vida digna.

Public Sphere and Social Representation in Niklas Luhmann

Our goal in this text is to demonstrate the possibility of reconstructing the concept of "public sphere" (*Öffentlichkeit*) from the theoretical framework of Niklas Luhmann. This possible reconstruction would allow us to expose a sociological problem concerning the representation of communication in modern society. We argue, as a first proposition, that modern society favors certain types of communication over others, and we support, based on this diagnosis, a second proposition that this privilege guides the communicative preferences in the treatment of different social themes.

Action and Motivation Regarding Medical Experiments: Rational Vs. Concerned Actors

The usage of assistance technologies today is often strongly influenced by the application of computer simulations (Grimm et al. 2015; Hillmann 2018). However, experiments with subjects in usability research continue to play an important role (Janda 2018). In the case of hearing aids, it is necessary to investigate whether the benefit measured in the laboratory also corresponds to the subjects' day-to-day experiences (Wong & Hickson 2012).

A question that should be considered is whether and how the participants influence the experiments and scientific results. Motivation is a key concept in this question and it is relevant to social science studies (Lizardo et al. 2016; Vaisey 2009) as well as to medical research (Hallowell et al. 2010; Mfutso-Bengo et al. 2015; Soule et al. 2016). This contribution focus on the question of why subjects take part in laboratory experiments.

Theories that address both action and motivation should be central here. I compare the theoretical concepts of the well-established rational choice (RC) theory with the new phenomenological-sociological "concern theory" (Lindemann 2016). These theories are theoretically and empirically compared in order to reveal the differences and similarities between them.

The empirical material is based on medical experiments carried out in 2017 (Paluch et al. 2019) and which are qualitatively analyzed with reference to the Grounded Theory (Corbin & Strauss 1990). The data suggests that the time dimension is important for action selection. The interrelation of present and future must be taken into account. Concern theory can examine this aspect more closely than the RC approaches. An actor is currently concerned because of an uncertain future. The statement of a test subject with hearing impairment shows a special type of concern mediates her motivation: the concern about whether she still lives in a world shared with others.

Criminalizing Feminicide in the Brazilian Context: Between Representations of Global, Regional and Local Issues

This paper aims to comprehend the differents social representations attributed to the term feminicide in the course of its criminalization in the Brazilian context. In Latin America, the use of the category began in the 1980s (Fregoso; Bejarano, 2011) by feminist activists in the Dominican Republic that translated the word femicide into Spanish. However, the concept earned a new specific meaning, focusing on state responsibility, based on reports of women killed in Ciudad Juárez (Mexico). Scholars and activists have been employing feminicide to indicate a responsibility for the State to prevent, investigate, and punish these gender-based homicides (García-Del Moral, 2015). Legal reforms in different Latin-American countries have been conducted, arguing a positive symbolic effect (Segato, 2013). In light of diverse meanings attributed to the term in different local contexts, a case study is proposed to analyze how feminicide signification happened through social representations utilized in this criminalization process. The process of creating a new legal category - such as the femicidio in Brazil - serves as an entry point to investigate the relationship between globalization and broad social issues such the emergence of new social practices and institutions. For this purpose, we use a document analysis technique regarding the legislative process to create the new legal category in Brazil. We have identified two main ways of representing feminicide in the course of its criminalization: i) the first representation is to construct a social problem, and ii) the second one is synonymous with lethal domestic violence. The first representation is related to regional and global discussions; the Brazilian context signifies the second one as domestic violence. These representations justified the need for state action in penal perspective. This paper helps to contribute to a broader discussion about how gender rights' concepts are internationalized and then translated to local contexts.

PAMPLONA, ROBERTA* (University of Toronto, Canada)

Feminicide As a Legal Category in the Brazilian Police Investigations: Reinforcing Representations of Gender and Boundaries about Violence

The meanings attached to violent practices are not fixed. Instead, they are mutable and contested by representations. Feminicide is a concept which is used continuously in different ways: from a notion to claim the state's responsibility for punishment to a category for reporting crimes. In 2015, feminicide became a legal category in the Brazilian Criminal Code resulting in a heavier penalty than a regular homicide. The process of addressing gender-based violence visible is simultaneously a criminalization process. State agents shape this process through their representations. This paper examines how lethal violent practices against women

are interpreted as feminicide cases - or not - in police inquiries. Data come from 36 police inquiries reports regarding women's victim, 19 classified as feminicide and 16 not, and observations within police stations. Relying on Bourdieu's relational sociology, we analyze representations about victims and offenders as ways to constitute feminine and masculine identities addressing certain understandings of violence in the social space. We found that police officers frame violent practices as a feminicide one using gender representations of domestic femininity and emotional labour, portraying violence as a gendered resource within relations. To interpret lethal violent practice against women without a gender-based motivation, police officers interpret drug trafficking dynamics as hypermasculinized one, and people involved as not having violent practices as emotional ones. Social inequalities - such as victim's occupation, author's criminal record, and neighborhood are used to gendered practices and identities. These findings allow us to discuss how inequalities can circulate culturally, highlighting social distinctions within representations of gender. It helps to approach the boundaries about what has been interpreted as gender violence or not, and how gender identity representations structure the ways of understanding violence.

Industrialization, Marketization, and Intergenerational Mobility in Post-Socialist Transition: Comparison between China, Russia, and Non-USSR East Bloc Countries

This paper aims to decompose the industrialization and marketization effects on intergenerational mobility in post-socialist countries. Using data from China, Russia, and Non-USSR East Bloc countries and applying constrained logistic specification of log-linear models, this paper finds the effects of industrialization and marketization are not universal in these three regions: only in China, industrialization process in the transition period promotes mobility while the effects don't appear in Russia and East Bloc countries; for the marketization process, the engagement in state/collective sectors promotes mobility in China and Russia but restrains mobility in non-USSR East Bloc countries, and the engagement in market sectors promotes mobility in Russia but restrains in China and non-USSR East Bloc countries. I also find variations for such effects among the cohorts exist in these three regions. The variations in state-market relationship in resources distribution in the three regions would be the cause for the three patterns.

PANAIA, MARTA* (Consejo Nacional de Investigaciones Cientificas y Técnicas, Argentina)

Los Tiempos Flexibles y La Profesión Más Allá Del Mercado En Las Trayectorias De Graduados De Enfermería y Hotelería y Turismo

Se plantean en este trabajo los procesos de construcción de las condiciones de trabajo temporal de dos profesiones habitualmente estudiadas desde otros puntos de vista, pero muy poco explorados desde la perspectiva de las "*temporalidades sociales*" Godard ; Cabannes (1996) y sus consecuencias más allá de la dinámica del mercado, perspectiva que se aplica en los Laboratorios MIG que estudia entre otras estas profesiones.

Ellas se inscriben en el análisis de dos diferentes modalidades de formación:
1.temporalidades largas de formación; y

Temporalidades cortas de formación profesional; y

las carreras profesionales posibles de acuerdo al uso del tiempo profesional a lo largo de la trayectoria de trabajo.

Ambos grupos las enfermeras y los licenciados en turismo están expuestos a horarios de trabajos socialmente atípicos o flexibles. La hipótesis a investigar indica que las modalidades sociales que llevan a ocupar los empleos de horarios flexibles o atípicos varían según el tipo de calificación de los asalariados y según el grado de reconocimiento de esos horarios de trabajo como horarios normales tanto a nivel salarial como de prestigio social (Bouffatigue; Bouteiller,2012).

Lo más frecuente es que entonces esos horarios de trabajo sean seleccionadas por poblaciones poco calificadas o con calificaciones poco reconocidas socialmente, mujeres o profesiones que no han logrado todavía un estatus profesional jerarquizado.

Las enfermeras son una profesión altamente feminizada y calificada pero sus calificaciones por la dominación de sexo tiende a devaluar e invisibilizar esta calificación (Kergoat et alt, 1992)

Los graduados en Turismo, son una formación de reciente generación con bajos grados de reconocimiento profesional y con una fuerte competencia a nivel de los idóneos que venían ejerciendo la profesión y están instalados en el sector, con poca calificación y en cambio fuerte dominio del capital instalado.

PANDE, AMRITA* (Department of Sociology, University of Cape Town, South Africa)

Transnational Reproduction of Whiteness

In this paper I argue that, within the transnational fertility industry, the medical management of gamete selection shapes but also gets shaped by intended parent's (IP's) demand for desired egg providers, and in essence reproduces the desirability of whiteness. This reaffirmation of the desirability of whiteness is manifested in two apparently dissonant ways: one, is what I call "raced desire as resemblance talk", wherein the desire for racial matching is made natural and universal. The second is what I call "strategic hybridization" or the desire for white mixed-race babies, wherein the desire for racial matching is often subverted by the desire for whitening the future generations. Clinics, egg banks and IP collude in this desire for racial matching and strategic hybridization. I use an intersection of feminist studies of raced reproduction, critical whiteness studies and mixed race studies to argue that, on the one hand, these transnational desiresbring attention to the need to understand raced desires as fluid, affective, and challenging a binary matrix (black/white, global/local) of what constitutes whiteness. On the other hand, and especially when evaluated against the invisibility of blackness within the transnational fertility industry, these choices mask stark instances of "flexible eugenics"– wherein whiteness and whitening of the future generations are reaffirmed as legitimate and worthy choices.

Eternal Childhood: A Qualitative Study of the Child-Rearing Practices Among the Mothers in Gurgaon (India)

Indians are often being accused of '*indulgent parenting*' by the West. Indian parents are known to prefer close physical association with their children often lasting lifetime. Children are being considered infantile even after attaining majority and independent living for children is not promoted. The joint family system facilitated this closeness as other family members volunteered to guard them when parents could not be available. Recently the rise of nuclear families and dual working parents has disrupted the traditional child rearing practices in the country. In this backdrop, the current study intends to examine the influence of technology on child rearing practices in Gurgaon, India. The sampling was purposive and convenience. Using in-depth interviews and focus group discussions, the data was collected from 60 mothers from the middle class section of the society. The data was thematically analysed using interpretive paradigm. The results reveal that co-sleeping is quite common among the parents until adolescents. It is further found that the middle class has been very proactive in employing technology for tracking their children such as employing webcams in schools, day care centres as well as homes to track their children when away from them. The participants also reported providing mobile phones to their children in order to track their whereabouts while being at work. However, some of the participants were quite anxious about the misuse of the mobile or internet by their children in their absence. The findings of the study would have significant implications for policy recommendations and research.

Equivalent Positions? Framing Intersectionality in the LGBT+ Movement in Uruguay

In recent decades, the struggles for sexual citizenship and the rights of the LGBT+ population have adopted significant visibility in Latin American countries. In particular, Uruguay has become a pioneer country in the approval of rights of this population, while it has registered significant growth in the structure, mobilization capacity and political impact of the social movement that addresses this issue.

In a context of "globalized activism," the paper analyzes the forms that sexual identities and practices acquire in Uruguay and, fundamentally, how they are politicized in such a way that they enable specific forms of collective action. How are transnational sexual identities (re) signified? Why are certain identity categories selected to name dissidence in a specific context? What sense do they acquire for local activists? What lines of action enable these interpretations in particular contexts of political opportunity? The objective is to analyze the framing process that politicized collective identity pursuing different goals: generate mobilization, publicly express who they are, or re-signify / destabilize identity categories.

Based on semi-structured interviews with activists of the LGBT+ movement in Uruguay and campaigns analysis during the period 2004-2017, framing constructions are analyzed. As a result, two interpretative frameworks are distinguished.

These positions express tensions and conflicts among activists, where the dispute over the meaning of "intersectionality" defines different lines of action and political articulation.

PANIGHEL, MARTA* (University of Genoa, Italy)

Neo Orientalism in the Fortress Europe: A Feminist Reading

Starting from the analysis of Edward Saïd (1978), passing through the feminist readings of Meyda Yeğenoğlu (1998) and Maryam Khalid (2014), Orientalism has been described as a strongly gendered system of power, in which racialized Other is (also) constructed through gender norms. On the one hand, the myth of the harem (Mernissi, 2000), the hypersexualisation of the veiled woman (Fanon, 1959) and of the odalisque. On the other hand, the non-virility, the feminisation and the homosexual practices attributed to the colonised men. These narratives have changed, almost reversed, over time, for example in the myth of the black rapist (Davis, 1981), in the image of veiled Muslim women (or migrants) as poor victims to be saved (Abu-Lughoud, 2001) or in the construction of the Muslim man as a violent terrorist (Puar, 2007). At the time of Islamophobia (Abdellali, Marwan 2016) and neo-Orientalism (Mascat, 2012), after the disintegration of the opposing blocs and after 9/11, the class conflict in the global world has succumbed to the racialisation of labour relations (Farris, 2017). At the same we assist at the growth of fascist and racist populism in Europe and while, in the name of the security of "Fortress Europe", thousands of lives of those who undertake a migration are being sacrificed. If it is impossible for Fanon and Du Bois to think of race without the concrete theoretical background of colonial experience (Mezzadra, Rahola 2003), how did the imagery of racial exclusion reproduce itself in the post-colonial age? If the construction of the Orientalist imaginary was functional to the colonial conquest, what is the objective behind the reactivation of those imaginaries, in the forms of Neo Orientalism and femonationalism? This paper will try to answer these questions by proposing a case study of the Italian case, within the framework of Southern Europe.

Perception and Adoption of Green Information and Communication Technology in Government Organizations: A Study in Indian Context

This paper attempts to study perception of Government Organizations on Green Information and Communication Technology (ICT) and its adoption in Government by following a case study approach. This paper examines the relationship between their perception on green ICT environment and organization behavior. Qualitative research is adopted in this research to get meaning and interpretation from organizations perspective and to explore a poorly understood topic i.e. Green ICT environment. This exploratory study is set in India and aims to provide generalization in a setting of government organizations. We conducted this qualitative study covering five states of India. Considering state level government organizations as a unit of analysis, interim results of our study reveals that certain Green ICT initiatives have been taken in the area of disposal, operations, services and procurement phases of green ICT life cycle in various degrees in a fragmented and unorganized way. The overall awareness, perception and importance level in Green ICT concepts and its adoption are not so encouraging. The adoption of green ICT is in early stage of Green ICT maturity and slow process as it is not a focus area or main concern in the existing situation. This work contributes by exploring perception on Green ICT and the enabling and inhibiting factors of adoption of Green ICT in government organizations. The study reveals that a comprehensive Green ICT policy with a clarity on how the perception to be changed at the central or strategy level in different government departments. The result shows that organizations tend to have higher perceptions on green ICT environment, but their behaviour reflects otherwise.

HORING, JESSICA (Universidade de São Paulo, Brazil)

Comparing Patterns of Mobilization in Armed Movements: Angola, Brazil and Nicaragua

This paper analyses the participation in three armed movements – the National Union for the Total Independence of Angola (UNITA), the Araguaia Guerrilla Movement, in Brazil, and the Sandinista National Liberation Front (FSLN), in Nicaragua. Using biographical material, we aim to shed light on the participation in these movements by presenting common pathways taken by the agents. We draw the activists' profiles and their paths to mobilization, by exploring objective dimensions that permeate biographies, such as familial, educational, professional, cultural and political aspects, which may determine a person's subjective identification. Historical reconstruction and data from interviews will be used to analyze the context of emergence of the three movements, and to perform the analysis of the trajectory of the activists.

Although the scenarios of the three movements are quite distinct, both in economic, cultural, and historic terms, they had in common their peripheral condition during the Cold War, and the highly repressive regimes in place in Angola, Brazil and Nicaragua at the time; which probably impacted their choices of collective repertoire. Comparing these movements is also relevant given their different results: while the Sandinistas in Nicaragua succeed in taking over the power of the State, the case of UNITA in Angola was almost successful, and the case of the Araguaia guerrilla in Brazil had a short lifetime. Furthermore, despite the specificity of each historical period, the study of the agents' pathways in these movements may bring a better understanding on the activism in the present, even if social movements, facing now the rise of new forms of authoritarian regimes, tend to adopt civil resistance instead of armed repertoires.

Satisfaction, Well-Being and Educational Attainment: How Do Children of Immigrants Perform Compared to Natives?

Children of immigrants are generally disadvantaged in education in most receiving European countries and this remains true even after controlling for their socio-economic status. There is a limited range of educationally relevant indicators of child development. The literature often focuses on objective indicators, such as long-term educational careers and it is difficult to know whether the educational disadvantage of migrant children is associated with lower cognitive development, more significant socio-emotional problems, lower perceived satisfaction in different domains of life, such as the school environment and the friendship and kin relations. In the Italian context, despite research on objective dimensions of immigrant children' integration, indicators of subjective well-being, such as self-reported life satisfaction, remain little explored.

In this paper we aim to fill the above gap by analyzing how self-reported satisfaction and well-being in different domains of life influence the educational attainment of both immigrant and native origin children residing in Italy, controlling for other relevant socio-demographic factors. We use data from the Survey on the "Integration of the Second Generation" carried out by Istat in 2015. The national representative sample includes 68,127 students interviewed in both lower and upper secondary schools. Around 47% of them are immigrant children without Italian citizenship. The largest share (72%) of immigrant children was born abroad, while the remaining part was born in Italy.

The relationship between well-being and school outcomes will be explored by building indicators that account for different aspects of well-being: relational/social (inside and outside school), emotional, economic and environmental. A comparison between immigrant and native children will be carried out, in order to understand and explore the existence of possibly significant differences in either school performance and/or in the factors influencing it. The estimated empirical models will address endogeneity concerns, by means of both Instrumental Variable techniques and simultaneous equations models.

The Health of Indigenous Peoples in Brazil: The Different Forms of Violation

The situation of indigenous people in Brazil has worsened in the last decade, with historical processes of violence and the reduction of social rights. Although scientific evidence shows that these peoples are widely exposed to multiple social

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

markers that make them the most vulnerable population in the country, indigenous health issues are not at the center of governmental discussions. There is still much to be thought around strategies for structuring public policies for these people, and this is the principal goal of this research. Based on the role of the legislative power, the House of Representatives and the Federal Senate in conducting public policies, their political control and the their importance in implementing popular demands and democracy, this study aims to analyze legislative activities from 1999 to 2018. The purpose is to check how much emphasis is placed on dealing with the theme of indigenous people's health and how this reveals a broad picture of violence perpetuated by the Brazilian state.The period chosen refers to a time of broad institutional changes in indigenous health in Brazil: the constitution of the indigenous health care subsystem, the approval of the national health care policy for indigenous peoples and the creation of a special indigenous health secretariat as responsible for conducting policy at the federal level. This is a qualitative study, carrying out a documental analysis of legislative activities produced by two institutions during the period of interest, followed by an analysis of the contents of selected documents. The results show how the actions of these institutions perpetuate forms of historical violence, highlights social actors, ideas and interests of different social groups that have decision-making power and are largely responsible for conducting public policies in the country.

Climate Change and Cosmovisions in Environmental Assessment Processes in Chile and South America

Adaptation and mitigation to climate change in developing countries will be effective as citizens and institutions asses the environmental impacts coherently. The historical experience of environmental assessment in Chile, and South America, leads us to believe that environmental assessment processes face technical and political difficulties, as well as regulatory and managerial problems. But "knowledge encounters" may also cause troubles. It has been studied how the expert accounts of physical reality have come into conflict with local knowledge. It is proposed that we are dealing with the dilemma expert knowledge / non-expert knowledge as if socio-technical knowledge was the only challenge to manage the environment. The varieties of types of knowledge found in environmental assessment processes has been scarce. It is the focus of this paper.

The "socio-climatic" semantic differences of the discourses of the social actors that take part in environmental assessment is also explained by the social actor's cosmovision (as a key background). The perspectives on climate change and energy issues are key subjects that help the construction of referential knowledge frameworks.

The thesis about the relevance of these "knowledge encounters" and the controversies in which climate change knowledge is decisive, is methodologically based in an empirical research in three communes of Chile (FONDECYT 1181065), on data obtained from two previous sociological researches in four South America countries and in comparative terms with the secondary sources provided by the existing literature in Latin America on this subject.

Museums, Cities and Institutional Critique: The Museum of Contemporary Art of Barcelona and the Museum of Art of Rio in Comparative Analisys

This paper aims to understand the processes of social change in the production of exhibitory spaces, created amid urban intervention projects to build creativity clusters. In comparative analisys, it shall focus on the foundation of *Museum of Art of Rio,* in 2013, and the urbanization of the Raval in Barcelona, after the foundation of the *MACBA*, in 1995. Keeping the due proportions, the case of Rio goes back to the urban intervention projects that prepared Barcelona to host the Olympic Games, in 1992, more than two decades ago. The case of Barcelona was presented as a model to Brazilian policy makers, however, not only because of the sports equipment built at the time, but because of its association with a broader urban plan that included, above all, building a global city and an European cultural capital.

This paper address the hypothesis that the materiality of the headquarters, once inserted in intervention processes in the city, is in the origin of new standards for art productions in the contemporary world, namely productions raised in dialogical relation with artivists and social movements that claim against gentrification. The hypothesis that inform these investigations assumes that the processes of multiplication of memory institutions and cultural centers, by contributing to the construction of images of global cities, cannot fail to cause consequences not foreseen by city planners, policy makers or the gatekeepers of the art system. What I have been trying to discuss is how the materiality of new museum institutions in specific spaces of the city may have given very specific contours to a certain set of exhibitions and to new paradigms within the artistic form, contributing to some extent to the widening of the heteronomy of the fields.

PARTIDO, OTHÓN* (Universidad Iberoamericana León, Mexico)

Violencia y Territorio En La Zona Metropolitana De León (ZML) Desde Una Perspectiva Espacial.

En un lapso breve, la tasa de homicidios en el estado mexicano de Guanajuato se multiplicó por diez, al pasar de 5 a 53 por cien mil habitantes de 2008 a 2018 (Comunicados INEGI 30/07/18 y 25/07/19). La explosión de la violencia, en una entidad relativamente pacífica, amerita estudios que esclarezcan uno de los casos más drásticos de difusión generalizada de la violencia en la República.

Guanajuato es una de las entidades más prósperas del país, al albergar un importante nodo comercial, industrial y agrícola de la Región Centro-Occidente. Llamado la "Cuna de la Independencia Nacional" y reconocido como el "granero de México", contaba con una de las minas más ricas de la Colonia y es paso estratégico entre la capital y la Región Norte. Se trata del corazón productivo del país.

La acelerada precarización de la seguridad se refleja en diversos estudios. El *Índice de Paz 2019* (IMCO) señala que "Guanajuato registró la calificación general con el mayor deterioro, debido a que su tasa de homicidios se incrementó 127 por ciento en 2018. En sólo un año, la entidad cayó ocho lugares en dicho *Índice* (IMCO, 2019: 9).

La vecindad con Michoacán y Jalisco, los altos índices de migración y desplazamiento, el paso de ductos en el cordón industrial, el rezago educativo, la desigualdad social en sus 46 municipios, la planeación desordenada, así como las presiones e implicancias de asentar grandes corporaciones transnacionales, son factores que agudizan la competencia criminal por territorios y dan lugar a una proliferación de entornos violentos en el espacio urbano.

En esta ponencia se presentarán resultados preliminares de una investigación sobre la violencia y el territorio en la Zona Metropolitana de León, ya que la crisis tiene impactos diferenciados en las sub-regiones del estado.

La Literatura Como Testigo y Reparación: Violencia y Forma Literária En La Obra Literaria Memórias De Um Sobrevivente, De Luiz Alberto Mendes

¿Para que sirve el testimonio y, en particular, el testimonio del sufrimiento - expresado o registrado literalmente en memorias, (auto)biografías o de otros registros, como testimonios e incluso novelas? Del trabajo de elaborar el sufrimiento y la violencia se puede observar que el testimonio sobre la violencia puede ser parte del esfuerzo para dar sentido a eventos pasados. Por lo tanto, el conjunto de registros de testigos obedece a diferentes incitaciones a su producción; en otras palabras, en este tipo de registro no es en sí misma la reconstrucción virtualmente confiable de eventos, participantes (víctimas y perpetradores, testigos), escenarios etc., sino las diferentes formas en que se trata la violencia y el sufrimiento y sus significados.

A partir de estas suposiciones, el análisis de la novela *Memorias de un sobreviviente*, de Luiz Alberto Mendes, no nos llevó a una conclusión, sino a una nueva hipótesis que aún necesita ser probada: esa literatura testimonial como un género típicamente latino-americano se convierte en el equivalente social y formal de la novela de la formación europea, en gran parte gracias al propio desarrollo histórico del continente, donde la violencia se convierte en el elemento estructurante de todo tipo de sociabilidad, así como en la constitución de los estados nacionales continentales.

En este sentido, la novela testimonial, como forma literaria que da forma al contexto social e histórico, tiene una dimensión política profunda al cuestionar el pasado, ya que ofrece registros alternativos a la memoria oficial, constituyendo la alteridad contra la que se enfrentan la memoria y el enfoque oficial y hegemónico de la violencia estatal y no estatal.

Controlling Risks: The Use of Risk/Needs Assessment Algorithms By the US Criminal Justice System

Algorithms have been increasingly implemented in differents aspects of the everyday life, impacting the decision-making process of a large number of social actors. Since the 2000's, criminal courts in the United States of America - both in federal level and in state or county level - are using risk/needs assessment algorithms to manage the system and to predict the risk of recidivism of people who have been arrested or convicted, based in criminal theories and statistical risks. Jurisdictions in at least 40 states of the federation and the federal system are employing and using one of three main proprietary systems - COMPAS, LSI-R, PSA - or are adapting a version of each one of them. However, neither the code nor formula of the algorithms are publicized, and no independent studies of validation occur. Moreover, because they are proprietary, they aren't subjected to open government laws. The use of this type of algorithms have been justified as tools with better neutrality and objectivity. However, civil organizations have been executing independent analyzes and are constantly denouncing social and racial bias in choosing the risks factors and, consequently, on the final score. Regardless, these algorithms are reshaping the criminal justice system and impact - in different ways - the life of at least seven million people who are under the correctional control system (incarcerated, on parole or probation). The purpose of this paper is to present quantitative and qualitative data analyzes from such algorithms and their use in the criminal justice system of the US, as well as discuss them through literature from Science and Technology Studies and Sociology of Punishment.

Activities of Unemployed Tribal Youth in Rural Areas (with reference to Gujarat India)

Social problems are universal in human society. Social problems mostly arise due to breach of social norms. Many social problems are found in society, such as poverty, unemployment, corruption, communal-ism etc. All this problems are obstacles in progress of society. Today the problem is unemployment touches the youths. It is burning social problem. In the rural tribal area. There is lack of development so youth faces many challenges. Here we select 100 unemployed youth from the five villages of south Gujarat region. The objectives of study are as under. To know the unemployment among youth, to know the activities of these youth. To compare the activities between educated and uneducated youth. This study shows that only 15% of youth do exercise, 76% youth are performing religious rituals in the early morning. More than 50% are watching T.V. to pass their time. Most of youth possess mobile and spend their time, 88% of youth visits to weekly market, 18% youth get daily wage labor work.

Social Change and Tribal Youth

Market economy, individual ownership, mechanization industrialization, different occupations, urbanisation, transportation, communication, new political thoughts (liberal, democratic secular) are all forces of changes. This has begun to cause a shift among the people from traditional occupations, traditional places of living and traditional ways of life and in the process to lead them to adopt new beliefs values and ideology. In this regard we try to relate tribal youth with some variables like rural-urban background. The education level of family, the income level of family, the caste, the composition of the residential family group, the occupation of their parents etc. We interviewed 50 tribal youth regarding the social change. It observed that there are correlation between the all above mentioned variables.

PATEL, SUJATA* (Savitribai Phule Pune University, India)

Colonial Modernity and Methodological Nationalism in the Framing of Sociology of Contemporary India

Nationalist ideas have been critical in laying the foundations of sociological perspectives given that these defined the nation/imagined community and thus the 'social'. It has been contended that nationalist thought in India was derivative in nature as it reproduced the narratives regarding what constitutes the 'nation/

imagined community' as represented in Orientalist positions and legitimized by the colonial state. The latter used these Orientalist positions to promote a notion of 'social' that perceived Indians as steeped in religiosities, hierarchical caste practices buttressed by family-marriage-kinship systems while at the same time the colonial state was introducing capitalism and modernity in India and Indians were experiencing being exploited through these processes. The episteme of colonial modernity, the paper argues was a discursive project of British colonialism which promoted ideas, ideologies and knowledge systems that argued that the 'social' in India was non-modern thereby making invisible the modern capitalist contours of everyday experience of the people who were colonised. Second, this paper argues that these ideas were reflected in one trend of India nationalist thought, referred to by some theorists as 'traditional nationalist thought' and were promoted by sociologists associated with these positions. This perspective was legitimised and became part of the discipline when the post independent Indian nation-state expanded University education from the 1950s onward. Methodological nationalism, an episteme institutionalized in India after 1950s, as a scientific perspective that equates societies with nation-states and comprehends them through its states and governments and the territories that it governs drew its content of theories, methodologies and methods for organizing sociological traditions from the episteme of colonial modernity. The paper concludes this narrative by elaborating how feminist studies has confronted the episteme of colonial modernity in redrawing a new perspective to comprehend gender in India.

Permaculture Movement in India As an Alternative Future: A Case Study

Permaculture, originally 'Permanent Agriculture', is a set of design principles for life centered on whole systems thinking, directly utilizing the patterns and resilient features observed in natural ecosystems.

It is important to create an alternate future for the next generation in a world where climate justice has to be non-negotiable value. Social movements must be formed by theorizing and critiquing the patriarchal economies. The core of this philosophy is being lived by few organizations by developing closelinks between theory and political activism.

There is a need to theorize this knowledge of the masses focused on responsible epistemic practice. This paper is a case study of an organisation Aranya Agricultural Initiatives working with communities in Medak district of Telangana in India on the principles of permaculture and contributing to the sustainable agriculture of the dryland area by uplifting the communities.

ARANYA aims to provide alternative solutions to the present conventional and chemical agricultural practices. It is an environmental and developmental organization facilitating and providing services to the communities, since two decades. Aranya also excels in training the young people to practise permaculture design techniques and adopt the philosophy on farm and in their lives too.

By using an exploratory and reflexive research design and using method of case-study this research will be built. During time of ecological crises, theory and practice is vital for challenging ecological and social injustice. This paper aims to document and create a resourceful knowledge that is working to create an alternate future not just for the communities around the area but also by creating young ecological warriors. This also tends to prove how such organizations are building conceptual approaches such as alternate food networks and thus question the very idea of production and consumption which is itself a major act of building social and political engagement.

Role of Individuals Groups, NGOs and Government Organizations in Flood Relief in Kolhapur and Sangli District of Maharashtra, India

India is the largest democracy in the world. But without its lively individuals, groups, NGOs on the scene, many ills in the society would continue unchallenged. Civil Society drives its strength from the Gandhian tradition of volunteerism, but today it expresses itself in many different forms of activism. Such activism is visible indifferent sectors in the country.

A flood is an overflow of water that submerges land that is usually dry. In the sense of 'flowing water, the word may also be applied to the inflow of the tide. Floods are an area of study of the discipline hydrology and area of significant concern in agriculture, civil engineering and public health.

Disasters result in a serious social and economic set-back to the sustainable development.In response to the worsening environmental conditions at various places, the local people have organized themselves in groups and they are registering their protest against flood disaster.

Here individual, groups. NGOs and government organizations are playing a significant role in creating disaster awareness among the masses. The role of the organizations working in the field of flood protection is of crucial importance.

Great heritage of art and culture is associated with Kolhapur and Sangli district. Being a prosperous upcoming urban center Kolhapur and Sangli is also experiencing environment imbalance (flood disaster) due constructing number of building in red and blue flood lines which are an non-developmental zones. As a result a number of individuals, groups, NGOs, Institutions and Government organizations have emerged to control the flood disasters. In order to know their main activities and efforts the research study covered all organizations working for flood awareness and protections in and around the Kolhapur and Sangli district. The study throws up new dimensions relating to causes of flood disasters and efforts of the mentioned organizations in this direction.

PATNAIK, ARCHANA* (Indian Institute of Technology, Kharagpur, India)

Food Sovereignty, Seed Sovereignty and Marginalised Community: A Case from Telangana, India

Local level democratic control over agricultural production is the key to achieving food sovereignty. Scholars have further argued that seed sovereignty plays an important role in achieving food sovereignty. It is from this perspective that the paper reflects on the resistance of a marginalised community that is Dalits in Telangana, India for achieving seed sovereignty through community seed banks and through that gaining food sovereignty. For the study a specific initiative of the Deccan Development Society (DDS) was analysed. Dalit women who make up the community studied here are doubly disadvantaged. With their collective activities of resistance expressive of the embedded social relations and cultural systems of both caste and gender they represent a unique case in debates on food sovereignty. The study is based on data that was collected both from primary and secondary sources. This paper draws from theories of commons and practices of seed networks to reflect on larger social issues related to gender and food sovereignty. Interviews, focus group discussions (FGDs) and participant observation comprised the primary sources, while published and unpublished documents, reports and official websites comprised the secondary sources. The study finds that in this case in order to re-establish local food self-sufficiency and secure marginalised community's access to and control over food production apart from seed sovereignty a space of commons is essential and obligatory. This paper will add to the scant studies on food sovereignty through seed sovereignty and the collective activities of a doubly marginalized community.

Social Capital of Pierre Bourdieu: Controlling Healthcare Access Inequalities in Kolkata, India

In spite of the presence of a lot of healthcare providing agencies in the cosmopolitan city of Kolkata, people are facing enormous challenges in accessing healthcare facilities. This paper attempts to explore the factors that determine possible inequalities in healthcare access among different categories of people in Kolkata and search avenues that can minimize such inequalities. The study at hand applies Pierre Bourdieu's concept of social capital to comprehend inequality and the role of social capital in this regard.

The study adopts a mixed method approach and convergent parallel design. 379 households having in-patient experience within the last one year have been selected as respondents through random sampling method for interviews with semi-structured schedule. Ten cases are also selected through convenience method for more intensive introspection.

Irrespective of economic capacity and socio-demographic characteristics of the patients the smooth access of healthcare varied on the basis of significant relationship of patient party with the healthcare providers, tactful human dealing by the patient party and liaison intervention by the Non-Governmental Organizations (NGO). Mere economic solvency or having health insurance did not assure the availability of proper treatment. Therefore, along with money, awareness and the individual relationship between the doctor and patient greatly impact how much fruitful the interaction for treatment was. It can further be added that until the interests of the 'provider' and the 'provided' intersect in one way or the other, it becomes very difficult for the person to accumulate social capital or in this case, to win the favor of the doctor. To minimize the inequality in healthcare access government and non-governmental organizations should make aware and train people about different facets of healthcare system and access strategies and introduce innovative mechanism of reward and punishment for providers.

Variation in Quality of Higher Education in the Sociology Discipline: A Sociological Study Among the Universities in Kolkata, India

Variation in quality of higher education can cause imbalance in the functioning of any society and severe inequality among individuals. The study explores the quality of Higher Education provided in Sociology, in Kolkata; makes evaluation of Bourdieu's theory of Education, of how education enhance social inequalities creating unstructured and invisible stratification in society and makes suggestions to avoid inequalities.

Using mixed method approach and convergent parallel design, 12 sociology teachers and 30 final year undergraduate students from different universities were selected as respondents through random sampling method and purposive/convenience sampling respectively for in-depth interview with semi-structured schedule.

Quality of Higher education varies depending on the aspects and crisis of individual educational institutions such as their curriculum, quality of teaching, infrastructural aspects, better access to academic resources, opportunities of exposure for the students and so on. Similar results have been found in a comparative study of 19 countries (Pfeffer, 2015). Higher education generates cultural capital based on qualitative nature of the education students are receiving from their institutions, irrespective of the student's social class and status.

The variation can be reduced by precise strategies like selection of students on rudimentary critical thinking abilities, reward system for teachers based on the academic progress of students to achieve uniform quality of higher education.

El Sexting Entre Jóvenes Bajo La Mirada De La Salud – Proteccionismo y El Silencio Sobre La Violencia De Género

Introducción y Justificativa
El *sexting* practicado medio la sociabilidad juvenil expone desafíos sobre todo con respeto a la iniciación de la vida sexual y las relaciones en el universo virtual. Además, prácticas violentas como la pornografía no consensual ha traído desafíos para el campo jurídico, y también para la salud mental, ya que ha ocasionado hasta el suicidio de chicas, lo que impulsionó el recién avance de las investigaciones en ese tema. La complejidad a la que está envuelta la práctica se da por la ambigüedad de sus sentidos, sea de placer o conflicto, y de autonomía o sumisión en el caso de las chicas. Hay por lo tanto una demanda por una mirada profundizada, que lleve en cuenta la perspectiva de los jóvenes, y de las relaciones de género y sexualidad.
Objetivos
Este trabajo tiene como objetivo analizar la producción académica científica con respeto al *sexting* en el área de la salud.
Método
Fue realizada una revisión sistemática con todos los aproximadamente 170 artículos sobre *sexting* disponibles en la base Pubmed hasta el 2019.
Resultados
La mayoría de los estudios sobre *sexting* en el campo de la salud fueron producidos por mujeres, en Estados Unidos y a partir del 2017. Son estudios de variadas áreas, como enfermería, salud mental, pediatría, que abordan sobre todo la prevalencia de la práctica entre adolescentes y jóvenes y su relación con comportamientos de riesgo.
Discusión
Los trabajos producidos sobre *sexting* en el campo de la salud hasta el momento demuestran una tendencia a patologisar la práctica y a proponer intervenciones proteccionistas, sin entretanto problematizar la cuestión de la violencia de género, aún que los datos de prevalencia demuestran claramente las diferencias de relación con ello entre mujeres y hombres.

PAUL, STEPHANIE* (, Haiti)

Sociological Study of Inequalities in Access to Health Experienced By Street Vendors in the Port-Au-Prince Metropolitan Area

While the Haitian economy relies heavily on the informal activities of street vendors, it must paradoxically be recognized that they are the most exposed to the ecological challenges facing Haiti for several decades. Spending most of their time on the streets, street vendors are more at risk of developing certain diseases due to the effects of environmental problems and deficient waste management.

Neglecting their own health to focus on generating income to meet the needs of their families, according to available data, these street vendors are among the categories with the least access to health care in Haiti. Taking into account this reality, this study proposes to analyze the inequalities that street vendors experience with respect to ecological issues and access to health care. Based on a series of research interviews conducted in different cities of the Port-au-Prince agglomeration, we analyze these inequalities through their causes and their impact on merchants' lives.

The Uranium Mining in Caetité (Bahia/Brazil): Public Engagement and Risk Perception

The aim of this paper is to discuss how people from Caetité (Bahia/Brazil) perceive risks and engage themselves (if they do) in response to the risks associated with the uranium mining in the region. It is the only active uranium mine in Brazil, explored by the state-owned enterprise Nuclear Industries of Brazil (INB). Social movements report an unusual incidence of cancer in the region, as well as the water contamination by uranium. On the one hand, INB alleges that the contamination is natural and that it occurs due to the presence of uranium in the region's soil. Thus, the company denies that it has any responsibility related to the contaminations or even the risks creation. On the other hand, social movements argue that there may be a relationship between mining activities, contamination and the cases of cancer. We are interested in investigating this controversy concerning the "natural" or "artificial" character of contamination, as well as the two positions that constitute this dissent: the scientific perspective, presented by INB, and the "lay" knowledge of locals affected by the uranium mining. We suppose that the presence of uranium and radiation in Caetité's environment has the features of a chronic and continuous pollution, related to what Liboiron, Tironi and Calvillo call "slow disaster". Rather than a side effect, the production of slow disaster is a constitutive attribute of the "Capitalocene", especially in the countries of the Global South, strongly affected by the imperative for development and economic growth through the exportation of natural resources (most of world's uranium comes from peripheral countries, as shown by the historian of technology Gabrielle Hecht). Therefore, since the unsafe conditions are unequally distributed, the risk and "slow disaster" production is associated with the "environmental racism" that reproduces the colonial and asymmetrical structure of global geopolitics.

PAVEZI, INGRID* (Albert-Ludwigs-Universität Freiburg, Germany)

About Geopolitical Postcolonialism(s): Relating the Latin American and the Global North Academic Contexts

Postcolonial approaches have been emerging in many analytical contexts worldwide, sometimes converging in meaning, and often differing in their specific geopolitical backgrounds.

As a Brazilian Ph.D. candidate based in Germany, I have been experiencing in my academic daily life the interface between the Latin American theories to postcolonialism, with which I am familiarized, and the theories that are dominating spread within or from the Global North, where I am currently settled.

In this sense, people in the Global North are mostly in dialogue with the theories i.e. from Said, Spivak or Fanon; but few is discussed about the contribution to the postcolonial framework of Latin American authors as i.e. Quijano, Dussel or Lugones. Often, authors from and / or settled in the Global North are considered universal, while those settled in the Global South are considered local. Due to this hierarchical and (still, or paradoxically) colonialist point of view, the result is that the North is considered as a source of knowledge, while the South is seen as providing mostly case studies.

From this necessity to discuss the relation between both postcolonial approaches, this paper explores the premises of what is considered local and global in the production of postcolonial knowledge, if there is a 'hierarchy' of theorizing according to the geopolitical position of its authors, and how do we could decolonize and overcome this problematic framework.

PAVEZI, INGRID* (Albert-Ludwigs-Universität Freiburg, Germany)

Mass Immigration in the Post-Humanitarian Era: Contextualizing the Relation between the Core and Peripheral Regions of the World-System

The second half of the twenty-century witnessed the proliferation of refugee camps and the politics of 'humanitarism' as a specific framework to manage vulnerable people who were forced to cross borders and to move. Refugees, displaced people, asylum seekers, and economic immigrants, are some examples of new legal definitions, designed by international agencies and incorporated and applied by national states. The social sciences have been rightly acknowledging and denouncing how problematic is the politics of segregating people in refugee camps, and the ambiguity of the humanitarian government as the model to manage vulnerable people and forced migration. Nevertheless, the early decades of the twenty-one-century are might pointing to a slightly different direction. Mass incarceration and the criminalization of migration are some of the consequences of the right-wing politics of today, as well as the neoliberal approach to immigration policies. Additionally, an emerging politics has been taking place regarding global population movement. Nation states have been negotiating directly about how to manage, block, and control the flux of vulnerable people. Some examples of this politics are the 'Regional Resettlement Arrangement between Australia and Papua New Guinea' from 2013, the 'EU-Turkey Statement & Action Plan' from 2016, and the current immigration politics between the US and Mexico. In common, those examples are responses from core regions of the world-system to mass migration from the peripheral regions, mediated by countries that are controlling and blocking those people to move to the core. This paper analysis these political dynamics between unequal regions and nation states in the world, applying the approach of world-system analysis, the sociology of inequalities and postcolonial perspectives to understand those emerging configurations to global immigration and the moving of vulnerable people.

DE CASTRO, CARLOS (,)
SÁNCHEZ GARCÍA, MIGUEL (University of Murcia,)
GADEA, ELENA (University of Murcia, Spain)

The Environmental Collapse of the 'garden of Europe': The Role of Public Regulations and Quality Standards in the Ecological Destruction of the Mar Menor in Murcia, Spain.

In October 2019 thousands of fish appeared dead on the shore of the beaches of the Mar Menor (Murcia, Spain), making one of the greatest national ecological disasters in recent decades extremely visible. The scope of this event placed in the public sphere the debate on the effectiveness of the regulations that protect the lagoon and control the environmental impact of agricultural activity that is located in its watershed.

Mar Menor is an appropriate socio-environmental enclave to analyze, on the one hand, how public standards of environmental protection (regional, state and supra-state) work in a specific territory, and on the second hand, the role of private quality and safety standards in the control of the environmental pollution linked to intensive agriculture.

The hypothesis of the paper is that the public-private regulation space in the case of the Mar Menor implies a high rationalization of the environmental management of the production process, which contributes to an increase of the value of the agri-food product in global commercial exchanges (reduction of chemical products, quality, naturalness, etc.). However, this hybrid space of environmental regulation makes the irrationality that the agricultural model generates in an aggregate way over the territory invisible and legitimate. The paper maintains that this contradiction between formal-economic rationality and socio-ecological irrationality is one of the structural bases within the intensive agriculture model.

At a methodological level, the study is based on a strategy that combines the analysis of secondary data (statistical sources, documentary analysis of public and private standards) with in-depth interviews with farmers, environmental associations and agrarian and political institutions.

The Special Regime for Young Adults Who Commit Crimes in the Current Portuguese Judicial Plan - Articulations and Trends.

Portuguese criminal law comprises a special regime, created in 1982, applicable to young adults who commit crimes (aged between 16 and 21 years), which provides for the reduction of the sentence and / or the application of specific educational measures (DL 401/82, of 23/09). However, as in other European countries, the application of this regime is optional. In order to understand how the Portuguese legal and judicial system young adults who commit crimes is under way the YOUTHRESPONSE research project. This is an innovative study in Portugal, since existing socio-legal studies focus on either adults or juvenile delinquency.

Within the scope of the project, the first results of the preliminary research carried out to date will be presented, which will be done in relation to the following axes of analysis: 1. Social context: the sociodemographic characterization of young adults, mainly from large urban areas , especially in the metropolitan area of Lisbon; 2. The articulations at the system level: the (indispensable, but non-existent) interactivity with the Educational Guardian Law; and 3. Current scenario: the growing trend of punishment and accumulation of support and judicial intervention devices, the need for support and social reintegration programs, and the need to update the regime.

The Role of Meta-Organizations in Negotiated Orders: Exploration of Two Cases

In market reforms, meta-organizations often play the role of market organizers that attempt to align certain beliefs with current practices. As the reform beliefs are neither the privileged domain of market organizers nor that of market actors, the engagement of plural constellations of actors underscores the negotiated—often contentious—nature of these processes. Contentiousness potentially shapes the content of reforms. The paper explores the market organizing elements and dynamics through which meta-organizations and its members define market boundaries. It draws on two cases of market reforms with socio-ecological aims: the construction of sustainable biofuels and of responsible wool. These cases were chosen for their apparently different degrees of contentiousness and for the different nature of the meta-organizations involved (EU and standard-setting organization). Actors engaged in a market reform not only address the potential contentiousness but also may contribute to it through market organizing. Hence, the redefinition of content and beliefs within the reform recursively shapes the market order fundament of "what is traded". I suggest that the attempts of market reform produce a negotiated order, that is, a temporally-bounded configuration of all market organizing elements at play, together with corresponding agreements about these elements. The paper discusses also the societal effects of these meta-organizations as agents of market reform.

Reflexivity As the Key Attribute of the Elites. a Conceptual Approach Based on the Study of Chilean Business Elites

Few concepts in political Sociology are as controversial, permeated by common sense and hardly definable as elites. A homogeneous elite in singular or functionally differentiated elites; active minorities in permanent circulation or a dominant class always aware of itself and with little renewal; as well as positional and agential approaches are usually combined without continuity solution. The prevailing uses and analysis also make it very difficult to distinguish an elite from a (privileged and ruling) social class. Based on the distinction of three levels of aggregation of the social world (class, milieu and elite) each endowed with a resource or central attribute, we consider that reflexivity is the key attribute for the configuration of an elite. In contrast to the habitus, which supposes the acquiring of standardized patterns of taste and valuation according to the original position in the social structure, reflexivity implies an intentional attitude of articulating one's own interests in the form of a project as well as the capacity of self-observation that allows to transcending this original and naturalized position. Reflexivity is not simply reflection or an intellectual attitude but it implies the ability to reflect and evaluate the indirect consequences of the own decisions. Based on the evidence generated by the study of Chilean business elites in their reaction to a growing

citizen questioning between 2011 and 2017, we analyze the development of this reflexive orientation and if it achieves some dislocation of habitus and capital. From this development one might identify transformative and non-transformative reactions as well as the degree of consolidation of the symbolic and social boundaries of that sector.

PELFINI, ALEJANDRO* (FLACSO-Argentina; Universidad del Salvador, Argentina)

Teorizando La Transformabilidad Más Allá De La Sustentabilidad. Hacia Una Tipología De Reacciones Entre El Habitus y La Reflexividad.

La transformabilidad de los sistemas sociales, de los patrones de comportamiento y de las orientaciones valóricas emerge recientemente como un factor clave en los debates en torno a la superación de la mera sustentabilidad. La concientización y la difusión de información experta siguen siendo elementos relevantes, pero no suficientes para desplegar profundos procesos de aprendizaje colectivo ante la actual crisis civilizatoria. No obstante, se ha avanzado poco en la conceptualización y en la clasificación de diferentes tipos y grados de transformación que permitan analizar y promover prácticas que vayan más allá de la sustentabilidad y sus simulaciones. En esta ponencia se presenta una posible tipología entre reacciones transformativas y no-transformativas ante un contexto desafiante, turbulento e incierto. La base de estas diferentes reacciones es la proporción de habitus y reflexividad. Mientras que el primero da cuenta de la consolidación de pautas de comportamiento y valoración estandarizadas y naturalizadas de acuerdo a la posición de un agente en la estructura social, la segunda implica una confrontación activa con esas mismas pautas previendo las consecuencias no intencionales de su misma realización. Por lo tanto, las reacciones transformativas se despliegan a partir de una dislocación entre las respuestas aprendidas y naturalizadas (habitus) que funcionan en condiciones de relativa estabilidad y la necesidad de reajuste y revisión antes situaciones de incertidumbre que requieren alguna dosis de auto-observación y conversación interna (reflexividad). Por el contrario, en las reacciones no-transformativas, el habitus prevalece frente a la reflexividad y están marcadas por la distorsión comunicativa (sin reconocer la validez y relevancia de nuevas demandas y con una escasa percepción de los cambios y estímulos del entorno) predominando el refugio en los patrones ya conocidos del milieu de origen y en sus respuestas mecánicas.

Public Communication of Science: Trust and Credibility in the Eyes of the Public the Results of the International Concise Project Regarding Channels and Sources of Communication

In this presentation we provide an overview of main results collected through 5 Public Consultation carried out within the Concise European project. 500 citizens of 5 different countries were involved in discussing four topics on communication: climate change, vaccines, biotechnologies an complementary and alternative medicines. Our primary aim is to focus on patterns of trust by which EU citizens acquire their science-related knowledge, and how this knowledge influences their beliefs, opinions, and perceptions.

In so doing, we take into account the use of channels and sources proposing an analysis of how citizens believe these important elements of the public communication of science to be credible. Further,

we propose an analysis of the level of public engagement expressed during consultations and the development of different practices of citizens science.

We aim to provide insight into the complexity of public communication of science and technology and the social and methodological richness that it embodies by highlighting the relevant role of public opinion and public participation. To this end, we propose four dimensions by which to map this rich domain of research: actors, relationship, trust and means. Our concluding argument is that studying these dimensions observing knowledge, beliefs, opinions and perceptions would do well to combine analytical and normative prerogatives for understanding the recent evolution of public communication of science and technology.

Identidad, Trabajo y Basura. Notas Sobre Una Experiencia De Trabajo Voluntario Para "Limpiar" El Planeta

Las producciones de Karl Marx y compañía permitieron reconocer, a mediados del siglo XIX, que sólo el trabajo humano produce valor. Desde entonces, los "viejos" trabajos no terminan de morir, mientras los nuevos no paran de nacer. Ello ha operado junto a la metamorfosis del capitalismo neocolonial globalizado (sensu Scribano), como sistema extractivo de múltiples energías sociales-naturales y de los medios elementales de/para la vida, como aparato represivo-militar, y

como "industria" de los dispositivos y mecanismos de "gestión" corporal/emocional. En este marco, en la presente comunicación se propone abordar los "nuevos" trabajos voluntarios vinculados a la temática ambiental, más precisamente, a las prácticas sociales enfocadas en la limpieza de espacios verdes a través de la recolección de basura. A tal fin, la ponencia se estructura en cuatro apartados. En primer lugar, se establecen algunas relaciones conceptuales entre trabajo e identidad, describiendo aspectos propios del trabajo "voluntario". Luego, se ofrece una breve caracterización de las políticas sociales ligadas a la recuperación de residuos y a la limpieza de espacios verdes en la ciudad de Rafaela (Santa Fe, Argentina). En tercer lugar, se aborda la edición 2019 del Día Mundial de la Limpieza, promocionada como "la acción cívica más grande de la historia" (*www.vamosahacerlo.com.ar*). Según los organizadores, en anteriores ediciones han participado unas 17 millones de personas, recolectando más 500.000 toneladas de basura en más de 100 países. Una vez realizada la presentación general del evento, se compartirán algunas observaciones de corte etnográfico tomadas durante y luego del trabajo realizado como participante de la acción en Rafaela. Por último, se establecen algunas reflexiones para dar continuidad a las exploraciones referidas a sensibilidades sociales, sustentabilidad y economía social.

Crisis Social y "Laboratorios De Nuevas Formas De Gubernamentalidad": La Gestión Institucional De La Precariedad, Al Influjo Del New Public Management [Social Crisis and "Laboratories of New Forms of Governmentality": Institutional Dealing with Precariousness Under the Influence of New Public Management]

Si los *Conditional Cash Transfers (CCTs) Programs* (o transferencias monetarias de ingresos condicionadas) implementados desde fines de la década de 1990 y generalizados en los años 2000 como políticas de lucha contra la pobreza fueron objeto de análisis y evaluación en América Latina, dicha reorientación parece haber sido insuficientemente contemplada desde el punto de vista de los nuevos "métodos de tratamiento de la miseria" o como formas de "gestión institucional de la precariedad". Poco consideradas en relación con la intervención profesional del trabajo social, sus repercusiones merecen ser problematizadas, a raíz de las nuevas prácticas neoliberales de "gubernamentalidad" del Estado y de gobierno de la sociedad, que han tendido a difundirse bajo la impulsión de reformas administrativas inspiradas en la doctrina del *New Public Management* –y a instancias de los organismos internacionales en la gobernanza de la mundialización. A partir de un estudio exploratorio en el campo de la intervención social en la Argentina, este *paper* busca contribuir a caracterizar una de las mutaciones más significativas en curso en el ámbito de la política social, reconociendo su impacto sobre el quehacer del trabajo social, llamado a ejercer su responsabilidad como "profesión social" en la implementación de las políticas socio-asistenciales y el seguimiento de los individuos o familias "vulnerables" –destinatarios de prestaciones y ayudas focalizadas que constituyen su población-meta. Teniendo en cuenta una evolución de la política social que presenta similitudes y contrastes en países de América Latina y de Europa Occidental, procuraremos demostrar de qué manera el giro estratégico en pos de la "inversión social" reviste una incidencia singular en las modalidades que adopta la intervención pública social. Este enfoque pretende renovar el interés de las "comparaciones improbables" en torno a las políticas sociales sujetas a "condicionalidad" y las misiones de parte de los agentes públicos encargados de su instrumentación.

En Defensa Del Derecho a Protestar: Paz Sin Voz, No Es Paz, Es Miedo

En el marco normativo internacional para los derechos humanos, en particular el preparado por las Naciones Unidas (ONU), las luchas sociales están protegidas por los derechos a la libertad de expresión y por el derecho a la reunión y asociación pacíficas. Las acciones tienen diferentes métodos y formas, pero en común tienen el deseo de llamar la atención de la sociedad en general sobre un tema en particular. La posibilidad de impugnar el orden actual y reclamar demandas sociales a través de la acción política de los movimientos populares son elementos fundamentales de una sociedad democrática y se entienden como instrumentos para la realización de otros derechos fundamentales. Por otro lado, hay segmentos de la sociedad en los que predomina la idea de las luchas sociales como disruptivas del orden. Este artículo supone que eliminar los conflictos sociales es imposible y, además, indeseable. Por lo tanto, las políticas públicas deben desarrollarse para reducir los enfrentamientos violentos y prevenir violaciones de los derechos humanos, respetando el derecho a protestar. Los países de todo el mundo tratan los conflictos de manera diferente, a veces de acuerdo y a veces en desacuerdo con las normas internacionales de derechos humanos. Para debatir este argumento, el documento se organizó en cuatro partes. El primero trae breves comentarios sobre el derecho a protestar, entendido como un derecho humano. El texto continúa abordando la importancia del contexto internacional para las protestas sociales en múltiples dimensiones. La tercera parte del artículo trae una recopilación de ejemplos de todo el mundo, organizados a partir de las principales controversias relacionadas con el ejercicio del derecho a la protesta, como el cierre de calles, la violencia policial, o el registro de acciones. Finalmente, defendemos la necesidad de desarrollar políticas públicas para protestas sociales que fomenten una cultura de paz.

PENNA, CAMILA* (Universidade Federal do Rio Grande do Sul, Brazil)

ROSA, MARCELO CARVALHO (University of Brasilia, Brazil)

CARVALHO, PRISCILA (Universidade Federal de Minas Gerais/ Federal University of Minas Gerais, Brazil)

A Methodological Proposal for Studying Heterogeneous Objects: A New Perspective on State and Social Movements Research

How to treat theoretically and methodologically a state agency that is also composed of movement activists and their opponents (Penna, 2015), with movements that internationalize in continuous dialogue with other movements and with policies of the state itself (Carvalho, 2018), or still with a movement whose effects and properties radically transform themselves in the course of research (Rosa, 2015)? From the rereading of three individual researches on the non-exemplary character of these objects, this paper seeks to suggest theoretical and methodological elements for the construction of a common basis from which this type of research tensions can produce conceptual effects.

In addition to a rhetorical conceptual device about the analysis of the collective formation process, this text reflects on the methodological conditions of possibility for the observation and description of research objects that combine heterogeneity and instability (Alvarez, 2014). Here we propose alternatives inspired by the dialogue between certain aspects of poststructuralist theories (Deleuze e Guatarri, 1980; DeLanda, 2018) and actor-network theory (Law, 2004; Latour, 2005) that advocate long-term description, especially from the mapping of controversies as the desirable explanation in an empirically based social science. We thus support the hypothesis that the description of the ongoing process of movement formation is a fruitful key to understanding its duration and public effects.

Political Participation and Democratic Attitudes in Brazil: Political Talk and Perceptions on Democracy

Political participation has been a recurring theme in political sociology. Authors who study political culture (Putnam, 1994; Almond, 1956; Almond and Verba 1963; Inglehart, 2000) point to participation as an important democratic value, just as studies of participatory experiences consider it a significant factor in deepening democracy. Studies on political culture and democratic attitudes in Brazil have pointed to the persistence of a distrust of democratic institutions (Moises, 2010) and a passive and anomic political culture (Baquero and Stumpf, 2014). Nevertheless, since the promulgation of the Federal Constitution of 1988 until the mid-2000s, the country has consolidated a considerable trajectory of participatory and associative experiences.

Although the practices of participation have been well studied, there is a gap regarding the ability of these experiences to affect the participants' opinions about their own democratic values, especially when considering moments of political instability. Thus, the present project seeks to answer the following question: How do participation practices influence the democratic values of Brazilian citizens? The aim is to analyze how the experience of citizens who get involved in different spaces of participation influence their beliefs about democracy and their own democratic values.

This research proposes the use of focus groups as a qualitative methodology capable of providing in-depth information about perceptions on democracy and its relations with political participation and trust in institutions. By conducting and analyzing the material of ten focus groups in Porto Alegre, São Paulo and Belo Horizonte, from March to September 2019, will seek to build a more complete picture of how Brazilians view democracy and how they process political information.

Colectivos: Construyendo Un Campo De Investigación

El propósito de esta ponencia es comprender como los investigadores brasileños entienden los grupos de acción política identificados como "colectivos" y desde qué campos de investigación se realizan estos análisis. Para esto, se analizarán resúmenes de disertaciones y tesis, indexados en la Biblioteca Digital Brasileña de Tesis y Disertaciones, producidas entre 2000 y 2018, que tuvieron como objeto de estudio los colectivos.

El fenómeno de los colectivos se ha observado en la sociedad y, en consecuencia, en la producción académica. Aunque no es un fenómeno nuevo, con referencias al campo del arte en los años 90, los colectivos adquirieron relevancia en estudios sobre movimientos sociales, acción colectiva y cultura que analizan la participación política de los jóvenes y la coyuntura brasileña de los últimos años (2013-2016), especialmente después de las grandes manifestaciones callejeras vinculadas a las redes sociales que ocurrieron en este período en Brasil. (GOHN, 2016, 2017, 2018; MAIA, 2013; PERALVA, 2017; SANTOS, 2017, PEREZ, 2017).

Es posible señalar algunas características de los colectivos, tales como: participación preponderante de los jóvenes; construcción de formas de organización colaborativas y no jerárquicas; centralidad de las redes sociales digitales, internet y teléfonos móviles en el desempeño, difusión y movilización; más allá de la dimensión territorial y cotidiana de las acciones para su constitución como espacio de acción política, participación, reclamo y pertenencia (BASSANI, 2016, GOHN, 2017, 2018; MAIA, 2013; MEIRELLES y NETO, 2018; PEREZ y SOUZA, 2017).

Las características múltiples y complejas de los colectivos han requerido la construcción de nuevos marcos analíticos, ya que las categorías de las teorías de acción colectiva y movimiento social no parecen ser capaces de explicar este fenómeno por sí solo, por eso que el análisis de la producción de tesis y las disertaciones pueden señalar posibles campos de investigación en construcción en el país.

La Cultura y Su Relevancia En El Conflicto Palestino-Israelí (identidad racial y cultura política)

Exponer que la manera en cómo se constituyen los sujetos que viven, forman parte y sufren en primera línea las consecuencias de un conflicto beligerante,

tiene un papel relevante. El acercamiento metodológico y disciplinario hacia los estudios de este tipo se centra principalmente en argumentaciones geopolíticas y de élites en la toma de decisiones. Si bien son partes visibles de los intereses que mantienen la tensión, la historia reciente de ambos pueblos nos muestra que el conflicto y los acuerdos de paz han sido revividos más de una vez por la población civil y la identidad que asume; al mismo tiempo, las últimas elecciones en Israel, tanto las del 11 de abril de 2019, donde el candidato del partido הליכוד

Ha-Likud (Bibi Netanyahu) resulta electo por otro periodo, y las legislativas del pasado 16 de septiembre, donde la derecha parece haber retrocedido ante una coalición de centro (כחול לבן , Kahol Lavan), la cual no parece tener un proyecto serio de paz, estos resultados concretos nos permiten identificar cómo el conflicto y la identidad cultural de los sujetos, tiene una manifestación clara en la cultura política, a través del sufragio, la que a su vez, repercute en el sostenimiento del conflicto. Exponer por qué sucede esto, por qué no se sostienen proyectos serios sobre la paz o la convivencia con el otro, a través de la delimitación del concepto "cultura" y sus manifestaciones en la cultura política y el sufragio, es lo que se abordará.

Data Teams for School Improvement: A Proposal from Italian Context

According to European Commission (2017) the Quality assurance approaches must support learning communities in the effective use of data with the aim of guaranteeing the best learning opportunities to all students. The topic of capacity building for school data use and school evaluation is central in the literature, that highlights the need to support the school self-evaluation processes, especially for the weaker or less prepared schools.

The contribution discusses about school teams that carry out self-evaluation processes and elaborate the school improvement plan, which has become a strategic element of development and innovation within the school in the perspective of Data-based decision making (Ikemoto & Marsh, 2007). In the international perspective the terminology of internal evaluation has changed with "data use", "data teams" and it refers an activity in which information is collected, analysed and interpreted to inform the solution of an educational problem defined by the school (Nelson et al., 2015).

In the second part of the discussion, starting from the Italian political scenario and from theoretical evolution of the subject, the contribution presents the role, composition, functions, skills and training needs of data teams in Italian context, since 2015 to our days.

Finally the contribution discusses about competitive factors to support school data use in the italian project Valu.E for schools: the promotion of intervention to enhance the evaluation culture in the places where learning takes places (Schildkamp *et al.* 2016); the construction of assessment skills of the school staff (Hubers & Poortman, 2018); the promotion of networks between paired schools (OECD, 2013); the allocation of human and financial resources to support school self-evaluation processes (OECD, 2013).

La Transición Escuela-Trabajo En Brasil Hoy: Desde La Insuficiencia De Las Políticas Setoriales a Los Nuevos Desafíos Abiertos a La Juventud.

La educación en Brasil ha experimentado una expansión significativa desde la Constitución de 1988. La disminución de las desigualdades escolares con un mayor acceso a los niveles medio y superior de escolaridad entre los sectores anteriormente marginados, ha traído cambios significativos en los modelos que marcaron la inserción social de los jóvenes hasta entonces. Cardoso (2015) nos muestra que los cambios importantes en los patrones de transición para la edad adulta, y especialmente la transición entre la escuela y el trabajo, comenzaron a anunciarse en la década de 1990, en Brasil, y se impulsaron a principios de la década de 2000. Em este entorno, lo trabajo ya no es la institución principal para la inserción social de los jóvenes de los grupos populares, sino que ahora "disputa" con la escuela el lugar de apoyo en los procesos de inserción social, lo que nos permite concluir que, durante el período definido, experimentamos un cambio importante en el régimen de transición, estableciendo nuevos desafíos. El presente trabajo busca llevar a debate los límites y las posibilidades abiertas por las políticas sectoriales implementadas en los últimos años, para enfrentar los

problemas relacionados con el campo de la educación y el trabajo juvenil y trae al análisis algunos programas que buscaron responder a los desafíos de " nuevo régimen de transición "en la primera mitad de la segunda década de 2000, tratando de enumerar elementos para comprender los desafíos nodales que enfrenta este grupo de edad delimitado por contingencias sociales específicas: la juventud

Democracy and Identity Politics: A Complex Interplay

This paper discusses the connection between democracy and the struggles for identity recognition, as there seems to exist a conflict nowadays between the idea of common good and how certain groups perceive their exclusion from power within the State dimension. Thus, we aim at comprehending their conceptions of democracy and how they relate specifically to their claims. Therefore, this paper analyzes a survey on appreciation for democracy in Brazil conducted by Datafolha in October 2018, registered under BR02581/2018 in the Superior Electoral Court, and the 2018 LatinoBarômetro poll. Based on both polls, we interviewed four representatives of groups struggling for justice and recognition in Aracaju (capital city of Sergipe, in northeast Brazil), as follows: "CasAmor", a host home for LGBTQI+ individuals; the first Urban Quilombo of Sergipe, known locally as "Praça da Maloca"; the Núcleo de Acolhimento de Imigrantes e Refugiados (NAIR), a project developed by Universidade Federal de Sergipe that works with migrants and refugees living in Aracaju; and "Ocupação Beatriz Nascimento", a squatting of the Homeless Workers Movement MTST. Indeed, three of them relate directly to the identity perspective. Such perspective is also implied in the fourth group due to the reference to one of the greatest representatives for Afro-descendants rights recognition in Brazil. Hence, another goal is to observe how the interviewees reflect on the contends regarding the defense of a common right superior to the identity struggles, thus problematizing democracy definitions. This enables reflections about the actions of these groups and their relation, in a broader context, to the contradictions revealed by the polls. Whereas appreciation for democracy has achieved its highest rating, some discourses and practices endorsed by the population contrast directly with the idea of democracy, as based on an equitable space for coexistence of the different, and could not be categorized as democratic.

Violent Deaths in Brazil: Challenges to Social Research

Brazil has some of the highest homicide numbers in the world (approximately 60,000 deaths per year). This communication proposes a reflection on the huge phenomenon of violent deaths in Brazil by discussing its highly complex social features that pose significant challenges to social researchers and policymakers. Our discussion is based on an ongoing research (CNPq 423550/2016-0) that focuses on the evolution of the homicide rates in the Brazilian cities of Salvador and São Paulo, and their respective spatial distribution. In addition to the statistical data, interviews were conducted and focal groups with specific social actors were made in both cities. The qualitative dimension of the research allowed us to observe how violent deaths are being treated (ou not) as a public problem at the executive level (provincial and municipal), and the difficulties in measuring the phenomenon with reasonable precision. The collected data helps us to better depict some of the multi-leveled obstacles social researchers and policymakers face in their effort to react to violent deaths as a paramount public issue in Brazil.

PERES, THIAGO* (State University of Rio de Janeiro, Brazil)

Precarious Work, Surviving Expedients and Informal Activities: What Is the Gender, Class and Race/Color of the Informality in the Brazilian Labor Market?

According to the International Labour Organization (ILO), in 2018, the informal economy represented more than sixty percent of the world's employed population. In other words, two billion women and men are devoid of decent working conditions. Although different countries have a greater or lesser degree of informality, the negative impacts of informality on the labor market are observed mostly in developing countries.

The research aims to analyse the relationship between the informality and unemployment in Latin America and, posteriorly, to present a current profile of the informality in the Brazilian labor market by observing their composition by income, gender, race/color, age and education. Methodologically, the study combines qualitative (interviews with Brazilian informal workers) and quantitative methods (statistical analysis of microdata provided by the ILO and the National Household Sample Survey (PNAD-Brazil).

In these terms, the results demonstrate that informality affects most of the Brazilian workers, but, in a different degree and intensity depending on the social groups involved. To anticipate the findings, the majority of informal workers have only secondary education. In 2019, more than 60% of them earn up to 8 dollars per day; black people are more informal than white people; although men are more informal than women, informal women earn 25% less than formal men; informal black women are twenty two times less likely to earn twelve hundred dollars than formal white men, and six times less likely than formal black women. The interviews highlight the specificities that configure the multiple forms of transition between the formal and informal, legal and illegal, thus demonstrating the contingencies of the differences between precarious work, surviving expedients and illegal activities.

PEREYRA, DIEGO* (Gino Germani Research Institute / Universidad Nacional de Lanús, Argentina)

Experiencias y Desafíos De La Formación y El Desarrollo Profesional De Los Sociólogos y Sociólogas En Argentina.

La sociología en Argentina tiene una larga historia, caracterizada por una temprana institucionalización de la disciplina pero un proceso de profesionalización tardío. Desde hace más de dos décadas, se observa una creciente profesionalización, expresada en la expansión del mercado de trabajo en términos de multiplicación de espacios de inserción y complejidad de los saberes requeridos. También han crecido el número de espacios de formación universitaria en sociología y los niveles de financiamiento en becas e investigaciones. Todo ello construye un escenario de múltiples desafíos. La fragmentación institucional y el debate entre diversas tradiciones locales de enseñanza e investigación sociológica muestran la heterogeneidad del campo y las dificultades para consensuar agendas y proyectos integrales sobre los problemas nacionales y el futuro de la sociedad argentina. Esta ponencia presenta una revisión de las principales tradiciones sociológicas que influyeron en la formación de los sociólogos y sociólogas argentinas, identificando sus representaciones e imaginarios sobre la disciplina y sus practicantes. A su vez, se ofrecen datos sobre estudiantes y graduados de sociología, en un intento de comprender el volumen de la formación y la inserción laboral en el país. Se ofrece así una reflexión sobre las tensiones del proceso de formación de sociólogos en Argentina y el entrecruce entre la programación académica y la demanda social y vocacional de los estudiantes. A partir de esos datos, se quiere comprender la situación del campo sociológico local y los desafíos de la profesionalización en un marco de interpretación que también es regional y global.

PEREYRA, DIEGO* (Gino Germani Research Institute / Universidad Nacional de Lanús, Argentina)

LAZARTE, LAUTARO (Instituto de Investigaciones Gino Germani, UBA, Buenos Aires, Argentina)

Sociologies in Conflict. a Reconstruccion of the Process and Impact of Sociology Student Strike in Buenos Aires, 1963.

By the hand of Gino Germani at the University of Buenos Aires, the creation of the first sociology department in Argentina in 1957 meant an important step in the institutionalization of the discipline. However, its foundation and development put on the table an epistemological and political debate about the values and meaning of sociology and the role of sociologists in society. In this way, the students' strong support for Germani's leadership from the beginning was quickly leading to a questioning about the origin of the funds, the theoretical and methodological orientation of the discipline and the absence of social commitment. Thus, in 1963, the students declared a strike that lasted for a semester and that acquired mythical edging in the history of the student struggle. Therefore, this paper wants to reconstruct that process seeking a reinterpretation of the reasons for the complaint, the behavior of the actors and the institutional consequences of the conflict. Through an analysis of institutional documents, brochures and notes of students and teachers and interviews, it want to analyze the strike as a repertoire of the student movement that required changes in career orientation, in a context of strong social tensions. Within the framework of a process of political radicalization after the Cuban revolution in 1959, this struggle expressed a clash between a scientific sociology of neo-positivist content and an alternative project that tried to articulate new intellectual demands, from Marxism to Latin

Is the Backlash Against Plastic a Distraction from Action on Climate Change?

Plastic has received an unprecedented amount of media attention globally, accompanied by a public backlash against single-use plastic, leading to nationwide bans and levies on some plastic products. Criticisms of the movement to reduce plastic waste are founded on the assumption that ocean plastic detracts from more pressing issues such as threats related to climate change. On the other hand, it is argued that efforts to reduce plastic pollution dovetail with conservation goals, where both contribute to action on climate change. This raises the question, to what extent is the plastic debate a distraction from action on climate change? This paper draws on evidence from a diverse range of stakeholders, in the UK and South Africa, that the researcher interacted with as a part of a project titled 'Circular Economy Approaches to the Elimination of Plastic Waste.' Data combines transcripts of semi-structured interviews with fieldnotes, gathered over a period of 6 months, which are analyzed using discourse analysis. Findings are grouped together according to different ideas that underpin individual opinions about the future of plastic. I focus on three discourses that position plastic packaging as something humans need to free themselves from; something that has value; and something that consumers need help with to 'do the right thing'. Conclusions are drawn about the extent to which each of these discourses can be interpreted as useful to climate change movements. This has implications for the funding landscape in terms of whether allocating resources for scientists to develop technological solutions to problem plastic (bioplastic/ enzymes that digest plastic), entrench the notion that consumers need not change unsustainable patterns of consumption. Recommendations are made about the role of social science in ensuring the purge on plastic does not come at the expense of progress on adapting to climate change and threats to biodiversity.

Valuing Plastic: Evaluation of a Green Anglican Recycling Scheme in Crossroads, Cape Town

South Africa is 11thin the top 20 countries ranked by mass of mismanaged plastic waste. Recycling cooperatives were seen as a way to improve waste management and create jobs, but 90% of recycling co-operatives in South Africa fail. This is partly because members, with no established working relationship, come together merely to secure government funding and subsequently disband. This action research project sought to set up and evaluate a pilot recycling scheme by utilizing the long-standing networks of a faith-based organization. The aim was to understand whether recycling schemes have a better chance of succeeding when some cooperative principles, such as reciprocal relationships built on trust, are already in place. This paper presents a case study of a partnership between Cambridge University and the Green Anglican movement, that trialed a small-scale recycling scheme in the 'township' of Crossroads in Cape Town. Participatory research methods are used to gather qualitative accounts about the process of securing participation in the scheme by The Mother's Union and the wider congregation. Fieldnotes and transcripts are analyzed using a combination of thematic and discourse analysis. Findings summarize the relative importance that parishioners placed on economic, environmental and social benefits, of collecting and separating recyclable and non-recyclable waste. Conclusions are drawn about the conditions under which faith-based groups can be mobilized to extract value (economic, environmental, social) from waste. This has implications for how best to tackle waste management on land so as to reduce plastic entering the ocean. Recommendations are made about the extent to which this project could be scaled up and/or scaled out if replicated by the Green Anglicans across Southern Africa.

Reformas laborales en Chile: poder de clase y continuidad de la ley laboral

Este trabajo busca explicar por qué, a pesar de múltiples intentos, no ha sido posible derogar el modelo de relaciones laborales impuesto durante la dictadura de Augusto Pinochet a través del Plan Laboral de 1979. Para ello se analizan brevemente los principales procesos de reforma laboral durante el periodo democrático, en especial el último intento de reforma llevado a cabo por el gobierno de la presidenta Michelle Bachelet entre 2015 y 2016, poniendo especial énfasis a la interacción entre gobierno, empresarios y trabajadores (organizados,

respectivamente, en la Confederación de la Producción y del Comercio y la Central Unitaria de Trabajadores respectivamente). A partir de evidencia que incluye más de 60 entrevistas en profundidad a actores clave y extenso material de archivo, se demuestra que la persistencia del Plan Laboral de 1979 se explica por la desigualdad de poder asociativo entre la CPC y la CUT. Esto permite entender por qué a mediados de la década de 2010 la CPC fue capaz de unificar y organizar colectivamente los intereses del empresariado y, de ese modo, incidir en momentos clave de los trámites legislativos, a pesar de que los principales recursos de poder político utilizados por los empresarios en los años 90 y 2000 (por ejemplo, la sobre representación de partidos de derecha en el parlamento) ya no existían. Al final del trabajo se pone en discusión estos hallazgos con la literatura reciente sobre reformas laborales (Murillo & Shrank, 2005; Cook 2007; Carnes 2014) y Recursos de Poder (Wright, 2000; Schmalz, et al, 2018; Brookes 2019), notando la necesidad de 1) extender el concepto de poder asociativo a la clase capitalista y 2) de estudiar la política social como resultado de la influencia simultánea, la interacción y el balance de poder entre trabajo y capital

PEREZ AHUMADA, PABLO* (Universidad Alberto Hurtado, Chile)

Working-Class and Capitalist Associational Power: Evidence from Chile

In recent years, scholars have used the concepts of *structural* and *associational* power to distinguish between the power derived from workers' location in the economic system and the power resulting from workers' collective formation of collective organization (Wright, 2000; Silver, 2003; Schmalz, et al, 2018). This article extends the notion of associational power to examine both worker and capitalist collective power. To do so, it compares how, since Chile's democratic restoration in 1990, Chilean workers and employers have organized in the Workers Unitary Central (CUT) and the Confederation of Production and Commerce (CPC). Then, through an analysis of a recent labor reform (2015 – 2016), the article shows how employers have been more successful in influencing the policymaking process than workers (e.g. how the CPC managed to defend the pro-business regulations inherited from the Pinochet dictatorship).

The article argues that this disparity in the power to influence policymaking is the expression of a disparity of associational power. This is observed in the contrast between the CPC's ability to mobilize employers and forge class-wide solidarity and consensus and the CUT's inability to overcome threats to working-class unity derived from political and partisan cleavages. After reflecting on the factors that explain this disparity of associational power, the article suggests that: 1. Associational power must be understood as a *capacity* (to organize and mobilize) rather than a *resource* (Brookes, 2018), 2. Associational power is key for advancing class interests: only when associational power is strong, can classes mobilize more effectively power resources such as partisan linkages; 3. The relationship between different types of power is complex: some power resources (e.g. union-party linkages) can become detrimental for the construction of associational power if they increase intra-class divisions; and 4. Studying working-class power requires analyzing how it shapes and is shaped by employer power.

Teachers' Unethical Behaviors, from the Viewpoint of Pre-University Students

The purpose of this paper is to analyze the role that teachers have on ethics and civics education of youngsters, based on the testimonies of pre-university students, gathered through the implementation of four focus groups. We discuss teachers' ethically questionable and ethically unacceptable behaviors. The first ones are those which are not explicitly considered in the codes of ethics and whose consequences and penalization are still on debate. Here, the students pointed out: the poor preparation of classes, the indifference towards students' learning, the use of ambiguous criteria for evaluation, the imposition of topics for written assignments, the use of outdated teaching methods, and poor dialogue skills. The second ones refer to behaviors included in the codes of ethics or other institutional instruments, and for which there are specific sanctions. In this regard, students mentioned: sexual harassment, attribution of nicknames, attitudes of discrimination or rejection because of their social origin, sexual orientation or simply because of their inexperience, and the indifference towards some risk situations.

These behaviors have a negative impact on students' ideas and attitudes, in addition to those they previously have about the adult world. Consequently, the youngsters see themselves as excluded, poor valued, not represented, with few chances to express their ideas, and with meager future options.

We think it is important to strengthen teachers' professional ethics education, since their job is not limited to communicate curricular contents, but also to the education of citizens. Besides, educational institutions need to open more opportunities for the reflection of ethical conflicts faced by teachers and students, using strategies that favor the analysis of situations and concerns related to their everyday experiences inside and outside school.

When Managerialism Meets Familialism: The Role of Organizational Constraints and Gendered Biases in Fathers' Engagement with the Israeli Welfare Services

The growing body of research on the causes of the low level of father participation in family- and child-oriented interventions in welfare services has hitherto mainly ignored the role of the organization and structure of the services.

In this paper, we aim to fill in this gap by reporting the findings from an organizational ethnography conducted in six Israeli departments of social services, analyzing the social workers' prespectives, work routines and procedures they employ towards fathers when working with families and children.

The findings show that while social workers mostly acknowledge the importance of father engagement and express commitment to gender equality, their work procedures and routines do not reflect this awareness, on the contrary, they reflect the existenss of prejudice attitudes towards fathers and the intersectionality of gender, race, class and social disadvantage. These routines and procedures consistently favor working mainly with mothers and positioning fathers as secondary carers and parents. This fits the managerial spirit characterize the welfare policy in Israel and other Western countries.

Our analysis finds that interventions follow Mother-Based Assumptions that posit the mother as the primary caregiver and as a result the contact person of the intervention. The combination of a familialist past, in which mothers were perceived as carrying the sole responsibility to childcare, with the managerial culture in the departments, requiring 'structured' and 'efficient' work procedures, leads to an enduring and resilient structure that maintains the exclusion of fathers from interventions – contrary to the interests of fathers, children, mothers, and families.

PERIA, PEDRO* (Escola de Administração de Empresas de São Paulo da Fundação Getulio Vargas, Brazil)

Theatre and Social Participation: The Experience of Augusto Boal's Legislative Theatre As an Instrument of Participation

Augusto Boal is responsible for systematize the techniques of the Theater of the Oppressed (TO): theatrical practice where oppressed individuals can represent their own oppressions and rehearse ways to combat them. In 1992, he was elected city councilor of Rio de Janeiro Workers Party and decided to merge the techniques of the TO with the legislative practice, creating the Legislative Theater (TL). In this model, the councilman's actions would be conditioned to the results of the theatrical dynamics performed by TO groups scattered throughout the city: the oppressions expressed were stimulus for the alteration of the law. This paper understands this experience as a participatory institution (AVRITZER, 2008) and seeks to understand what TL can teach about forms of social participation. The research is divided into two stages: the description of and comparison with other already institutionalized participation instruments (public hearings, policy councils and participatory budgets). The study focuses on the framework of the qualitative methodology, involving bibliographic analysis, document analysis and semi-structured and unstructured interviews. The first results are linked to the contradiction given by the union between a Subversive Art, the TO, and a Politics of Order, the institutionality of the Chamber. Boal's experience was a laboratory to understand how the fields of art and politics intersect. The TL does not fit into any other model already categorized as a participatory institution. The defining characteristics are: co-production, pedagogical and artistical character. This new model inaugurated by Boal demonstrated with a broader democratizing capacity than the other instruments and with a similar degree of dependence on the political system. The first learning is linked to the belief in active citizenship, fostered by the co-productive and pedagogical dimensions from TL. The second relates to the artistic dimension, which gives the method a tone disruptive action needed for any democratizing project.

PERON, ALCIDES EDUARDO DOS* (University of São Paulo, Brazil)

Smart (in)Security: A Study between the Newly Developed Technologies of Surveillance, Monitoring and Control of São Paulo and London

Over the past years various surveillance and monitoring tools where developed by police departments all over the world, both to deal with criminality and monitor their citizens. Generally, these tools were developed through public-private partnerships, under the mantle of promoting "smart and safer cities", and are introducing dataveillance techniques, such as predictive algorithms and facial recognition systems in a way to dismantle reactive practices among police forces, and promote "proactive" conducts to deal with criminality. Considering the experiences of London and of São Paulo, systems like Gang Matrix, Live Facial Recognition System, the Detecta, City Cameras and SP+Segura, are playing a significative role in shaping police practices into a "criminology of everyday life" (Garland, 2001). However, following the warnings of Shoshana Zuboff (2018), David Lyon (2017) and Bauman (2013), and attentive to activist organization's arguments (such as Liberty, Big Brother Watch, Stop Watch), these instruments seem to be intrusive, and legitimating police arbitrariness and discrimination. Thus, drawing on Foucault's concept of Governmentality, on Critical Security Studies approaches, and through an empirical study between the use of these predictive systems in London (2019-2020), and São Paulo (2017-2019), our aim in this article is to comprehend how this instruments works, and were adopted by the local forces, and the most significative effects of their deployment. We argue – and our research until now seem to correspond – that even though these instruments provide a strong capacity to police forces and private groups to govern security while "sensoring" the city (Andrejevic and Burdon, 2015), it also allows these same organizations to produce excesses and discriminative practices. This seem to point to a kind of iliberal governamentality (Optiz, 2011 and Lemke, 2017) of the security, where the lines between public and private, and legal and ilegal are becoming even more blurred.

Análisis Comparado De Indicadores De Desigualdades Sociales Entre Países Americanos.

La desigualdad es una característica histórica y estructural de las sociedades americanas que se ha mantenido y reproducido incluso en períodos de crecimiento y prosperidad económica. Aunque hubo avances importantes en los últimos quince años, América Latina y el Caribe sigue siendo una región desigual (CEPAL, 2018), con diferencias considerables con Canadá y Estados Unidos. Para medir la desigualdad importa considerar distintas variables que configuren una perspectiva más amplia, no basta sólo medir la distribución del ingreso de la población, e indicadores de salud, educación, vivienda, seguridad social, género.

Asimismo se observa el fortalecimiento de la capacidad de los países de medir indicadores, lo que estimula la posibilidad de comparar países en desarrollo y, estos con los países desarrollados (Altimir, 2013), que implica una contribución al análisis multivariado de la desigualdad. En base a la noción de espacio social (Bourdieu, 1979, 1989, 2002) este trabajo tiene como objetivo presentar un panorama más rico y multidimensional sobre la desigualdad en América. El estudio se fundamenta en la combinación de datos extraídos de diversas fuentes (CEPAL, Banco Mundial y PNUD), con criterios similares de tratamiento que ofrecen garantías de comparabilidad. Para lo cual se utiliza la técnica estadística de Análisis de Componentes Principales (A.C.P.). Se busca integrar el P.I.B. y Coeficiente de Gini con otras dimensiones pertinentes, tales como el IDH Género, acceso a la educación superior, población rural, fecundidad, violencia, entre otras. Como es de esperar, el primer componente opone los países más ricos, escolarizados y urbanos a los países más rurales, de menor PIB per cápita y menos escolarizados. Con todo, el estudio permite identificar factores menos evidentes, como la sobreinversión educacional (como la matrícula en la enseñanza superior) en países como Brasil, Chile y Argentina, si se comparan con aquellos países más ricos, Estados Unidos y Canadá.

PETERLONGO, GIANMARCO* (University of Bologna, Italy)

Uberized and Vulnerable? Impacts of Digital Labor on Platform Workers. the Case of Uber Drivers in Buenos Aires.

As many scholars argue, the ecosystem of digital platforms has its origin in the neoliberalization processes of the economy and in the labor market transformations in the post-Fordism era (Sennett, 1998; Beck, 2000; Boltanski & Chiapello, 2014; Peck & Theodore, 2013). The proliferation of digital intermediation platforms and the use of digital mechanisms and algorithms in work organization can be conceived as ways to subsume new economic and social environments at the 'frontiers of capital' (Mezzadra & Neilson, 2014). The ecosystem of digital platforms has gradually expanded its boundaries, incorporating the economic activities typical of urban informality (deliveries, domestic work, taxis, short rentals). The process of informal work subsumption to capital thus highlights that the sphere of social reproduction is crucial for the new processes of value extraction (Gallino, 2011; Chicchi, 2019). Primarily the paper provides a classification of digitization effects on workers' daily activity, summarized as follows: "disciplinary effects", related to command and control functions, such as geo-localization of delivery couriers; "performative effects", i.e. aimed at intensifying workers' activity, as in the case of evaluation systems; "discriminatory effects", related to exploitation mechanisms based on gender, race and class categories. Furthermore, the research question explores the impacts of digital work in terms of vulnerability among workers employed in lean platforms, such as Uber, Helpling and Deliveroo. The empirical aim is to deeply investigate the dimension of "vulnerability of the social". It is conceived either at the individual level viewed as a weakening of the social bond and even in terms of the capacity for collective action. The paper will present empirical data from the case of Uber drivers in Buenos Aires, acquired by participant observation and in-depth interviews.

Practice Theory and Schizophrenia: A Study in the Heuristics of Insanity

The notion of "heuristics of insanity" refers to a methodological procedure that has proven fruitful in research domains as varied as Freudian psychoanalysis and contemporary neuroscience. It consists in taking the realms of the "insane" or the "pathological" as privileged analytical pathways to the illumination of "ordinary" or "normal" modalities of human action and experience. Bringing this cognitive strategy into social-theoretical accounts of human conduct, the paper makes use of phenomenological, existential and psychoanalytical descriptions of schizoid and schizophrenic experiences so as to understand these in the light of practice theory, but also, and more importantly, to critically rethink practice theory in the light of what such descriptions teach us about the multiple human ways of "being-in-the-world" (Heidegger). The study defends that these experiences, despite the undeniable amounts of psychic suffering and practical difficulties they entail, must not be conceived as mere functional deficits, but rather as "philosophical attitudes in existential form". Within human experience itself, these attitudes "invert", as it were, certain influential postulates of practice theory: 1) the sense of immersion within a world whose reality is experienced as self-evident is replaced with an experience of *acute separation between one's subjectivity and the external world*, which is perceived as distant and somewhat unreal; b) the pragmatic purposes that commonly guide human cognition are corroded by an *apathy of the will*, which leads to radically "neutral" modes of cognitive apprehension of the world; c) the ordinary reliance upon tacit beliefs and skills is replaced with a *hyper-reflexive* compulsion to continuously problematize aspects of one's subjectivity that most people serenely abandon to the implicit domains of their practical "sense" (Bourdieu) or "consciousness" (Giddens); finally, the experience of one's body as the dynamic instrument of one's interventions upon the world is replaced with a radical estrangement from one's own embodied existence.

PETERS, TOMAS* (Universidad de Chile, Chile)

Elective Affinity between Cultural Consumption and Socio-Cultural Perception: The Case in Chile

This paper demonstrates the elective affinity between cultural consumption and socio-cultural perception. Based on the data gathered by the *Encuesta de participación y consumo cultural 2009* ("2009 cultural participation and consumption poll"), in Chile, we came out with statistical evidence that proves that cultural consumption holds an "elective affinity" with the democratic, political, and social assessments of the consumers of cultural goods and services. This trend can also be observed among people who make part of the low income segments of the population, but that in fact consume high doses of culture.

Thus, starting with the current discussions around the studies of cultural consumption, the article develops a theoretical reflection on the concept of cultural consumption and its intersections with other social and political dimensions. We discuss the uses to which the concept is subjected to in cultural consumption studies in Latin America and we propose a definition that takes in consideration the assessments that people make of the socio-cultural processes that they experience.

Black Women's Words: Using Oral History to Understand the Foundations of Black Women's Educational Advocacy

This paper explores class and race-based resources that Black women incorporate in their educational advocacy strategies by using data from Black Feminist methods of oral history and archival analysis. Adding to Nash's (2018) characterization of Black Feminisms as defensiveness (2018) I explore Black women's motherwork strategies in the post-war context of economic opportunity, and racial segregation. I argue that the theorization of interlocking structures of race, gender, and class championed by Black Feminists is important for understanding not only their domination in educational settings, but their accumulation of the race- and class-based socialization strategies to help their children navigate their pre-college education. I add that Black Feminism is a form of analysis that privileges the understanding of Black Women due to their multiple, marginalized identities, but it can also inform investigative techniques that undermine narratives of "pathology" and "oppositional cultures" that plague Black women. This work responds to the parental involvement and educational inequality literature that sought to choose whether race or class was more salient in defining difference, and instead relies on a more structuralist approach to understanding the educational inequality; as well as a historical approach to understand Black women's diverse strategies to combat this manifestation of discrimination.

PETOUSI, VASILIKI* (University of Crete, Greece)

Innovation in Science and Research: Its Impact on Research Integrity and the Lives of Researchers

Innovation has for long been one of the preferential narratives within science. Progressively, the push towards innovation is intensified while grand funding schemes such as Europe's Horizon 2020 recount innovation and research as a fast-track way to "breakthroughs, discoveries and world-firsts by taking great ideas from the lab to the market" *https://ec.europa.eu/programmes/horizon2020/en/tags/horizon2020/en/tags/horizon-2020-research-and-innovation-programme*. But in the context of high competition for funding, demand for high through-put results in short time, increased academic productivity requirements, quantification of scientific results and a move towards a business-like model of higher education and research how is innovation understood and communicated by scientists and researchers? How is the drive towards innovation affecting the professional lives and careers particularly of young researchers and scientists, given the increased levels of job instability and insecurity many of them face? And what about their personal well being and lives? Moreover, what impact may the pursuit of innovation in the current socio-economic, academic and scientific contexts have on the scientific and research endeavor itself? Is it possible, for example, that research and scientific integrity, a *sine qua non* condition of sustainable innovation are jeopardized? This paper attempts an investigative account of the above questions based on findings from a focus group discussion of young and early-stage career researchers from various and multiple scientific fields and expertise coming from North, South and East European countries. Additional evidence from interviews and a web survey will be presented. Research was performed within the EU project DEFORM funded by the EU under Horizon 2020 program.

The Making of Global Citizenship

According to Beck, cosmopolitanism is a "Global sense, a sense of boundary-lessness. An everyday, historically alert, reflexive awareness of ambivalences in a milieu of blurring differentiations and cultural contradictions. It reveals not just the 'anguish' but also the possibility of shaping one's life and social relations under conditions of cultural mixture. It is simultaneously a skeptical, disillusioned, self-critical outlook" (Beck U., Cronin C., Cosmopolitan Vision, 2006). In other words, a cosmopolitan way of life is the necessary consequence of a globalized

world, where the Lebenswelt more ad more depends on immaterial and disembedded (Giddens, The consequences of modernity, 1991) processes. In such a context, more and more individuals are developing self-representations and lifestyles characterizing by weak local ties and high rates of mobility, both geographical and professional. Also due of the growing flows of migrants and refugees, the need is strong for supranational norms (such as the case of European Union) that grant the opportunity for individual to move across different areas of the world, beyond national legislations. This entails deep changes in the notion of citizenship, whose traditions link with nation-states sounds more and more anachronistic. This paper is focused on theoretical reflections, case studies or scenario analyses on law-making processes related to the evolution of the norms on citizenship into a cosmopolitan and global direction.

PETROSINO, DANIELE* (Università degli studi "Aldo Moro", Italy)

Super-Diversity and Intersectionality: From Individualism to Collective Identity

This paper will discuss the relationship between the super-diversity approach and the intersectionality one. It will be argued that there is not only a difference on an epistemological level, but a different vision of the process of forming a collective identity among migrants.

One of the aspects that characterize today migratory phenomenon is the extreme fragmentation and articulation (Foner 2017). This has involved a shift of perspective towards diversity as a specific form of incorporation and of governing inequalities (Faist 2009, 2014).

As far as the immigrant population is concerned, around the last decade the use of the category of super-diversity (Vertovec 2007, 2017) has been adopted to highlight this condition of extreme differentiation. The use of this category has made the traditional forms of analysis and interpretation of the differences gradually obsolete according to schemes linked only to ethnic affiliations.

This condition implies a rupture of the forms of reification of identity and opens the space for a coherently constructivist approach.

Superdiversity can be considered an analytical category that allows the indeterminacy of the immigrant identity to be addressed.

But this category is strongly ambivalent. It is an analytical tool (Aptekar 2019) and is consistent with the process of individualization that characterizes our time and poses the problem of how to build a collective identity among immigrants.

On the other side intersectionality has a clear theoretical and political positioning because it refers to the overlap of different conditions of subordination which reinforce each other.

Although the two approaches seem divergent in their premises, they could work together to search an answer to the problem mentioned above.

While superdiversity helps to understand the difficulty for a migrant collective identity to emerge, intersectionality, emphasizing the dimensions of inequality and power poses the basis for a collective identity.

RC05-62.7

PETROSINO, DANIELE* (Università degli studi "Aldo Moro", Italy)

Venetians First, Italians First, Europeans First? Nativism and the New Emerging Cleavages in European Societies.

The paper intends to investigate the emergence of nativism in Europe, with a focus on the Italian situation, as one of the conditions of the emergence of a new social cleavage (Schmitter).

In Western Europe countries, until a decade ago, interaction and inclusion were values and objectives to be pursued, in which the integration process culminated in the nationalization or institutionalization of multiculturalism and political integration. In Europe there is no longer this sharing of values and the emergence of new cleavage based on immigration and xenophobia marks an epochal break. In European societies there is a substantial part of the population that rejects immigration and there are political actors, including governmental ones or those in the process of becoming them, which actively promote policies of closure and institutional discrimination. This orientation presents the characteristics of nativism (Guia 2016).

There are conditions that can make us talk about the existence of a natives/immigrants and natives/cosmopolitans cleavages. The fact that they become salient depends on many circumstances. Institutional conditions first, then the emergence of contextual factors that increase the perceptibility of the division and the presence of actors who nurture this perception.

The prolonged economic crisis that has increased the conditions of hardship and the number of poor people in the different European countries, has also accentuated the request for protection, which is based on the most elementary one: are you one of us or not? (Duyvendak 2018) The introduced principles of territorial discrimination and of national and residential privilege are based on this request, which assumes different forms of expression, from regional to national.

Especially in the Italian case (Newth 2019), the profound contradictions of this principle emerge: the sub-state claims enter friction with the state ones.

ABLAZHEY, ANATOLY (Novosibirsk State University, Russia)

Social Policy in the Educational Environment: Problems and Prospects

In the changing socio-cultural conditions, the student community, as expected, wants to have a greater impact on the development of the institution of education. As a part of our research the sociological survey among students from various institutes has been held where 196 respondents from five cities of Russia (Moscow, S-Petersburg, Novosibirsk, Omsk, Tomsk) have participated. The data of the survey represent that the majority of respondents are satisfied with a quality of the educational process (73. 9%). Satisfaction by the professorial work is 69.6%. In addition, according to respondents, social politics of the institute, especially support of student organizations and unities, level of scholarship programs, level of non-studying activities development (creativity, sports groups, etc.), lack of problems with accommodation and conditions in dormitories is in a whole satisfactory (50.9%). But over the past 10 years there has been a negative dynamics of this indicator. In 2009, 69.4% satisfactorily assessed the social policy of the university, and in 2015 this indicator dropped to 58.4%. It is noteworthy that, first of all, social policy causes discontent among students in humanitarian areas of training: 57.6% of the number of dissatisfied in 2009, 62.3% in 2015 and 68.4% in 2019. While responding to a question about their readiness to influence on the educational process formation 47.8% of the interviewed replied that they were not ready to do anything, however 52.2% of students represented a desire to express their dissatisfaction through social networks (8.7%), or to complain to the university union or higher authorities (26.1%), or to use destructive methods (17.4%). This tendency predicts a risk of students' actions but still it is not clear what form they can choose – either in legitimate way or through destructive methods.

Spatiotemporal Analysis of the Intersection of Ethnic and Socioeconomic Segregation in the Netherlands

Spatial segregation of ethnic and socioeconomic groups affects economic and social functioning of cities as integral urban systems as well as individual outcomes of people, such as income, education or health. Both causes and consequences of segregation involve many different processes, which operate at different spatial scales, from small neighbourhoods to urban regions, and over short- and long-term periods of time. In the conditions of growing economic inequalities as well as international and internal migrations, it becomes particularly relevant how ethnic and socioeconomic segregation develops, but also how these two aspects of segregation relate to each other. While there is a lot of discussion in the Netherlands on segregation trends, both ethnic and socioeconomic, there is no clear evidence whether segregation of various population groups is increasing or decreasing and how this differs between different places within the country. Some of the reasons are that most of the empirical evidence is cross-sectional, analysing one spatial scale, and focussing on one specific characteristic of people, most often ethnicity, with a limited evidence on the socioeconomic segregation. This study investigates spatiotemporal trends of segregation in the Netherlands, focussing on the intersection of ethnic and socioeconomic segregation in different places. We use individual-level register data from 1999 onwards, geocoded at 100m by 100m grid cells, to follow segregation trends over a substantial period of time and at multiple spatial scales.

Closing the Field. Building Barriers Against Unaffiliated Responders As Preservation Strategy

Unaffiliated responders are a valuable resource in the response to disasters. They undertake a major part of disaster response activities in the immediate aftermath, such as S&R, and bring in plentiful skills and resources. Still, they often fail to be recognized as a valuable resource and the relationship between professionalized and unaffiliated (or "lay") responders is highly conflictual rather than cooperative. This is largely assumed to stem from the perpetuation of disaster myths, which are shared beliefs about behavioral patterns of the general public and inform disaster response.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

This paper suggests a more conflictual and power-laden perspective to understand the full scope of meaning of this neglect. Rather than a simple question of "false" beliefs, it is about preserving the established order in the field of disaster response. Since invading actors challenge the established order in the field and the domain legitimacy of established field actors, defending the field's boundaries is a key preservation strategy (the term "strategy" does not refer to an instrumental rationality but rather to a kind of "practical sense" in the Bourdieuian sense). Using the example of a mudslide disaster in the Austrian Alps, the paper examines the means and instruments by which actors undertake (and contest) the social closure of the field. From this perspective, disaster myths along with other practices in the disaster response can be acknowledged as powerful (symbolic) devices for building (symbolic) barriers against the field entrance of external actors.

Climate Change and the Perception of Citrus Producers in Brazil

The Brazilian citrus occupies a position of relevance in the world scenario, mainly the state of São Paulo. The projections for climate change in the upcoming years present new challenges for citrus producers and can be pointed as a strong underline of citrus production drops in recent years and the adoption of more profitable crops with a more appropriate phenology to the new climatic conditions observed in these regions. One of the main parts of the production process of the citrus is the producers and its decisions regarding the continuity of those crops or its replacement. However, their awareness of the climate changes is a perception that, a priori, is considered as a requirement for the management of agricultural production but that cannot be said to be always present. Thus, this work aims to observe how this perception about climate change and its relation with the citrus production occurs or not, what are the possible answers or its lack that permeates the discourse of such producers and to observe if the awareness promulgated and defended by scholars is really effective and reaches these actors. In order to illustrate such scenario, interviews with some producers of one of the former biggest citrus production sites in the world, Limeira (State of São Paulo), will be used as the main source of this work. Such analysis aims to draw attention to the need of rethinking how scholars and agriculture producers can communicate more effectively in order to visualize a future for citrus production in the new climate scenario.

How to Move Beyond Pitfalls of Intersectional Research with Historical Sociology

While intersectionality is closely linked to decolonial social research, historical sociology has mostly dealt with the empirical analysis of inequality from the perspective of a white/male/industrial working class within the Global North. By combining the two, I argue that historical sociology can be decolonized and gain a more sensitive view on the workings of inequality. Intersectional research, on the other hand, can fruitfully overcome the opposition between deduction and reconstruction by incorporating historical-sociological methodology:

Intersectionality operationalizes inequality as multiple axes – especially the triad of gender/race/class. In empirical sociological research, the delicate question arises as to how these categories should be dealt with: Are some variables deduced first and then operationalized in hypotheses? Or do they have to be reconstructed inductively from the data in each study? Both logics are problematic:

On the one hand, deduction reaches its limits if the data hardly permit an analysis of categories other than "gender (m/f)" or "nationality". And even if several categories prove to be relevant and significant – it still explains inequality essentially as differences between variables. So, what to do if the deductive explanation turns out to be neither feasible nor fruitful?

Then, relevant features are inductively worked out from the empirical data though a reconstructive procedure. In recent years, more than 13 categories have been lined out as relevant. This approach, though, hardly allows to go beyond the repeated determination of (ever further) lines of inequality – and the structural foundation of identity politics risks getting lost on the way.

Combining historical sociological analysis with a decolonial intersectional perspective helps moving beyond essentialization on the one hand and ever repeating differentiation on the other. By combining the two, the (re-)production of overlapping hierarchies and power structures as mutually reinforcing and eternally changing can be shown in their genesis and contingency.

Criteria for Intellectual Reception in China: The Case of Pierre Bourdieu

While recent work in the sociology of knowledge has examined Pierre Bourdieu's reception, dissemination and legitimation in the West, there are few studies of his influence in other regions of the globe. My paper explored the French thinker's diffusion and reception in China (PRC), and addressed the question: what is the nexus between Bourdieu's work and intellectual interests in China? The objectives of my study were twofold: 1) to measure the impact of Bourdieu's work in China based on the volume of Chinese articles that cite Bourdieu; and 2) to explore how his ideas are taken up by Chinese scholars. I argued that increasing usage of Bourdieu's ideas in China is a result of three factors: first is China's desire to shrink their temporal lag between transnational and national circulation of scholarship; second, the state's desire to close their generational gap resulted in an isomorphic response to their political and economic instability; and third, the pragmatic considerations of Bourdieu's ideas, such as field, capital and habitus, are acceptable in the Chinese context. Methodologically, I integrated historical knowledge with a citational and textual analysis of English language abstracts in Chinese scholarship. I examined how my empirical data 'fits' into institutional, cultural, and personal prerequisites for successful intellectual reception. My study found there to be, a) a correlation between institutional reputation and Bourdieu's successful reception; b) a cultural congruency through the Chinese adaptation of Bourdieu's ideas; and c) the use of Bourdieu's ideas are often unrelated to China's major political issues.

Liberal Peace As an Obstacle to Sustainable Development: An Analysis of UN Peacekeeping Operations and Its Implications to Post-War States

The United Nations (UN) have set an agenda with seventeen goals of sustainable development to be achieved by 2030 based on the eradication of poverty, the promotion of prosperity, the protection of the environment and the fight against climate change. Peacebuilding, the right to justice and the establishment of effective institutions are part of this agenda and occupy an important place in its debates since the Organization has committed itself with the preservation of international peace and security. Considering this, in post-war states, peacekeeping operations, in particular peacebuilding processes, manifest themselves as the main form of peace maintenance and reconstruction of legal and institutional structures lost during periods of conflict. Thus, based on the liberal peace model, peacebuilding gives legitimacy to Western liberal ideology and an emphasis on free markets and democracy. Consequently, this model aims to reach a positive peace where the indirect forms of violence are tackled. Taking this into account, this paper intends to analyze the processes of peacebuilding in its theoretical and practical spheres and to observe to what extent the theory matches the practice. In this perspective, it is clear that, due to the impositions made by the liberal peace model, illicit activities that imply in the violation of human rights end up hindering the achievement of positive peace and highlighting the power discrepancies and the ineffectiveness of the liberal peace model. Under these conditions, structural violence is maintained resulting in the continuation of the conflict or in the emergence of a new one. Finally, to investigate the propositions exposed, this study will employ the hypothetical-deductive research method in addition to the use of bibliographic-documentary technical procedures, such as the consultation of primary and secondary sources.

Narratives in Social Media: The Strategic Use of Twitter and Youtube By Jair Bolsonaro's Political Base

Since the Brazilian presidential elections of 2018, candidate Jair Bolsonaro has structured a complex support network that has mobilized different social networks and messaging applications. This structure, which remains active to this day, has allowed Bolsonaro to overcome the short time allocated for his electoral campaign in television and was a key instrument for his victory. This article seeks

to understand how different social networks have been used by Bolsonaro's base for i) the creation of medium and long term political narratives; and ii) the dissemination of counter-narratives that guide the electorate when Bolsonaro is under attack from the media, digital influencers or political opponents. For this, we monitor the performance of his support base on Twitter and Youtube, analyzing the relationship between the construction of narratives in each of these social networks. The data collection took place between July and September 2019, including events such as the appointment of his son, Eduardo Bolsonaro, as Brazilian ambassador in the United States and the deepening of political and public clashes between the Executive, Legislative and Judiciary branches of government. Our findings show the networks act in a coordinated and complementary manner, creating a communicative ecosystem unrelated to traditional mass media.

Political Effects of Changings in Everyday Sociability: Social Media, Construction of Reality and Political Change

The growing overlap between communication technologies and everyday life has generated a phenomenological transformation in the way people construct reality. This process, which has been developing since the 1990s, is driven by the spread of smartphones and social networks, which mediate interactions in a ubiquitous way. This phenomenon not only changes the dynamics of action and formation of organized collectivities (social movements, elites and parties, for example), but also generates more scattered and unintended changes. From the concept of collective subjectivity (DOMINGUES, 1995), we seek to identify the latter, investigating the interactive process between individuals and collective subjectivities with low degree of centering and intentionality. The analysis will focus on the transformations in the formation and manifestation of the notion of public and public opinion, observing how individuals interact and create reality from them. The argument is that these collective subjectivities - created and perceived through mediated interaction - are fundamental to understanding contemporary political dynamics.

After Higher Education Expansion: Inequalities in Dropout and Completion Rates, a Case Study of Federal University of Rio De Janeiro

The question that mobilizes the researchers is to analyze if in the process of educational expansion, the educational inequalities are: reduced, maintained at the same level or expanded. In Brazil, we have an extensive literature to answer this question using macro level analyses, but the micro level studies are less frequent. The paper reflects the new trend in the educational stratification studies: to measure what happens after the university access at the micro level. The objective is to analyze the impacts of gender, race, social origin, family income and cultural capital (language´s course, computer at home) in course choice, dropout and completion in Federal University of Rio de Janeiro, the bigger public and high qualify university in Brazil. We used data from the Integrated Academic Management System and the questionnaire applied in the student enrollment in the university to describe the student profile and calculated a logistic regression to analyze the impacts of socioeconomic indicators and cultural capital in completion and dropout. We found that black and white men conclude the course less and drop-out more than black and white women. What affects the completion or drop-out? The completion for white women is negative affect by be a worker student; for black women is positive affect by socioeconomic characteristics and negative affect by study at night; for black men is negative affect by have children, for white men positive affect by study at night. The dropout for white women is positive affect by be a worker student and have kids; for black women is negative affect by cultural capital and positive affect by be a worker student and frequency at preparatory course to university access; for black men be a worker student and study at night have positive impact; and for white men be a worker student has positive impact.

Gender Roles and Division of Household Work By Gender and Race in Brazil

Family literature in the US indicates that black women are less likely than white women to formalize marriage, are less dependent on spouses, and black men and women are more tolerant with mothers who works and more equal in gender roles. The differences are attributed to historically experienced socioeconomic constraints and the choices made to deal with them. And in Brazil? The paper analyzes the survey Gender and Family using data about perceptions of gender roles, practices of division of domestic work and satisfaction with articulation between paid work and family according to gender and race. Three indexes were constructed to measure these dimensions, we analyzed the indexes' variation into gender and race; and regressions were calculated to measure the effect of socioeconomic and family characteristics on indexes. Regarding perceptions, white women are more equal and adherence increases with schooling and decreases with number of children and the presence of a spouse; Black men are less equal and adherence to more equal roles decreases with age and number of children. Regarding practices, black men are more equal and adherence to more equal practices increases with education and more equal perceptions of gender roles; and black women experience more unequal practices, but equal practices increase with schooling. Regarding satisfaction, white men are more satisfied and have the age and working hours that receive this satisfaction; as black women are less satisfied, but satisfaction increases with schooling and decreases with the presence of a spouse. Under racist and sexist systems whiteness privileges men.

PILCHER, JANE* (Nottingham Trent University, United Kingdom)

Names and Naming in Adoption: A Critical Analysis of Social Policy and LAW in England

Adoption, involving the legal transfer of responsibility for children, is not a large-scale phenomenon in any society. Yet, myriad issues of substantial political, economic and social weight coalesce within adoption, making it an important topic of political, professional-practice and multidisciplinary academic interest. Adoption is entangled with questions of international and national law and public policy on social welfare, social inequalities, and social justice, and of the value and status of children, as well as issues under focus in this article: meanings of identity and belonging, and of family and kinship, including in relation to names. In this paper, I extend understandings of the key role adoption plays in a range of weighty multiply interlinked political, economic and social issues through undertaking a discursive analysis of how social policy and law on adoption addresses issues of names and naming. Influenced both by critical adoption studies and critical name studies, I identify four normative constructions linking names and family and kinship identities of 'belonging' within adoption policy and law in England: 'family surnames', 'name change', 'children's rights' and 'identity'. I argue that, although linked, these constructions are often in tension with one another because of deeply contradictory interactions between social policy and national and international law regarding names and naming in adoption processes. Drawing on these findings, I conclude with policy recommendations, including the need to update statutory guidance in England to better reflect developments arising from case law on names in adoption so that social justice outcomes for people affected by adoption are improved.

PIMENTA, IRACY* (Federal University of Minas Gerais, Brazil)
QUEIROZ, SARAH (Federal University of Minas Gerais, Brazil)

The Relationship between Motherhood and Education in Brazil in 1980 and 2010

The objective of the paper is to analyze the relationship between education and motherhood in Brazil, comparing data from the 1980 and 2010 Demographic Census. We analyzed the probability of having or not having children with a logistic model and the number expected of children with a count model.

The theories about declining fertility cover the relationship between female education and motherhood. The theory of demand for children, for example (BECKER 1981; EASTERLIN AND CRIMMINS, 1985) addresses the opportunity cost of raising a child. The more educated the mother is, the more opportunity she has in the job market, and thus the greater her opportunity cost.

In Brazil, the decline in fertility began in the 1970s, a period in which there was a large increase in female participation in the labor market due to the industrialization and urbanization processes in the country. During this period, women still

had low levels of education, but the increase in education in subsequent years, coupled with the increasing female participation in the labor sphere, contributed to a rapid decline in fertility.

As expected, the results show that more education decreases the chances of having children and the number expected of children in both years. However, education seems to have a large impact in 2010. Other variables included in the models as controls show interesting results, such as age, which indicates a postponement of motherhood between 1980 and 2010, and marital status, showing a higher probability of single women having children, which probably reflects the lower traditionalism.

The Rising of Tourism Public Policies in Latin America: An Analysis of Their Persuasive Strategies in the Context of Economic Matrix Change

This paper aims to analyze how the tourism is inserted in the economic, social and political agenda in the Latin American national states, through their public policies specifically formulated to this sector, along the last 30 years, regarding the new international labor division. Therefore, we will theoretically procedure to the world-system theories (Wallerstein, 1974; 2000), as well as the critical geopolitics (Ó Tuathail, 1996; Taylor & Flint, 2002) and, particularly, the concepts of "totality" and "tourism as a (productive) model", proposed by the sociologist César Dachary, in order to analyze how this activity is inserted organically and functionally in the contemporary capitalist productive system, accelerating and enhancing this system, through to the conversion of not useful space-times in useful products and experiences of consumption. Methodologically, we have used a mixed method, mainly based in secondary data, also on a bibliographical and documental data collection, in which "tourism" will be focused on the national states from its most visible and objective level, i.e. through its landing in public policies of 5 countries in the last 30 years: Brazil, Argentina, México, Colombia and Ecuador. To analyze the corpus of more than 20.000 policies, firstly we have proceed in the categorization, classification of the public policies using the protocol proposed by Pimentel (2011; 2014). As results, we have found that the recent importance reached by tourism discourse in each country seems to be associated with an institutional change in the way of Governments realize the tourism as an alternative economic activity, in a short time perspective, based on a low level of investments and an intensive human job dependence, which matches with the requirements of these *in development* countries. Concluding, this activity re-orients the national economic strategy the extent of their conversion into public policies by reorienting the productive matrix of each country.

Migrant-Run CBOs: From Coping and Adapting to Transforming Communities

Immigrant- and Refugee-Run Community-Based Organizations (CBOs) —managed by and for migrants —are frequently small, informal, financially unstable, and thus often invisible to healthcare, housing and human services providers. Research demonstrates that Migrant-Run (Immigrant + Refugee) CBOs are undercounted and underfunded, generating civic inequalities compared to their counter partners (Gleeson and Bloemraad 2012; Lacroix et al 2015). Yet, Migrant-Run CBOs facilitate the integration of migrant communities in the U.S. society, playing a key role in social and cultural adjustment (Clarke 2014; Piacentini 2012).

Our research aims to understand the organizational life of Migrant-Run CBOs. We identified 21 Migrant-Run CBOs in a Midwest county and administered a pre-tested organizational survey to the board members. The in-depth survey consisted of 258 closed-ended questions about the nature and scope of CBOs' activities. We documented CBOs' size, budgets, communities served, and CBOs' links to service providers in the realm of healthcare, housing and transportation, human services, and citizenship and naturalization.

Data analysis revised the social resilience framework developed by Adger (2000). The goal was to define a Migrant-Run CBOs' ability to cope with and adapt to the new social, political, environmental and economic context. We classified CBOs' activities, including their advocacy and provision of services at the individual and community levels, as coping, adapting, and transforming actions. Out of 244 activities counted, about one-third are coping and over half are adapting ac-

tivities. We hope that research findings can help Migrant-Run CBOs to increase their capacity at all spheres of social resilience, but especially their activities towards social transformation.

"Tá Patrão" a Study on Musical Work in the "Funk Ostentação" Music Genre in the City of São Paulo, Brazil

This research aims to analyze the work of MCs (Master of Cerimonies) of the music genre known as "funk ostentação" in the city of São Paulo, Brazil. The MCs are responsible for the composition and/or presentation of the songs offered through virtual platforms and/or live performances in clubs and block parties. The interest is to verify how this specific aesthetic of the "funk ostentação" articulates with the general funk music market, which emerges as a promising work alternative in the "creative industries" for many young men and women in poor neighborhoods. The MCs take a leading role as trendsetters, reinforcing a lifestyle through the lyrics of the songs, whose theme revolves around the incentive of conspicuous consumption of luxury goods, viewed as a measure of individual value. This songs project characters whose trajectories were previously confined to the so-called "territories of poverty" now at the heart of consumer society, making the access to consumption a common denominator, where the representations of "center" and "periphery" meet. The starting point will be the discussion on artistic and musical work, analyzing the meanings of the "work" category itself in the "funk ostentação" circuits, considering also the influence of gender and generation in the construction of the MCs professional trajectories. The methodology used is qualitative, contemplating an ethnographic effort to accompany live performances, interviews with key informants and also analysis of the lyrics.

Internationalization of Freire's Thought

This paper analyzes the internationalization of Paulo Freire's theory. The author transcended the spatial and academic barriers of the world system of knowledge production and circulation and became a world reference in education. It is an inverse trajectory of what normally occurs in the international circuit of knowledge production in which the theory elaborated or systematized in by authors of centers of the Global South is later reproduced and adapted in peripheral countries. The research was carried out through the elaboration of maps that analyze Freire's displacements around the world, the partnerships with different academics and the main activities he developed in Latin America, United States, Europe and Africa. The relationship with the reception contexts and the interactions of Freire's theory with local realities and challenges was analyzed. The research results point to convergent explanations about the internationalization of Freire's thought. The displacement map presents different institutions and people with whom he dialogued and presented his theory after leaving Brazil due to the military coup of 1964. The partnership map complements the previous one and highlights the dialogues based on convergent theories and conceptions about education and social change. The map of Freire's main activities in exile finds different ways that the theory interacted with local contexts through the author's participation in institutions and dialogue with activists, missionaries and social movements. The analysis of the internationalization of Paulo Freire's theory took place at different times: dissemination, dialogue and remake. In these processes, Freire's theory surpassed hierarchies between subjects and places of knowledge production and reproduction by recreating his theory in different socio-political contexts, by reflecting on different forms of oppression, and by recognizing education as a confrontation with oppression.

Individuation and Schooling in Urban Peripheries: Considerations about Young Position-Taking in Basic Education - Porto Alegre/ Brazil

The problematization presented in this article are engendered from discussions within the sociology of youth, highlighting the experience of schooling among young people from peripheral locations. We aim to analyze the interrelationships between social interactions, school housing and labor demands among students of popular groups. To that end, we have considered the contributions of Danilo Martuccelli and Jesús Martín-Barbero to individuation and contemporary youth experiences, respectively. This research was carried out in three neighborhoods of the city of Porto Alegre/RS, between 2016 and 2019, with students from public institutions, by using different techniques: applying questionnaires, deploying discussion groups and observation in loco. We can perceive an intense use of cell phones and social networks, for there is a "mutual affectation" between being a student and being a youngster. The relational dynamics produce by young students seems to indicate that the moral imperative of accountability and independence — often associated with the world of work — articulates with aesthetic dispositions for sociable interaction in daily school life.

PINHO, CARLOS EDUARDO* (Universidade do Vale do Rio dos Sinos (UNISINOS), Brazil)

From the Regulated Order to the Deregulation of Labor Relations in Brazil

The purpose of this paper is to answer the following question: In the midst of the political economy of contemporary Brazil, how did the process of deconstructing the institutional legacy of state corporatism, based on the 1930s, as an instance of representation of interests regarding State/society, public/private and capital/labor relations? The focus will be on the recent democratic rupture of 2016, which elevated Michel Temer to the Presidency of the Republic, followed by the implementation of radical austerity policies leading to the deterioration of the institutional framework for social protection (Labor Reform, Outsourcing Law, Dismantling of Labor Justice, end of union tax) and the institutional legacy of state corporatism. Such radicalization of neoliberal orthodoxy has been carried out by the conservative liberal coalition of the Jair Bolsonaro administration, especially through the extinction of the Ministry of Labor and absorption of its functions by the Ministry of Economy, whose minister is Paulo Guedes, linked to the Chicago School, cradle of neoliberal orthodoxy and supporter of the ultraliberal economic program of the dictatorship of general Augusto Pinochet in Chile (1973-1990). Methodologically, this will be done through an interlocution with the national/international literature on Sociology of Labor and the tensions between (financial) capitalism and mass representative democracy. Interviews will be conducted with actors from the bureaucracy of the now defunct Ministry of Labor and the Inter-Union Department of Statistic and Socioeconomic Studies (DIEESE) as well as empirical data on recent changes in labor relations in Brazil. The objective is to prove our research hypothesis, namely that Brazil, from 2016, moved from the point of view of capital/labor relations, from a regulated state order, to a radical process of deregulation and corrosion of social protection, in view of the severe recession that began in 2014, whose recovery is very slow.

RC13-162.2

PINJANI, PRATAP* (Government College, Ajmer (Rajasthan, India), India)

Role of Leisure in Celebration of Cultural Diversity

Literature has ever since focused on the relationship between leisure and cultural diversity. Culture is something which defines & includes knowledge, belief, art, morals, law, custom and any other capabilities and habits acquired by man as a member of the society. For multiethnic countries which experience culturally diverse groups & their practices, it is important to be aware of how attitudes, systems and programs facilitate such outcomes and strive to be more culturally inclusive. Thus leisure participation for such countries can facilitate valuing diversity, it can also be an alienating experience. Leisure has assumed a continuum of roles in relation to cultural diversity ranging from suppression to celebration of difference. It is associated with having behaviors outside of work such as sport, recreation, cultural pursuits, play and social activities.

Leisure activities can therefore be used to socially assimilate ethnically diverse groups into dominant cultural practices. In case of countries with multiple ethnic groups and cultures certain issues exist which can be explained by these two the-

ories . The first is labeled *marginality*, and proposes that certain ethnic groups are limited in their leisure choices by class-based indicators such as income and level of education (Floyd, and Gramann, 1993). The second is *ethnicity*, which suggests that ethnic groups choose to participate in certain activities due to cultural traditions, practices and group characteristics such as language or religion (Allison, 1979).

However inspite of multiculturalism and enormous diversity not only in languages but also in dress styles, food habits, customs& manner, lifecycle ceremonies, faiths and festivals, art & architecture , leisure can be used to express and enhance cultural practices and provides opportunities to challenge the stereotypes.

PINSON, HALLELI* (School of education, Israel)

Sociology of Education and the Wasteland of Global Migration Research: Reviewing the Field and Defining a New Agenda

Migration and the movement of people is one of the greatest societal and humanitarian challenges of the 21st century. Indeed, in 2017, international migration reached an all recorder pick with 258 million people living in a country other than that in which they were born. Globalization has also shaped new child migration flows, with around 50 million migrant children many of which subject to considerable instability. In 2007 we have argued (Pinson and Arnot, 2007) that, when it comes to sociology of education it was 'a wasteland' as far as studies of the social effects of migration were concerned. Over a decade later I revisit this argument exploring whether education and migration has now been developed into a viable specialism in mainstream sociology of education research, and whether one of the great societal challenges of our age is being understood from a sociological perspective. Systematically examining the work published on migration and education since 2005 in major sociology of education journals (Sociology of Education, BJSE, ISSE and others), in this slowly growing body of work, the majority of studies focus either on the global mobility of university students or on school case-studies and the experiences of migrant children and those working with them. While these are both valuable foci, what is missing is a consideration of how 'the age of migration' and the characteristics of global migration in the 21st century challenge the values, the policies and practices associated with state education institutions. To a large extent, the sociology of education is only beginning to grasp the significance that human movement has had for the politics and practice of education. There is now the need to put forward a new sociological agenda that addresses this reality and what it signifies for social order and social change.

New and Old Feminist Activisms in Poland

2016 protests against restricting abortion law in Poland has not only succeed in stopping the proposal, but also resulted in emergence of a new wave of feminist activism. Groups and networks that emerged from this cycle of contention are significantly different to the ones prior them, generational- and geographically-wise, as numerous protests in small and provincial Polish towns were said to be the biggest strength of the campaign.

This new wave of activism in Poland is about re-defining the political. In this process, the boundaries between the private and public (political) spheres become blurred. To some extent, this resembles the 1970s feminist claim that "the personal is political", and evidence supporting this can be found in many places as "lifestyle activism" seems to be more dominant than social activism, with numerous aspects of one's life are politicized.

Political and Discursive Opportunity Structures are closed for the feminist movement, but there is a gap between the support for feminist groups and the support for their claims. POS are closed regarding political allies and are also closed for cooperation between groups within the movement.

In this regard, new wave of Polish feminism is not political but rather anti-political, especially in regard to institutionalized politics. Using the term suggested by John Holloway (2005), feminist activists are using anti-power instead of trying to take over power.

The core of the paper is the analysis of the relations between the two groups of feminist activists from small and big cities (1st line of division) and old and new activists (2nd line of division). The analysis is based on around 30 in-depth interviews with activists from small and big towns, with various experience of activism in the movement, with particular attention given to internal movement dynamics that point out to contagious aspects of cooperation.

PIOTROWSKI, GRZEGORZ* (European Solidarity Centre, Poland)

'Sometimes Anti-Social, Always Anti-Fascist' – Interplay between Moderate and Radical Actors within the Polish Anti-Racist and Anti-Fascist Movements.

In the last years, Polish politics have radicalized and more xenophobic, homophobic, and racist claims are being made publicly. One of the turning points were the 2015 parliamentary and presidential elections, when fear against refugees and immigrants became one of the key themes. After the victory of the Law and Justice party, openings were created within Political and Discursive Opportunity Structures for radical right wing groups in Poland. This has sparked a reaction: re-invigoration of the Polish anti-fascist and anti-racist movement scene, with new groups emerging throughout the country, growing numbers of participants at anti-racist and anti-fascist demonstrations etc. The goal of this paper is to critically examine the concept of unspoken intra-movement division of labor between moderate and radical flanks in the context of Polish anti-racist and anti-fascist movement, basing on data from ethnographic fieldwork conducted in Poland between 2017 and 2019. Particular focus is put on the issue of radicalism and the role it plays in alliance-formation processes. The title of the paper – a name of a 1999 punk album recorded by Stage Bottles – indicates one of the key issues within the broadly understood Polish anti-racist movement (of which anti-fascist activities are part of): the common ground for cooperation between moderates and radicals is rather limited. The conceptualization of radicalism by both types of actors (radicals and moderates), its use as a bargaining tool in coalition-making, and how radicalism backfires against the movement by jeopardizing the coalitions and provoking repressions are the main questions driving the analysis. Interestingly, concept of radicalism is used by social movements beyond the usual conceptualization as a choice of radical repertoire of action or radical political claims, but is also visible in approaches to organizational modes or the broadening the range of claims affected by intersectionality of the movement.

PIRINA, GIORGIO* (University of Bologna, Italy)

Digital Platforms and Cities: The Cases of Bologna City of Food and Lisbon Tvde Service.

This paper deal with the relation between cities and digital platforms, in the frameworks of Global Value Chains (GVCs) and platform capitalism. After a brief introduction of literature concerning these approaches, the analysis will focus on the contexts of research: Bologna and Lisbon. In both these cities, the shifting toward a touristic economy has been a strategy to boost the urban economy and to improve their competitive position in the global hierarchy and in the spatial division of consumption and labour. The emergence of sharing/gig economy is contributing to shape the social and urban space and, furthermore, to extract value from it. However, globally exist several practices included in what is known as platform cooperativism, whose purpose is reframe concepts like innovation and efficiency and facilitate the active participation of people in the decisional process. The questions are: in which manner digital platforms, such as for example those of food delivery, Airbnb and Uber contribute to transform the urban structure and labour process of i) Bologna, within the framework of the so-called city of food and ii) Lisbon, given the recent "Lei da Uber" (Uber Law)? The former is an interesting case study because of the so-called "Carta dei diritti dei lavoratori digitali in ambito urbano", which represents a bottom-up (from social movement and Municipal scale) attempt to regulate the food delivery sector. The latter represents a top-down regulation (from the national scale) of TVDE service, that is "Transporte individual e remunerado de passageiros em veículos descaracterizados" (individual and remunerated transport of passengers in uncharacterized vehicles). For both cases some empirical evidence will be used, assisted by current literature on touristification and platform capitalism. The non-standard methodology will be useful to seize the processual dimension of cases study and emphasize ground's features.

Les Voyelles Atones Finales Dans Trois Variations Du Parler Des Classes Populaires De Curitiba Au Brésil : Un Jeu De Distinction.

Dans la plupart du Brésil la voyelle [e] atone finale se prononce /i/. C'est la prononciation la plus courante et la moins marquée du portugais brésilien (PB). Ce phénomène est phonétiquement identifié comme l'élévation de la voyelle [e]. A titre d'exemple, le mot *frequente* est, dans la norme du PB, prononcé /frekˈẽtʃi/ ou /frekˈẽti/. Néanmoins, dans la variation de Curitiba - et du dialecte « suliste » - le /e/ atone final peut être « effacé » (Dubiela, 2016; Lessmann, 2017). Cette manière de prononcer la fin des mots n'est pas seulement le résultat de la socialisation familiale mais opère aussi comme un capital distinctif (Labov, 1962 ; 1972). L'« ef-

facement » de la voyelle /e/ atone finale est une caractéristique de la manière de parler de certains des enfants que j'ai interviewé. Ces enfants, qu'habitent dans des quartiers populaires de Curitiba, ont des conditions de vie très variés : pendant que certaines familles sont plus stables, d'autres vivent dans la précarité. Le but de cette communication est de suggérer que la stratification sociale en fractions de classe peut prendre en compte les manières dont les enfants de classe populaire s'approprient des sons de la langue. Dans ce jeu complexe d'appartenances, certains enfants vont mettre en avant le dialecte « suliste ». L'usage de cette variation peut, symboliquement, placer l'individu dans une catégorie proche à ceux dotés d'un mode de parler perçu comme étant plus prestigieux.

Altering the Trajectory of Finance: Meaning-Making and Control in Malaysian Islamic Investment Banks

This paper examines the case of Islamic investment banks as a case study for how external critics achieve an understanding of conventional finance and are seeking to alter the trajectory of capitalism by building a transnational Islamic alternative. The research is based on over 50 ethnographic interviews with investment bankers and Shariah experts on their prosaic work practices in Islamic investment banks between 2005 and 2019.

This paper demonstrates that Islamic finance is a meaning-making and control project negotiated between investment bankers, Shariah scholars, and Shariah personnel in small group social interactions embedded in larger assemblages of cognition and agency. By *meaning-making*, I wish to emphasize that Islamic finance's self-definition is itself inherently contested, and so identifying cultural practices as "conventional finance" or as "Islamic finance" is an ongoing meaning-making process. Islamic finance is also a *project of control*—to control not only the meaning of Islamic finance, but to control investment bankers and ultimately their clients. The control project is inseparable from the meaning-making project; before one can be a critic of finance, much less alter the trajectory of finance by controlling an investment banker, one must understand and interpret financial instruments and services.

Drawing on these propositions and observations, I argue that the degree to which Islamic finance is a substantive altering of the trajectory of finance is contingent on a power struggle between entrepreneurs, moral critics, and bureaucratic ethicists within the financial service commodity chain. This research induces five strategic factors that shape the balance of power between the three parties. I conclude by speculating on the implications of these findings for development theory, as well as other actors and social movements seeking to moralize the economy and alter the trajectory of capitalism.

Collaboration, Critical Realism, and the Sociology of Religion: Reflections on Intellectual Brokerage from Islamic Banking and Finance

This paper explores two projects in "economic theology" in order to arrive at a stronger methodological and theoretical understanding of contested forms of collaboration. Economic theology is a nascent academic field of study that examines how transcendental concepts such as those found in theology influence economic life, and how economic concepts are (or can be) shaped by theology. Economic theology is also a practice in the world. With well over $2 trillion held in Islamic banks and financial instruments, 97% of which is in Muslim-majority countries, Islamic banking and finance may be the world's largest ongoing project to reshape economic relationships using religious and sacred theorizing. My research is based on over 50 focused, ethnographic interviews with investment bankers and Shari'a scholars in Islamic investment banks.

The paper's strategy is to point out that Islamic banking and finance requires intellectual brokerage between Islamic experts and non-Muslim experts in finance. Similarly, research in economic theology (and the sociology of religion more broadly) entails intellectual brokerage between researchers and subjects (collaborators) with often radically different ontological understandings of the existence and characteristic of Transcendental Being(s) such as Allah. Based on my research, I softly suggest that my practitioners appear to be using a philosophy of science termed critical realism (or at least some form of realism). I propose that social science researchers of religion would benefit from mimicking my informants and adopting a position of critical realism in their academic research, which I detail in the presentation. The task for the academic project of economic theology is in this respect identical to the practitioner project of economic theology—to engage in intellectual brokerage to better understand our common world despite our socially constructed distinctive knowledges of that world.

Le Renouveau Des Études Durkheimiennes

Le renouveau des études durkheimiennes donne lieu à l'application de nouvelles pratiques et méthodes de recherches. Nous en exposerons quelques-unes tout en mettant en relief la non-cumulativité des acquis. Les études durkheimiennes ne cessent de représenter un terreau fertile de l'histoire et de la sociologie de la sociologie. Depuis les travaux de Lukes et Clark (1973) au début des années 70 jusqu'aux travaux de Ph. Besnard puis M Fournier (1996? 2009), la vie et l'oeuvre de Durkheim ont fait l'objet de travaux alliant chacun à leur manière une histoire des idées et des divers contextes où elles se déploient. Ces travaux remarquables ont su susciter des études qui, à leurs tour, tentent à la fois de faire l'histoire de la sociologie durkheimienne, celle de son contexte socio-politique, institutionnel et intellectuel ainsi que celle de la construction de la doctrine et de son déploiement dans une série d'oeuvres. Mais nous verrons aussi que des préoccupations plus accrues quant au rôle des "autres durkheimiens" ou encore à celui de l'enseignement ou des pratiques concrètes de la recherche et de la diffusion, souvent collectives, surgissent dans ce renouveau des études durkheimiennes. Ces approches nouvelles dont nous présenterons quelques représentants, tout en s'appuyant explicitement sur certains travaux antérieurs des Durkheimian Studies, négligent souvent une série d'éléments factuels historiquement démontrés par celles-ci ou n'indiquent pas toujours explicitement la porté théorique des découvertes qu'elles font. En somme tâcherons donc de présenter les éléments saillants de l'approche mêlant bio-intellectuelle et analyse théorique préconisée Marcel, de l'anthropologie du travail de sociologue proposée par Bert et de l'étude des outils de l'enseignement et de la recherche que sont les bibliothèques et des rapports entretenus par Durkheim avec ses étudiants qui sont au centre de préoccupations de Béra de manière à en montrer l'intérêt pour l'histoire de la sociologie.

The Two-Faced Function of Social Capital in the World-Systems

The Two-Faced Function of Social Capital in the World-Systems
The modern model of the World System based on Chase-Dunn's approach is a "lasagna" of overlapping networks of information exchange, political and military interactions, exchange of prestigious goods and bulk goods respective. Based on original research the author suggests that for integration in such networks each individual needs a budget of social and cultural capital (Bourdieu) that can be converted into economic capital on the labor market. In culturally heterogeneous societies the exchange rates are depending on each capital stock's specific cultural background. The proposed model is based on original research in Southeast Asia on the Zhèng Hé voyages and their legacy, especially the phenomenon of dethroned elites manifested by the Cheng Ho cult: The reason for the Zhèng Hé missions (1405-33) can be found with the China-sponsored foundation of the Sultanate of Melaka to introduce the rule of law: Islam has the idea of non-negotiable laws. Mandala polities have traits of Melanesian Big Men societies. The Chinese diaspora élite of Hanafi Muslims had to join the informal Cheng Ho cult once China ceased to rule the waves: The Cheng Ho cult is specific to the informal viz. popular Chinese diaspora culture.

Facing the "trap at the escape of the trap" at any socioeconomic phase transition (L. Grinin) the hypothesis is that populists claim that governmental enforcement of a specific ideological hegemony shall prevent the disenfranchisement of citizens with but a "local" individual capital stock for globalization. The capital exchange rate is supposed to depend on which ideology is in power (in the sense of Sahlins' "Culture and Practical Reason"). The prediction of populist revolts may be done in a similar way Korotayev et.al. analyzed the Egyptian revolution.

The Insights of Single Black Middle Class Women from Soweto on Not Dating Undesirable Unemployed Men in the 4IR Society.

Single Black middle class from Soweto and the undesirable unemployed men in the 4IR

As South Africa is immersed in the global promotion of the fourth industrial revolution (4IR), the concept of intimate relations and love is changing. Divorce rates are on the rise and most people are remaining single. For example, most single Black middle-class women, are single because of various reasons which include; the increasing rate of women entering the labour market, the rising unemployment rate of men in South Africa, particularly Black men and the focus on the progression of women has hindered single Black middle-class women with the opportunity of finding love or being romantically involved. Thus, changing dynamics of the breadwinner and traditional gender roles in the 4IR society have met most women and men in the South African context with dismay. Using a qualitative research approach, this study revealed that despite the class status

of single Black middle-class women from Soweto, these women would not be romantically involved with unemployed men, because of the lack of provision by unemployed men. Out of all the twenty participants interviewed only one mentioned she would not mind dating an unemployed man and the rest of the participants stated that they would not date an unemployed man and regard them as undesirable. Therefore, this paper will be focusing on how love constantly changes in the 4IR society and how unemployed men are hindered from finding love as they are undesirable. Also, the pertinent issues of money and love amongst the single Black middle-class women from Soweto will be discussed.

Fluid Interests: Social Mobility and Redistributive Preferences in Comparative Perspective

This research examines how objective and subjective social mobility influence preferences for redistribution accounting for the inequality, economic development and the type of welfare state by country. I argue that the greater social mobility experienced and perceived by a person, the lower the preferences for redistribution. The described hypotheses are tested by using multilevel regressions in the International Social Survey Program (ISSP) -inequality module- 2009 (N=31.266) with data from the World Bank and the Standardized Income Inequality Database (SWIID). The results show that both objetive and subjetive social mobility have a negative effect on preferences towards redistribution. In addition, this relationship would be moderated by country's inequality and economic development, so that in less unequal countries, social mobility would have more pronounced effect compared to more equal countries. On the other hand, in more developed contexts, people ascending in the social structure would have less preference for redistribution compared to less developed contexts. Regarding the genorosity of Welfare Strates, the results show thar according to how this dimension is conceptualized -such as social espending or education spending- the conclusions would be different, opening new questions for future research. The central finding of this research is thar redistributive policies would be harmed -in terms of legitimacy and citizen suppor- as a result of the same social mobility processes that they trigger.

PLEYERS, GEOFFREY* (FNRS-CriDIS/UCLouvain & CEMondiales, Belgium)

Social Movements and Alter-Activism in an Authoritarian World

At the beginning of the decade, a global wave of movements prompted hopes of a new wave of democratization in all regions of the world. Many of these hopes have vanished by the end of the decade, marked by a comeback of authoritarianism, the rise of reactionary movements and repressive regimes.

By the end of the decade, citizens' movement continue to rise in different countries and progressive movements have not disappeared. The context is however very different and some the activists" who occupied the square and implement their "alter-activist" culture based on prefigurative activism with strong personal and subjective dimensions have adopted different paths. Based on interviews and case studies conducted in nine countries where square occupations and/or citizens' mass protests with similar demands took place between 2010 and 2016, this article will focus on three major changes among alter-activists since the authoritarian turn that took place in the middle of the decade.

The way they adapt and resist to the new repertoire of repression and to direct confrontation with conservative and extreme-right.

New combinations between the horizontal and non-institutional alter-activist culture and party politics, including for case studies among a new generation of young political leaders.

The deepening of radical emancipation projects, often inspired by on subaltern actors and perspectives from the global south.

The Future of Small Towns and Rural Communities in Central Russia: Today and in Perspective. "so the Last Shall be First, and the First Last: For Many be Called, but Few Chosen (Matthew 20:16)

As of January 1, 2018, there are in Russia 789 small towns with a population of less than 50 thousand. The question of the future of small towns is much more complicated than the mobilization of the goodwill of state bodies and the citizens themselves who are concerned about their future. From the point of view of

macrosociology, we see the constantly contracting expanding space of non-urban Russia. The rural population concentrates around small towns (periphery with a radius of 5-8 kilometers) and around regional centers - up to 20 kilometers radius. The rest of the space is, in general, in a state of depopulation and attenuation of economic activity. This is especially evident in the example of central Russia and the Near North. Physical territories noticeably lose their dominant importance in the modern conditions of digitalization, development of info-communications and virtualization. Territorial issues and distances go into the background against the backdrop of the dominance of virtual extraterritorial production and related methods of making a profit. The world becomes dynamic, filled with various kinds of mobilities (*John Urry*), moving in the direction of preferential migration zones and leaving areas that do not meet the requirements of comfortable and productive living (*Zigmund Baumann "liquid modernity"*). Let us ask ourselves the question: what is the economic and socio-demographic perspective of small towns in Russia? However, in this bleak picture there is one important beam of light. It is associated with the process of de-urbanization and return/reverse migration. As mega-cities turn into huge agglomerations and fire-breathing Leviathans (fMoscow and St.Peterburg in first place), the potential of return migration from cities to rural areas and small towns, providing a more comfortable living environment and productive creative work, is maturing. Sometimes this flow of migrants is called "dacha migration", sometimes "reverse migration", "return migration".

The Use of Participatory Action Research (PAR) for the Self-Evaluation of Italian Provincial Centres for Adult Education

The school self-evaluation (SSE) represents a useful procedure for understanding the school internal functioning and supporting the overall improvement of the school system (Schildkamp,2007; Vanhoof & Van Petegem,2010). The Participatory Action Research (PAR) assumes that the school improvement tends to be effective in presence of a local knowledge of the school through the involvement of different school actors (Hughes,2003;Kindon, Pain, & Kesby,2007). In the PAR, the actors work together to analyse the school situation and/or planning actions for changing school situation for the better. In the present study, the National Institute for the Educational Evaluation of Instruction and Training (INVALSI) tried to apply the PAR for the SSE of provincial centres for adult education, which represent a new realty who needs to be more deeply known in Italy. The main aims were to develop a format of SSE as well a glossary of the words included in the format. Participants were Italian teachers and school principals of 131 provincial centres for adult education and 18 research centres on adult learning. To achieve these aims, INVALSI organized several working meetings with the school actors to define the format of SSE through the use of the PAR methodology. During the meetings, school actors also elaborated a glossary aimed to achieve shared meanings of terminologies within the SSE format. Results of the collaborative process were the format of SSE and glossary of terminologies included in the format, which focused on relevant dimensions of the school system (e.g.,school context, educational practices). Successively, each provincial centre completed the developed SSE format to analyse the school strengths and weaknesses, also comparing own school situation with other Italian provincial centres. The use of PAR for the SSE of provincial centres for adult education may represent a relevant practice to better plan improvement actions for the school system.

POLIZZI, EMANUELE* (University of Milano Bicocca, Italy)

The Advocacy Action of Solidarity Economy Actors in the Italian Case

Italian solidarity economy actors have played different roles in their history: innovators of approaches and repertoires of action to deal with social needs, advocacy actors to claim for citizen's social rights and providers of social services. In the last decades, some of the most relevant actors of this sector passed through a process of professionalization, due to the public acknowledgment for their contribution in creating or delivering goods and services that the public sector was not (or was no longer) able to do by itself. The economic crisis started in 2008 increased this professionalization process. The social expenditure retrenchment

of welfare policies and a national third sector reform introduced in 2016 led these actors to search for new markets, to hybridize themselves with other sectors and to make them more able to live and develop their activities in a market dimension.

One the most important effects of this professionalization and marketization process on the solidarity economy actors is the weakening and the change in their advocacy role.

Drawing from several local and national case studies, this paper analyzes the change occurred in two kinds of advocacy action:

1) the institutional advocacy, by focusing on participatory arenas for the welfare policy-making process at the local level;

2) the social movement advocacy, by focusing on the mobilizations for the migrant rights and the advocacy coalition for the introduction of a basic income national policy.

Indigenizing the Corporate Academy: A Critique of Initiatives to Redress the Inequalities of Indigenous Peoples in Canadian Universities

In recent years, due in large part to the Calls to Action of the Truth and Reconciliation Commission of Canada, a lot of energy and resources have been put into Indigenizing Canadian universities in order to redress the many inequalities and injustices they produce and perpetuate for Indigenous peoples. This paper seeks to make a strategic intervention into this Indigenization project by arguing that, unless university corporatization is simultaneously confronted, Indigenization efforts will be neither as efficient nor effective as its proponents hope or expect. Through a series of examples (related to issues including performance evaluation, university governance, and knowledge production and dissemination), I show that and how corporate structures, practices, and values in Canadian universities limit, undermine, corrupt, and/or nullify Indigenization initiatives and their intended benefits. I further support my case for incorporating opposition to corporatization into the Indigenization project not by addressing the disadvantages of failing to do this, but by addressing some of the practical and political advantages of making this change, including its potential to open up new approaches and resources to advance Indigenization and its aims. Although this paper focuses on Indigenization initiatives in Canadian universities, it also draws on and contributes to higher educational research in other settler colonial countries, such as Australia and the United States. Some of the issues it raises are also relevant to ongoing Indigenization initiatives in Canadian and other countries' elementary and secondary schools.

Changing Agrifood Strategies in Brazil: Agribusiness and the Amazon

A key element of the Anthropocene, the large-scale deforestation of the Amazon – and its influence on destabilizing the Earth system – has prompted growing global reactions over the last decades. Among the various consequences of these criticisms, one has been a set of changes in the strategies of the agribusiness actors in Brazil. Initiatives such as the Soy Moratorium (2006), the Institute for a Responsible Agribusiness (2007), the Brazilian Alliance for the Climate (2009) and the Brazilian Coalition on Climate, Forests, and Agriculture (2015) represent, in different ways, responses to this matter. Based on fieldwork and on the examination of documents, the paper analyzes this process of institutional change and its implications. On the one hand, the results indicate that these initiatives are related to some advancements in promoting a more sustainable agrifood system in the country; on the other hand, they suggest that such strategies have serious limitations and contradictions.

PONCE DE LEON, ZOILA* (Washington & Lee University, USA)

Political Parties and Policy Reform: Expansion of Healthcare in Latin America

Reforms seeking to expand access to social benefits promise to alleviate social inequality. Yet, the political process behind the formation of these reforms can severely affect the prospects for tackling such disparity. Over the last decades, Latin American countries have attempted to expand access to healthcare and reform a system that discriminates citizens based on their socioeconomic status. These reforms, however, have been different: some more expansive than others, with more or less planning behind them, some more sustainable than others. What explains these differences in the quality of healthcare reforms? Specifically, how and why the role of political parties as policy makers has an effect on the quality of legislation and its implementation. Although previous research has posed an association between the presence of programmatic parties and policy quality, it

has not shown the mechanisms through which programmatic parties can affect policy. Existing literature has also focused on the responsibility of strong left-wing parties for the expansion of social benefits, overlooking the development of reforms under right-wing governments. I argue that the programmatic commitments of parties affect the quality of legislation. Reforms can follow a path in which parties with values closely tied to the policy issue shape a reform's specifications regarding implementation and funding. Reforms can also follow a path in which parties disengaged from the definition of specifications allow technocrats without partisan ties to dominate the policymaking process. Both paths can lead to reforms that increase formal coverage and even funding of the health sector. The key difference is in the feasibility of granting effective access to healthcare and the sustainability of funding. I compare three processes of reform aiming to expand access to healthcare enacted in the 2000s: the Chilean AUGE (Universal Access with Explicit Guarantees), the Mexican Seguro Popular and the Peruvian Universal Health Insurance.

RC19-240.3

PONCE DE LEON, ZOILA* (Washington & Lee University, USA)

Two Paths to Reform: Political Parties and Technocrats in Latin American Healthcare Policy

Over the last decades, Latin American countries have attempted to expand access to healthcare and reform a system that discriminates citizens based on their socioeconomic status. These reforms, however, have been different: some more expansive than others, with more or less planning behind them, some more sustainable than others. Although previous research has posed that programmatic parties are important for policy quality, it has not shown the mechanisms through which programmatic parties can affect policy. Existing literature has also focused on the responsibility of strong left-wing parties for the expansion of social benefits, overlooking the development of reforms under right-wing governments. I compare three processes of reform aiming to expand access to healthcare enacted in the 2000s: the Chilean AUGE (Universal Access with Explicit Guarantees), enacted in the context of programmatic parties and a left-wing coalition in power, the Mexican Seguro Popular, approved in the context of programmatic parties and a right-wing party in power, and the Peruvian AUS (Universal Health Insurance), adopted in the context of non-programmatic parties and a right-wing party in power. I argue that the programmatic commitments of parties, only present when the core values that unite party leaders relate to a policy issue, affect the quality of legislation. Reforms can follow a path in which parties with values closely tied to the policy issue shape a reform's specifications regarding implementation and funding. Reforms can also follow a path in which parties disengaged from the definition of specifications allow technocrats without partisan ties to dominate the policymaking process. Both paths can lead to reforms that expand formal coverage and even increase funding for the health sector. The key difference is in the feasibility of granting access to healthcare and the sustainability of funding. This study is based on 12 months of extensive field research.

RC10-JS-13.4

PONNIAH, THOMAS* (, Canada)

Politics and the Utopian Laboratory

The modern philosopher G. W. F. Hegel once noted that the political process that embodies a new universal impulse often perishes while its principle persists. What is the principle that the World Social Forum brought forward? My book (co-edited with William F. Fisher) Another World is Possible—published at the beginning of 2003—was the first book in English on the World Social Forum (WSF), the first to contend that the common theme that threaded through all of the alternatives proposed at the WSF was a call for a participatory, radical democracy, and the first to argue that the Forum represented the initial steps for building a new left and a new global civilization. Over the years, there have been a number of insightful interpretations of the WSF process: it embodies resistance to globalization; it epitomizes the latest struggle against imperialism; it manifests the power of identity; it is an insurgency against all forms of hierarchical discrimination, including patriarchy; it exemplifies the "movement of the multitude," or articulates the emergence of the epistemologies of the South. The interpretation that I offered did not and does not exclude any of the others but encompasses them within a common overlapping framework: the "alternative globalization," or "global justice," movements that emerged from the WSF at minimum call for a radically participatory democratic process to be integrated into all major economic, political, cultural, or ecological decisions. Social movements around the planet are too diverse to fully develop—at this time—a common substantive notion of the good but instead, for the first time in history, bring forward a shared principle of the process of emancipation, that is, the call for a global radical democracy that extends across all social domains.

PONNIAH, UJITHRA* (Tata Institute of Social Sciences (TISS), India)

Devotional Love? Businessmen Doing Philanthropy in Delhi

India ranks fourth in the number of billionaires it produces and 130 on the United Nations Development Programme's Human Development Index. Despite stark inequality in social indicators, philanthropic contributions to the 'third' sector remain abysmally low and a bulk of contributions go to God. This paper by focusing on philanthropy undertaken by caste business elites, attempts to understand their perceptions of self and inequality.

This paper draws on a 15-month ethnographic study of business elites- Agarwals in Delhi. By using a conjugated framework of caste and affect, I show that through *devotional love* performed towards the caste community and by extension Hinduism, businessmen perceive themselves as patrons and the marginalised as clients and not citizens.

Studies show that philanthropy undertaken in colonial India, helped distinguish business groups in the eyes of the colonial rulers while strengthening one's location in the market. Public colleges in Delhi University setup by Agarwals at the turn of the 20th century, were named after the highest donor. In the late 1980s however, there was a growing feeling amongst the businessmen that people were not aware for the community's philanthropic contributions. Hence, philanthropies were organised through registered societies under the name of Maharaja Agrasen. These philanthropies served three purposes: *first*, it produced businesses as moral economies. This helped regulate internal competition and trust-based credit networks; *second*, it helped produce familial love which played the regulatory role of ensuring the younger generation of business elites were interested both in the business and the community; and *third*, it produced businessmen as patrons. Pedestalisation of self, meant that the relationship to the 'other' was always an unequal and hierarchical one. Philanthropic investments in temples, cow hospitals, dharmshalas (religious rest houses) and even colleges helped reproduce elites devotional love for the self.

Rural Youth and Participatory Development: An Approach from the Agroecology Perspective

To understand Brazilian rural development's perspectives in recent decades implies grasping the change in the roles of the State and civil society in the process of social transformation. In the context of participatory development, agroecological practices and contextualized education favor the capacity of self-management and the emancipation of local actors, empowering communities to reconstruct social and economic arrangements, contesting a hegemonic system.

The paper examines the contribution of agroecological movements to the construction of a social transformation model based on youth's protagonism in development initiatives. The methodology applied has a qualitative character, a result of empiric research in the semi-arid of Bahia, Brazil, in 2019/2020.

The research presents the challenges of a development perspective based on youth as agents of change, at the same time as it shows that it is possible to act across and expand networks to ensure that propositional actions around contextualized education and agroecology have greater political strength in territorial and regional spheres.

Theoretical Pluralism and the Foundations of Sociological Reasoning

As social scientists, we are very familiar with, and habituated to, the (epistemological grounded) necessity of establishing the theoretical and conceptual presuppositions of our investigations. This scientific procedure is undoubtedly correct. The priority of the rational in the construction of the object is well established within our scientific community - even the neopositivists concede that. Nevertheless, however necessary this theoretical priority may be, it is not sufficient in itself to explain and justify the prevailing theoretical pluralism in our discipline - and in the social sciences in general - without receding into relativistic apories we are all well acquainted with.

In this paper, we propose to integrate this justifed inquiry of the rational conditions of possibility of the social life with the less perceived, but equally important, question: how must the social reality be (i) if sociology, and (ii) if different, rival, and under some respects irreconcilable, sociological theories, are to be possible? (We can observe that the well known argument about different scientific paradigms is not an answer: our question is precisely how they can be antagonstic in several respects, compossible, and claim to be objectively and empirically grounded, at the same time.)

In pushing this unavoidable questions to all its extent, we can, maybe, integrate the foundations of the social sciences in our proposal of a mode of existence that is historical in its constitution, and embraces multiple determinations (the same social act can, at the same time, be characterized by its 'economic' constraints, its 'moral' dimensions, its affective bonds, or rather its inner ambivalence, etc.) that are just derivatively analitical: they are first, and foremost, existentiallly co-inherent in the nature of social life itself.

PONTIER, MARTIN* (Laboratoire d'Economie et de Sociologie du Travail, France)

Working on Migration Routes: Greece As a Transit Territory

La Grèce joue également un rôle de territoire de transit pour les migrations forcées du Moyen Orient et de l'Afrique subsaharienne. Nous étudierons principalement les activités de travail des migrants et les conditions de leur insertion sur les marchés du travail locaux, grâce aux intermédiaires locaux, nationaux et transnationaux et à leurs effets sur les parcours de migration vers d'autres pays européens. Nous inscrirons notre démarche dans une visée comparative de l'impact des dispositifs légaux grecs et européens sur l'accès aux marchés du travail pour les réfugiés et les migrants. Au regard de ces dispositifs nous analyserons la mutation des échanges régionaux transfrontaliers de travailleurs entre les pays situés à la frontière Nord de la Grèce et de l'UE.

Aux migrants économiques des années 1990 sont venus s'ajouter plusieurs centaines de milliers de personnes fuyant les guerres et passant par la Grèce, point de passage important vers le reste de l'UE. L'UNHCR estime que plus de 300 000 réfugiés et migrants ont entrepris de traverser la mer méditerranée pour rejoindre principalement les côtes grecques ou italiennes en 2016.

Dans le contexte de la crise grec et des migrations forcées en Méditerranée, il s'agit de comprendre les rapports au travail qui en découlent, de saisir le poids économique des migrants et réfugiés à l'entrée de l'UE et aussi d'analyser comment la crise économique a produit des discours visant à redéfinir les capacités d'inclusions sociales en Grèce.

Le double contexte grec depuis 2008, d'immigrations nouvelles (période de modification législatives sur les migrations) et de crise économique (ex: les trois mémorandums de 2010, 2012, 2015), a renforcé d'un côté, la division ethnique du travail en Grèce et une « illégalisation » progressive de ressortissant étranger et a entraîné de l'autre côté, une redéfinition de la syndicalisation et du droit du travail en Grèce.

Exploring Differences in the Relationship between Physical Activity and Depression Symptoms between Countries

In contemporary society, the role of physical activity in preventing and decreasing depression is gaining increasing scientific attention. Clinical studies have shown physical activity can help relieving depression in individuals, and therefore suggest governments should take a more proactive role in combating depression through increasing physical activity levels. However, although policymakers nowadays are increasingly aware of the benefits of physical activity, there is still a lack of information on how physical activity would influence depression symptoms in general populations. Furthermore, an assumption of the general recommendations for adequate psychical activity levels is that they are generally applicable, and that the differences between countries are non-existent. We question this assumption and we proceed to investigate the relationship between physical activity and depressive symptoms in a sample of European countries. The main research questions guiding our study are: 1) are there differences between countries in the relationship between physical activity and depressive symptoms, and 2) how can we explain such differences?

To our knowledge, this is a first study that specifically inquires whether the relationship between physical activity and depressive symptoms varies between countries. As such, there is little theoretical work done that we can use to substantiate specific expectations regarding how this relationship would work. To address this lack in the literature we borrow from different fields and we explore the role of environmental factors such as climate and sunlight exposure, as well as social characteristics such as urbanization levels, poverty, or criminality as moderators of the relationship between physical activity and depressive symptoms. In order to test our arguments, we use data from the 2014 wave of the European Social Survey, which provides information on 40185 respondents living across 21 European countries.

Powerful Substances in Tiny Bits: The Microdosing Practice Among Tiu Students

Microdosing is defined as the ingestion of "sub-threshold doses of psychedelic drugs in an attempt to enhance cognitive tasks, to boost physical energy levels, to promote emotional balance, and to treat anxiety, depression and addiction" (Kuypers et al., 2019). Microdosing was documented among various social groups, from young professionals in Silicon Valley to mothers or students and academics. Its appeal can be attributed to the performance and mood enhancing effects that are claimed to be induced, and also to the fact that the use of psychedelics can be considered, in comparison to other drugs such as Ritalin or cannabis, a safe option. In the present project, we examine how the microdosing practice manifests itself among the student population at a Dutch university. Our argument is that the microdosing among the student population reflects specific institutional pressures. Previous work conducted among the same population has revealed that mental illness, and specifically burn-out, were linked mainly to pressures related to the academic life, e.g., performance / workload pressures and self-image threats due to criticism. Another identified reason of burnout was the perceived competitive labor market, which is presented to the students, among others, in the form of CV development trainings and that results in the experienced pressure to improve their competitive advantage by engaging in a multitude of extra-curricular activities. We argue that such pressures play a role in the pursue of methods to enhance performance, and microdosing is one of such methods. Subsequently, this project directly links to the general topic of pharmaceuticalization in the specific type of a context – the academic one, and its forms of dissemination.

Exploring the Migration Effects of Cyclones and Floods in Southern Africa.

Are cyclones and related environmental catastrophes the next drivers of intra and international migration within the Southern African region? This question comes in the wake of the devastating effects of Cyclone Ida and Kenneth which the United Nations has classified as the worst tropical cyclone to have hit the southern Africa region. The strong winds and torrential rains have put the region in a state of crisis, causing huge losses of life, damaging critical infrastructure and submerged entire communities. Leaving affected people in desperate situations with limited resources. The literature shows that common adaptation strategy for rural households affected by disasters or other economic hardship is temporary migration to urban areas for short-term employment. While they may not migrate permanently as a result of floods or cyclones temporary migration will continue to be an adaptation strategy for affected communities. Within the region this migration may not only be rural-urban but also migration cross-border into countries with better off economies. In the aftermath of a cyclone such as Idai and Kenneth as well as floods in Durban and Port St Johns it would be hardly surprising to learn of increases in new arrivals in nearby urban areas or the nearest border towns. The paper thus seeks to understand ways in which cyclones like Idai and Kenneth and floods have altered migratory patterns within South Africa, Zimbabwe, Malawi, and Mozambique. It does so by demonstrating the extent of displacement on livelihoods caused by the cyclones and floods and the adaptation role of migration. It is anticipated that the findings of the study will highlight ways in which regional policymakers can put in place measures to mitigate the effects of floods on human mobility.

The Rise of Employment Precarization in the Digital Era: The Case of Russia

Digitalization of public life has a serious impact on the development of social and labor relations. In spite of the fact that digitalization has many positive

effects, we can point out that the issue of employment precarization is coming to the fore and it is reflected in the growth of vulnerability and social insecurity among workers. This trend is manifested to the fullest extent in the Russian society. In this regard this paper considers theoretical and practical issues of employment precarization in Russia in the context of its rapid digitalization. According to the results of our study, Russia is witnessing an increase in the scale of precarious employment against the background of rapid digitalization. This is confirmed by both official statistics and sociological observations. Using our own technique, we have found that the processes of employment precarization in Russia are widespread (about 69% of employees are involved in precarious employment relations), and they affect standard jobs as well as non-standard jobs. The reasons for such a situation are as follows: expanding practice of using fixed-term employment contracts; developing the informal sector of the economy; limitations of the institutional environment and sustainability of the economic situation in a given territory. Since the level and pace of digitalization in Russia are noticeably inferior to those in Europe's most advances countries, we can assume that in the future the threat of employment precarization will only increase.

Young Evangelicals and High School

Young evangelicals express their religion and find the support of school officials and management to act in school everyday life, spread their beliefs and express their faith. There seems to be a conception, especially among other Christian officials, of the young evangelical as a synonym for a good student. Thus, this identity of youngsters is easily accepted in school. These findings are part of a developing doctoral research entitled "Young Evangelicals and High School". Part of the investigative work, aimed at understanding the relationship of young evangelicals with religion and high school, was based on observations during three semesters of a group that meets in a vocational high school in Campinas-SP. Meetings take place at the investigated school for more than 15 years, weekly and during lunch break. Occasionally, the group mobilizes out-of-school outreach and twice a year promotes scavenger hunts before vacations. Not linked to any official religious institution, the group only calls itself "Christian" to reinforce the idea that it does not belong to any particular denomination or religion. Its purpose, according to its members, is to "speak of the love of God." However, most of its members are evangelical students. The work has reinforced what has already been found in other similar research, that is, the strong presence of religion in the lives of young Brazilians and the growing adherence to evangelical denominations. However, it is important to emphasize that a diversity of meanings prevails about what is "being religious" (Novaes, 2016) and there are innumerable ways of "being evangelical" among these young people, so it's not possible to affirm that they share the same standpoints.

Confronting the Politics of Inequality in the Social Construction of Disasters: The Case of Mining Waste Dams

We focus here on disasters caused by the inadequate and inefficacious construction, management, regulation and control of mining waste dams, which are and excellent example of the politics of inequality. Our empirical reference are the disasters that took place in Mariana and Brumadinho, State of Minas Gerais, Brazil, in 2015 and 2019, respectively, which attracted significant attention in the international media. The rapid expansion in recent decades of the extractivist model based on large-scale mining, controlled by mega multinational companies, an activity largely deregulated and, in practice, free from even the lighter democratic controls, has generated a threatening landscape, as alerted by international organizations, academics, environmental activists, and the affected communities themselves.

In the rescue operation at Brumadinho there were at least 3,500 emergency professionals directly involved, including 1,500 health professionals and 1,800 firefighters. The operational costs of rescuing people and related tasks are covered by the government, that is, by Brazilian citizens. Also, the health impacts of the disasters are not acknowledged by the mining companies, which seek to avoid responsibilities owing to the high costs involved. The evidence shows that mining companies attempt to stop the people affected by the disasters from participating in the decision-making processes related to damage compensation, as companies seek to reduce the costs involved in the operations of restitution and inthe settling of grievances, and try to preserve their international profile.

The evidence shows that the root-causes of these catastrophic events are the political and economic decisions taken by governments, multinational companies and international institutions that promote the ultraliberal and antidemocratic model centred on defending the anarchic freedom of the market and on demonizing state intervention by means of legislation, regulation, and public policies to protect human populations, life, and the environment. This is the dominant model of the current capitalist financial-corporate model.

Food Activism and Political Consumerism By Latin American Social Movements

Food became central and won great visibility in all spheres of social life as a potential symbol of what distress a society. The form of we produce, purchase and eat is now perceived as central in the construction of the utopia of a better world. Several social movements have been organizing forms of activism around food issues. On the other hand, consumers once perceived as passive actors, are now considered as key players and political actors, sometimes in an ambiguous way. The paper will present and discus some selected examples of Latin American social movements which have been incorporated political consumerism as a form of food activism. It will also discuss how they politicize urban consumers as political actors, addressing topics like meanings of consumer, types of projects and campaigns, themes, political strategies, target sectors, actors, efficacy, opportunities, barriers, and futures perspectives. The internal dynamic among institutional settings, as well as the foreign influences, leads to different ways to perceive and put in practice the process of politicization of consumption and to adopt food activism strategies. The paper intends to bring theoretical contributions from food and eat sociology, and from consumption studies to understand food activism.

Generación, Subjetividad Política y Activismo En El Escenario Posterior Al #YoSoy132 En México

En este trabajo presentamos los resultados de una investigación más amplia que analiza la repercusión del movimiento #YoSoy132. Modonessi (2017) caracteriza al periodo entre 2012 y 2014 en México, como un ciclo de movilización juvenil y estudiantil que fue sedimentándose a nivel experiencial en una camada de activistas y militantes y dio luz a formas específicas de politización generacional. Las derivas de este movimiento formarían parte de un mismo proceso sociopolítico (González Contreras, 2017). El recorrido que estos jóvenes activistas han seguido durante este ciclo de movilizaciones que inició en 2012 nos permite afirmar que el #YoSoy132 tuvo un fuerte impacto generacional en términos de construcción de ciudadanía (Portillo, 2015, 2018). Nuestro análisis presenta el seguimiento a las acciones colectivas que han ocurrido entre 2017 y 2019. Nos cuestionamos por la forma en que se articulan las subjetividades políticas, las prácticas comunicativas y los contextos sociodigitales derivados del activismo juvenil en México luego del movimiento #YoSoy132. Nuestro estudio incorporó un diseño metodológico cualitativo que nos permite adentrarnos en la dimensión subjetiva de los sujetos (Orozco y González, 2011). Para ello, se llevaron a cabo 20 entrevistas en profundidad con jóvenes activistas mexicanos que participaron en alguna movilización entre 2017 y 2019. Las entrevistas estuvieron estructuradas en torno a cuatro categorías analíticas: biografía, generación, mediaciones tecno-comunicativas y construcción de ciudadanía. Los resultados confirman nuestra hipótesis respecto de una cierta subjetividad que apuesta por la reconfiguración de las formas de organización y participación ciudadana que se articula a partir de redes de colaboración y que apuesta por nuevas formas de nombrar y relacionarse con la política.

Shifting Social Inequality in Higher Education between Access and Non-Completion? Effects of the Introduction of Access Restrictions in an Open-Access-System: The Case of Austria

Regarding the question, if and how the mechanisms of social inequality in higher education shift from access to completion and vice versa, Austria offers an interesting case for analysis. Austria has been an open-access system, where anybody with a higher education qualification could study any program at any (public) university, but since 2005, universities have gradually introduced access restrictions in certain study programs. In a comprehensive research project, I an-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

alyzed the effects of these restrictions on social inequality (regarding the social background), taking into account the effects on the social selectivity during study. The project involved several stages:

Reviewing international and national literature and comparing international case studies;

Developing a theoretical framework, covering all steps of selection in higher education;

Analyses of changes in the social composition of beginners and graduates in programs with and without access restrictions, using an "Interrupted Time Series Analysis"-Design

Logistic regression analyses of completion and dropout rates and the effects of different types of access restrictions thereon

For the empirical approaches, I used nation-wide administrative data (full data on beginners at public universities in Austria from 2001 to 2016 and their study progress/outcomes).

In the presentation at the ISA-Forum, I would like to focus on the main empirical results. They suggest that there is no yes-or-no-answer to the question about the effects of access restrictions, but that the effects depend on the type of access restriction and the subject of the study program. I will discuss several explanations for these results and in how far these results are applicable and relevant for other countries and higher education systems. The project distinguishes itself by looking at both the social selectivity in access as well as during study and adds important theoretical reasoning and empirical evidence to the research of educational inequality.

POSSAMAI, ADAM* (Western Sydney University, Australia)

Online Exorcism and Morality

Recent works have highlighted that exorcism is not an atavistic ritual but that it has a part of our contemporary western world. As religious institutions have become more secularised, a vacuum has been left for professionals to deal with demons. While Pentecostals movements have developed their Ministry of Deliverance at a global scale, the Catholic Church is only slowly catching up with its recent creation of the International Association of Exorcists. While exorcists claim that there is a higher demand for exorcism, they grow as a profession and warn people of the devil's presence in games, popular culture, and family curses (even for migrants after arriving in their host country). The use of social media has not been left out from these developments as Facebook exorcism videos have spread, apps are available to help performing rituals of exorcism in Catholicism and Islam, remote online forms of exorcism are available, and rituals of exorcism can be performed via a mobile device. While questions of morality are malleable in this context, e.g. giving a sense of security or providing extra insecurity in this world of anxiety, this paper points to perhaps the unintended consequence of stepping up the over-policing of the devil, which in return creates a higher demand to seek religious professionals. With this online expansion, the possessed or the afflicted no longer has an excuse in this neo-liberal world for not being able to seek a cure for himself or herself against the devil.

Legitimacy and State Violence: Reflections on the Judicial Treatment of Violent Deaths Caused and Suffered By Police Officers in Brazil

Brazil is facing increasing rates of police lethal violence, as well as assassinations of police officers. This is happening despite the numerous legal documents that were produced during the Brazilian democratization period (after 1988) with the objective of controlling violence in police actions. The killing of suspects (and non-suspects) is regarded as an authorized police practice, recognized and incorporated in the daily routine of police corporations. It is also very frequently declared by the Judiciary as a legal practice. This communication is based on an ongoing national research coordinated by the Brazilian Forum for Public Security (Fórum Brasileiro de Segurança Pública), in five cities (São Paulo, Rio de Janeiro, Salvador, Belo Horizonte e Porto Alegre). The objective of the research is to describe and understand the current state of affairs of the judicial treatment (including the work of the police, prosecutors, defenders and judges) of deaths caused and suffered by police officers in Brazil. Our proposal focuses on the Brazilian state of Bahia, particularly the city of Salvador, where we analysed 34 cases of deaths involving police officers as authors or victims. In addition to the analysis of the case files, we are conducting interviews with specific social actors (police officers, prosecutors and judges). Based on a Luhmannian approach, we propose a discussion about how some homicides have been legitimized by the State as a legal practice in specific contexts.

Demographic Data and Analyses of the Transgender and Cisgender Populations

The 2018 General Social Survey (GSS) is a full-probability, personal-interview survey of persons 18 years of age and older living in households in the U.S. It the first nationally representative U.S. dataset to include questions about the respondent's sex at birth and the respondent's current gender. These data provide us with an opportunity to ascertain the percentage levels of transgender and cisgender persons and to analyze their demographic and socioeconomic characteristics. In our paper we first discuss how the 2018 GSS was adapted to make transgender and cisgender groups statistically visible; we also discuss the "blind spots" that remain for a thorough statistical analysis of these populations. We also consider other kinds of survey questions that could be employed to identify transgender and cisgender persons, and the methodologically "best" placement of these and related questions in the survey instrument. We then use the GSS data for nearly 1,400 respondents to identify transgender and cisgender persons. Respondents who are inconsistent with respect to the two variables are categorized as transgender (current gender incongruence with sex assigned at birth), and those who are consistent as cisgender (current gender congruence with sex assigned at birth). We next use the GSS respondent sampling weights to produce statistically unbiased estimates of the percentages of persons aged 18+ in the U.S. population who are transgender and who are cisgender. Finally, we estimate logistic regression equations to describe some of the demographic and socioeconomic characteristics of the transgender and cisgender populations. Our research is one of the first demographic analyses of the transgender and cisgender populations of the U.S. using data that are nationally representative.

Ecological Analyses of Migration Streams in China: 2005-2010

Using provincial residential change data from China's 2010 Census, we analyze the patterns of China's inter-province migration streams for the 2005-2010 period. Our dependent variable is the number of migrants in each of the 930 migration streams for the 2005-2010 time period to and from each of the 31 provinces of China, i.e., 31 x's 30 = 930. We show that the interprovincial migration stream patterns for China in the 2005-2010 period are similar to those reported in earlier research for the 1995-2000 period. For instance, of the 10 largest migration streams, Guangdong, Zhejiang and Jiangsu continue to be the major destinations. Also, the overall direction of inter-provincial migration remains the same, i.e., from the middle and western provinces to the eastern provinces.

To better understand the dynamics of interprovincial migration in China, we next estimate regression equations of the provincial-level determinants using a classic gravity model and a human ecological model. We show that interprovincial migration in the 2005-2010 period is highly responsive to the gravity variables and to several of the human ecological variables. We discuss these results and consider their implications for population mobility in China.

Professional Dynasties: Social Monopoly or Knowledge Capitalization?

The paper studies positive (professional knowledge capitalization) and destructive (social monopoly) sides of professional dynasties in the Russian society. Applying interdisciplinary approaches we identify conditions, contributing factors for the development and formation of new professional dynasties. Professional dynasties are studied as a social monopoly in the socio-professional structure of society in correlation with certain types of professions, type of settlement and level of urbanization. The influence of dynasties on professional tracks and social advancement of family members is revealed in the context of familism and nepotism. In a high competitive labour market professional dynasty is one of the means of social monopolization (due to accumulation and redistribution of social resources among family members). Professional dynasties gradually turn into stable groups of professional-stratification structure, causing social inequality.

Sandpit Democracy. about the Third Wave of Participatory Budgeting in France

Many works have been studying how participatory budgeting (PB) has been adapted within a country. PB used to be in Brazil a first step towards radical changes between administration and the citizens' role with a much bigger discussion about local assets and source of incomes. Looking at how these policy transfers in France have been adopted in 2019, this paper analyses 161 active cases of municipal PB. 10 years ago, Sintomer's team was labelling French PB as typical of "proximity democracy". If lack of precise rules and the omnipresence of elected officials were prominent in the first generation of PB in France, now most of processes are more formal and we might wonder if "selective listening" or cherrypicking typical from that time is still occurring as budgets are bigger (Parisians are voting for €100,000,000 each year). Still most of participatory budgeting processes are only discussing less than 1% of local budgets and half of them less than 0.27% of budget.

Most of winning proposals in PB are related to marginal urbanism such as sport facilities, community gardens and basic urban infrastructures whereas submitted proposals are broader than these issues. But city halls are filtering proposals before the vote, in order to choose which proposals are "feasible" or "desirable" from their point of view. This means than informal cherrypicking is still happening and interviews confirm how political filter is maintained. Poor accountability happens in most cases also due to the nature of filtered proposals. Only 13% are explaining the motives for rejecting proposals prior to the vote. So French PB cases can't be seen as robust democratic innovations and they can't help to foster accountability and appears unlikely to increase citizenry trust.

RC10-130.1

PRADEAU, GIL* (University of Westminster, United Kingdom)

The Resistible Rise of Participatory Budgeting. Complexity and Participatory Politics at the State Level in Brazil

There has been a participatory turn calling for a stronger citizen engagement for the last decades. Diverse political movements sustain various approaches that led to this participatory turn. In Latin America and especially in Brazil, new participatory institutions were designed to engage citizens in addressing the issues related to urbanization and access to land.

While some scholars have conceived a device such as participatory budgeting (PB) as a policy associated with the ideology of the Partido dos Trabalhadores (PT) and mainly implemented at the municipal level, very few works actually studied state-level experiences. In fact, few states tried to organize such participatory processes, but surprisingly, none of the current states led by governors from PT are carrying it out. Are they designed to be policy failure?

This paper focuses on the challenges for the state-level implementation based on a comparison between 27 states about the necessary conditions for institutionalizing participatory budgeting. This would help to understand the nature of interactive leadership needed for adoption and the degree of complexity of such mechanisms.

The paper shows that the main drivers for replication of PB at the city-level are not strong predictors of the state-level adoption such as geographical proximity (between states or within states), ideological proximity, high Human Development Index score and the previous municipal executive experience. The last section compares three different designs : Rio Grande do Sul, Maranhão and Paraíba. Paraíba and Rio Grande do Sul managed to scale up participatory budgeting because of the election of a former mayor who implemented PB while in office whereas and for distinct reasons, Maranhão has overcome political bargaining for capital expenses with local prefeitos.

MATEI, STEFANIA (University of Bucharest, Romania)

Time Capital Conversion and Accumulation: Methods for Assessing Subtle Forms of Social Inequality

Defining and measuring differential access to material and symbolic resources is central to sociology and related-fields. Social inequality has been traditionally explored in terms of economic, social and cultural capital. However, power relations are linked to time-use patterns impacted by environmental, cultural and technological factors. A review of relevant theory and research shows a need for alternative indicators to gain awareness of the most enduring features that shape convertibility and transferability processes between and across various forms of capital. This paper applies an index of 'individual time capital' as a composite measure to assess subtle ways in which social inequality is structured in data-driven societies, thus demonstrating the advantages of using the newly introduced concept of 'time capital' to study social inequality and its structural reproduction.

Therefore, our approach might inform decision making processes, interventions on personal and social wellbeing, as well as public policy and redistributive justice initiatives.

RC14-175.1

PRETTO, ALBERTINA* (Freelance sociologist, Italy)

Accessibility and Conservation: A(n) (im)Possible Match

In literature, values are considered as symbolic-cultural elements, accepted, acknowledged and shared by a community or society, which guide action and interaction, making them possible. Values are conceptions of the desirable, that is they refer to 'what should be' for a plurality of individuals. Nevertheless, different values can be in conflict within the same community or society. In Italy, Europe and elsewhere, norms and regulations are set up and in evolution to ensure equal rights to people with disabilities in all aspects of life, including access to the built environment. But despite the norms and regulations on accessibility, people with disabilities continue to face many problems in the built environment, particularly in historic places and buildings. As a matter of fact, local, national and supranational governments assign great importance to the conservation of historic city centres and buildings. The old Italian and European cities are full of them, and they are not just tourist and/or cultural attractions but they are often used as public places, work and study spaces in which universal accessibility should be ensured. The presentation, based on a large qualitative research study carried out in an old Italian city, aims to show that there is only a partial - and often inconsistent - implementation of the accessibility regulations in historic built environments, due to the precedence given to conservation regulations. The latter brings up many accessibility issues, and thus limits the possibility of people with disabilities to autonomously move around and carry out everyday life activities. The study suggests that historical and aesthetic values and accessibility can coexist, in particular if people with disabilities are included in decision-making processes and can have their say through participatory planning.

PRETTO, ALBERTINA* (Freelance sociologist, Italy)

The East and the West in the Same Border Area

My presentation focuses on a case study carried out in Gorizia, an Italian city in the region of Friuli-Venezia Giulia, and Nova Gorica, in the Slovenian region of Goriska. The particularity of these two cities resides in the fact that they used to belong to the same nation, whereas now they are separated by a national border. Gorizia was part of the Habsburg empire since the beginning of the 16th century and was annexed to Italy in 1921, after World War I. At the end of World War II, it was occupied by Tito's Yugoslav army but, in 1945, Gorizia was assigned to Italy again. The Paris Peace Treaty in 1947 defined the new border between Italy and Yugoslavia. In order to establish a local political and administrative entity, the Yugoslav regime created and built the city of Nova Gorica in the urbanised part of Gorizia under its control. Using a particular type of qualitative interview with photos, the bipolar photo elicitation, the study explores the sense of socio-territorial belonging in these two cities. Since their separation, their history and social processes took different paths, but the two cities are located along the same border area. The research question (in particular but not only) focuses on the Gorizia and Nova Gorica residents' sense of belonging to their respective cities, countries and Europe.

Populist Constitutionalism and the Bolivian Constitution: The Democratic Dimension at Stake

The present work aims to analyze the Bolivian Constitution of 2009 through the theory of *populist constitutionalism*. This theory consists in an effort to characterize the constitutional changes and reforms that are held during the mandate of populist leaders and parties, which are frequently exemplified with the cases of Hungary, Poland, Turkey etc. The Bolivian case, as well as the Latin-American cases of Ecuator and Venezuela, is often pointed out as a populist constitution, although there is no precise analysis of any of these three constitutions yet. Therefore, this works intends to present a thorough investigation of the Bolivian Constitution. The question to be answered is whether it can be classified as a populist constitution, a problem that can be solved through the operationalization of the concept to be accomplished through a bibliographic review and the analysis of the constitutional block, as well as legal regulations. The theory of populist constitutionalism will also be confronted with another constitutional theory, developed to analyze and classify the Latin-American constitutions created after the period of military dictatorships in the continent. These authors claim that these constitutions compose their own constitutional moment called *Latin-American Democratic Constitutionalism*, in which the democratic principles are deepened and the catalogue of social rights is increased. However, the main allegation of most of the authors of the populist constitutionalism is that the populists constitutions

are anti-pluralist and anti-democratic *per se*, which depicts a fundamental contradiction at the core of these two theories. Thus, through a careful analysis of the Bolivian Constitution, it is possible to verify in what extent each theory can portray the democratic dimension in this case, and whether the *populist constitutionalism* theory, developed mostly in Europe and applied to European cases, is suitable for a Latin-American one.

Medicine of the Future: Digitalization Versus Humanization

The emergence and expansion of Internet space, the existence of virtual reality, the development of artificial intelligence, robotic medicine, the use of neural networks, Big Data arrays in health care - poses a number of challenges to society and medicine of the future, giving unprecedented opportunities for the development and introduction of new technologies into medicine, but also actualizes the need for self-determination in the new reality of members of society.

However, it is necessary to note the stratifying risks that arise as a result of the introduction of new technologies in medicine – first of all, the danger of "erosion of the moral foundations " of medical practice and the elimination of contact between doctor and patient, the difficult access of patients to modern high-tech care, and the increasing convergence of medical science and practice.

Analysis of the development of social Institute of medicine in Russia and abroad in real time allows to expand the idea of the intense interdisciplinary perspectives of development and possibilities of studying the influence of social processes on the functioning of the health system, the determination of the social prerequisites (primarily, information inequalities, and a deformation of social consciousness and value fields of social processes) needs of population in medical services and in commitment to a healthy lifestyle, the impact of globalization of social processes on medicine.

The interdisciplinarity and convergence of research approaches, largely associated with the conditions sociostructural transformations of the modern period, the main imperative of which was the COVID-19 pandemic, it is the accumulation of interdisciplinary methodological approaches and techniques can potentially allow us to get closer to understanding and concretizing the new standards of social interaction discussed in society.

And in this context, the future of the sociology of medicine lies in interdisciplinarity and the development of digital space.

PROSONO, MARVIN* (Missouri State University, USA)

One of the Specters Haunting Marxism: The Failure of the Concept of Alienation in a World Increasingly Filled with Robots and Populists

Having explored the implications of sex-bots and the emergence of robotics in general for the concepts of "alienation" and "nature" in the paper "The Climax of Alienation" at the ISA meetings in Toronto in 2018, this present work confronts directly the failure of "alienation" as a either catalyst for or a harbinger of supposed revolutionary realization. That earlier paper advanced the idea that the concept "nature" began as and continues to be an obfuscation preventing an honest appraisal of the processes of evolution as they transform multifarious worlds.   In the present post-industrial dispensation, where the neo-liberal economic order has reduced the proletariat to a "precariat" of disparate and desperate individuals, how can alienation be recognized? Is it reasonable to continue using a formulation in its Marxist sense nearing two hundred years old to understand human social and economic behavior in a context whereby technological developments have radically transformed the social psychological landscape? As processes of change proceed, individuals and the social worlds in which they are embedded attempt to adapt. Marxist versions of alienation have from the start been dependent on a status quo which was disturbed by such adaptations to the expansion of capitalism as trade unionism and social welfare legislation, originally opposed by Marx himself. Beginning with a short summary of alienation, its proponents and detractors, theorists such as Bauman, Baudrillard and Veblen are deployed to critique alienation as an over-psychologized remnant of a once seemingly useful critique.

To Market, to Market: An Economic Sociology of Greenhouse Gas Emissions Trading in Brazil and India

Markets for environmental goods are being advocated as solutions to local and global environmental problems. The most ambitious of environmental markets is the evolving and overlapping network of carbon markets that seek to reduce global emissions of greenhouse gases linked to climate change. The challenges of environmental markets are numerous. Environmental economists point to defining the market commodity, the initial allocation of rights, and monitoring compliance as central to the success of an environmental market. An economic sociology perspective suggests that other factors will structure market behavior. Economic sociologists conceive of markets as "fields" or "local social orders," where action is structured by hierarchical networks of actors, formal regulations and informal norms, and shared beliefs. Applying an economic sociology framework to investigate the emergence of greenhouse gas emissions trading markets in Brazil and India reveals five field-level structures that have shaped the particular trajectories by which Brazilian and Indian firms came to participate in their national carbon markets: (1) state intervention, (2) international intervention, (3) the network of project developers, (4) pre-existing industry structures, and (5) shifting risk perceptions.

Bringing Feminist Thinking into Frameworks of Forced Migration

As forced migration becomes the new normal around the world, it is imperative we rethink some of the feminist frameworks on this subject. Many powerful governments have normalized processes of repelling migrants on lands and seas. We typically consider these actions as part of our analysis of forced migration. Yet deportation and detention ought to be part of our forced migration frameworks as well. Drawing upon my previous work on migrants, human security and rights (2018), trafficking (2018), and distancing as governance (2019) for a framework, I will highlight patterns of migrant governance that uses force and violence as practice, policy, and profit. I will link these patterns to discuss decolonized feminist theories that can be fruitfully extended to analyze the violence towards migrants.

Global Knowledge of the Heart – the Rise of the European Society of Cardiology

Cardiovascular diseases (CVDs) account for one third of worldwide deaths. Thus, the global field of cardiological knowledge is highly relevant for a broad range of stake holders. Today, a handful of organisations dominates the field of cardiological knowledge. The European Society of Cardiology (ESC), a meta-organisation encompassing 57 national cardiac societies as member organisations, and 47 cardiac societies as affiliated organisations, is one of these. With roots in Europe, the ESC has achieved global scope. ESC guidelines for the diagnosis and therapy of CVDs are used in many health care systems around the world, either directly or as models for adapted guidelines. Thus, clinical cardiological practice around the world is considerably shaped through knowledge produced by the ESC. This paper focuses on heart failure as one of the most serious CVDs in terms of mortality and economic burden. The first guidelines for the diagnosis and therapy of heart failure were put forward by the ESC and US-American organisations in the 1990s, after so-called "evidence based knowledge" became available. Based on interviews with authors (i.e., cardiologists), an in-depth analysis of several guidelines, and an analysis of citation networks, this paper 1) reconstructs how since then the ESC emerged as a global player in the field, 2) how national member organisations standardised their respective guidelines, and 3) how other cardiological organisations around the world have increasingly adopted models produced by the ESC.

"We Write Guidelines for the Rich" – How Clinical Practice Guidelines Take into Account Economic and Technological Inequalities

This paper examines how clinical practice guidelines, and their authors, take into account economic and technological inequalities when formulating recommendations for the diagnosis and treatment of diseases. It inquires into the implications for health care provision on a national level. The focus is on heart failure, which is one of the most serious cardiovascular diseases in terms of mortality and economic burden worldwide.

Demands for therapeutics are necessarily embedded in horizons of knowledge and information. Where there is no access to knowledge about the availability and possible applications of expensive drugs or medical devices, there will be no demand for them. Clinical practice guidelines are one of the media through which such knowledge becomes accessible for a broad range of stake holders, including medical practitioners and patients. Guidelines formulate recommendations for the diagnosis and treatment of diseases according to what is held as the current "gold standard" (or, so-called evidence based medicine). In other words, they expose the cutting edge of biomedical knowledge for a specific domain. Thereby, they also serve as an epistemic infrastructure for decision makers in health care systems. However, considerations of economic, political, or cultural nature are mostly kept out of such guidelines. Against this background, it is interesting that in recent years a number of cardiological organisations, on a national, regional, and also international level, began to take into account the economic and technological realisability of certain guideline recommendations contingent on the contexts of their prospective implementation.

The data for this paper are from interviews with cardiologists who were involved in the development of clinical practice guidelines for the diagnosis and treatment of heart failure, as well as from in-depths analyses of these same guidelines. Guidelines from different regions of the world, published by regional and national cardiological organisations, are taken into consideration

Gender, Motherhood, and Commuting Time in Brazil

The general objective of this paper is to analyze the commuting time of women, with and without children, and men, based on some attributes, for the year of 2015. Specifically, we seek to verify the impact of demographic, social and economic characteristics – such as age, marital status, race/color, sector of activity and others – on the commuting time of mothers, non-mothers and men, using ordered logistic regression.

The literature on the subject converges to the conclusion that women spend less time commuting than men (BLUMEN, 1994; CRANE, 2007). The main explanation is the roles of each sex in the family. Women are usually responsible for household chores, and one way to reconcile this occupation with a formal work is to look for jobs that are closer to the household. Men, in turn, are socially assigned to the role of main providers of their home, which gives them the liberty to look for more distant workplaces if they generate higher pay.

The results in Brazil are in line with the existing literature. In addition, the division of women between mothers and non-mothers proved to be important, since they have different behaviors. If only a gender comparison were performed, there would probably be a difference between men and women, but it would be influenced by those who have children, because those who do not have them, shows a behavior closer to males. In short, regarding to commuting time, motherhood seems to exert more influence than gender.

QUIJOUX, MAXIME* (CNRS, France)

May the Union Bring Democracy Overtaking the Company? the Case of French Cgt Today.

Since the 2000s, democracy at work has become the support of a new political imagination likely to offer an alternative to the excesses of capitalist globalization. Driven by social movements, analysts have tried to shed light on the different ruptures brought about by certain experiences of self-management at work. The rapid rise in the number of cases of labour buyouts caused by the 2001 crisis in Argentina has thus been a significant source of reflection on the contours of self-management. These experiences are often presented as examples of a better division of labour and involvement in the definition of work (Rebon, 2010). These experiments have since been the source of new scientific (Ozarow, Croucher, 2014) but also political (Wright, 2010; Holloway, 2010) ambitions.

This article aims to capture the participatory phenomena of the Helio-Corbeil printing plant, which was taken over by its employees in a cooperative in February 2012. Having become partners, employees find themselves in an incongruous situation: while they now own their company under the leadership of trade unionists, they find it difficult to take advantage of the new spaces for deliberation. Long characterized by its contesting dimensions, the group seems unable to formulate any proposal for or against their new leadership. This article aims to explain this paradox in two stages: first, by borrowing from French political sociology the notion of political skills, we aim to show that the inclination to work participation is very unevenly distributed among employees: Secondly, however, this original inequality is mitigated by the existence of informal regulations allowed by the new workers composition of the factory: by placing members of trade unionists and production members at the head of the company, the cooperative creates mechanisms of control and trust that compensate for the asymmetry of political power.

RABE, MARLIZE* (University of the Western Cape, South Africa)

To be a Father and/or an Inmate, That Is the Question, but What Is the Answer?

The aim of this paper is to explore international practices and policies related to incarcerated fathers to revisit policies in South Africa. According to the 12th edition of the World Prison Population List, the total inmate population in South Africa is approximately 158 111 (97% male) which is about 280 prisoners per 100 000 population (compared to the estimated global rate of 150 per 100 000 population). In aiming to rehabilitate inmates, links with family ties are increasingly investigated, especially in countries from the Global North, since continuous links with family members are found to counter male recidivism. However, South Africa is characterised by high levels of violence against women and children and gang-related criminality, therefore it is not necessarily in the best interest of families to have continuous ties with fathers. In addition, certain fathers may have lost contact with children long before being incarcerated since 64 per cent of all children do not live with their biological fathers in South Africa. Non-residential fatherhood is one of the main factors contributing to household fluidity in South Africa. The reasons for non-resident biological fatherhood include the death of the biological father, entrenched migrant patterns, a precarious economic environment, shifting mother-father relationships, undisclosed paternity and men who abscond paternal responsibilities. Although various studies focused on these different elements, paternal absence due to incarceration received comparatively little attention in South Africa despite a growing body of literature on incarcerated mothers. A qualitative study revealed that children of incarcerated men belonging to gangs may be harmed by rival gangs. Not surprisingly, certain preliminary work aiming to strengthen fatherhood skills of incarcerated men in South Africa focused on inmates who already demonstrated attributes of rehabilitation.

Local Childhoods of the South: A Mere "Case" or the Epistemic Position in the Production of Knowledge about Children?

It is often assumed that the diversity of childhoods - in their complexity and variability - must be taken into account in theorization in order that different child realities can be discursively constituted by available concepts and theories. In this paper the notion of 'local childhoods' is discussed against the backdrop of the notion of the global child whose perspective tends to normatize variability and inscribe it into a localized/peripheric geographical condition. It is argued that exemplary local childhoods represent those seemingly insurgent cases which defy hegemonic theories and whose locality is worth specifying. In this vein, Southern childhoods have been frequently referred to as traditional, non-modern or inadequate in their ways of being and living securing thus the metonymic effect of locality for what needs to be developed and surpassed. It is here argued how the notions of globality and locality of childhood are embedded in a geopolitical perspective foregrounding the global in detriment of the local. Thus, it is discussed in what ways the locality of childhood – especially that of Southern countries - can engender processes of 'local knowledge' in order to better respond to local demands and issues about childhood rather than standing as a mere case to validate universalized theories. It is further discussed how 'local knowledge' can forward a critique of a globalized view of childhood which represents a local universalism with a globalized intent. Two exemplary local childhoods of insurgent value will be shortly presented to illustrate the argument: that of the children of the Movimento dos Sem Terra in Brazil (Landless Rural Movement) and that of Youtubers' children.

RURAL Territory in Movement: Youth, Gender and Family Agriculture in the Semiarid Region of Northeast Brazil

The migration of small farmers from the semi-arid Northeast to the urban area is a recurring phenomenon in Brazil and aggravated by prolonged periods of drought and in families with socioeconomic vulnerabilities. Even with the advance of proactive public policies aimed at improving small farmers, such as improving the accessibility of water resources, fragilities persist. For silently and continuously, the migration of the sons and daughters of family farmers has revealed new challenges, especially when led by women. This article aims to analyse the factors that contribute to the mobility process of young people, sons and daughters of family farmers, according to gender issues. The research used the method of the Participatory Rapid Diagnosis and the construction of indicators to understand the repulsion factors that exist in the socioeconomic unit of small farmers and in the territory, at communities in the semi-arid region of Ceará State. Through the application of a semi-structured questionnaire on 214 young people enrolled in a high school in rural area of Quixeramobim municipality in the state of Ceará, Brazil, it was found that migration is desired by 80.43% of young women and 73.77% of young men. The factors of repulsion, in small farmers, are differentiated according to gender. This reveals gender inequalities, the invisibility of women's reproductive work, their absence from decision-making to property management, and many times they are denied the right to inherit land. Family farming brings in itself importance of agricultural production, but it also reveals social reproduction with the complexity of power relations between family members, who are not only labour force but also relatives.

RACHLITZ, KURT* (ISF München, Germany)

Organizations, Inter-Organizational Relations and Societal Changes

A variety of societal changes is currently affecting organizations. To understand their response patterns, however, it is not enough to look at organizations in an isolated manner.

The most prominent approaches for conceptualizing inter-organizational relations as networks are presented. Nevertheless, the analysis of these network forms no longer seems to suffice. As a consequence, new terms are emerging, two of which are particularly promising: 'Meta-organization' and '(platform-based) ecosystem'.

The derived distinctions are reconciled with the systems theoretical vocabulary proposed by Luhmann. I follow the debate between Ahrne et al. and Apelt et al., but take a third position. Both agree on the premise that decided order is the one sufficient criterion for the definition of organization. However, this criterion underestimates the concept of *decision process*. It is uncertainty absorption which is the condition of possibility for organizations and their taking decisions based on absent decisions. 'Absence' is therefore a second necessary condition for 'organization'. In this sense Apelt et al. rightly criticize Ahrne et al. for trivializing the concept of society. But: They themselves trivialize the social realm by ignoring the difference present / absent, therefore suppressing the two system levels based on presence: Interaction and social movement. If these additional system levels are considered, Ahrne/Brunsson and Luhmann can be correlated in the following way:

	Decided Order	Non-Decided Order
Absence	(I) Organization Meta-Organization	(II) Society / Institution Org-Network / Ecosystem
Presence	(III) Social Movement Partial Organization	(IV) Interaction Personal Network

This distinction emphasizes the significance of the internal differentiation of order based on absence. Paradoxically, inter-organizational relations have a two-fold effect on society: They claim and bring about planned social change (I+III) and at the same time contribute not least to today's grand challenges (II) – *without the possibility to be made responsible for them.*

Climate Change and Alternative Energies in Brazil

Brazil has been losing relevance as one of the protagonists in the fight to mitigate climate change. This study presents results of research on the development of alternative energies in the country, and its relationship with society and the environment. Among the results, we highlight the existence of a peculiar socio-technical network, as well as the presence of an arena with great weight of political and legal agents, highlighting the effects of the political crisis that has been developing since 2013. These factors have had a negative effect on the transformative potential of expanding the clean energy matrix in the country, as well as contributing to the deterioration of the national agenda to combat climate change.

Community Perception, Collective Action and Flood Recovery: A Study on the Dynamics and Situatedness of Institutions in Kerala, India.

This paper looks into the **dynamics of people's perception**, the **evolution of contextual collective action** and adherence to **local knowledge and practices**, and its application in **preventing disaster and reducing the risks** to life and livelihood in a **complex socio-ecological system.**

Kerala, the southernmost state of **India** had witnessed torrential rain, landslides and debris flow followed by severe **flood** for two consecutive years in **2018** and **2019**. The paper addresses in detail the **aspects of community engagement, dynamic and transient nature of institutions, the spontaneity of collective action and value of local knowledge and practices in planning/ mitigation strategies, immediate response and recovery** concerning these events.

The paper argues that the **formal, as well as the informal institutions, evolved over time and with strong guiding principles for operation and resource management fails at times in responding to the unanticipated events in complex socio-ecological systems.** This argument is substantiated by a detailed analysis of four events that occurred in 2019, immediately at the onset of the flood. These events represent dynamic perceptions and institutional and collective action mechanisms in the same socio-ecological system. The paper elaborates on the similarities and differences in people's perception of risk and disaster, institutional functioning, and collective mobilization and action, across time and space in the context of anticipated risk and uncertainty regarding the 2018 and 2019 floods. The **use and value of local knowledge and practice in mitigating disasters** are highlighted. The paper observes that the existing **institutional and power structures in the ecosystem need to change.** It demands to **go beyond the notions of structured, external, pre-planned, and linear models for equitable and sustainable resource management as well as risk reduction.**

The paper adheres to a **qualitative paradigm** and follows **case narratives** for **thematic analysis** and presentation.

Unvailing Decentralization Framework in India: Learnings from Policy Instruments and Practices of Kerala

Countries embarking decentralisation generally devolves functions, functionaries, and funds to the Local Governments; what is termed Three-Fs. In India, decentralisation took place in 1992 with the insertion of article 243 in the Constitution; which envisaged the creation of Local Governments. Article 243 G sets out the 'Powers, authority and responsibilities of Panchayats' and affirms that these will be as, by law determined by the States. India being a federal country and Panchayats is the State subject, Constitution envisages the States to take measures on political, administrative, and fiscal decentralisation. All States in the country have enacted confirmity Act and devolved powers based on 11th schedule but to varying degrees. In a federal system, knitting of central, state, and local governance is required through policy instruments; maintaining the principle of subsidiarity. Keeping the vision of article 243, it shall be the constitutional mandate of the States to ensure mechanisms in place for vibrant local governments. However, scanning through the level of decentralisation and policy instruments in different states reveals that the situation is not encouraging. The exception being the State of Kerala in South India, which has implemented decentralisation far ahead in Three-Fs compared to other States in the country. Moreover, Kerala has introduced policy instruments for decentralisation that ensures not only vibrant Local Governments but also fraternal relations with Local Governments. What are those policy instruments? How these are instrumental in maintaining better relation with Local Governments? What lessons they provide for other States in the country and also federal countries at large? These are some of the questions the present paper will address.

Health Status of School Student in Insurgency Affected Northeast India: An Anthropological Study

Violence due to Insurgency in northeast has results in an environment of communal violence and hatred between various ethnic-groups. Northeast region of India being geographically hilly terrain and difficult to reach have led to underdeveloped state since long. As a result, ethnic minorities in these regions have started guerrilla warfare resulting in mushrooming of insurgency activities. This region has the highest number of insurgency organisation in the country. Violence has affected the academic achievement and performance of the school children. Frequent disturbance in the academic environment of the region by public protest and insurgent activities deteriorated the psychological health of the student which is a cause of concern. Most of the conflicts are intra- state often resulting in communal violence and trauma. The present study is an attempt to find out the health status of the school student and to investigate the psychological health of the student. The present study was conducted among school student at age of 15 to 21 year. The study consists of 670 school student including both boys and girls. Psychological assessment and health status was evaluated by using Cornell Medical Health questionnaire. The findings suggested that insurgency and unrest has significantly affected the physical and psychological health of the school going children. Children of the high socioeconomic background tends to developed more psychological problems than from the lower socioeconomic children. The study suggest the need for immediate measures and remedial projects from public and nongovernmental policy makers for intervention.

Politics on Climate Change from Kyoto Protocol to Katowice

Because of climate change, one degree of warming has already delivered floods, hurricanes, droughts, wildfires and heat waves, further leading on track to reach as much as by four degrees by 2100. Henceforth, the issue of climate change addressed seriously at global level and annual summits have been organised by United Nations since 1992, followed by politics of developed nations too, to create a common consensus on to cut emission of greenhouse gases.

The aims, agreements and commitments particularly in context to Kyoto Protocol (1997) through Paris Agreement (2015) till Katowice Conference of Parties (COP- 24 Rule-book 2018) have been addressed, but the implementation part is the victim of politics.

Kyoto Protocol is known for its innovative carbon trading mechanism and the clean development mechanism. Paris Agreement is significant for the commitments made to reduce the global temperature by 2 degree Celsius. A deal at Katowice, all 200 nations made a consensus to finalize to adopt a universal rule- book for implementing the 2015 Paris Agreement, paves the way for operationalizing the post 2020 climate pledges made in Paris. To implement the deal in totality is "a big **responsibility"** and **"willpower** is needed", stated respectively by Chairperson of COP 24 Michel Kurtyka and UN secretary general Antonio Guterus.

Obviously politics is involved that the developing countries have to implement the agenda of development and the nation like India has per ca-pita emissions significantly lower than the global average. While the average annual emission of a US citizen is 16.9 tonnes, which is much higher than an Indian citizen (1.9 tonnes). Therefore, developed countries may try to escape from the agreements and responsibility but no one can escape climate change.

Reinforced Subjugation of Women: The Case of Widow Victims of HIV/AIDS in Manipur, India

In traditional patriarchal Hindu society, a woman derived social status from her husband and therefore a widow, considered a symbol of misfortune, is forced to withdraw completely from social life and live a severe & disciplined life, indicating virtually a social death. Though efforts to improve the condition of women, including widows, started in the early colonial period, glaring gender discrimination continued over the centuries. Social stigmatization, discrimination, controlled sexuality and home confinement of widows are deeply rooted in the traditional values and beliefs of the communities in India. In spite of the civil and customary laws being in place to govern marriage, inheritance, land ownership and child custody, huge gap exists between the legal measures and the practices due to a rigid patriarchal attitude. Irrespective of their group identity, many widows are deprived of universally acknowledged human rights; forbidden essential and even sexually harassed. In recent decades HIV/AIDS has greatly increased the number of wid-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

ows, especially young widows. Manipur comprising Hindu, Muslim & tribal populations ranks second by the number of HIV/AIDS cases. However, lack of substantial measures for rehabilitation of the widows with or without children, the actual victims of infection from their husbands, makes them more vulnerable as existing intervention programme focuses on male Intravenous Drug Users. They live with forced austerity, social withdrawal, seclusion, misfortune and social stigma. Theirs is a triple layered subjugation reinforced successively- first, as women; second, as widows and, third, as vulnerable widows with HIV/AIDS infliction/ stigma. In this paper the reinforced subjugation is revealed on the basis of the interviews of the widows from the Imphal West district of Manipur in India.

Rural out-Migration in India: The Emerging Patterns

Traditionally India has witnessed low spatial mobility due to stronghold of caste, social norms, joint family, local culture, low educational level and slow agrarian transformation but it has significantly augmented in recent decades, especially from 1990s onward, in the wake of expanding economy, advancing transport and communication infrastructure, increasing levels of education and rising aspirations of people. Regional disparity in development pushed many people from backward areas to prosperous areas. Many people living in backward, hilly, desert, tribal, flood affected, drought prone and conflict ridden areas used migration as survival strategy. Industrial development, rapid urbanization and economic growth are instrumental in drawing people to urban areas from rural areas characterized by scarcity, disparity, poverty and redundancy. However, rural out-migration is not essentially denouncing the village life but it denotes people's aspiration to prosper and their response to economic crisis. That is, it reflects an opportunity, as well, to improve socio-economic status in rural areas. It has both positive and negative effects on the place of origin and the place of destination. The present paper reveals patterns, causes and consequences of out-migration in an Indian village on the basis of field data collected during April-May 2018.

Reflecting on Pedagogic Practice and Curriculum Transformation in Sociology in the Context of Calls for Decolonisation and Africanisation

The lecturer as the key recontextualising agent carries much of the responsibility to realise pedagogic and curriculum transformation, including the process of decolonisation, Africanisation and indigenisation. This paper is a reflection of the misperceptions, experiences and learnings in navigating a journey to engage with curriculum and pedagogic transformation in the sociology undergraduate curricula I teach at my institution and site of delivery in South Africa. The first section of the paper asserts that the self-study is one of the indispensable reflexive tools to demonstrate transformed practice and thinking. The subsequent discussion focuses on the resistance and reluctance towards a scholarship on teaching and learning in the country. Two broad ideas are then explicated. *Firstly*, the idea of recontextualising knowledge from the discipline for pedagogic practice. *Secondly*, that the philosophical strands foundational to sociology are congruous with the call to transform, decolonise and Africanise the curriculum and pedagogic practice. The paper asserts that questions about what and how an African world view can contribute to pedagogic practice are equally important as decisions on what comprises a decolonised and Africanised curriculum.

RAMACHIOTTI, BRUNA* (Universidade de São Paulo, Brazil)

Armadura Institucional y Legitimación De La Violencia Estatal: Una Mirada Desde La Letalidad Policial En El Estado De São Paulo En La Primera Mitad De 2020.

Este trabajo tiene por objeto, con base en datos sobre letalidad policial en el estado de São Paulo en el primer semestre de 2020, discutir un cambio de escala del apoyo institucional a la acción letal de las fuerzas del orden en un escenario de degradación social, política y de rasgos autoritarios que se intensifican desde 2016.

La presencia de dispositivos burocráticos que apoyan la lógica de la guerra y el protagonismo militar en la gestión de la seguridad en tiempos democráticos no es una discusión reciente. Jorge Zaverucha (2009) ya advirtió de la presencia de enclaves autoritarios sancionados constitucionalmente -como la policía dentro del diseño institucional de la Constitución de 1988- mantenidos y ampliados por líderes que se oponían a la dictadura militar. Sin embargo, el objetivo de este trabajo es demostrar cómo, desde el gobierno de Michel Temer (2016-2018), esta "legalidad autoritaria" (Pereira, 2005) gana nuevos contornos.

Son leyes, resoluciones, decretos infralegales y maniobras legales que, junto con el desmantelamiento de los mecanismos de control de la actividad policial,

conformarán una armadura institucional regida por la lógica policial, que amplía la legitimación de la violencia estatal, incrementando un sistema de protección jurídico-política que sustenta las acciones arbitrarias de las fuerzas del orden.

Lo que se propone aquí es una mirada más atenta a esta armadura institucional, construida sobre una lógica militarizada del orden urbano, que termina por promover la adopción de instrumentos extralegales en el control de conflictos, permitiendo un cambio de escala en el albedrío de las fuerzas policiales y dando amplitud a los instrumentos burocrático-legales que los sustentan. Es decir, se intentará desvelar los engranajes de esta maquinaria estatal que cada vez tiene menos amarras burocráticas para matar, como se ha visto en los registros de letalidad de la policía en la primera mitad de 2020.

Trade Unions and International Resistance to Global Corporate Strategies in Brazil: The Case of the Auto Sector

Post-2008 in Brazil meant changes in corporate strategies regarding work and union action. The consolidation of global production networks (GPNs) led by automotive transnational corporations and the demands imposed by this process on productive territories have resulted in production flexibility, reduced labour rights, and weakened workers' bargaining power. The purpose of the paper, based on empirical research underway on the workers in automobile production networks in the Southern region of Rio de Janeiro, Brazil (where large transnational companies predominate in value chain's first layers), is to identify the signs of resistance and potential for contestation and political confrontation at the most varied scales (global, national and local), and bet on the possibility of building new resources of power by workers and their representative bodies, such as initiatives aimed at establishing world standards of labor relations and union networks.

The Class Dynamics of Britain's Multifaceted Constitutional Crisis: Nationalism, Brexit and Scottish Independence

Britain is facing a series of interconnected political and social crises: Austerity has exacerbated existing social tensions; the British government is attempting to negotiate a new relationship with the EU; and Britain faces the prospect of another referendum on Scottish independence. While narratives of a "class" have been used to explain support for both Brexit and Scottish independence, these are often impressionistic and descriptive. Scholars have used income as a proxy for social class, but few studies have systematically incorporated the tools of class analysis. Using data from the Scottish Social Attitudes Survey, and the British National Election Survey, this paper argues that adopting the neo-Marxian class analysis framework developed by Erik Olin Wright casts new light on the dynamics of support for both Brexit and Scottish independence, forcing us to rethink previous assumptions about the nature of populist coalitions. The paper will also argue, however, that this theoretical approach now needs to overcome limitations, such as the class characteristics of cosmopolitan trans-European identity, which complicates studies based on national surveys.

RAMÍREZ, HERNÁN* (, Brazil)

O Ciclo Ideológico De Las Políticas Economía En Argentina y Brasil: Alternancia Sin Fin Entre Heterodoxia y Ortodoxia

Argentina y Brasil atravesaron ciclos en que se alternan políticas heterodoxas y ortodoxas, con vaivenes que los llevaron a crisis pronunciadas. Paralelamente, observamos una fatiga ideológica, en una etapa actual donde los predicados teóricos parecen repetirse y darse en un umbral de sofisticación inferior al alcanzado en sus etapas de auge. Esto ha llevado a una estagnación, en el que las fuerzas en disputa no consiguen establecer un dominio hegemónico, valiéndose más de la impugnación de lo que la convicción.

Igualmente se constata un desbalance en los centros de poder que dan fuerza a esos dos espectros teóricos. Las tendencias ortodoxas consiguieron articularse mejor dentro del campo profesional de la economía y de los agentes del mercado, en lo que los partidarios de la heterodoxia demuestran singular debilidad, aunque con algún crecimiento en los últimos años, pero esto no se traslada ahora vis-à-vis a los sectores subalternos, que ya no obedecen electoralmente los dictámenes de los grupos dominantes, ni con las amenazas disciplinadoras de antaño, rechazando en las urnas las políticas ortodoxas, no obstante tampoco consiguen afirmar del todo la heterodoxia cuando arriban al poder.

Así, la ponencia analizará como se forma y desarrolla este ciclo, en un recorrido que va desde finales de la década del cincuenta al presente. La misma considerará el campo de las políticas económicas más allá de lo teórico, incorporando la disputa de los agentes sociales y políticos. En particular nos interesa conocer la forma en que estas se producen, legitiman y convierten en políticas estatales, en dinámicas individuales que no son meramente transpolables, ya que sustentamos la hipótesis de que las políticas económicas dependen de una ecuación variable en el tiempo que articula un entramado de ideas, fuerzas sociales que las sustentan y cursos de acción política que las tornen opciones de poder.

RAMÍREZ, VIVIANA* (Universidad de las Américas Puebla, México, Mexico)

Officer-Recipient Relationships and the Effectiveness of Policy Implementation

This article has the purpose of exploring the relational character of the implementation process of public policies by analysing the relationship between front-line officers and recipients of one of the most notorious social protection programmes in the world, the Oportunidades-Prospera programme in Mexico. Oportunidades-Prospera is a conditional cash transfer programme that, because of its emphasis on conditionality/co-responsibility, produces constant and compulsory interactions between health officers and recipients during the delivery of the programme's health conditionality. This article explores the nature of this relationship from the perspective of health officers and analyses its implications over the quality of programme delivery and of the implementation process. The perspectives of physicians and nurses from two localities of the state of Puebla, an indigenous rural locality and a non-indigenous semi-rural locality, were compared through semi-structured interviews and observations of the provision of health workshops. The results suggest that the attitudes of health staff towards the recipients influenced significantly the quality of the workshops and the medical attention provided as part of the programme. In turn, these perceptions and attitudes from officers about recipients and themselves, their respective roles in the programme and the way programme delivery should take place, was framed by three key aspects: the discourse of conditionality of the programme, the contrasting identities between officers and recipients as well as the job position of officers within the health clinics. Ultimately, this study shows that the relational context of the implementation process of social programmes has an important role on the success of the programme's aims but more importantly on the recipient's experience of the programme.

Renting for Attractive Schools or Becoming a Homeowner Near Bad Schools?

Middle Class Residential Status and School Patterns in the Paris Metropolis

In French cities, given the strong correlation between the distribution of attractive school offer, the social hierarchy of urban spaces and the prices on the housing market, the middle classes are likely to face complex trade-offs between housing tenure and access to attractive educational resources. This paper examines the effects of housing tenure on middle-class residential segregation and its relationship with inequalities in school provision. The Paris metropolis is an apt site for this study: real estate prices have sharply increased, the large public housing stock is increasingly aimed at middle-income households, and the local school market combines a highly differentiated public sector based on the school catchment area policy with a selective private sector which is not concerned by this rule. First, we use census microdata to show that proximity to attractive public schools in privileged urban contexts is associated with higher representation in the private and public rental sectors, whereas access to homeownership mostly unfolds in working-class areas with poorly performing schools. Second, building on fieldwork in privileged and mixed neighbourhoods, we show that the middle classes articulate different values and attitudes to deal with exacerbating constraints on the housing market and competition for better schools. Some of them use strategically the rental sector to maintain proximity with the most attractive schools. Depending on their spatial location, owners are either stuck in less attractive school contexts or may find attractive schooling alternatives at different spatial scales. Overall, the paper shows that the interplay between housing tenure, the social profile of places and the unequal geography of education shapes different residential status within the middle classes, which is crucial to understand social stratification and class relations in large cities as well as to improve public policies aimed at tackling the effects of place in the (re)production of inequalities.

RAMOS, MARILIA* (Federal University of Rio Grande do Sul, Brazil)
GONÇALVES, FERNANDO (Instituto Federal de Educação, Ciência e Tecnologia do Rio Grande do Sul, IFRS, Brasil., Brazil)

Success in the Educational Field:

Conditions for Entry into the University in Brazil

The Access to higher education in Brazil can be considered as a relative success in school, since only 14% of young people attended it in 2009. The goal of this article is to map the conditions necessary for this success. The methodology is quantitative, based on the socioeconomic data of the ENEM 2009 / SISU 2010, in order to search the conditions of access to higher education. The theoretical framework was based on genetic structuralism and its developments in the New Sociology of Education. The results indicate that, although cultural capital is important, as shown by the influence of the indicators that operate it (parental schooling, reading habits, etc.), economic capital is determinant of the chances of success. Courses requiring a higher grade for admission filter candidates from the upper classes.

Peripheral Movements and Meanings for Peripheries in Brazil

In Brazil, from the late twentieth and early twenty-first centuries, a group of collective actors who call themselves peripheral movements, widely referenced in hip hop culture and especially rap sang in the southeast of the country, has emerged and gained strength. The idea of   periphery, for these movements, seeks to synthesize various conflicts present in their dwelling places (mainly in the urban environment, but also in the rural), interspersing and intersecting issues considered as specific and issues considered as structural. Our purpose with this paper is to present part of the early research findings that explored what discursive resources these movements use to link their local agendas with so-called "structural" problems, such as multiple and persistent inequalities, filling content or thickening the meaning of the notion of periphery. The partial results discussed in the article were produced from data collected in structured questionnaire interviews, answered by subjects from organizations or periphery movements from 24 states of Brazil, totaling approximately 600 interviews, answered between the second semester of 2018 and the 1st semester of 2019.

(Re)Construcción De La Identidad Social y Profesional: Trayectorias De Un Grupo De Docentes De Escuelas Técnicas En México

La mayoría de los estudios sociológicos sobre la institución escolar se interesan principalmente en los alumnos, sus resultados, su origen social y su trayectoria escolar, así como en las practicas pedagógicas de los profesores y en las políticas educativas del Estado. Son mucho menos frecuentes los análisis sobre el cuerpo docente, sus trayectorias sociales y escolares, sus condiciones de trabajo y, en definitiva, el proceso de construcción social de su identidad profesional. En lo que respecta a los docentes de escuelas técnicas, constatamos que ha sido un campo de investigación poco explorado. Este hecho refleja sin duda el lugar de ocupa la formación para el trabajo en el ámbito de la investigación educativa. En esta intervención queremos abordar los resultados de una investigación que permite trazar precisamente un perfil sociológico de un grupo de docentes de escuelas técnicas en dos regiones mexicanas, una al sur, en una comunidad de predominancia indígena, y otra al norte del país en una zona de tradición industrial. Nos interesamos en su trayectoria social y profesional, así como en el contexto institucional que regula esa trayectoria. De esa forma ponemos en evidencia que el principio de reproducción social que se observa entre los alumnos que frecuentan los diferentes sistemas de formación se encuentra también entre los profesores: sus trayectorias sociales están generalmente marcadas por la precariedad, como las de sus alumnos, y la construcción de su identidad profesional es compleja pues se sitúa permanentemente entre las lógicas del mundo escolar y las del mundo del trabajo. En ese proceso intervienen además dos dimensiones subjetivas: una basada en la representación del oficio como la marca de un acenso social y otra en las relaciones entre el acceso al oficio «idealizado» y la regulación institucional, que condiciona las prácticas y determina el campo de posibilidades de carrera.

La Búsqueda De Una Articulación Social Casi Imposible: Formación Profesional y Acceso Al Empleo De Técnicos Medios En México

La correspondencia entre la formación escolar y los empleos locales constituye uno de los objetivos comunes del sector público y del privado. Sin embargo, esa correspondencia no es ni mecánica y natural, sino que se construye y se negocia permanentemente entre los diversos actores institucionales, cuyas lógicas son frecuentemente contradictorias. Así, la figura del técnico medio, que encarna la esperanza de un ascenso social gracias a una certificación escolar para las familias de origen popular, se encuentra en medio de una tensión entre las lógicas escolares y los modos de funcionamiento del aparato productivo. En esta comunicación queremos interrogar precisamente el proceso de articulación entre la formación escolar y el acceso al trabajo, la manera de medirlo en un mercado de trabajo local, es decir social e históricamente situado y las adaptaciones y negociaciones que esa articulación exige del técnico medio: ¿Cómo esa búsqueda de articulación reconfigura la identidad de los jóvenes técnicos y cuáles son las "estrategias de empleabilidad" que éstos ponen en práctica? Nuestro trabajo de campo en dos localidades mexicanas tiene el objetivo de contrastar las representaciones de empleadores locales, especialmente en lo que se refiere al lugar que ocupa en esas representaciones el título de técnico medio, y las experiencias de jóvenes en formación terminal o recientemente titulados que buscan integrarse al mercado laboral.

RAMOS ZINCKE, CLAUDIO* (Department of Sociology, Universidad Alberto Hurtado, Chile)

Internationalization of the Chilean University, Enacted By a Global Evaluation and Regulation Device

A central aspect of the internationalization of the university occurs through scientific research. In the case of Chile, during the last 15 years, there has been a strong impulse towards internationalization using several ways: scholarships for postgraduate studies abroad; public funds for international collaboration; policies and incentives employed by Conicyt (National Commission for Scientific and Technological Research), organizations of higher education accreditation and universities. Notably, obtaining research funds, academic evaluation, and university accreditation have as one of their crucial and differentiating dimensions the publications in journals indexed in Web of Science and Scopus. This has led researchers and academic units to focus mainly on journals in central countries, showing increases of around 120% in such publications between 2007 and 2016. A dynamic of internationalization has been produced, in terms of focus, dialogues, themes, and collaborations, with repercussions on teaching content and scholars and students' mobility and aspirations. Some of the policies address ethnic and gender equity considerations, but in general, the search for diversity and equity are not core components of this process of internationalization.

 Global indexations, which operate from central countries, constitute, in the case of Chile, a powerful device for the evaluation and regulation of science that, given the policies implemented, has a strong effect on scientific production and university operation, reinforcing the country's internal inequalities and international asymmetries.

 This study is based on a survey applied to a statistically representative sample of university scholars, belonging to the entire range of disciplines and universities in the country, and on the analysis of secondary data.

RAMOS ZINCKE, CLAUDIO* (Department of Sociology, Universidad Alberto Hurtado, Chile)

José Joaquín Brunner: Social Reflexivity about the University, Confrontation of Interpretations and Institutional Change

José Joaquín Brunner is one of the most prominent and prolific Chilean sociologists of recent decades. One of his lines of research, developed from the 1980s to the present, refers to higher education, especially to the university, having more than 250 publications in this field, 28% of them published in other Latin American countries and 15% in central countries. In this work over the years, Brunner has productively combined empirical research, theoretical reflection, discussion on national contingency, public dissemination, and direct participation in state institutions concerning higher education (HE). From early on, he integrated and assimilated international research production (Clark and Neave, for instance), elaborated original research on various dimensions of HE, interpreted reality, proposed policy measures and discussed with circulating interpretations, becoming an unavoidable interlocutor in the national stage when it comes to HE. At the same time, he became part of an international network dedicated to this educational sector. His numerous sociological elaborations have generated and articulated social reflexivity about higher education, contributed to public debate, guided interpretations, and decisions, and intermingled with social action. Using Burawoy's categories, Brunner is a researcher who moves across the different ways of doing sociology: academic, public, critical, and policy design sociology.

An intense dialogue between international and local social science is manifested in his work. Brunner appears actively and continuously collecting, processing, "translating" (adapting and transforming) and articulating knowledge. He is also a leading actor in local practical-discursive struggles between actors seeking to intervene in the educational system.

The presentation is based on an investigation that analyzed extensively the author's work on higher education, as well as press material and 15 in-depth interviews with strategic informants.

Consumerist Culture and Environment: New Role and Responsibilities

Environmental conservation is one of the burning challenges in front of the whole world. Several international, national, and regional label policies and active groups have been working for the betterment of the environment. However, such efforts are not sufficient in the contemporary scenario of the whole world and particularly in India. Because on the one side market, media, and increment in purchasing capacities are forcing to mass attitude for consumption and on the other, environmental degradation has been seeking to collective consciousness for environmental rectification. This is one of the major sociological explanations towards this emerging trend of plural discourses in this context. On the one hand, high goals for the development of developed, devolving, and underdeveloped countries and on the other, pressure for sustainable development for the coming future. Paralyzed policies and consumerist cultural practices are responsible for environmental degradation. Moreover, any organization cannot get success without mass participation on an environmental issue. To this end, this paper makes a theoretical understanding of consumerism culture practices in the context of India as well as an overview of the role of market and media. However, this paper will focus on the emergent of various efforts to environmental protection like conscience efforts of civil society and mass movements from local to global. The wider roles of media to cultural change for awareness about the contemporary condition of the environment, and connect the people on one platform for a revolutionary vision from all over the world.

Women's Interest and Their Representation in Politics: Exploring through the Local Level Politics of Haryana in India

Women's representation is constantly increasing at local level politics after passed 73rd and 74th amendments in 1992-93 in the Indian constitution. These amendments provided 33 per cent reservation to women at local level politics for increasing their participation. Today women representatives are more than 33 per cent. As well their voting turn out is also increasing. But their representation in higher politics is still very low. The representation of women in both the houses of parliament, Lok Sabha and Rajya Sabha, has never exceed more than 14 percent in almost 73 years of independence. The situation is quite similar even at the state level, especially in the state of Haryana, the representation of women in the Haryana state assembly has also never gone above 14 percent. This study will focus on women's interest in politics and different factors those restrict them to enter in higher politics.

Putting Patients First? Examining the Coact Quality Improvement Initiative in a Canadian Hospital

Institutional ethnographic (IE) research into nurses' work in a Canadian hospital drew attention an improvement strategy called CoACT. Fieldnotes from a nursing meeting captured a charge nurse's comment: "We're doing CoACT audits today, please ensure that you are attending to all your elements". Ethnographic description of "all the elements" revealed multiple, coordinated practices. CoACT directions include: 1) *shift handover* to be conducted at each patient's bedside

with a script for what *must* be included; 2) *whiteboards to include* up-to-date notes visible to the patient at the foot of each bed; 3) *NOD*, scripted introductions at each patient encounter – name, occupation, duty; 4) *Comfort Rounds* – two hourly visits to each patient with a scripted list of things to be asked and attended to; 5) *team huddles* – held at regular intervals during the shift among the three nursing personnel assigned to a group of 10-11 patients; 6) *Rapid Rounds* -- a daily meeting with non-nursing members of the interprofessional team to report on patients' progress and the anticipated date of discharge ADOD; 7) *site wide bed huddle* centered on the current bed occupancy rate and patients waiting for beds are divvied out. My IE analysis shows CoACT is a quality improvement effort with an expansive coordinative reach that enters into the practices of nurses, doctors and allied health professionals and ties them into the daily management of hospital bed capacity and allocation.

IE provided a way to examine how CoACT's institutionalized ruling relations materialize as definite work processes. These were used to explicate *how a planned organization for work coordinates what can happen. It allocates nurses' time and limits time available for other work.* Specifically, this paper focuses on how the QI initiative organizes professional nursing practices towards institutional purposes that are different from nurses' traditional concerns.

Transformative Resilience in the Context of Climate Change

Climate-related weather events and environmental change will have gender differentiated consequences for physical and mental health of rural communities and farmers in the coming years. As global providers of major foodstuffs (e.g. beef, wheat, dairy and dairy products), Australia and United States' farmers and farm communities will be impacted not only economically, but also physically and emotionally, by climate-related weather. With such large-scale environmental disruption, there is growing awareness of ecological grief, whereby people that retain working relationships to natural environments are more likely to experience grief from ecological losses, such as loss of ecosystems and livestock due to acute or chronic environmental change (Cunsolo and Ellis 2018). Because of men and women's differing positions, roles, and responsibilities within rural communities, gender plays an important role in individual's experiences with climate change and adaption (Alston 2013; McKune et al. 2015). Using in-depth interviews with male and female farmers in Australia and the United States, our paper explores how socio-economic, political, and cultural dynamics shape men and women's responses to climate-related weather events and environmental change in farming communities.

New Noises New Voices

As an artist interested in Noise, and a CODA (child of deaf adults), I will tackle the issue of noise and counterculture from the entry point of deafness and un-cultured voices. In ableist societies the voice is a cultural product, and certain voices, perceived as "other", flawed, "noisy", can open up discourses related to shared sonic spaces, disruption, and inclusivity. Soundscape is here described as a social and political environment, and the bodies immersed in it are considered according to the entire spectrum of their capacities, beyond listening, in rhythmanalytical terms. The understanding of the soundscape within the thresholds of audibility expels and rejects communities which carry the stigma of "handicap", such as Deaf communities. Despite being considered disabled, or deviant, Deaf bodies can be the starting point for a renewed consideration of soundscapes and their related political frameworks of control. Deaf culture is for me the last example of counterculture in all-speaking and all-hearing ableist societies. This theoretical exercise is accompanied by examples from contemporary art and technological-historical references, sketching examples of "acts of silencing" and "acts of noising", while underlining the value of "deviant" bodies as resistant bodies. This research is connected to a wider line of research within my artistic practice, tackling the role of noise in the analysis of sociopolitical systems by observing how different agents/actants activate or hinder the agency of dissident bodies in the ever more granular complexity of contemporary times.

"Coffee and Cigarettes": Work Contexts and Performance Management

In a context of an increasingly global and competitive economy, emerging restructuring and organizational dynamics demand greater versatility and functional efficiency, while often establishing precarious working conditions for professionals. Problems such as the intensive pace of work, insufficient free time for extra-work activities, long working hours and/or rotating shift systems, along with the need to adapt to new practices and routines, are just some of the indicators which reflect the high pressure put on professional performance. While this pressure cross-cuts different working areas, the extent of its impact tends to be most relevant within professional groups whose nature of work links them to more demanding and higher responsive levels of performance.

This presentation draws on an ongoing sociological study on 'performance consumptions' at work, i.e., the use of medicines, dietary supplements and other products to improve physical, intellectual and social performance in the workplace. Based on five Focus Group Discussions with a total of 22 participants from two main professional groups, we explore 1) the work context and working conditions of these professionals and the pressures they create for certain forms and levels of performance and 2) how these groups manage (pharmacologically or not) such professional imperatives. Focusing on the social context that structures the daily work of these individuals, we analyse the social expression of such performance consumptions, specifically those that are mobilized to deal with issues such as sleep problems, fatigue, to improve concentration, or to deal with the negative implications of stress.While the widespread use of coffee and cigarettes appears as a legitimate practice in the everyday working routines, due to both their socializing markers and their perceived improvement in performance management, specific products (energy drinks and medicines) were mentioned mostly when managing more extreme situations arising from work-related activities.

Dual Study Programs: Safe Education Paths in Times of Increasing Uncertainty?

In the current international discussion about a stronger interlinking of academic and vocational education, dual study programs seem to be prime examples of work-based higher education in Germany, which generates the specific competence profile of an "academic-operational type of education" (Graf/Powell/Fortwengler/Bernard 2017; Krone/Nieding/Ratermann-Busse 2019). Between 2007 and 2016, the number of dual first semester students has grown more than tenfold (Autorengruppe Bildungsberichterstattung 2018). But what is the special value of this form of study?

The IAQ at the University of Duisburg-Essen explores since 2010 the special features of dual study programs as an interface between vocational and higher education. Based on the researches, the aim of the presentation is to outline several aspects relevant for the topics of the selected session.

Firstly, it will be revealed that companies assume a selection function in access to dual study programs, which entails the risk of a limited equal opportunity in view of participation at this work-based higher education. Secondly, it will be illustrated how students and graduates assess this combination of academic learning contents and company experiences in preparation for a successful transition from university to work. In this context, the role of companies and universities in this process will also be examined. Thirdly, it will be illustrated, why young adults in Germany, in times of uncertainty caused by internationalized and intransparent educational structures, globalization and neoliberalism, are increasingly opting for this not only financially secure educational path.

The Labour-Nature Relationship: Listening to Workers and Unions

For more than eight years, we have been investigating environmental policies, perspectives and theories of industrial and agricultural trade unions as well as those of organisations of small fishers and farmers. We have worked together with colleagues and conducted interviews in South Africa, India, Brazil, Sweden, Spain, and the UK. We have interviewed over 100 unionists and leaders of workers' organisations, who saw themselves as engaged environmentalists in those countries. The interviews were a mixture of informative interviews and life history interviews.

Using content and discourse analyses of the interviews I would like to present some comparative results from workers in these countries concentrating on the following issues:

How is the relationship between labour and nature constructed by workers, either directly or implicitly by the kind of environmental policies they develop?

How can their views be explained in the contexts of the national and organisational history and the life histories of our interviewees?

How do publicly promoted concepts like just transition or environmental justice translate – if at all – into actual programmes and policies of workers' organisations?

How do the interviewees envision the future relationship of labour-nature and what kind of society do they aspire to?

Against the Current or Trajectories of Difference? Biographical Dimensions of Social Activism in the Context of Jewish-Muslim Relations in Berlin.

In the current political climate and the general rise of right-wing populism in Europe and beyond, minorities experience increasing political pressure. This often manifests itself in the harshened discourse on minorities, especially Muslims, as well as the apparent acceptance of a public debate imbued by anti-Muslim racism and xenophobia. One of these dimensions is the public image on the relations between Jews and Muslims in Germany: drawing on the accusation of "Muslim Antisemitism", populist actors strategically create antagonisms between the two minorities. As a consequence, Jewish and Muslim actors have to publicly position themselves, not seldom pushed by their communities or political actors. Trying to counteract these tendencies, new initiatives of Jewish-Muslim cooperation have emerged, bringing together individuals with the ambition for socio-political change. Taking a closer look at these individuals, this paper explores the biographical dimensions of Jewish actors engaging in social protest promoting Jewish-Muslim alliance in Berlin. It observes how individual biographies and trajectories are tied into processes of collectivization among ethnic and religious minorities. Taking the example of male, female and queer activists, it argues for a gender-sensitive and intersectional perspective on social protest and biography highlighting how biographical knowledge production can help us understand how individual protesters re-work biographical experiences of difference and exclusion and become agents of change**.** By doing so, I seek to develop a broader understanding of how processes of collectivization are tied into individual biographies and the necessity to analyse these interactions systematically. Thereby, it makes a broader case for the urgency to use biographical research to understand the (biographical) positioning of actors and their relation to the politics of difference and diversity. This will open up a discussion on the possibilities of biographical research for the understanding of current political transformations and the possibility of change through social protest.

RAU, VANESSA* (University of Cambridge, United Kingdom)

"Seeing and Being Seen" or Transformations of Religious Practice in Urban Space? Towards an Understanding of the Religious Scene.

Contemporary urban realities are thoroughly characterized by migration, movement and mobilities. As a consequence, transient forms of life and settlement are increasingly shaping social life and urban organization. These transformations have not only left their mark on the organization of urban social realities and everyday life but also on the organization and practice of religion. While Tönnies' concepts of *Gesellschaft* and *Gemeinschaft* can no longer explain post-modern and post-secular urban constellations, terms like *religious commu-*

nity, congregation or *parish* can no longer hold for contemporary organization of (migrant) religious practice: communal ritual, prayer, service or study groups are increasingly organized around 'events'. These are open and flexible gatherings which do not require permanent membership and long-term commitment but instead, they are cherished for offering open occasions and the opportunity to 'seeing and being seen' or to 'drop in and pray' or 'spirituality of sorts'. Drawing on my ethnography of a newly emerging Hebrew-Jewish scene in Berlin and its determining characteristics of migration and conversion processes of its inhabitants, this paper argues for a radical re-thinking of contemporary religious practice in urban cosmopolitan spaces. In dialogue with existing research and discussions on urban scenes (Hitzler, Kosnick, Blum and Kahn-Harris), I take the case of Jewish-Hebrew constellations to conceptualize new developments in urban religion as a case of an urban cultural and migrant scenes. Not only does this reflect new developments in urban realities but also radically transforms the concept and practice of religion and community as we know it. Against this backdrop, I argue that the study of religion as scenes allows for thinking and researching religion intersectionally: in the context of the cities and urban socio-economic diversities, gender and sexuality as well as migration, ethnicity and belonging.

RAVAL, CHANDRIKABEN* (Gujarat University, India)

Use of Social Media Among Post Graduate Students of Gujarat University.

Social Media is a part of young students' life. Social media also includes social networking sites.

The main objectives of this research paper is to know the socio-economic profile of the post graduate students who used social media and to explore what are the most popular social media used by the educated youth, to examine the gender difference between the use of social media and its negative and positive impacts on their personal, peer, family and social life.

Four hundred post graduate students are selected from different faculties for this study. Questionnaire is used for data collection.

This research paper is divided into four parts. First part provides the information regarding the concept of social media, youth self socialization; theory of social interaction and some reviews regarding this topic. Second part is on methodology. Third part shows empirical data analysis of the data with various gender and caste variables.

Fourth part is on main findings and concluding remarks.

The study focuses that social media is useful to them for research and education, to gain knowledge and to do fast communication. There is gender difference for use of social media in respect of spending time and money. Most of the respondents felt that social media is quite useful at personal and peer group level. It is useful to know the global events and trends in a post modern society. It is very fast and saves time and money. But it has diverse effect on written capacity, memory power and face to face interaction in daily life.

The study shows that social media has a negative impact on the society, i.e. increase in cyber crime, increase in deviant behavior approval in some aspects and creates risk for own identity and culture. The paper concludes with some important remarks and suggestions.

RAY, ANJALI* (Adamas University, India)

Mental Health of Adolescent Students: An Empirical Observation on Mental Health Indicator in Terms of Selected Psycho-Social Correlates

Background: Mental health and wellbeing are the fundamental human rights and key to social development. Students' mental health implies harmony and integration within students, between each student and other members of the society. This mental health is closely associated with their efficiency and effective use of capacities for observation, imagination, learning, thinking, decision making, as well as higher order mental functioning. Therefore management of mental health is extremely important.

Objectives: As a step in this direction, the present study firstly aimed to identify the mental health status (wellbeing and depression level) of adolescent school students; and secondly to find out the relationship between mental health status of students and selected psycho-social variables(academic career development stress, anxiety, parent-peer attachment patterns, decision making strategies and self confidence level).

Method: Accordingly responses were collected from **randomly selected sample of 600 school students** by using **9 tools**- general information and socio-economic status schedule, Academic career development stress scale (Goswami and Ray,2006), STAI (Speilberger, et al,1970), Self confidence inventory (Basavanna, 1971), Depression symptom checklist (WHO,2007), Beck depression inventory, 2nd Edition(Beck, et al,1996), IPPA (Armsden and Greensberg, 1991), Flinders decision making inventory (Mann, 1982) and Ray & Sakar (2018) Adapted version of Mental health inventory (Jagadish & srivastav, 1983).

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Results: Qualitative and quantitative analysis of responses (mean, standard deviation,'t', ANOVA, correlation, regression analysis, etc) highlighted the following:

Moderate level of well being was the general characteristic feature of the adolescent students

Level of mental health indicators displayed marked specificity in terms of selected demographic issues of the adolescent students.

There was complex networking between selected mental health status and selected psycho-social variables and variety of such networking systems were involved in regulating the nature and characteristic feature of mental health status.

The study projected some recommendations for school health program.

RAY, MANASHI* (West Virginia State University, USA)

Ambiguities and Complexities of Selective Adaptation Among Transnational Indian American Entrepreneurs

Migrant and ethnic entrepreneurship in developed economies and the US has been the subject of extensive research exploring how ethnic cultural capital and networks act as mechanisms of assimilation in host societies and how structural challenges arising from discrimination based on race/ethnicity, gender, class, religion, and nationality/immigration status shape entrepreneurial performance. Apart from a small but growing body of research on cross-border entrepreneurship, scholarship on entrepreneurship in immigrant-receiving advanced economies has focused on individual nations. Thus, new perspectives are needed to understand the complex inspirations and creativity of migrant transnational entrepreneurs for their cross-border enterprises, particularly how they employ 'selective or partial' adaptation and socialities that complement their lifestyles and augment their global businesses.

Using data collected through in-depth interviews with sixty migrant and returnee Indian American entrepreneurs working in info-tech, professional services, and retail sectors in major metropolitan areas in India and the US, I explain how a) citizenship status, b) entrepreneurs' asymmetrical possession of cultural capital (e.g. language competency, knowledge of the society and its ways of doing business), and c) the association of cultural capital with 'class' resources, defined as private property, wealth, investment capital, and human capital (Light & Karageorgis 1994), present transnational entrepreneurs with the freedom to reformulate their identities and to make individual choices for their expression of economic, civic, and social activities in both countries, such as developing e-learning platforms tailored for poor children, working on collaborative community and environmental improvement projects, or investing in 'nation building' by training and providing employment opportunities to rural youth in cloud computing companies. I argue that the differential distribution of capital, especially risk management, among Indian entrepreneurs and the ways in which their lives nospan multiple worlds explain the diversity of (non)adaptation and (non)assimilation to the host society in this select population.

RAY, MANASHI* (West Virginia State University, USA)

Not to be 'Outpaced' Nor 'Underestimated': Transnational Lives of Indian Women Entrepreneurs

While entrepreneurship has generally been seen as empowering for women, female entrepreneurs operate in an occupation defined by masculine cultural assumptions and face discriminatory practices and biases based on the belief that women do not possess the traits and skills necessary for business success. The challenges of cross-border enterprise faced by transnational entrepreneurs compound these difficulties and make many women less driven to easily abandon their pursuits. Drawing on in-depth interviews, life histories and career trajectories of fifteen Indian American migrant and returnee women entrepreneurs in info-tech professional services, manufacturing, and retail and wholesale sectors, the paper aims to tackle questions including a) How do women transnational entrepreneurs mitigate gender discrimination/closure mechanisms in transnational spaces, defined as border-crossing social spaces sustained by ties of social actors, networks, and organizations across multiple nation-states (Faist 2000)? b) What coping mechanisms do women transnational entrepreneurs use for ensuring business survival and growth in a field where actions and initiatives are usually defined by masculine norms? And c) What systemic cultural challenges are encountered by women transnational entrepreneurs?

By combining Bourdieu's concept of the dynamism of cultural, social and economic capital with the macro-level factors of economic and political structures, the meso-level of networks, and the micro-level of personal narratives, the paper conducts a multi-level analysis of migrants' agencies and strategies of mobilizing resources for building new capital in new places, as well as the way these entrepreneurs take advantage of ebbs and flows in the valorization of migrants' capital in transnational space and time to promote their entrepreneurial success. My findings show how women transnational entrepreneurs are positioned in transnational spaces as privileged or subordinated and their ability to valorize their capital affects the rejection of culturally ascribed female roles and heteronormative models of femininity, in addition to contesting gendered institutions.

Can Certification Challenge Buyer Power, Improve Worker Wellbeing, and Strengthen Labor Agency? Lessons from Fairtrade Certified Plantations in Ecuador

This paper analyzes the strategic potential and empirical challenges of private governance initiatives in improving global labor conditions, drawing lessons from Fairtrade International certification of flower plantations in Ecuador. The study explains Fairtrade's institutional logic and central goals of advancing trade fairness, sustainable livelihoods, and empowerment. A global production network lens reveals the strategic potential of Fairtrade's trade standards in challenging the market pressures that typically undermine workers and its labor standards in promoting worker wellbeing and labor agency within and beyond the workplace. Yet certification gains are delimited by global market and local labor regime dynamics. As I demonstrate, Fairtrade (1) has not significantly reduced buyer power in certified flower markets; (2) has improved Ecuadorian flower plantation labor conditions and worker wellbeing, but workers remain economically vulnerable; and (3) has strengthened the agency of flower workers, but bolstering individual empowerment has proved easier than collective empowerment.

The global Covid-19 health and economic crisis highlights the successes as well as failures of certification to promote trade fairness, sustainable livelihoods, and worker empowerment when they are needed most.

The Teacher Supply in Latin America: A Review of Research

Although having a good teacher is a condition for the right to education, the distribution and behavior of teacher supply is are among the least understood issues affecting the equality of education. In the developing world, there is a long tradition of inquiry into the employment, working conditions, and training of teachers. But only recently, teacher shortages and the quality of the teacher supply have been regarded as an impediment and threat to achieving education development goals.

The goal of the review is to present a narrative analysis of the research on teacher shortages and the characteristics and behavior of the supply of teachers in Latin America, with a focus on the inequalities in the distribution of the teacher supply. I draw from general labor economics texts and from scholars that elaborate on the specific features of the market as applied to teachers.

The review shows that that, in Latin America, the attributes that make teachers effective are found to be unequally distributed. With few exceptions, the most deprived schools are worse off. In some cases, the divide is between public and private schools, in others, between urban/rural or large/small but, ultimately, they all reveal socioeconomic differences. The evidence is limited regarding what makes teaching attractive, on the choice of school, teacher transfer, and attrition. Studies show that intrinsic motivation is not all that it takes to attract potential candidates to teacher education, especially highly talented ones. Professional development opportunities, working conditions, and salaries may play a part. But what is certain is that the dynamics are very complex, as an increase in the proportion of individuals attracted to teaching majors could come with a decrease in teacher quality. The presentation concludes with the implications of the findings to the potentials and possibilities of teacher policies to reduce the inequalities.

Social Movements, Alter-Hegemony and Experimental Production of Other Possible Worlds from Local and Regional

In this paper we claim the ideas of the ecologie of knowledges, ecologie of trans-scales and ecologie of temporalities, elaborated by Boaventura de Sousa Santos, to propose that many rural and local-regional experiences recover conceptions of historicity different from the hegemonic, and are capable of interconnecting in a balanced way past, present and future. We can investigate trought them, other ways of producing the social that allow us to face the modern-western civilizational crisis and propose historical alternatives to capitalism. Specifically, in this paper we analyze the experience of the movement for the defense of the San Pedro Mezquital River in Nayarit, Mexico, as an example that shows the capacities of regional hegemonic articulation of a rural-indigenous movement, which nonetheless acquires intersectoral social expressions, and that connects with the national and international scales without these necessarily overruling their nature. Likewise, we especially focus our analysis on the alter-civilizatory or alter-hegemonic orientation of the conceptions and practices within the movement, particularly raised by communities of the originary Nayeri people, who placed themselves at the center of this configuration of social action, radiating in different degrees to its other components.

Modelo De Turismo Cultural Para El Desarrollo Sostenible Desde Una Perspectiva Adaptativa Del Territorio

Este documento presentará un modelo de turismo cultural para el desarrollo sostenible en una ruta patrimonial en Morelos, México (Recaman Mejía A. L., 2014) El problema se detecta a partir del índice de pobreza que en la mayoría de los casos críticos alcanzó el 73% de la población en 2010 (CONEVAL, 2012) La región se vio afectada por dos terremotos en septiembre de 2017 (8,2 y 7,1 escala de Richter) dañando a una gran parte del patrimonio construido de la región. Esta situación nos hace pensar en la dinámica adaptativa que el territorio debe tener en cuenta y sus estrategias de gestión del patrimonio para su sustentabilidad. Dada su complejidad, esto refleja la necesidad de construir una solución a partir de la teoría de los problemas sociales complejos (García, 2007). Se escogen dos poblaciones de las once que componen la ruta y donde la investigación tiene lugar. El modelo integra los principios etnoecológicos propuestos por Víctor Toledo (Toledo, 1996) donde se muestran la importancia del control territorial, ecológico, cultural, social y político de las comunidades que habitan la ruta. El resultado de la investigación conduce a abordar el modelo desde un enfoque de gestión adaptativa del territorio (Recaman Mejía L. , 2017), el cual nos garantiza fortalecer la gobernanza, los servicios ecosistémicos y los servicios ambientales, generando así territorios resilientes.

The Informal Street Vendors' Daily Strategies and Motivations: The Case of Open-Air Markets in Milan

Street vending represents one of the most visible manifestations of the informal economy, which involves a large number of immigrants in many global cities of developed countries. Indeed, the economic globalization and the consistent immigration flows increased dynamics of socio-economic polarization, in a way that often immigrants are forced to work informally. The study aims to investigate the individual reasons that drive immigrants to work informally and the strategies adopted by them to guarantee their daily livelihood activities, to confront exclusionary policies, and to cohabit with regular street vendors. This contribution comes from the results of my Ph.D. case study research, which aims to analyse the characteristics of the informal street vending sector, considering different open-air markets of the city of Milan. The empirical material emerges from the conduction of 35 qualitative in-depth interviews, which involved both informal and regular street vendors, and from more than 150 hours of participant observation on the field. The study reveals how selling on the streets mainly represents a survival choice and it is closely related to the difficulties to obtain documents needed to regularly reside and work in the host country. Moreover, it emerges how social networks and ethnic communities play a decisive role in entering the sector and also affect the daily resistance strategies implemented by street vendors. finally, the study highlights both positive forms of coexistence between regular and irregular street vendors, and dynamics of conflict, which affect the trajectories and work strategies of informal street vendors. Adopting an actor-oriented approach to study this manifestation of informality, contributes to filling a gap in the literature on developed countries as few empirical research focus the attention on the street vendors' agency and resilient strategies of resistance and on the relation between the regular and informal dimensions of the street vending sector.

RECH, CARLA* (Universidade Federal do Rio Grande do Sul, Brazil)

Building Bridges between Social Movements and the State: An Analysis of the Flow of Individuals in Strategic Action Fields

Studies conducted in recent decades in Brazil have shown patterns of interaction between state and non-state organizations, identifying the existence of a dynamic of relationships between these social spaces, partly shaped by the flow of individuals. Despite that, such research does not indicate which elements would make it possible to occupy key positions and other workspaces within governments, posing researchers with an analytical challenge to understand how and why certain people take such a journey and end up occupying positions within the government state bureaucracy, specifically those that have or had in their trajectory links with organizations of social movements. This paper aims to present results of the doctorate in progress, whose research has been dedicated to investigate the flow of people who worked in the Brazilian federal government from 2003, through discretionary ways. This research is theoretically based on the theory of strategic action fields (Fligstein; Macadam, 2011), the approach of social networks (Marques, 1999, 2000, 2003) and the concept of institutional activism (Santoro; Mcguire, 2007; Abers, 2017; Cayres, 2017). We start from the hypothesis of the transit from the societal field to the state field may be determined by political and institutional conditions; educational/work experiences and relational conditions (links and mediations) and that the existence of strategic saction fields, connected by networks and the deliberate action of individuals in key positions (institutional activists) would be the necessary conditions for the traffic to occur. By conducting and analyzing 23 interviews, it was possible to confirm the hypothesis and verify that the fields of action were historically constructed and that individuals connected to them either during university education and/or through their work experiences, with the social movements, highlighting the links formed and the multiple recognitions derived from the trajectory type as important elements for the flow.

BERNARDI, LAURA (LIVES, University of Lausanne, Switzerland)

Changes in Legal Regulations, Parental Health and Well-being, and Children's Physical Custody Arrangements among Post-Separation Families in Switzerland

Changing legal conditions, gender ideologies, and parental practices across Europe led to a higher share of parents practicing joint physical custody (JPC) upon separation, in part because this post-separation custody arrangement seems best suited to allow for more equally shared parental roles and children's access to both parents. Prior studies documented that, in countries with little institutional support for JPC, JPC families were highly selective. In countries where JPC prioritized, either as default or as priority custody arrangement, the share of JPC increased, and consequently, profiles of JPC families became less selective. Whether the diffusion of JPC across the social strata also shapes associations between JPC and parental health and well-being, for which prior studies have yielded inconsistent results, is unclear. This study focuses on Switzerland, where no clearly defined legal pathways toward JPC existed until 2017. Since a substantial family law change in 2017, judges are advised to investigate the possibility of JPC routinely regardless of parents' demands or disagreements. We analyze data from two samples of post-separation parents—one surveyed before (N = 788) and one shortly after family law changes facilitating access to JPC (N = 887)—to examine differences in the prevalence of JPC, sociodemographic correlates of JPC, and its associations with parental health and well-being before and after 2017. In both samples, JPC parents represented only a small fraction and JPC was associated with parents' higher education or less financial strain. JPC-health and -well-being linkages also varied by education, particularly after the 2017 legislative change. We conclude that prevailing gender- biased employment practices may counteract the broadened access to JPC by reinforcing more traditional sole custody models among less resourceful parents. Results will further be discussed in light of implications for policy and practice, as well as issues related to self- selection into different custody arrangements.

Competing Victimhoods: A Framework for the Analysis of Post-Colonial Multi-Ethnic Societies

This essay seeks to interrupt the dominant discourse on race, ethnicity, gender and class (intersectionality) globally, which has focussed on the experiences of 'whites' with their others, primarily in North America and Europe and shift it to the post-colonial multi-ethnic societies of the Global South. It draws on the historical experience of Trinidad and Tobago, the multi-ethnic nation-state comprising the two most southerly islands of the Caribbean archipelago to present the analytic of competing victimhoods as a mechanism for understanding inter-ethnic tensions and conflict in multi-ethnic post-colonial societies. This has the ability to make visible different groups' interpretations of their histories of hardships and distinct colonial experiences by going beneath the surface of simple hegemony and subordination relations and to examine legitimate and/or illegitimate feelings of fear and insecurity. Such an approach moves our analysis from a focus on individual

group identities to the interactions between, among and within groups and the ways in which these various levels of feeling intersect and shape behaviours, attitudes and ideologies.

REDDOCK, RHODA* (The University of the West Indies, Trinidad and Tobago)

Unstable Ethnicities: Constructing 'Race' in the Caribbean

Censuses of Jamaica and Trinidad and Tobago

This paper examines the social constructions of ethnic identities and categories and their inscription and integration into national and regional census and statistical systems with special emphasis on Jamaica and Trinidad and Tobago. In this I recognise the process of racialization (Omi and Winant, 1987) to refer to 'the extension of racial meaning [often negative] to a previously racially unclassified relationship, social practice or group (Winant,1994:59)." The paper interrogates the meanings underlying ethnoracial categories in Trinidad and Tobago and Jamaica and explore the factors leading to their ethnogenesis: i.e. the creation of new ethnoracial categories. Drawing on all the censuses of these two Caribbean countries beginning with the mid-19th Century slave registrations, changes in census categorisation are examined over time and the social, historical and political factors that shape their construction. I argue that these colonially and officially constructed ethnic categories have shaped popular understandings of 'race' and 'ethnicity' and cemented them in the popular imagination.

REGADAS LUIZ, JOSE VICTOR* (Fundação Oswaldo Cruz, Brazil)

The Crisis of Cold War Social Sciences and the Origins of Think Thanks in the United States

The making of the social space of think tanks, currently the main liaison between political power and intellectual production in the US, rather than simply defying the specific ideological content of the postwar "liberal consensus", has also contributed to create a new discursive matrix, no more anchored in the rhetorical appeal of scientific objectivity and neutrality as before, but in the claim for a balanced supply of ideological opinions in a polarized "market of ideas". The purpose of this work is to unveil a crucial aspect of the genesis of this new type of institutional space and its correspondent discursive matrix. It's argued that this phenomenon has risen as a result of the deep crisis of the American cold war university in the late 1960s and early 1970s, amid the growing social and political turmoil surrounding the Vietnam War and the Civil Rights' struggles, epitomized by the students' rebellion on the university campuses and the insurgency of academic intellectuals in radical caucuses within their professional associations, where the behavioralist credo which had sustained the postwar liberal ideology became fiercely challenged. The sharp theoretical, political, methodological and epistemological critique of behavioralism, as I try to demonstrate, was followed by a vigorous impulse toward institutional alternatives to the Academy, since the insurgent intellectuals sought ways to free themselves from the prevailing scientist dogma in order to produce a more relevant, critical and politically oriented social knowledge. Therefore, the emergence of think tanks is interpreted as an institutional response to the crisis of the cold war social sciences, which came up to prompt a new discursive matrix based more on the defense of "values" than on the analysis of "facts", more concerned with the relevance of political ends than with methodological accuracy, more openly focused on ideological positions than on scientific knowledge.

REHN, ALF* (University of Southern Denmark, Denmark)

Producing the Innovation Imperative: An Inquiry into Group Dynamics, Feedback Loops, and Autopoietic Affirmation in the Innovation Industry

It is nigh on impossible to deny that the notion, concept, and discursive device of "innovation" has become quite powerful in contemporary society. That said, there is little research done on exactly how this narrative colonization works, and what agents are driving it. The paper proposed here suggests that a key force in establishing the innovation imperative is "the innovation industry", defined as the authors, pundits, consultants, event managers, and similar who have as their occupation the commodification and dissemination of statements regarding innovation. This paper represents a study of this loosely coupled global network, of which the author has been part for the last five years, and argues that the production of innovation knowledge needs to be understood as part genre, part autopoietic affirmation, and part performance. Drawing on both cultural studies, auto-ethnography, and a sociology of media, the paper attempts to highlight the manner in which the innovation imperative is produced as part imperative, part exhortation, and part repetition.

Rather than treating narratives and discourses around innovation as objective statements, the paper discusses the manner in which such statements are produced, and the complex networks that exist to amplify and support the same. By showing how the community of the innovation industry bolsters itself by supporting its agents, and how a motley crew of publishers, institutions, ratings agencies and the likes ensure that the innovation imperative is repeated and strengthened, the paper aims to show how conceptual colonization works and what agents need to be corralled to enable this. Succinctly put, the paper will show how understanding the backstage setup of the innovation industry is instrumental in making the innovation imperative possible.

Racial Latitudes: Memorialization, Proximity, and Intergroup Relations

Memorialization has been a growing trend over the past few decades. To date, there has been limited research on how memorials affect modern day relationships between groups and how they impact the attitudes and behaviors of individuals. This project focuses on understanding how the first large-scale memorial to victims of racial violence in the United States impacts intergroup attitudes in the immediate community surrounding it. Utilizing results from a longitudinal two-wave survey data collection within the community (referred to as "memorial city"), and two comparative samples in the same state (the treatment group that was made aware of the contents of the memorial and the control group that was not exposed to any mention of the memorial), a comparison over time was run on four racial attitudes outcome variables: two scales of traditional racial resentment, racial competition, and social distance. Preliminary results reveal a complicated story: in wave one, both comparative groups had higher levels of conservative racial attitudes on all four measures when compared to the memorial city. By wave two, four months after the opening, both the memorial city and the treatment group showed greater racial tension by way of increases in both resentment scales, while the resentment within the control group remained relatively unchanged. However, in terms of racial competition, the memorial city and the control group showed slight improvement, while the treatment group revealed a sense of greater racial competition. Finally, all three samples showed a substantial increase in social distance between wave one and wave two, indicating an external effect impacting all samples. Further analyses will include random effects models and a geo-spatial analysis. The preliminary results reveal that the role and use of memorialization in promoting positive race relations is potentially fraught with complexities, including the specific content of the memorialization.

Biographical Interviews and Observation to Find Women's Prison Interpretation

Three types of jail interpretation were identified using a combination of methods: Biographical interviews, observation and reconstructive analysis. The research was carried out by visiting a female prison in South of Brazil and analysing women prisoner's and ex-prisoner's interviews. These narratives were about their trajectories, considering socialization, history context and individual experience inside and outside the institutions.

Women who made the choice to leave their criminal past for the sake of their freedom in the future help to form the first interpretation type. The ones who paid their penalties did not commit any more crimes because to do so, would mean facing more time in prison. One interviewee, for example, admitted to planning her husband's murder, but the thought of returning to prison and losing her freedom again was enough to change her mind.

The prison offers redemption for women who represent the second type. They believe that the penalty was suitable and helpfull in certain way. There are many kinds of learning for them, but the most important is learning how to be a better person. It was possible because of the time to think about their mistakes and life in general.

The reason behind committing crimes for people in the thrid type is that they had no other option. Because of this, they do not think they deserve the penalty of prison. Some of them fight against the rules, because they do not accept them. The experience in prison does not mean that they are not going to commit anymore crimes inside or outside the institution.

REIMBERG, JULIANA* (Fundação Getulio Vargas, Brazil)

Homeless Women in Sao Paulo City: An Analysis of a Women's Shelter from Individual Narratives

This case study analyses the situation of homeless women in Sao Paulo city from the perspective of a women's shelter. The objective is to understand the municipal host service policy for homeless women, drawing the social relations among the sheltered and also between them and the shelter's employees. During the study was possible to characterize the shelter service and the role it plays in the homeless women's trajectory.

The methodology used was qualitative, being the primary data collection made from semi-structured interviews and direct observations in a women's shelter in Sao Paulo. The secondary data presented were extracted from library databases, as well as from content available on government websites and newspapers, being the theoretical framework based on the debate of intersectionality in the Welfare State and female poverty.

The findings of this case study indicate the complexity and the multiple faces of the homeless people. As observed, frequently the women's shelter is used as a response to problems other than street life. Many interviewees pointed out that they moved to a homeless shelter after episodes of domestic violence and break of family bonds. In this sense, this work illustrates the problems associated with the prevalence of a one institutional reception model, adopted by the municipal government to attend the homeless women's needs, as well as the parallel strategies developed collaboratively among the sheltered to fill the gaps in the social assistance policy.

Thus, this paper highlights the importance of diversifying the host services to attend the homeless women's needs and argues that this is fundamental for the success of exit strategies in the social policies.

REIS, ELISA* (Federal University of Rio de Janeiro, Brazil)

Bringing a Historical Perspective to Research on Elite Perceptions

The paper focus on the perceptions of Brazilian elites in two distinctive moments about issues such as poverty, inequality, race, minority rights, affirmative action policies, and role of the state. It looks at the salient political and economic factors that prevailed in each of the periods under consideration seeking to explore if perceived opportunities to maximize economic and/or political gains might affect perceptions, thus creating room for reshaping social policies. The analysis takes into account the premise that deep seated cultural values influence perceptions but takes the former as constantly reshaped by historical circumstances thus accommodating interest-based motivations that inform policy preferences. A few impressionist comparisons with other national elites are used just to point to the relevance of further comparative work.

Islam Et Marxisme : Ethnographie d'Une (in)Compatibilité Depuis Le Cas Belge

Cette intervention propose de soumettre les résultats de l'ethnographie menée auprès des groupes se revendiquant du marxisme militant et plus particulièrement des individus parmi eux qui, depuis le spectre large du « marqueur identitaire » (le prénom, le voile, le visage, etc.) attribué dans l'interaction ou avant elle jusqu'à la foi musulmane revendiquée explicitement, doivent se positionner vis-à-vis de l'islam en tant que marxistes.

Si l'ethnographie ouvre la possibilité de faire la description de la « carrière militante » au sein des groupes marxistes, la méthode du récit de vie révèle les stratégies élaborées par les acteurs afin de concilier leur « islamité/musulmanité » et leur engagement idéologique. La construction d'une identité de « marxiste musulman » exige directement ou indirectement que l'on se prononce dans le sous-champ politique marxiste quant aux « contradictions » que semble recouvrir cette double-appartenance. Du point de vue de l'acteur et d'un extrême à l'autre, il peut s'agir ici d'un rejet « pragmatique » de la question considérée comme sans impact sur la pratique militante jusqu'à la justification de l'exclusion de l'islam par le marxisme, ou inversement. Entre ces deux postures, une vaste gamme d'entreprises de conjugaison de l'islam au corpus idéologique marxiste – et réciproquement – se déploie, sous des formes infiniment diverses, en invoquant autant d'événements historiques que de sources théoriques ou d'expériences militantes.

Être un marxiste musulman et l'enjeu définitionnel que cela représente est manifestement un objet de lutte et de concurrence au sein du sous-champ politique marxiste (depuis la construction identitaire de l'acteur jusqu'à la stratégie politique partisane), mais c'est aussi un lieu de « contradictions » au travers duquel s'axpriment les fractures sociales, économiques et politiques de la société belge d'une part, et la violence du contexte politique international d'autre part.

Values and the Making of Standards in the Coffee "Sustainable" and "Fair" Networks.

After decades of witnessing the multiplication of all kinds of sustainable, ethical or fair labels and of the several standards systems that support the claims behind them, there is a growing opacity around the values that they are supposed to represent. The concept of sustainability, for instance, has received different meanings, each of them giving way to a different set of standards; those standards, in turn, construct different production patterns, some of them far from being socially sustainable; in this sense, for example, the Small Producer's network criticizes what they call the "false sustainability" of some "ethical" networks that do not change the model of constant exploitation of natural and human resources, while the producers are faced to the increase of the requirements and costs of certifications. The concept of fairness itself has been questioned and hackneyed when the standards are constructed lowing the bar of the criteria, in order to facilitate their compliance by the mainstream actors of the agrifood system. The paper aims to analyze the relations between the opaque and diluted values and the making of standards in the case of sustainable and fair coffee, coffee being the most certified and labelled agrifood product.

Identitarian Activism, Everyday Life and Resistances

The paper explores the different tactics of confrontation and the repertoires of actions in identitarian activists who present themselves as anarchists. The identitarian activism has been becoming more and more influent in everyday life of young people who pursue to deconstruct themselves from historically dominant definitions of the self. By dealing with sociability of everyday life, the activism on minority issues is very diversified and reveals enormous multiplicity of individual and collective actions. Some groups close themselves in their own identity, trying to reinforce it as a strategy to resist from dominant and excluding power relations. However, by enforcing homogeneity and driving away differences, they ended up reproducing dogmatism and hierarchy typically found in institutions of control, punishment and domination. This research investigates how activists who antagonize with the State and its technologies of shaping subjectivity deals with identity issues. Based on bibliographic research, digital and printed materials, semi-structured interviews and direct field observations, we discuss the data collection from a post-anarchist approach. Which means we merge the contributions of recognized anarchist thinkers with post-structuralist philosophy to better understand the meanings and the objectives of the set of values and strategies of those activists.

Interdisciplinarity Today in Environmental Education in Mexico: Prospects and Challenges for the Postgraduate Course in the Face of a Common Future

The Interdisciplinarity of Environmental Education today, is in a historical process that includes: Education for the conservation of 50's a 60's, the Ecological Education of 60's a 70's, the Environmental Education proper in 1972 and the Education for Sustainable Development in 2015. This work aims to analyze the interdisciplinarity of Environmental Education EA to account for what happens in six masters in Mexico in the face of the great challenges that are in the field of environment and education and the building their perspectives. This is where the capacities and strengths of research centers and institutes play an important role, where knowledge is generated and researchers are trained who are key and critical for Environmental Education in postgraduate studies in Mexico. We then have a great challenge because in a review of the universities in Mexico 138 were detected in Programs, Centers, Institutes and Faculties are for the treatment of the Environment and 140 in Education, of which only six are dedicated to Environmental Education in particular, from different perspectives and at different times. The methodology used was mixed where programs, universities, centers and institutes were collected and quantified. Then the megatrends are: 1) Autonomy and self-government; 2) The commodification and differentiation and 3) The overcrowding and internationalization, means that the problem is that the development and application of these trends has a dialectical relationship with the development of the Country, which is better understood from the Postgraduate and that should permeate towards the whole educational system. Interdisciplinary knowledge is necessary to have a different meaning to the current one.

Interrogando La Trama Emocional Del Habitar: Exploraciones Para Analizar La Experiencia De Mujeres En Asentamientos Precarios De Latinoamérica

Las ciudades actuales latinoamericanas presentan una trama de fragmentaciones que se corresponde con las desigualdades y conflictos que los procesos de acumulación del capital generan. En ellas, la articulación entre las diferentes configuraciones de poder estructuran y posibilitan determinados modos de sentir y habitar la ciudad. La dimensión de género en este contexto, atraviesa las experiencias del habitar en territorios de precariedad, organizando determinadas disposiciones emocionales y corporales, y constituyendo determinadas sensibilidades.

En este marco, la presente ponencia se propone un recorrido que retoma investigaciones y aportes desde los estudios sociales sobre los cuerpos y emociones, así como diferentes perspectivas de los estudios urbanos que integran dimensiones de la sensibilidad, afectividad y corporalidad, atravesados por la clave de género; con el objetivo de aportar a la construcción de un estado del arte de los estudios sobre las sensibilidades asociadas al habitar en mujeres de asentamientos precarios.

Se parte de la búsqueda y análisis de investigaciones publicadas en artículos de revistas científicas, libros y publicaciones de instituciones académicas y/o científicas, por autores/as latinoamericanos/as relevadas en motores de búsqueda de información a partir de conceptos clave, atendiendo a un recorte que abarca publicaciones desde el año 2000 hasta la actualidad.

La intención del trabajo consiste en relevar los debates más actuales, conocer las investigaciones que se han realizado alrededor del objeto enunciado desde diferentes perspectivas y hacer evidente las múltiples relaciones entre los estudios sociales sobre las emociones y los estudios urbanos; destacando la centralidad de las experiencias sensibles en la comprensión de las problemáticas urbanas.

Movilidad Ocupacional En El Uruguay, El Efecto De La Educación y El Capital Social

La idea de que los sujetos cuentan con determinados activos producto de sus relaciones personales, es una idea que se recoge desde los inicios de la sociología, sin embargo no será hasta los años 80 cuando comience a formalizarse la noción de capital social tal como lo conocemos en la actualidad. Los aportes de Pierre Bourdieu y James Coleman fueron fundamentales para darle carácter sociológico a este concepto. Ahora bien, los efectos del capital social en la movilidad ocupacional, se comienzan a observar con los trabajos de Nan Lin a finales del siglo pasado. La pregunta que orienta los trabajos sobre movilidad es si existe asociación o independencia entre el origen social de las personas y la clase social de destino, y qué papel juegan en esta relación, la educación, el género, la raza o el lugar de residencia, junto con el capital social.

La presente ponencia se propone analizar la incidencia del capital social en la movilidad ocupacional de una muestra representativa de personas económicamente activa de tres ciudades uruguayas: Montevideo, Salto y Maldonado. A tales efectos se emplea el generador de posiciones para la construcción de un índice de capital social, tal como lo formulara Nan Lin. Se considera el primer empleo del sujeto, el empleo actual y el empleo anterior, a efectos de identificar su pertenencia de clase, empleando para ellos la escala EGP.

Se espera identificar mayor movilidad ascendente entre quienes detentan mayores niveles de capital social, luego de controlar por nivel educativo, género y región.

The Challenges for Social Interconnectedness after Human Exceptionalism: On the Way from Artificial Intelligence to Artificial Sociality

The paper tries to identify and address the gaps in knowledge production with regard to people and M2M relations developed in professional literature. It also attempts to portray new theoretical perspectives for the era of post-human exceptionalism.

 The project focuses on the basic of theoretical approaches that are presented in current cognitive sociology, social biology, computer sciences in relations with an analytics of what we once called 'social intercourse'. We are working within a framework of 'sociology of human interactions' – theoretical findings developed by E. Goffman, G. Garfinkel, R. Collins, J, Habermas, A. Rawls, J. Alexander. This conceptual framework is characterized by intentionally anthropocentric position in current theoretical debates. We discuss specific features that characterized interactions between human beings (emotionality, sociality, spontaneity, etc.).

 The most influential theoretical resources that reflect on interactions of non-humans are communication theories, actor-network theory, science and technology studies, human-computer interaction philosophy. All these approaches, in spite of huge differences between them, share one limitation: they are not able to "catch" specific characteristics of 'social intercourse', specifically human interconnectedness that objective the system of social relations of a specific society. Communication theories analyze all types of interactions as information exchanges, while other approaches make too strong arguments neglecting 'human exceptionalism'.

 We believe that these theoretical frames could not assist in making conceptual distinctions between human interactions, human-machine interactions and interactions between the machines that are conceptualized either as exchange of signals or as heterogeneous networks. Sociology of human interactions, on the contrary, provides theoretical foundations to consider the question of how these types of interactions differ from each other and, as a consequence, to inquire into a problem of distinction between human consciousness and artificial intelligence.

 The data and materials for discussion come from field research organized by the USA-Russia research Laboratory TANDEM in 2017-2019.

RHEAUME, JACQUES* (Département de communication sociale et publique Université du Québec à Montréal, Canada)

Clinical Sociology in North-America, the Quebec Experience.

La Sociologie Clinique En Amérique Du Nord, l'Expérience Québécoise.

Clinical sociology represents an innovative and creative movement on both epistemological and methodological ground. It is to be considered as a form of action-research and clinical, in the sense of being close to the people defined as active subjects in the social and political sphere. In its development in Quebec (Canada), the first influences came from the United States, particularly form the Chicago School tradition and later on, from the psychosocial and human relations movement initiated by Kurt Lewin in the forties. By the sixties, came a strong influence from Europe, especially France, with the contributions inspired by a critical, post-marxist sociology, the institutional analysis (*L'analyse institutionnelle*) and, in psychology, the social psychoanalysis practices and theories. There were also, in the seventies and later on strong inspirations coming from Latin America, especially in the educational and community development field, with the ideas and practices of Paulo Freire (Brazil), and Orlando Fals Borda (Columbia), and in social psychology, the works of Enrique Pichon-Riviere (Argentina). But where are we now in clinical sociology?

Our presentation is to examine the actual practices and theories related to a clinical sociological approach in Quebec. We will stress the main challenges and issues to be met through this development : academic and institutional resistance, discipline restrictions, contrasting various methodologies, diversity of social contexts (education, the workplace and organizations, community groups, health system). A clinical sociology is to posses a specific identity, being a critical sociological perspective based on a clinical posture. As such, it is open to multidisciplinary and multi methods approaches. In our conclusion, we will explore that specific identity through some analysis of some examples drawn from our own experience.

Une Entreprise d'Insertion Sociale Par Le Travail Pour Des Jeunes En Difficulté: Boulot Vers, Une Organisation Communautaire

Nous présentons une recherche-intervention dans un organisme communautaire qui œuvre depuis 35 ans au Québec auprès de jeunes en difficultés, dans un quartier populaire de la ville de Montréal (Québec, Canada). Les objectifs de l'organisme sont de faciliter l'insertion sociale de jeunes de 16 à 25 ans par une expérience de travail en ébénisterie. Notre recherche a consisté à faire un bilan critique de ces stages de travail d'une courte durée (6 à 9 mois et un suivi) sur les parcours de vie de ces jeunes. La méthode des histoires de vie auprès d'un certain nombre de stagiaires fut utilisée, combinée à des mesures statistiques.

Nous visons à montrer la dimension préventive, en santé mentale, d'une démarche communautaire fondée sur une expérience de travail. En effet, le travail offre plusieurs composantes qui permettent un développement personnel bien en lien avec une dynamique collective et sociale. Nous explorons les effets d'une telle démarche sur l'estime de soi, le travail en collaboration, les rapports à l'autorité, les compétences liés à la production d'une œuvre utile, et cela sur les bases

d'un parcours de vie marqués au départ par des manques importants, mais aussi des ressources et des capacités. Ce moment d'intervention qu'est le stage prend tout son sens sur ce qui le précède et sur tout ce qui se passe par la suite. D'où l'intérêt d'une méthodologie comme les histoires de vie.

RIBEIRO, EDUARDO* (State University of Rio de Janeiro, Brazil)

Educational Inequalities, Territories and Armed Violence in Rio De Janeiro

The main hypothesis of the study project is that armed violence limitates educational conditions and opportunities, interfering negatively both in student's performance and in the daily life of schools. It is possible to think of the category of armed violence as a phenomenon related to the practices of domination and appropriation carried out in certain cities by armed criminal groups, a phenomenon that has occurred historically in Rio de Janeiro. It is assumed that students who study in schools within territories with higher levels of armed violence, as well as those living in more violent places, obtain, on average, worse educational results. The same logic applies to schools. In this context, the present paper takes the educational impacts of armed violence as a transversal motto to give some thought, in the context of Sociology of Education, to issues related to the generation and maintenance of inequalities of educational conditions and opportunities.

Institutions and Income: An Applied Individual's Analysis

The main objective of this research is to evaluate the relationship between the economic dimension (individual income) and the institutional dimension (values) from the concepts of Institutions and Social Capital. The dependent variable is the individual's income and the ordered logistic regression model is adequate for the categorical dependent variable. The data base of individual values is the World Values Survey (WVS), which involves the values, beliefs, and motivations of citizens. The period of analysis runs from 1994 to 2014. The results show that values such as family, trust, gender equality, interest in politics and democracy, competition, size of government (less intervention) are positively related to higher income. On the other hand, values such as religion, obedience, authority, and income equality are inversely related to higher income.

Rural Politics after 15 Years of Akp: Assessing the Effects on Small-Scale Farming and the Agency of Rural Social Movements in Turkey

Turkey's Structural Adjustment Policies (SAPs) in agriculture, begun in the 80s under international pressure to ensure integration into capitalist world economy, which lead to extended exodus of rural populations as farming ceased to provide sufficient livelihood. After 15 years of AKP (Justice and Development Party), the country faces growing de-ruralization and increasing insecurity for small farmers: 'gambling' is a word frequently used to describe small farmers facing the uncertainty of market conditions.

Turkey recently faced drastic increase in the prices of basic agricultural products due to a decrease in the cultivation of agricultural land. The President quickly labelled intermediaries as "opportunists", and before recent local elections the government had large tents built in main cities named "halk sebze ve meyve" (vegetables and fruits for public), promising to sell at lower prices.

The research departures from the hypothesis that the Rural has been highly appropriated by structures of power and political relations on detriment of rural populations. The *growing at all costs* populist rhetoric of the AKP unfolds systematic privatizations of state-owned companies and redistribution of rents in the agricultural sector, which feeds the regimes' neopatrimonialism, while its authoritarianism and political Islam prevents and denies the agency of rural social movements.

Is the Pretrial Detention the Anticipation of Punishment in a Brazilian City?

The size of the penitentiary system in Brazil has been pointed by several scholars as the most important challenge the country faces today. There has been some attempts to reform it, such as the custody hearings implemented in 2015 to reduce the number of provisional detainees, which presently account for 40% of prison inmates. This paper aims to contribute to this debate, by analyzing the decision-making process in the criminal justice system of Belo Horizonte (Minas Gerais – Brazil). Based on a sample of 824 cases held by custody hearings between 2015 and 2016, that was tracked from arrest to final disposition, we were able to assess the factors that influence sentencing decisions, with a specific focus on the role of pretrial release status. Results show that after controlling for legal factors (as offense severity and prior criminal record) and demographic factors (as race, age and gender), pretrial detention does influence the conviction rates. Implications for the rise of the Penal State in Brazil are than discussed.

Geopolitics of Knowledge and Social Theory: A Study of Social Theory in Brazilian Social Science Journals

In the last decades social sciences have accompanied the proliferation of intellectual contributions interested in discussing the asymmetries in global production and circulation of knowledge. This paper dialogues with the literature that works with the geopolitics of knowledge, looking to the Brazilian social sciences. A quantitative and qualitative analysis was made based on the content of 493 articles published in 22 major Brazilian social science journals, from 2010 to 2018, focusing on social theory related articles. The main objective of this paper is to understand to what extent the debate on social theory in Brazilian journals expresses global power relations in our field of knowledge. Primarily, quantitative data analysis on the national intellectual profiles shows that most contributions from foreigners in Brazilian magazines are made by intellectuals from Global North. Secondly, qualitative analysis of the content of titles, abstracts, and keywords, followed by statistical correlation tests, shows that publications of North researchers were more likely to have an innovative and purposeful character compared to articles by Global-South authors. This work argues that the low presence of publications by Global-South authors in the journals may serve as an expression of the intellectual extroversion of Brazilian social sciences, which focuses on the debates that come from social experiences typical of Euro-America countries. In view of the results found, this paper points out that the debate held in Brazilian journals in the area of Social Theory expresses the international division of intellectual work that places the Northern countries as a place of enunciation with greater power of influence and innovation of the theoretical principles that direct the work of the social sciences.

The Geopolitics of Climate Expertise: State, Power, and North/South Relations

The science/policy interface is an important context for studying how climate expertise is negotiated, recognized or contested, and has received in recent decades a great deal of attention in Science and Technology Studies (STS). In this paper we look at this interface with a particular focus on interactions between experts and policy-makers in the Global South. We review a number of case studies carried out in Brazil and argue that to properly understand how climate expertise is negotiated, recognized, and contested it is crucial to take into consideration how different groups of authors understand the geopolitics of the international climate regime and how they seek to affect the balance of power between different countries. In this sense, it is important to consider representational as well as performative elements that constitute this interface. On the one hand, what is at stake in the climate science/policy interface is the identity attributed to different groups of actors, be they scientists, policy-makers, or both, as well as the meaning attributed to the science or political decisions made by them. On the other, their actions are performative in the sense that they produce knowledge and policy with a view to influence national and/or international climate policy. Thus our

argument is that there is a geopolitics of expertise in climate change, so that the climate/policy interface is a dispute arena in which different actors seek to circulate certain representations and perform what 'real' climate expertise is.

Harmonizing Theory of Decision

Decision and decision making are very debated construct. Whether decision is characterized as rational or intuitive; paradoxical or performative; processual or fixed; decision theory remains one of the pillars of organization theory. Decision theory has been explored from a constructivist perspective, post-positivist view, processual perspective, pragmatist view and more. Furthermore, it intrigues scholars in fields as varied as organization theory, economics, sociology, psychology and neuroscience. Still, no single theory has successfully rallied decision scholars. This paper reviews decision ontologies in order to propose a unified theory of decision. As such, we postulate that decision becomes a path dependent narrative of past actions based on interpretations of artefacts embedded in their environment. This paper contributes to synthesizing decision theory perspectives. Furthermore, it suggests a discursive way to view and work with decision.

Culture As Social Critique: Artistical Action, Politics and Social Anticipation

How can culture impact social imaginary and what is its responsibility in constructing, and as well in consolidating, social reality and shared perspectives is also a crucial issue in our contemporary societies. In Lukàcs, Goldmann, Marcuse and Adorno we find different modalities of inquiring the relationship between culture, art and society and their central position within social issues. The cultural contradictions of capitalism, as already Daniel Bell highlighted, can be not only mirrored by art, but even more, anticipated by it. Artistic action can be a political action as it challenges social and cultural paradigms. And there is a kind of art which is for the present, and some art which is giving a blind date to future anticipating new types of realities. This paper will go through the different positions and theories in the debate, analyzing the relationship that artistic action can have to reality when it tends to anticipate social issues.

RICCIONI, ILARIA* (Free University of Bozen,, Italy)

Forms of Public Sphere: The Theatre As a Collective Social Builder

The theatre can be a privileged space for re-constructing the public sphere in the sense of Habermas so to examine the construction of environmental solidarities. Despite the digital revolution the theater seems to re-gain space as form of social construction of critique and political engagement. As Badiou affirms (Badiou 2015) politics is the core of theatrical development as well as its capacity to build grounded reflections from a collective work. In other words, theatre can be a metaphor of society and its internal struggles. In this paper I will consider the relation between the symbolic power of the theatre as collective work and civil sphere builder and the contemporary need for a new reconstruction of societal meanings as well as a new sense for engagement.

A Novel Approach to Long-Term Humanitarian Aid: Creating Sustainable Development in Refugee and Internally-Displaced Populations Post-Disaster

According to the Office of the United Nations Higher Commission for Refugees (UNHCR), there are roughly 68.5 million forcibly-displaced people worldwide of which 40 million are internally-displaced people (IDPs) and 25.4 million are refugees (United Nations Higher Commission for Refugees [UNHCR], 2019). Substantial growth in refugee and IDP populations has steadily increased contributing to the highest level of displacement on record (UNHCR, 2019). Subsequently, efforts created to address the refugee crisis, such as the inclusion of IDPs in the 2030 Agenda for Sustainable Development, highlight the first time an international framework has included IDPs in development plans. While this adoption increases awareness for refugee and IDP populations, there still exists the need for a comprehensive approach that extends beyond immediate assistance into reduced vulnerability and sustainability (Zeender, 2018). This paper contributes

a new approach to humanitarian assistance for refugees and IDPs that moves beyond immediate assistance into long-term humanitarianism and supports strengthening communities. The approach is a five-step process that includes: a) identifying a community in need; b) research phase; c) intervention development; d) program deployment; and e) monitoring and evaluation. This approach was applied to the Lumiere de Jeune (LDJ) community in Gressier, Haiti in 2015.

RICHTER, MARIA* (Soziologisches Forschungsinstitut Göttingen (SOFI), Germany)

The German Vocational Training System: Increasing Internal Social Stratification in Times of Labor Market Transformations

Germany is widely known for its dual system of firm-based training combined with school-based education. In the recent recession, this so-called dual system has received much international attention: Whereas youth unemployment has increased enormously in many (European) countries, this has not been the case in Germany. From the outside it looks like the dual system is highly integrative. This assumption is supported by the fact that no official criteria for admission is required to enter a dual apprenticeship; even students without a school degree are formally eligible. Therefore, the German VET system has an integrative potential for low-achieving youth. But the firm-based dual system is market driven and highly competitive so that youth searching for apprenticeship places depend on firms' recruitment policies. Due to educational expansion, demographic change as well as the development towards a "knowledge-based" and service economy with its related upskilling und upgrading processes recruitment procedures have changed so that the chances for low-achieving school leavers to enroll in fully qualifying VET programs decreased over the last years. Considering the fact that full-qualifying VET programs do not carry equal labor market opportunities – wages, later unemployment risks and the risk of being employed only in low-skilled jobs as well as the chances for upward career mobility differ remarkably between occupations – this paper not only analyzes the chances to enter vocational training by school degree but also considers differences by occupation. Empirical findings presented are based on vocational education and training data from Germany's Federal Statistical Office. The results show strong occupational segmentation patterns in vocational training by school degree which become even more pronounced in the recent years so that not only lower secondary school graduates but also trainees holding an intermediate school degree have growing difficulties to get access to certain occupations.

Growing up between Musallas and the Pope. Young Muslims between Religious and Cultural Identities

Muslims in Italy are including not only members of the first generation but also a growing number of second generation. Given this, it increasingly apparent that any research on Muslims needs to consider how both Muslim immigrants and their Italian-born, or second-generation, offspring adapt to life in Italy, i.e. a non Muslim context and where among young people (both Muslims and non Muslims) the issues of atheism and indifference in the relation with religion are increasing. The paper will examine generation differences in ethno-religious identity of Muslim Italians, and place its findings within the larger literature on second generation, acculturation, and religiosity. This study addresses mainly the questions: a) How does second-generation Muslims, as a group, express their religious identity, and b) Are there differences with their religious parents' identity? The issue of ethno-religious adaptation of second-generation Muslims in Italy is a critical area of study given that the negative attitude of media after the most recent attacks, e.g. in Paris, Bruxelles, and in a context where a party, the League, use religious difference for fight against immigration, stressing the distance between Muslim young generations and the others. Data used in the paper have been carried out through semi-structured qualitative interviews, on the one hand, with 60 young Muslims and 20 Muslims belonging to the older generation.

RIDGEWAY, CECILIA* (, USA)

Status As a Cultural Schema for Cooperative Interdependence

Status, which is based on differences in esteem and honor, is an ancient and universal form of inequality which nevertheless interpenetrates modern institutions and organizations. Given its ubiquity and significance, we need to better understand the basic nature of status as a form of inequality. I argue that status hierarchies are a cultural invention to organize and manage social relations in a fundamental human condition: cooperative interdependence to achieve valued goals with nested competitive interdependence to maximize individual outcomes in the effort. I consider this claim in relation to both empirical evidence and, briefly, evolutionary accounts. Evidence suggests that the cultural schema of status is

two-fold, consisting of a deeply learned basic norm of status allocation and a set of more explicit, variable, and changing common knowledge status beliefs that people draw on to coordinate judgments about who or what is more deserving of higher status. The cultural nature of status allows people to spread it widely to social phenomena (e.g., firms in a business field) well beyond its origins in interpersonal hierarchies. In particular, I argue, the association of status with social difference groups (e.g., race, gender, class-as-culture) gives inequalities based on those difference groups an autonomous, independent capacity to reproduce themselves through interpersonal status processes.

RIEKER, PETER* (University of Zurich, Switzerland)

Life-Histories in the Shadow of the Stasi

The Stasi, the Ministry for State Security (MfS) of the former German Democratic Republic, tried also to recruit minors and young adults as unofficial staff members, in order to collect information on citizens under suspicion. The young people the Stasi intended to recruit were addressed by employees of the MfS ho were psychologically trained and who documented these recruitment-processes in detail. When these former minors and young adults who had been addressed by Stasi-employees were asked to speak about their experiences and to tell their life-history decades after these recruitment-procedures their accounts are shaped by characteristics of living in an authoritarian regime with its extensive social control in various ways.

Based on interviews with people who had been addressed by the Stasi in order to recruit them as unofficial members of the staff when they were young, various forms of influence of this former state security service on their memories and their way of remembering can be reconstructed. In this context, the atmosphere of uncertainty and the need for deception can be analyzed in its consequences for the narration. Furthermore, the Stasi-documents represent a massive challenge of the biographical life-histories of the concerned, since these documents were regarded as being more reliable than memories. Finally, it has to be recognized that the narrations of these interviewees are not only shaped by the experiences of living in an authoritarian regime in the past, but also by the way the democratic society they now live in deal with their past in the present.

RIEMANN, ME-LINH* (Catholic University of Leuven, Germany)

Brexit As an Everyday Encounter: Argumentation Patterns of EU Citizens in the UK

When trying to understand Brexit as a collective crisis from a sociological perspective, it is crucial to take into account how the phenomenon unfolds in the *everyday* lives of EU migrants across the country - and how they make sense of this

The paper that I wish to present is based on a research project on biographical experiences in the context of intra-European migration processes from Spain to the UK and Germany in the years 2008-2018. The data basis consists of 58 autobiographical narrative interviews, the analysis of which is informed by a specific type of social scientific narrative analysis (Schütze 2008).

It was noticeable how my informants shifted from lines of *narration* to *argumentation* when speaking about Brexit - thereby revealing sentiments of being rejected, and strategies of resistance. In my presentation, I will focus on how the analysis of argumentative sequences (within narrative interviews) can shed light on the biographical experiences of marginalisation and the vulnerabilities of EU migrants in the UK. Drawing on Elias and Scotson's (1994 [1965]) established-outsider relations my aim is to show how a detailed analysis of different schemes of communication (narration, argumentation, and description) in such interviews can be used to discover insights and develop generative questions that go beyond the single case. By paying close attention to how 'we'- and 'they'-images appear in biographical narratives, one can learn something about e.g. inter-group tensions that are also of macro-sociological concern.

Finally, I would like to conclude with some methodological reflections on studying Brexit-related issues in the future - and discuss the chances and limitations of different qualitative data and analytical procedures.

Researching Precariousness in Times of Covid-19: Experiences from the Field

Whilst it is more important than ever to systematically study how people's working conditions are affected by Covid-19, the age of physical distancing has created unique challenges for qualitative researchers.

In the RC38 session, we would like to share some of our fieldwork experiences in the context of the ERC-funded research project *RespectMe: Researching Precariousness across the Paid/Unpaid Work Continuum*. This study focuses on the experiences of workers employed and self-employed across different sectors (creative, gig, care) in eight different countries in Europe. Despite the challenges, we have so far collected over 200 biographical narratives. Most of these interviews took place online, which is a set-up that has unique advantages but also disadvantages:

While the informants' focus can be interrupted by multiple distractions during online communication (ranging from technical problems to interference of other people), we have observed that trust relationships could be developed despite the lack of direct face-to-face contact with the researcher. These interviews often resulted in long, rich and highly personal narratives.

Being able to conduct interviews online has enabled us to arrange meetings in a spontaneous manner with informants who sometimes lived quite far away. One ought to remember, however, that the access to new technology is highly stratified by class, gender and race. Given the focus of our study, this is a very important limitation to consider.

The question still remains, what the difference is, methodologically speaking, between face-to-face and online biographical narrative interviewing. We invite our audience to critically engage with this question, by offering empirical examples from our ongoing data collection.

Wage Labour Borders and New Forms of Employment: Beyond the Notion of "Subordination"?

The mobilisation of the workers activity, in order to create wealth, is today possible without having to integrate them in a company of defined borders on a lasting basis. The mobilisation of the workforce, its involvement in the sequence of the production processes, therefore adopts complex combinations that overflow and transform the traditional wage relationship. The notion of "subordination", traditionally used to define the different employment status (wage labour versus self-employed labour, for example), is insufficient in this scenario: the formally-recognized independence of the employment status does not guarantee the worker the absence of different levels of subordination or dependence in the performing of his/her job (this would be the case, for example, of the economically-dependent self-employment). Based on the data of the *European Working Conditions Survey* (EWCS) by Eurofound, a quinquennial survey to 43.000 workers in 35 European countries about different issues related to working and employment conditions, this communication presents the construction of a synthetic index of "subordination", that consists of different dimensions as the income, the work process organization and the own time availability, and analyses their distribution among the different modes of employment of the workforce in the European Union. The objective is to analyse to what extent the traditional legal categories are still useful to study the current existing combination of forms of employment.

The Potential of Quantum Cognition to Conceptualize Farmers' Decision to Convert to Organic Farming

In the context of global change, organic farming is seen as a promising option for sustainable agriculture, increasingly supported by public institutions and growing consumers' demand. Yet, the conversion rate of farmers to organic farming is often far below the objectives and potential for development. This has been partly explained by sociological studies, showing that the conversion process is not only technical, but also involves an evolution of farmers' values and worldviews. This evolution typically happens in a context of strong uncertainty, sometimes in a seemingly paradoxical way. Yet, these sociological studies often remain descriptive, and a conceptualization is lacking to help decision-makers to better understand and foster organic conversions. In this communication, we are exploring the potential of the emerging field of quantum cognition for this conceptualization. This field seems promising, as many "quantum-like" models have shown to be able to predict and accommodate in a flexible and elegant way many paradoxical decisions that typically happen in a context of uncertainty, such as organic conversion. Until recently, these "quantum-like" models had been mostly

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

applied to theoretical problems (such as the prisoners' dilemma), but more pioneering applications are currently explored for real world scenarios, such as credit applications. Building on these pioneering applications, as a first step toward a quantum conceptualization of organic conversions, we are specifically exploring influence diagrams as a way of modelling the farmers' preferences under a quantum-like formalism. Influence diagrams are compact graphical representations in which the utility function depends on the probabilistic influences of a quantum-like Bayesian Network. The second step of our conceptualization is an exploration of the dynamic aspects of the organic conversion process, involving quantum dynamical models. Finally, we are discussing how such quantum formalisms could be useful for decision-makers in generating alternative narratives and new recommendations, compared to more classical representations.

Human Dignity and Dignification of Victims in Societies in Transition

A basic definition of human dignity emphasizes the recognition of the intrinsic worth of all human beings; this means that people should not be used as means to achieve an end, that we are all equal, with the same rights, and entitled to autonomy and agency. The dignification discourse implies a process by which victims re-acquire their dignity or get their dignity restored (usually by the state) after experiencing human rights violations. Some Transitional Justice mechanisms establish "guaranteeing the dignification of victims" as one of their main goals, as in the case of the *Truth, Coexistence and non-Recurrence Commission* in Colombia. Human dignity is a highly disputed and debated concept in fields such as International Human Rights Law, or in Constitutional Law, but it has been completely taken for granted in transitional justice. This paper is the result of a three-year research on the uses of the idea of human dignity in transitional justice, based on the socio-cultural understandings of human dignity by victims, transitional justice bureaucrats and policymakers in Colombia, as well as, the analysis of reports and policies of transitional justice, with a particular focus on reparations and truth commissions in Latin America.

Southeast Asia Regional Integration and Cooperation: The Nexus between Human Rights and Trafficking in Persons

In the era of globalization, people can move easily across borders and this situation can be exploited for trafficking in persons. In Asia, ASEAN is considered as regional institution that unified its members in three community, which are: security, economic, and socio cultural. Within these three communities, the purpose of the formation of ASEAN Economic community is to bolster economic and development growth in the region. On the other hand, development can lead to poverty in less developed area and resulted in people's movement to more prosperous area. People are free to move and have the right for a decent works, yet it makes them vulnerable to trafficking and being exploited. By looking at the southeast Asia, I examine the implication of how regional integration and cooperation in this region can result in violation of human rights in terms of trafficking in persons. This research is based on the secondary data derived from the ASEAN countries' developments and trafficking in persons literature and official reports. The development and economic growth in the region have created an opportunity for people to have a better life, meanwhile, it makes them vulnerable to be exploited and becoming trafficked people. The integration and cooperation in southeast Asia appear only to tackle human trafficking issue which more focus on cross-border trafficking yet less focus on the issue of domestic trafficking.

La Institución Escolar en Tensión: Entre El Control Social y La Promoción De Derechos

A partir de un estudio de caso de un liceo periférico de Montevideo, la presente investigación aborda las prácticas institucionales para trabajar con los "adolescentes problemáticos", por parte los diferentes actores educativos: docentes, educadores, y psicólogos.

En un estudio de dos años, en un marco de participación-acción, se reconstruyen los conflictos escolares y su tratamiento, desde la mirada de los diversos actores educativos, analizando las formas en que se clasifica y aborda el conflicto escolar, así como sus vínculos con 1) Los diagnósticos médicos, psicoédagógicos y psiquiátricos; 2) Las instituciones de control social: policía, e instituciones de encierro.

La investigación permite abordar una tensión en la dinámica educativa, propia de las tensiones que intersectan al sistema como tal: De un lado, el mandato político de universalizar la educación, incluyendo una mayor cantidad de estudiantes, que provienen de los espacios culturales más empobrecidos. Del otro, una serie de prácticas, enmarcadas en una pedagogía excluyente, que redundan en el aumento del control social institucional sobre los jóvenes de contextos empobrecidos.

En este sentido, la institución escolar desarrolla en su seno la contradicción de promover el ejercicio de derechos, al mismo tiempo que genera importantes procesos de control social, de la mano de una violencia institucional que es padecida por los docentes, pero principalmente por los adolescentes que acuden al centro educativo.

Así, el estudio permite explorar las formas en que el conflicto, y la violencia se desarrollan en las instituciones escolares, y su vinculo con un tejido más amplio de control. Asimismo, permite explorar los mecanismos por los cuales se desarrolla este proceso de control y disciplinamiento, a partir de los saberes técnicos y profesionales, pedagógicos, psicológicos y médicos.

Working As a Teacher: Demands for Recognition of Secondary School Teachers in Montevideo

La presente ponencia se enmarca en la tesis doctoral en sociología, centrada la cultura del trabajo docente en el Uruguay. La misma busca analizar la conformación de identidad profesional docente desde las demandas de reconocimiento generadas por los trabajadores de la educación en la Enseñanza Media en Montevideo.

La demandas de reconocimiento son entendidas según la teoría de Honneth (1997), como formulaciones discursivas que permiten la emergencia del sujeto, específicamente desde los procesos de trabajo. De forma conexa, la identidad es entendida desde la teoría de Taylor (1993) como narrativas del yo que dan sentido y unicidad a la experiencia humana (Giddens, 2004).

El campo es fruto de un proceso de investigación-acción de tres años en centros de enseñanza secundaria, realizando observaciones participantes, conversatorios docentes, y entrevistas en profundidad.

Los resultados sugieren a) la centralidad de las demandas asociadas a la esfera del amor: respeto, escucha, necesidad del trabajo con otros, seguridad frente a situaciones de miedo en el barrio; b) demandas asociadas a la esfera del derecho: condiciones dignas de trabajo, respeto por el horario, organización del trabajo: liderazgo del director y; c) demandas asociadas a la esfera de la solidaridad, reconociendo el valor único del saber docente, el conocimiento disciplinar y didáctico, y el saber específico como profesional de la educación

En términos de la identidad profesional, prevalece una autopercepción de la docencia vinculada al trabajo desarrollado a la interna del aula, con énfasis en el trato con los adolescentes y el trabajo afectivo. En contraposición, son consideradas marginales a la definición del quehacer docente tareas vinculadas a la gestión y organización en el centro educativo, así como el trabajo con las comunidades familiares y territoriales.

adverso. Es notable como la Asociación ha logrado continuidad organizando congresos cada dos años y concitando cada vez más la asistencia y participación de colegas de todo el continente, y cada vez más de fuera de él.

Por sus congresos y la producción de sus grupos de trabajo han circulado gran parte de los debates y desafíos conceptuales de la sociología latinoamericana. El análisis de ellos a la par del contexto en el que se gesta, nos puede sin dudas iluminar sobre el vínculo entre la sociología, las necesidades socio políticas y las discusiones conceptuales y metodológicas. La tensión entre las demandas, las necesidades de conocimiento y el cambio social en el continente. En la presente ponencia se analizan ponencias presentadas en los tres últimos congresos de ALAS para comprender mejor este vínculo. Se realizará un análisis de "gran volumen de datos" (big data) de carácter cualitativo para extraer conclusiones sobre los enfoques teóricos, los temas o áreas temáticas dominantes así como sobre la coaparición de determinados conceptos teóricos. Se podrá así reflexionar sobre los temas y problemas que más ocupan a la sociología latinoamericana presentada en los congresos así como sobre su evolución reciente.

Globalization and Corporatist Industrial Relations in Postindustrial Democracies: Retrenchment and Convergence Revisited

The role of globalization in fostering the retrenchment and convergence in industrial relations among postindustrial democracies remains a highly contested issue in the comparative political economy literature. The 'hyper-globalization' thesis suggests the globalization of production empowered firms and employer organizations to exit and reject long-standing patterns of cooperative industrial relations with labor which has resulted in a convergence toward a neoliberal model of industrial relations. Alternatively, the 'path dependence' thesis suggests national institutions mitigate the isomorphic pressures of globalization and promote the persistence of distinct national models of industrial relations among postindustrial democracies. Despite the persistence of this debate, few studies systematically investigate the deleterious and convergent effects of globalization on corporatist industrial relations. In this study, we adjudicate this ongoing debate using dynamic panel data analysis to evaluate the effects of production globalization on corporatist industrial relations and estimate the rate of convergence in corporatist industrial relations among postindustrial democracies from 1972 to 2006. Contrary to theories of national institutional diversity and path dependency, the findings suggest industrial relation systems are converging at a faster rate in coordinated and mixed-market economies than liberal market economies (LMEs). However, the globalization of production plays an exceedingly minor role in that trend. Conversely, production globalization induced the retrenchment and increasing convergence toward neoliberal industrial relations only among liberal market economies. Overall, this study shows the persisting diversity in industrial relations *between* varieties of capitalism is in part a function of the large effects of globalization on industrial relations *within* LMEs.

The Great Recession, Financialization, & Wage Inequality in the Brics: A Comparative Distributional Analysis

An extensive literature has emerged on the role of finance in the growth of income inequality in the United States and other advanced economies. Despite the proliferation of research on finance and income inequality, few studies investigate the distributional consequences of financialization in these countries. This is surprising given the rapid development and prominence of financial sectors in emerging economies. This study fills an important gap in the extant literature by examining the financial wage premium – the above market wages and salaries of financial workers, managers, and executives – in five emerging economies: Brazil, Russia, India, China, and South Africa (BRICS). Specifically, this study examines changes in the wage differential between financial and non-financial sectors across the earnings distribution of each country before (2003-2007) and after the Great Recession (2010-2013) to track changes in the distributional location and magnitude of the financial wage premium. Drawing on the harmonized national survey data from Waves 7 and 9 of the Luxembourg Income Study, I estimate differences in labor income between financial and non-financial sectors across 20 percentiles of the overall earnings distribution in each country across two different time periods using unconditional quantile regression models. Findings indicate the financial wage premium was present across all percentiles of earnings in each country but was more concentrated in the upper-end of the distribution in Russia, India, and South Africa before the Great Recession. After the Great Recession, cross-national differences in the financial wage premium greatly expanded as the premium became more concentrated in the upper-end of the distribution in China and Brazil while the magnitude of the premium declined in other coun-

tries. Results show how the Great Recession may have weakened the market power of financial actors in some emerging economies while increasing the market power of financial actors in other emerging economies.

ROBICQUET, PIERRE* (Ecole des hautes études en sciences sociales (EHESS), France)

Principles of Professional Competition and Rules of Collective Action in French Public Psychiatry

Based on the perspective of public psychiatry in France, I wish to discuss how the influence of managerial logics in public service organizations reshapes the study of the processes of professional competition and collective action's coordination.

Since the 1970s, the functioning of public psychiatry has been based on the articulation of hospital services and ambulatory structures, limited to a geographical area called a "sector". Each sector is part of a local network of actors from the health and medico-social field, historically coordinated by doctors. Starting in the 1990s, a series of reforms aimed to separate the functions of steering and execution and to reduce the activity and mandate of hospital institutions, in line with new public management. In this context, the rehabilitation of patients has become an unavoidable rule. In spite of central administration's attempts to regulate it, the systems designed to guarantee continuity of care are not standardized and involve a combination of services and actors often experimental. For this communication, I would like to analyze the formation of cooperation networks in mental health.

My argument is that doctors' actions can neither be explained as a response to the "decline" of the professions, nor can it be read as a standard competitive strategy of positioning for the monopoly of care. On the contrary, framed by these reforms and constrained by their dependence on networks, the phenomena of professional competition have evolved. I will develop the hypothesis that the coordination of work depends on sophisticated strategies for positioning professionals on a therapeutic chain, and managing their "commitment" to partners and patients.

The data of this communication came from an ethnographic work in two hospital units in Paris suburbs, between 2019 and 2020. The fieldwork is carried out through observation of consultations, professional meetings and semi-directive interviews with medical staff, primarily.

ROBICQUET, PIERRE* (Ecole des hautes études en sciences sociales (EHESS), France)

Role and Boundary Issues of Public Psychiatrists. Cross-Study of Professional and Organisational Dynamics in Public Psychiatry

Based on an ongoing study of psychiatrists in the French health system, I would like to discuss the interrelationship between the reshaping of the professions and public service institutions.

Over the last twenty years, trends in psychiatry in France and other Western countries in terms of public action reforms have led to a decline in hospitalisation and the emergence of networked intervention, at the crossroads of the health and social sectors. Support and rehabilitation of patients have become priority issues in mental health policies. In this model, care brings together a multiplicity of actors who are supposed to guarantee the long-term follow-up of patients. The missions of orientation, support and partnership are therefore imposed on a daily basis and in a particularly restrictive manner on health professionals. However, although they seem unavoidable, these missions vary locally, depending on the context, territorial arrangements, and the resources of patients, institutions or professionals. I am interested in psychiatrists' decisions to fulfil the functions of patient monitoring and orientation, in order to study the dynamics of professional *segmentation* (Bucher, Strauss, 1961).

To conduct my research work, I have carried out a multi-situated ethnography in the hospital environment, focused on the problematisation of medico-social situations of patients' support. Through observation and interviews, I have been interested in the ways in which psychiatrists delimit their functions and stabilise a satisfactory work organisation. Based on these observations, my proposal is that the resolution of these work situations is a relevant key for analysing the contemporary dynamics of professional segmentation in public psychiatry. More than institutional and theoretical affiliation, or sharing a certain conception of care, psychiatrists stabilise singular and competing work organisations according to their *strategies* (Friedberg, 1993) and *engagement* (Becker, 1960) to mastering the orientation of their patients.

Digital Inequalities: Understudied Connections

This research makes a new and provocative contribution to the literature on digital inequalities: future planning is impacted by social media FOMO among high school seniors mapping out their postgraduate educational and work plans. Findings from in-depth interviews with high school seniors in an agricultural belt of California show how social media engagements have unexpected consequences for important life events for young people at a pivotal point in the lives: career and college planning. As findings show, the negative effects of digital inequalities as they relate to social media marginalization may have profound consequences on capital-enhancing activities. In making these connections, this research makes important contributions to the literature on social media and digital inequalities, as well as young people and future planning. At the same time, it will make an important theoretical contribution by harnessing theories from symbolic interactionism that have been underutilized in studies of digital phenomena.

Are New Political Parties More Deliberative? Analysing Spanish 'connective Parties'

Academics have been focusing in the last years on the role that Internet might have in strengthening the relationship between representatives and represented. In this debate, Bennett, Segerberg & Knüpfer (2017) have recently introduced the concept of "connective parties". That is, parties that would replace classical vertical structures of traditional parties by assembly and interactive processes, both online and offline. Therefore, they would maintain a more fluid relationship with their constituents, characterized by co-production of content and reciprocity in communication flows. According to the authors, connective parties would coincide with the new left political parties that have been born of the recent waves of citizen mobilization, included the Spanish party "Podemos". Objective of this work is to test the connective parties hypothesis. Thus, the research will focus on the case of Spanish study, analyzing the 288000 twitter accounts of the deputies of the Spanish XII legislature. Using a social network analysis and the theory of graphs, we compare the communicative styles of the Spanish deputies depending on their reference party and the interlocutor they are interacting with (ordinary citizens, media, journalists, influencers or other deputies and parties). Results show how deputies that belong to Podemos are not more inclined to interact with ordinary citizens compared with politicians of the traditional parties.

The "Place" of the Body in Anísio Teixeira Thoughts: Dance Memories at 307/308 South Park School in Brasília, Brazil.

Currently human way of life is subordinated to an economic rationality substantiated by capitalism. It is not unusual for us realize a tangle of individualistic and consumerist principles, influencing habits, way of thinking, as well as laying down styles and identities that reverberate in the image that the subjects nurture about their bodies. However, we understand that this proposition does not subsist only without conflicts. Reflecting over other perspectives we recognize personalities who campaigned for spread of progressive thinking, especially in education. Thus, we identify in Anísio Teixeira's educational philosophy a life reading based on reflective experiences. Therefore, this study aimed to identify the "place" of the body in the thought of this educator, in the period from 1955 to 1974, considering that he recognized in school a socially valuable space. Advocate for an education made up of democratic values, idealized and defended a school where individuals could position themselves according to their affinities and vocations, starting the formation of citizens who would once actively intervene in society. Thus was born, in 1958, the School Building Plan of Brasília and with it, the Park School, a space dedicated to learning, artistic, body and functional experiments. The 307/308 South Park School, opened in 1960, in accordance with the urban plan of the capital presented a modern and innovative architectural design as well, it privileged times and spaces for body education. Among the activities we observed that the dance was explicitly developed and meaningful content in the body identity composition of those who experienced the Park School in that period. The sources analyzed showed that dance at school as an artistic expression

promoted particularities originating from Brazilian culture and the world, contributing to the social and cultural formation of students. Which allows us to make educational assumptions for the current global scenario.

ROCHA, MANUELA* (UNICAMP - UNIVERSIDADE ESTADUAL DE CAMPINAS, Brazil)

The Uberization of Work in the Brazilian Construction Industry

This paper aims to analyze the uberization of work in the construction industry in Brazil. We discuss the characteristics of platforms and apps for contracting construction services in Brazil and the similarities and differences between them and the reports available on consumer complaint sites and consumer protection associations such as "Reclame Aqui" and "Proteste".

These platforms are digital companies that act as intermediaries between potential clients and service providers: the so-called uberization of work. Companies do not recognize an employment contract and do not guarantee any worker social security. Moreover, workers receive wages based on production, and must pay a share to the company for the "intermediation" activity. They also fully assume the risks of the activity and bear entirely the means of production as well as the maintenance and repair expenses.

The current stage of capitalism, financial and digital, rests on a mechanism of social spoliation, that is, deprivation and withdrawal of workers social rights. Across the world, transnational corporations are pushing governments to make labor legislation more flexible. The trends of changes in the labor environment worldwide point to the increase of precariousness, intensification and exploration of workers. The model popularized by the Uber company in the transportation sector is increasingly presented as business strategies spread across various economic sectors.

ROCHE CÁRCEL, JUAN A.* (Universidad de Alicante, Spain)

"En Tránsito Por La Frontera Turca. Análisis Sociológico De Las Obras Del Fotoperiodista Kemal Vural Tarlan Sobre Los Refugiados Sirios"

El objetivo fundamental de esta propuesta consiste en realizar un análisis cualitativo o de contenido, desde la Sociología de los Cuerpos y de las Emociones y desde la Sociología Visual, de las fotografías sobre los refugiados sirios del sociólogo y fotoperiodista turco Kemal Vural Tarlan, con el fin de ejemplificar cómo la excepcionalidad de estas personas en tránsito por la frontera turca construye y deconstruye, al mismo tiempo, este límite entre dos países. Para ello, en primer lugar, voy a describir cómo cruzan la frontera, los peligros que asumen y las emociones que experimentan en su trayectoria; en segundo, trataré de desvelar los significados emocionales que esconden los objetos, las cosas, los restos dejados atrás, abandonados u olvidados, en su traslado; en tercero, intentaré definir cómo es el territorio fronterizo por el que pasan, si representa o no una liminalidad entre naciones o, si por el contrario, queda disuelto, trascendiendo así el carácter regional para convertirse en un asunto internacional; y, finalmente, mostraré si, efectivamente, los desplazados encontraron hospitalidad, tras su dramática aventura y, a la postre, el grado de refugio alcanzado. Para alcanzar estos objetivos, me he sustentado en una sociología comprensiva y un método de análisis iconológico o documental de Mannheim, en el que se interrelaciona tres mundos: el de los refugiados, sus cuerpos y sus emociones, el del espacio en el que se mueven y el de las fotografías, entendidas como documentos sociales.

RODRIGUES, FÁBIO* (Prefeitura Municipal de Ivoti, Brazil)

The Political Collusion of Calamity: The Case of the Strike of Truckers and the 'strike' of the Gaucho Municipalities in May 2018.

In May 2018 a large demonstration of truckers once again drew attention to the transportation sector in Brazil. This time fuel supplies threatened essential services on the grounds that workers in the sector needed recognition of their agendas. The federal government, in a state of apparent inertia, responded to the crisis in a dubious and disorientated manner. A sort of virtual strikers guerrilla war has been set up by groups of WhatsApp. The "chain of command" of the strikers did not seem to exist and its duration startled a country already plunged into a deep crisis of legitimacy of the institutions. The state of Rio Grande do Sul, already battered by its huge financial liabilities and its budget, had no financial health to make the required and necessary transfers to the gauchos municipalities. This financial crisis violently hit a state with a strong municipalist tradition. At the same time, at this juncture, there was a discreet manifestation of the municipalities guided and promoted by the Federation of Municipalities Associations of Rio Grande do Sul (FAMURS). This entity is registered as a private entity, intended for the "defense of social rights", it has great and old influence in articulating the local political elites in regional and state scale. Already in the middle of the strike,

　　　　*** denotes a presenting author.*** Abstracts are organized by first presenting author's last name.

on May 24, FAMURS counted 384 municipalities adhering to the "demonstration" with the suggestive title on its page: "FAMURS guides municipalities to stop the service for a day." His legal counsel prepared two draft decrees for the municipalities, one of optional point and one of public calamity. Through a survey with the ombudsmen and portals of 497 municipalities, we found that approximately 263 municipalities provided some kind of administrative measure (decree of optional point, emergency situation, public calamity and / or other measures).

RODRIGUES, HERBERT* (Centre for the Study of Violence - University of São Paulo (NEV-USP), Brazil)

The Recognition of Victimization and Fear of Crime on the Legal Socialization Process of Brazilian Adolescents

It is important to recognize how young adolescents come to view authorities during formative years. This study captures a snapshot of Brazilian adolescents to gain a deeper understanding of what makes some individuals more compliant with rules and laws than others. When individuals perceive authorities to be respectful and unbiased, they are much more likely to perceive them to be legitimate sources of authority and be willing to comply with their rules and requests. However, experiencing, witnessing, and fearing victimization have been linked to the process of legal socialization and subsequent attitudes and behavior. In addition, procedural justice may influence adolescent perceptions of fairness of the authorities. The present study tested whether procedural justice mediated and moderated the relationship between young adolescents' direct and vicarious victimization and developing a sense of legitimacy in authority and cynicism towards authority. A longitudinal sample of 800 Brazilian students living in São Paulo was used to fit the analysis to examine these relationships. The findings revealed a link between victimization and legal socialization. The overall mediating model significantly predicted the direct and indirect relationships between victimization and fear of crime and the formation of legitimacy and cynicism. The moderating effect of procedural justice on direct victimization also significantly predicted the formation of legitimacy. Research that has demonstrated the importance of legal socialization focused primarily on high school students and on Western societies samples. This study provides data from a younger, urban, Latin American setting to investigate the impacts of victimization and fear of crime on the legal socialization.

RODRIGUES, LIDIANE* (Federal University of São Carlos, Brazil)

How Does an Author Become Classic? the Case of Karl Marx in Brazil.

This research proposal addresses the reception of Karl Marx's work in Brazil, characterizing the process by which this author became a "classic" within the Brazilian social sciences. The paper reconstructs the experience of the first interdisciplinary academic reading circles of Karl Marx's *Capital*, which took place at the University of São Paulo at the end of the 1950s. This practice became routine and Karl Marx shifted from the position of a "stigmatized" (exclusively political) author to a "classic" author (whose reading was scientifically necessary). The paper also presents a cartography of Marxism in Brazilian universities, based on a database of 988 responses to a questionnaire by (self-declared) Marxist teachers and students. Finally, it articulates this cartography to the morphological reconfiguration of Brazilian teaching and research institutions, which occurred in the 1970s. It claims that the variations in symbolic value and prestige of Brazilian Marxists are indicative of a structural dimension of Brazilian intellectual space: its relationship with the hegemony of the Euro-American center, exporter of theories, authors, research techniques, etc. Until the 1970s, when Brazilian teaching and research institutions were under European, and particularly French, influence, Marxism could impose itself as an "inescapable theory". The success of the United States of America in global competition for symbolic hegemony in peripheral countries, engendered during the Cold War - and particularly after the Cuban Revolution (1959), as far as Latin America is concerned - strongly impacted the Brazilian intellectual space. Theoretical and political preferences shifted from Marxism to liberalism and to the orientations of "new leftists".

Labour Movement and Precoriousness: A Look from Cut's Facebook Page

This paper analyzes how Central Única dos Trabalhadores (CUT) addresses uberization from its Facebook page. We review posts made about the subject, from May through December /2019. Data will be collected through weekly ob-

servation of the Facebook page. Since the beginning of the year CUT's been using Facebook, and other medias, to call workers for action, against government decisions and legislative changes that have negative impact on the working class, as well as to publicize movements and actions of workers around the globe. The budget cut for public university, changes on work legislation, the Uber Strike where some of the events that motivated posts on uberization. It has been a constant theme, since it urges unions to prove their importance, especially to those who are precarious and commonly non-unionized. Previous studies have shown that Facebook has been important to report on events, and also to strengthen specific narratives about these events. Therefore, the content of the posts will be analyzed to verify how important events related to precariousness are reported on CUT's Facebook and to highlight the narratives that emerge from them. Posts comments will also be reviewed to indicate different narratives that may emerge. CUT is the largest Trade Union Central in Latin America and has active profiles on various social media platforms. Facebook is the oldest and largest in number of followers. In Brazil, this is the platform with the largest number of users, justifying the choice for this platform. We expect, in the end, to understand how CUT addresses the subject and seeks to integrate the precarious workers, contributing to the general panorama of studies on the reformulation of the trade union movement in today's context.

Between Critical Theory and Social Movements: The Possibility of Social Critique

Taking as a starting point the idea that critical thinking takes place both at the meta-pragmatic register of critical social theories and at the pragmatic register of everyday struggles against power and domination, this paper aims to deal with the question of how political sociology can be linked to sociological theory. I propose the notion of social critique as an 'articulatory concept' that encompasses both critical theories and practices of social critique carried out by social movements. Based on a discussion of the themes of utopia, recognition and disagreement in contemporary critical theory, and drawing specifically on Luc Boltanski´s critical sociology and Fredric Jameson´s idea of cognitive mappings, I explore the way in which the cognitive maps elaborated by social movements when they face the realities of power and domination in the areas of education and housing in Chile, relate to the cognitive maps elaborated theoretically by critical theorists. I show that whilst critical theories provide social movements with a semantic repository for thinking and contesting social inequalities from a point of view that goes beyond meritocratic and individualistic views of justice, critical theories can use social movements' 'theories from bellow' to renew not only their concepts, but crucially to review their very foundations. This paper is partially based on the findings of a qualitative empirical research conducted between 2014 and 2018.

RODRÍGUEZ, JUAN PABLO* (University of Oxford, United Kingdom)

Hacia Una Ciudadanía Popular? Vida y Territorio En El Actual Movimiento De Pobladores Chileno

Basado en una investigación cualitativa que incluyó entrevistas con participantes y activistas de cuatro organizaciones del actual movimiento de pobladores en Chile, esta ponencia explora las practicas políticas del movimiento de pobladores en Chile en la actualidad, poniendo énfasis en las intersecciones entre la participación política institucional y prácticas de autogestión como base de una idea de ciudadanía popular. Propongo la idea de ciudadanía popular como un concepto articulador entre una política popular basada en la idea de territorio y comunidad y una política democrática popular que amplía la noción de ciudadanía democrática liberal. Además de describir cómo el movimiento de pobladores es capaz de organizar colectivamente un conjunto de prácticas que rompen con los efectos fragmentadores de las políticas de vivienda neoliberal, exploro las innovaciones discursivas en las formas de legitimar ante otros pobladores, organizaciones y la sociedad chilena en general dichas prácticas. Finalmente, discuto los límites que las prácticas de los sectores populares enfrentan en la actualidad y muestro cómo las ideas de vida y territorio pueden proveer un repositorio semántico que potencialmente puede trascender algunos de dichos límites.

De Movimientos De Desocupados a Street-Level-Bureaucrats. El Caso Argentino.

En este trabajo se propone abordar el tema de la implementación de políticas sociales inclusivas a través del caso de las organizaciones híbridas provenientes

de los movimientos de desocupados que han sido vectores de las políticas sociales en Argentina. Creadas por la acción colectiva de los desempleados y de los trabajadores precarios a finales de los años 90 contra los efectos de las reformas "neoliberales", estas organizaciones se han ido posicionando como intermediarios entre el Estado y los desempleados gracias a su proximidad territorial con las poblaciones vulnerables en el marco de las recomposiciones de la acción pública. El establecimiento de un mecanismo institucional de asistencia específica (programas de transferencias condicionadas de recursos) de conformidad con las necesidades de las instituciones financieras internacionales, tuvo efectos en la creación de una red de organizaciones cuyas competencias y responsabilidades en materia de distribución y gestión de la asistencia social se revelaron en muchos casos eficaces. Mostraremos ello a través de una etnografía y entrevistas a los distintos agentes dentro de las organizaciones.

Imagen y Emoción En La Autofotografía

La **AUTOFOTOGRAFÍA** es una técnica cualitativa de recogida de datos que consiste en obtener información de las personas participantes en cierta investigación o implicadas en determinada realidad, lanzando una pregunta vinculada con un tema específico, pregunta que tienen que contestar por medio de fotografías realizadas personalmente para tal fin. Su origen se localiza en el trabajo de los psicólogos Ziller, Ojura y Osawa en los años 70 en EE.UU.

El objetivo de esta comunicación es compartir la utilidad de la técnica autofotográfica en el acercamiento y conocimiento de las emociones, desde un punto de vista investigador, social y educativo. De acuerdo a las ideas que guían este encuentro, por un lado, la de poder reflexionar en torno a los retos que el mundo global nos plantea en relación a la convivencia, y por otro al modo de desarrollar un modelo de conocimiento y análisis sociológico innovador para afrontar problemáticas comunes con matices particulares, la autofotografía representa una herramienta visual de autoconocimiento, así como de conocimiento y reconocimiento de la diferencia, al tratarse de una técnica a través de la cual poder llegar a aspectos de la realidad difícilmente alcanzables solo a través de la palabra, combinando fotografía y relato.

Como ilustración, se incluirán ejemplos procedentes de diversas aplicaciones de la autofotografía a través de las cuales poder reflexionar acerca de su potencial, ejemplos en los que las emociones se presentan en forma de imágenes aparentemente estáticas con las que adentrarse en emociones narradas: la de un alumnado que comienza su andadura en el mundo universitario, la de mujeres que dan forma a su identidad como madres y cuidadoras, o la de personas de perfiles heterogéneos que reflexionan acerca de algo tan intangible como el alma.

"Solamente aquello que narra puede permitirnos comprender" (Sontag, *Sobre la fotografía*, p. 33).

The Justification of Intimate Partner Violence Against Women in Europe and North Africa

In this paper, I will explore the relationship between the justifications of IPVAW (dependent variable) with other attitudinal variables (sexual tolerance, gender equality, equal right between men and women as an essential element of democracy). I will construct a model that include also the social position of individual (decision making nucleus, social periphery); and the consumption of the media as sources of information (Internet) in opposition to the traditional source of information (TV, Talk). I will apply the model to the data of the sixth wave of the world values survey (2010-2014). The main hypothesis are H1. Men will use more the ICT as women, and they will justify more IPVAW in the European Union and the MENA Region. H2. The European Union and the MENA Region will differ on the justification of IPVAW. In Europe, the citizen will justify less the IPVAW and this opinion will be more homogenous in the general population. H3. The combination of values (on sexual tolerance, democracy and equality) of the citizens of the European Union and the MENA Region will differ significantly. H4. The citizens of the social periphery in the European Union and in the MENA Region will show more support for violence against women as the citizens of the decision-making nucleus. The decision-making nucleus will use more sources of information (talk, TV, internet) as the social peripheries. H6. Values related to violence against women of the connected citizens in the European Union will differ significantly from the values of connected citizens in the MENA Region. I will work with structural equation modeling (SEM) using the AMOS (Analysis of Moment Structures) software. SEMs allow me to test complex hypotheses that include reciprocal relation, interactions and direct and indirect effects.

Public Policies Influencing Adolescent Pregnancy Prevalence in Latin America and the Caribbean, 2000-2019

Despite experiencing notable and sustained decreases in fertility rates amongst the general population in the latter half of the twentieth century, adolescent pregnancy rates in Latin America and the Caribbean have failed to decrease at a similar pace. The region continues to experience high levels of adolescent pregnancy, with 15% of total fertility being from women under 20 (2010-2015) in stark comparison to a 10% share in Africa and 7% in Asia (UN DESA, 2015). Studies have indicated that inequality of opportunity seems to explain why the adolescent fertility rate is higher in LAC than in other comparable regions.

Existing evidence about public policies which reduce adolescent pregnancy prevalence draws heavily from developed countries, where in general programs have been implemented through a sustained period of time, and with a rather stable financial investment. However, evidence also points out that interventions need to be well adapted to local contexts, and that more often than not policies in developing countries are implemented for shorter periods of time. As a result, there is little evidence available about the effect public policies in LAC are having on adolescent pregnancy prevalence, or its proxy indicators.

This paper presents a mixed-methods scoping review of policies implemented in LAC, to synthesise and assess the findings revealed in published literature, 2000-2019. By focusing on the findings of the region, the paper will confirm – or refute –the prevailing paradigm about what are the best approaches to reduce adolescent pregnancy.

This paper forms part of a larger research which seeks to identify how are public policies affecting adolescent fertility rates in LAC - including the widely used Conditional Cash Transfer schemes - and whether there is enough evidence to support the validity of programmatic models promoted by the UN and other actors for the reduction of adolescent pregnancy.

Opinión Pública, Comunicación Política y Neurociencias

La comunicación es parte fundamental de la convivencia humana. Sin embargo, no todo lo que decimos o escuchamos se convierte en un hecho comunicativo. Tiene que ser recibido activando nuestras mentes y compartir un significado similar para ambas partes. Nuestras experiencias previas inciden de manera importante en la interpretación de lo que vemos y escuchamos. Y son parte importante en la toma de decisiones. De tal manera que la información y las experiencias despiertan nuestros sentimientos y nos impulsan a la toma de determinadas decisiones. Y esto puede ser por lo que se esté experimentando personalmente o lo que se esté observando que está experimentando otros.

Las emociones influyen en el aspecto político en dos direcciones:

La lealtad a los partidos políticos y candidatos.

Un examen crítico de los partidarios y los candidatos basado en cálculos racionales influidos por una mayor ansiedad cuando el futuro es desconocido.

Tanto en una como la otra la toma de decisiones depende de las emociones activadas.

El cerebro es el órgano que dirige la toma de decisiones, los estados emocionales y atencionales. Las neurociencias han logrado comprender cómo es que funciona el cerebro y, de esta forma, han ayudado a predecir la posible conducta de las personas. Para esto las neurociencias se valen de técnicas como el electroencefalograma con el cual podemos saber qué ocurre en el cerebro de las personas en cuestión de milisegundos.

El presente estudio tuvo como objeto encontrar los momentos de mayor aceptación y rechazo de dos mensajes publicitarios de candidatos a la gubernatura de Guerrero. Para poder estudiar lo anteriormente mencionado, nos basamos en técnicas de electroencefalografía y análisis estadístico y neurocientífico. Buscando una explicación a las preferencias electorales y de género realizamos un estudio de comunicación política a través de la Neurociencia.

Las Aristas Del Discurso De Las Jóvenes Singles En España: Entre La Liberación y La Coerción.

La literatura sobre *singles* constituye uno de los exponentes más significativos acerca de la ideologización de un modo de vida, suponiendo el triunfo de la parte

más amable del proceso de individualización en las sociedades actuales: todo individuo tiene que tomar las riendas de su vida y construir un proyecto emocional y afectivo. El presente trabajo, sin embargo, trata de exponer las aristas ocultas del discurso realizado en torno a las *singles*, "quintaesencia" de la liberación y realización personal, al poner en contexto y trayectoria la vida de mujeres jóvenes que viven solas en España.

El crecimiento de los hogares unipersonales, como forma de residencia en España, es una de las características más reseñables de la realidad demográfica actual: en 2018 algo más del 10% de la población española vive sola mientras que, en términos de hogares, la cifra alcanza el 25%. Este fenómeno constituye un camino fructífero para rastrear cómo los cambios sociales de gran envergadura (el proceso de individualización) tienen su correlato en la vida cotidiana de sus habitantes y, en concreto, en el proceso de atomización residencial.

En este sentido, la propuesta pretende acercarse a la realidad de las mujeres de entre 25 y 45 años que viven solas. La elección de este segmento poblacional responde a que la emergencia de su vida en solitario ha sido más pujante en las últimas dos décadas, aparte de hallarse en edades activas laboralmente y en aquellos años cruciales para su proyecto emocional y reproductivo. La apuesta metodológica se ha articulado en dos ámbitos distintos, Barcelona (gran ciudad) y Jaén (pequeña-mediana ciudad), permitiendo aplicarse un análisis comparativo. El material analizado, obtenido a partir de la realización de entrevistas en profundidad, se centra en aspectos que van desde las condiciones materiales (empleo, vivienda) hasta la construcción de expectativas (pareja, descendencia).

Do It Abroad: On Internationalization and Fieldwork

Social sciences' internationalization is often studies through collaboration (co-authorship), mobility, and circulation of ideas (translations, citations). Less attention has been paid to the role of fieldwork, specially of graduate students but also of established scholars, in internationalizing the social sciences. In this paper I discuss how fieldwork has partially shaped social scientists' careers by showing the intertwining between international connections and institutional pressures and incentives. I conclude that fieldwork often allows researchers to build trust with colleagues and/or supervisors and, as a consequence, important bonds are established that transcend the location and period of fieldwork to give rise to personal relationships.

ROEHRER, STEFAN* (Institute for Employment Research (IAB), Germany)

Integration As a Discursive Construction – a Reconstruction of Understandings of 'integration' in Germany

According to the current (German) discourse on 'integration', it seems to be clear, that newcomers in a society are expected to change in several ways. The assumed progress, which the newcomers in that process make, becomes increasingly monitored, evaluated and even problematized. Therefore, the proposed contribution addresses the question, how asylum seekers deal with these invocations of integration and self-optimization. It is particularly interested in how recent immigrants conceptualize and interpret the expectations they face.

To answer these questions I draw on 37 narrative biographical conversations with refugees from Syria. Furthermore, this analysis integrates a sociology of knowledge approach to discourse. Understanding biographies as articulations in this discourse, this study is aiming to reconstruct subject positions as well as the resulting (self-) expectations.

As this contribution adopts an empirical subjectification research perspective, it fits in the sessions main topic, showing the potential of multi-method approaches including biographical research. Moreover, this study reflects on the current (German) discourse of 'integration' as well as its imperatives.

Consequences of the COVID-19 Pandemic for the Border Exchange and Identity: The Case of Polish-German Twin Cities

Borders' closure during the COVID-19 pandemic had a particular impact on the everyday life of borderland residents. It was especially important in those areas where economic viability is based on cross-border exchange and where international cooperation within border areas constitute an essential part of the local identity. We referred to this problem within the research project "De-Re-Bord.

Socio-spatial transformations in German-Polish interstices. Practices of debordering and rebordering", in which, since 2018, we research social relations on the Polish-German border. During the closure of the state borders, we have returned to the previously interviewed border areas' residents and conducted qualitative interviews on everyday life in the COVID-19 pandemic.

In our presentation, comparing data collected in different stages of the research (before and during the pandemic), we will describe the impact of the COVID-19 pandemic on Polish-German border twin cities. We will indicate how borders' closure affected the economic and neighborhood practices, identity, and borderscape of the researched areas. We will also show how different management and perception of the pandemic situation in two countries influenced the cross-border social and economic flows.

Creating Documentary Film: On Collaboration between Sociologists and Photographers

In my presentation I will address the process of making a documentary film realized as a part of the scientific research project "RurAction. Social Entrepreneurship in Structurally Weak Rural Regions: Analysing Innovative Troubleshooters in Action" (https://ruraction.eu/). This project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Sklodowska-Curie grant agreement No 721999. The film was created jointly by visual sociologists and professional documentary photographers (Pix House Foundation, https://pix.house/). It presents social innovations and social entrepreneurs in rural areas of three European regions: Baixo Alentejo (Portugal), Phthiotos (Greece), The Mid-West (Ireland). The materials for the film were collected during field trips to these regions. They show the daily work and life of the inhabitants, their views and voices as well as the experts' opinions. The presentation will discuss stages of creating the film (and dilemmas that may arise in the process), such as:

Drafting of a script (including: ways of presenting abstract sociological concepts in the film, discussions how to combine different theoretical traditions)

Creating principles of a daily cooperation between sociologists and photographers (including development of a common language to understand mutual expectations)

Creating rapport with people and institutions featured (including: ways of obtaining informed consent, oscillating between the documentary nature of the film and advertising expectations of some organizations)

Creating a film narrative (including: rules of combining visual and verbal narrations, showing universal phenomena in the perspective of individual stories, creating relations between private and public spheres)

Developing new ethical dilemmas that arise during film making (including the impact of film presentation on the lives of local communities

The presentation will compose the aforementioned dilemmas with the frames and fragments of the film. Its special feature will be to describe the dilemmas from a double perspective: sociological and photographic.

Cyberactivism As a Sociopolitical Phenomenon: An Integrated Analytical Model for Democratization within Networked Societies

To analyze the networked society (Castells, 2007, 2017; Tufekci, 2017) and the impacts of digital technologies in offline activism (Tufekci, 2017; Valenzuela, 2013), the present paper has discussed the power relations and activism dynamics from the datafication advent. Aiming to comprehend how activists can influence, by the means of the current digital technologies, companies' and governments' communicational and organizational processes, a model was created to categorize cyberactivism considering the following criteria: (a) intention of action, (b) target audience, (c) digital technology employed e (d) power intensity. After a bibliographical and documental gathering, it was possible to identify twenty modalities of cyberactivist actions and create four main categories: (1) Mobilization, (2) Stress, (3) Joint and (4) Support. It was possible, then, to systematize the modalities analysis so that one can comprehend what they are, which tools they can employ, what their goals and expected outcomes are and how they can be restrained. Hence, it was possible to not only identify and schematize how these actions can be practiced together, but also suggest ways of effective and collaborative interventions. Finally, the Cablegate case, which engaged actors such as Wikileaks and Anonymous, was analyzed in face of this model.

ROHNER, REBEKKA* (University of Vienna, Austria)
GALLISTL, VERA (Department of Sociology, Austria)

The Institutionalization of the Life Course and Its Effects on Technology Usage and Non-Usage in Old Age

Background: In western societies, digital literacy got crucial to ensure social inclusion. However, studies have repeatedly shown that older adults are less likely to use digital technologies. As a consequence, studies have identified a series of barriers older adults face in the appropriation of digital technologies. However, most of these studies use somewhat oversimplified concepts to explain technology use and non-use in later life, framing it as a result of low acceptance or of a rational decision (Wanka & Gallistl, 2017). In this paper, we want to widen the perspective on older adults' technology acceptance, exploring the role of life-course transitions in technology use and non-use in later life.

Methods: We conducted 15 semi-structured interviews with Austrians aged 60 years or older, who have never used a computer in their life and use the internet irregularly. Interview partners were asked to visualize their life-course and the technologies that were relevant in different life stages. The interviews were analysed following Grounded Theory of Strauss and Corbin (1999).

Results: Results show that the appropriation of new technologies usually happens during education and work, with technologies being usually understood as closely linked with the profession or household. As a consequence, retirement and the life-stage of older age is often framed as "technologically deprived", with interview partners arguing that they stopped appropriating new technologies in their retirement because there was neither a necessity nor professional support to do so. This lack of institutionalization of technology use leads to a lack of institutionalized support and individual interest.

Conclusion: Institutions of the life course play an important role in the appropriation of technologies, which are usually overlooked in gerontological research on the topic. The consideration of life-courses and its transitions leads to a new and deeper understanding of the barriers older adults face in digital societies.

KRÜGER, SABINE (BIBB - Federal Institute for Vocational Education and Training, Germany)

Returns to Personality and Task Usage in Germany

A growing body of literature has identified labor market polarization processes as a driver of the increase in social inequality in the US and in Europe. According to the "routinization hypothesis", the polarization is caused by the impact of digital technology on the evaluation of skills in the labor market with rising premia for abstract, i.e. analytic and interactive job tasks (e.g. Goos, Manning, & Salomons, 2014). Another important strand of literature has provided evidence that personality traits (non-cognitive skills) such as the Big 5 explain a significant and independent part of the variance in educational and labor market success (see e.g. Almlund et al., 2011). This paper brings these two strands of literature together. Using data from a follow-up survey to the latest BIBB/BAuA Employment Survey 2018 comprising 8,000 respondents, we analyze the importance of personality traits in different job task domains in Germany by asking i) what is the impact of worker personality on individual task usage? and ii) What are the returns to non-cognitive skills for individuals performing different tasks? Preliminary results show a positive correlation of the traits "openness to experiences" and "emotional stability" and analytic tasks, and a positive correlation between "extraversion" and interactive tasks on the other hand. Second, the analyses reveal that openness and emotional stability are only positively rewarded in jobs with high analytic task content, and that extraversion is stronger positively related to wages in jobs with interactive tasks content, respectively. The study is relevant from a policy perspective, in that different job tasks in today's labor markets are remunerated differently and thus influence the extent and structure of social inequality. The influence of personality factors on task usage shown in this empirical analysis adds to the argument that education policy measures should take these "non-cognitive" characteristics more into account.

ROJAS WIESNER, MARTHA* (El Colegio de la Frontera Sur, Mexico)
BASOK, TANYA* (University of Windsor, Canada)

Entre La Regularidad y La Irregularidad Migratoria: Migrantes De Centroamérica En El Sur De México

En el último cuarto de siglo, en México, se han incrementado de manera notoria las medidas de control y verificación migratorias. Las preocupaciones de los gobiernos en turno por la afluencia de migrantes que sin documentos migratorios intentan llegar a los Estados Unidos cruzando por México, han conducido a este tipo de medidas que han estado enmarcadas en argumentos relacionados con la soberanía y la seguridad nacional. Las políticas migratorias restrictivas, derivadas de este tipo de preocupaciones, se ha enfocado en la gestión de flujos migratorios, lo que ha tenido distintas consecuencias, no sólo en la producción de irregularidad migratoria, sino en las condiciones de vida y de trabajo de quienes se movilizan por distintas causas, en mayor medida de carácter forzado. En este contexto, los programas de regularización migratoria que el estado mexicano ha ofrecido no producen más que formas precarias de legalidad/regularidad que no eliminan la ilegalidad/irregularidad, sino que desdibujan la distinción entre ambas. Quienes no pueden alcanzar un estatus legal/regular a través de los canales oficiales han recurrido a soluciones más "creativas" para estar "legalizados", lo que a la larga los vuelve aún más vulnerables. A partir de la revisión de las disposiciones mexicanas relacionadas con la política migratoria y de los relatos de migrantes centroamericanos, de paso o establecidos en México, nos enfocamos en el análisis del límite difuso entre la regularidad y la irregularidad migratoria en México y de sus consecuencias en las condiciones de vida y de trabajo de estas personas migrantes.

RC31-390.1

ROJAS WIESNER, MARTHA* (El Colegio de la Frontera Sur, Mexico)
WINTON, AILSA (El Colegio de la Frontera Sur, Mexico)

Hanging By a Thread: The Migration "Crisis" in Mexico As Lived Experience

Over the past three decades, a range of measures have been introduced in Mexico to contain the movement of migrants coming over the border from Central America, be they from that region or beyond. The related discourse and actions of the Mexican government, under tacit or explicit pressure from the US, represent a denial or indifference towards the magnitude of the deterioration in security and living conditions driving many from their homes. Politically, the so-called "migration crises" are constructed not to provide a solution to displacement, but rather to justify the continued and heightened control of the movement of (already) displaced people across national borders.

However, based on studies carried out over a number of years by the authors along Mexico´s southern border, we argue here that the real crises lie in the experience of each person and family forced to move to find a way out of critical, chronically precarious lived realities. Hanging by a thread, on the margins of survival, mobilizing oneself is sometimes the only option there is to stop the thread from breaking. In this sense, the recent migrant "caravans" are part of this same context; not new in essence, rather just a different way of mobilizing for survival. Yet, upon arrival in Mexico, blamed for causing a crisis and subject to intense repression, the migrant subject faces new and acute risks, created by a restrictive framework that not only violates their rights, but exacerbates racism and xenophobia in a country that remains fundamentally hostile to poor immigrants and refugees.

ROJEK-ADAMEK, PAULINA* (Pedagogical University of Kraków, Poland)

Designer As an Artist, Researcher and Manager. Professional Role and Its Contemporary Dimensions.

Difficulties in defining the profession of designer affect many areas, but it seems that one of the most serious is the lack of an unambiguous interpretation of how to define design today. According to the definition adopted by the International Council of Societies of Industrial Design (ICSID) design means creative activity aimed at defining the multi-aspect features of objects, processes, services and their entire systems in life cycles. As a result, the scope of the designer's competence is broadened into new areas of knowledge, which systematically results in the redefinition of the professional role. Professionalization of the designer's role is closely related to the process of social change as well as views on the concept of work. "A post-industrial society, because it focuses on services - especially professional and technical services - is a game between people." (Bell 1998: 184). In practice, this means integration of institutional (organizational) conditions with

various forms of capital, including creative capital, treated as an important element of new value. This phenomenon can be referred to the transition to the third stage of capitalism, described by Boltansky and Chiapello (2005), which accentuates the degree of previously unobserved diversification of production, the intersection of elements of creativity with economic and technological innovations, basing management, among others on the skills of cooperation and communication, which has an impact on defining the scope of particular professions and specialties. Therefore, the purpose of the paper is to describe the designers' work along with the characteristics of the current dimensions of this professional role. The presented information are based on the empirical research conducted by the author in 2016-2018. They are compared three cognitive perspectives: the world of professional designers, potential and actual recipients of their work, and experts representing design institutions operating in the Polish environment.

GUERRA, LIA* (Universidad Nacional de la Patagonia Austral, Argentina)

Reflections on the Malaise of Adolescents in Southern Patagonia

This communication arises out of an inquity carried out within the framework of a research project from the Public Policy Program of the National University of the Southern Patagonia (Argentina), whose objective was to produce knowledge about the state of adolescent pregnancy situation and Public policies implemented in Caleta Olivia, Santa Cruz province, south-south Patagonia for its prevention. It was an exploratory study quanti-quali within whose framework, articulations were made with other situations related to youth in the region, given that it is the age group most affected by social inequality. In this context, some indicators related to adolescent morbidity and mortality are presented that are of special interest as long as they show high rates of psychic distress that allow characterizing this age group as a high-risk population. Thereby, suicides constitute the second cause of death in adolescents, and it is verified that from the beginning of the 90s to the present, mortality by suicides tripled in the whole country and the tendency of the rates is to rise in the most jurisdictions. Likewise, the self-inflicted injuries had an increase of more than 30% between 2005 and 2011, and the latest Global School-based Student Health Survey (GHSH) administered in the country reveals that 16.9% of adolescents seriously considered suicide, while 16, 2% attempted one or more times in the 12 months prior to the study. These data become even more alarming to the extent that the decrease in all protective factors is verified in the 5-year period (between the administration of the two editions of the survey), which deserves analyzing the forms of malaise that dwell teenage subjectivity.

Is There Room for Otherness in Humanism? Erich Fromm's Alternative

Erich Fromm developed a systematic social characterology, which built on Freudian, Marxian, and other sociological insights to reach for accurate distinctions between different social groups and classes. His concept of "character" implies a peculiar relationship between what he called affective, intellectual, and sensory *potentialities*. From these categories, a rich phenomenology is produced, which tries to account for the specific *mode of relatedness* each studied group exercises towards others and itself. Coming from a psychoanalytic background, Fromm explains the (largely unconscious) dynamics of those character formations in terms of each group's dominant *orientation* to life, and the accordingly dominant affective, intellectual, and sensory *attitudes* in which it expresses itself. The full development of his categories culminates in his concept of *experience*, which mediates between his scientific and political standpoints. It will be argued that Fromm's notions of "social character" and "experience" are helpful, both for current sociological research on subjectivity, and for the understanding of nowadays' political life. They lead to a humanistic conception which, albeit unwilling to give up the notion that there are universal features for mankind, centers on the (inner and outer) experience of *otherness* as the crucial movement allowing, both for a fuller integration of the person, *and* for a radically democratic form of politics. We are thus presented with a set of categories which may aid us in understanding - from a subjective viewpoint - which mechanisms contribute to the social conflicts and bonds specific to our times, and also what are the potentialities and alternatives we may expect from them.

Association of Research Companies "Group 7/89":

Goals, Objectives and Achievements

The Association of Research Companies 'Group 7/89' is a body of organizations that carry out professional activities in the market of sociological research. In 2001, when it was founded, the Association united only six companies and now the '7/89 Group' has more than 45 subsidiaries in all major regions of Russia, as well as in foreign countries, Mongolia and Belarus. This unique community of professionals bring together key specialists who are concerned about maintaining high quality of research and the ethical standards of communication in the research market, and therefore operate under the unified "Professional Code of Researcher - Member of the '7/89' Association" with which all the members are obliged to comply.

There is no centralized leadership in the Association. The Council and the Chairman of the Association, who coordinate the activities of the group until their re-election, are selected at annual meetings, held on the basis of one of the member companies, therefore implementing the principle of democracy and network management. The main goal of the Association is to carry out infrastructure projects in the industry, to promote the development of a civilized market for sociological and marketing research in Russia and around the world, as well as to represent and protect the common interests of the Association members. The Electronic Newsletter, issued by the Association, has more than four thousand subscribers. 'Group 7/89' conducts industry-significant projects and events on voluntary basis, measures the ratings of research companies, organizes the only exhibition of research companies in Russia (Research EXPO), holds contests and training webinars. The formats which combine educational and tourist spheres proved to be largely successful. The members of the Association see further development in the formation of transparent rules of the game in the market, as well as in the promotion of higher professional standards.

The Impact of the Economic Crisis on the Work Activities of the Population

The analysis of the work activity of Russian citizens has always been relevant, as it is connected not only with the economy but also with the education system, which is supposed to be designed to supply the country with new personnel. Currently, the relevance of this topic has become aggravated due to economic sanctions by the Western powers. In February 2019 the Institute of public opinion "Qualitas" published a study into the impact of the economic crisis of recent years on the work of residents of a large Russian city (Voronezh). The study was conducted by telephone survey of the residents of Voronezh on a representative sample of urban population older than 18 years old. The study compares aspects of working life, in different crisis periods with a gap of ten years between them. The existing discrepancy between the needs of the market and the system of higher education became evident, as the study revealed that there is a significant number of university graduates who work not in their specialty. The study also examines the specific consequences of the sluggish economic crisis in its impact on the work of citizens: the number of dismissed or sent on unpaid leave, cases of wage cuts, reduction of working hours etc. The attitude of workers to their job and the fears of its loss were also studied. The research showed that today people lose their jobs more often, but are less afraid of it than ten years ago. The practical implementations of the research can be of interest to politicians and economists, who need to realize the fact that the public consciousness constantly changes and adjusts the attitude to work and motivation in the workplace.

Political Ecology Approach to Joint Climatic Knowledge Production. a Case Study of Cutusuma, an Aymara Community in the Bolivian Andes

Introduction: Climatic hazards, such as water scarcity and intense rainfall, jeopardize food production around the world. Indigenous communities in the Andean highlands (Antiplano) are highly susceptible to these impacts, and they have knowledge of local agroclimatic risk management strategies. In Bolivia, following anti-neoliberal and pro-indigenous political transformations from 2003 to 2009, indigenous knowledge has been included in climatic knowledge production with the government. However, few studies have assessed the socio-political engagement processes underlying current climatic knowledge production and adaptation strategies.

Methods: Interviews, focus groups and participatory observations were conducted in rural agricultural communities in the Katari River Basin, Department of La Paz, Bolivia, in 2019. Study participants (n=30) included indigenous leaders and public servants at different levels of government. Participants were asked about the relation between water and power in their jurisdiction, information sharing and interactions between social organizations and different levels of government.

Results: Two key social-technical interfaces were identified: (1) the social platform of the Katari River watershed, (2) the originary people's platform to fight climate change. Interviews revealed a unique relation between the spiritual (yatiri) and agricultural (yapuchiri) leaders in the Cutusuma community with respect to practices for managing and reducing climate impacts on agriculture.

Conclusions: Yapuchiris and other indigenous peoples who observe and make agroclimatic predictions can be further empowered to share their experiences in different sociotechnical interfaces at global scales. Despite these advances in climatic knowledge co-production, further work is needed to incorporate deeper philosophical and ontological considerations of the apparent colonial structures that remain.

The Transformational Potential of Urban Electrification – Insights from United States and Mexico

Urbanization and electrification are profoundly transforming energy systems globally. Cities are engines of development that spatially concentrate the critical human activities and transboundary infrastructures driving and being affected by electricity generation, distribution, and use. This spatial concentration creates unique opportunities for electrification to advance multiple economic, social, and environmental goals; at the same time, it alters the distribution of risks and vulnerabilities in complex ways.

Because cities are key players in this field, the choices urban actors make about how to implement electrification and achieve energy sustainability, resilience, and innovation will have tremendous implications for the future of electrification, and ultimately the sustainability of our global society. Technological breakthroughs and market disruptions such as electric vehicles, ride hailing services, and renewable power grid services are driving electrification's potential to drastically transform urban energy system dynamics globally.

In this presentation, I will share some results from my current research in the United States and Mexico on the agents and drivers of these changes. I will ask whether these changes are bringing about positive social and environmental change in terms of low carbon, improvements in air quality and health and affordable electricity and mobility. Or if these transformations are instead altering the distribution of existing risks and vulnerabilities in complex ways; whether they are further eroding distributive and procedural justice for mostly benefiting the rich and educated, for reinforcing elitism in urban and transportation planning and for worsening health risks.

Urban Electrification: Toward an Integrated Research and Development Agenda

Urbanization and electrification are deeply transforming energy systems globally. Cities are engines of development that spatially concentrate the critical human activities and transboundary infrastructures driving and being affected by energy generation, distribution, and use. This spatial concentration creates unique opportunities for electrification to advance multiple economic, social, and environmental goals; at the same time, it alters the distribution of risks and vulnerabilities in complex ways. Because cities are key players in this field, the choices urban actors make about how to implement electrification and achieve energy sustainability, resilience, and innovation will have tremendous implications for the future of electrification, and ultimately the sustainability of our global society.

In this presentation, we highlight results from a workshop on Urban Electrification sponsored by the National Renewable Laboratory. We outline a vision for advancing a research and development (R&D) agenda to thoroughly examine the characteristics and relationships among urbanization, electrification, and cities, including the imperative of shifting renewable sources for electricity. We use a systems approach to trace current knowledge and identify knowledge gaps in diverse and not yet connected elements of this emerging field, while calling for a more active collaboration among engineering, and physical and social sciences in the development of an integrated R&D agenda, focused on:

Innovative and rigorous scientific approaches, including social science methods examining the multiscale drivers, attributes, and impacts of urban electrification

Socio-spatial and temporal differences across and within cities and their countrie

The implications of electrification across multiple sectors for the future of cities and of urbanization using projections, scenarios, and data-driven models

Human behavior and decision making, together with social, economic, technologic, environmental, and governance conditions, defining barriers and enablers, pressures for and against energy transitions, path dependencies, and agents of change.

The outcomes, actions, and options, including potential co-benefits and undesirable trade-offs.

Revisioning Paradigmatic Conceptualizations of Research so As to Embrace Possibilities for Using the Research Space to Further Social and Ecological Justice

Pragmatism as a paradigmatic underpinning for mixed methods research has often been used to suggest that researchers can sidestep philosophical debates regarding the apparent impossibility of mixing incommensurable understandings of what "social research" entails. The suggestion is that our research can be guided by the (pragmatic) quest to answer a "research question", and that any method that can be used toward this end can be appropriately harnessed. As noted by Freshwater & Fisher, "philosophical debates" often became seen as "less important than the adoption of a ... practical approach orientated toward the production of knowledge" (2015, p. 668). Nevertheless, as they note, what is still not accounted for in such a (practically-oriented) pragmatism is how "knowledge" and the "knowing endeavor" are to be defined. Hall (2013) avers that a more philosophically-directed pragmatism has to include epistemological deliberations around the *nature of knowing*. She points to many pragmatists who have defined "knowing" as validated by its contribution to what Dewey (1983) calls "intelligent action", which is itself linked to considerations around "ethics and social justice" (Hall, 2013, p. 17). In this paper I take up and extend this argument and I suggest that thoughtful invocation of "paradigms" needs to be accompanied by deliberations around how the research space can be used to contribute to the development of social discourses concerned with forwarding an inclusive wellbeing in society, including the wellbeing of nature as part of our domain for discussion. I suggest that if this becomes our focus, then all the prevalent paradigms as "normally" defined (postpositivism, constructivism, emancipatory/transformative, pragmatic, and Indigenous) can become reconfigured so as to enable the mixing of methods

via an "empirical praxis" which at the same time contributes imaginatively to the enhancement of the quality of social and ecological living (as also explored in Romm, 2018).

Songs of Life: Music and Soundscapes in Empowering the People and the Society

Workshop:
This is a informational and experimental workshop, where we investigate the Art & Culture based methods in the context of community building and rehabilition. Sociocultural inspiration and Music therapy form together the theoretical context for this workshop.

Main focus is in Music and Soundscapes and the empowering and therapeutic potential of Music, when working with people under social suppression and psychological difficulties.

Main Theoretical aspects are:
Music and individual growth
Music and community building
Music and social reformation

We take a look at the possibilities of Music & Soundscapes in individual rehabilitation and growths as well as in building a healthy ad sustainable community. We also take a look at how Music can reflect and express the social and political atmosphere in society in larger scale. One of the best examples of that is so called "singing revolution" in Estonia, when the country became independent from USSR while the big singing festival in Tallin became an essential part of that Estonia`s strive for freedom.

There are also lot of examples of songs, that have had a strong impact in society as a vehicles for social reformation and awakening. For example John Lennon`s" Imagine", Bob Marley`s "Redemption Song", "Wind of Change" By the Scorpions or Billie Holidays`s "Strange fruit".

The main backbone of this workshop is still how to understand the empowering effect of Music in Human Life in General and especially in **individual growth** and **community building**. We will do some exercises like "writing to the music", "music and pictures", "creating soundscapes". We also study "musical biography" as a tool for self-knowledge for individual and the community.

This workshop can be anything starting from 20 minutes up till 90 minutes. There will be a simple preliminary assignment.

Mikko Romppanen

Narratives of Change - Risk Amplification and Science Journalism in the UK

Amplified risk reporting is often considered a consequence of poor quality journalism which sensationalises and politicises scientific information. Amplified risk reporting is suggested to impact public risk perceptions, decision making, and introduce scientifically inaccurate discourses into the policy making process. However, since the 1980's, the British Press has undergone several paradigmatic shifts which has impacted the quality of risk reporting in the UK.

A series of twenty interviews were conducted with science journalists, and explored the factors considered to impact the quality of risk reporting in the UK. Interviewee's outlined how key narratives reorientated press culture by challenging their professional reputation, encouraged pro-science reporting, and fostered better working relationships with research institutions. The mid-2000/early-2010's were considered to be a 'golden era' of high quality science journalism that addressed concerns about amplified risk reporting in the 1990s/early-2000's. However journalists foresee an emerging news narrative that questions the credibility, accuracy, and legitimacy of scientific information supplied by research institutions. It is further expected that social media content will aid the amplification of risk across the next decade.

Globalization and Stratification of Education System in India: Emerging Patterns

Globalization is a process which has implications for overall institutions of the developing and the developed society in one way or the other. The developing societies like India have unique system of social stratification of their own. This Indian stratification system was traditionally based on the caste system which has its bearings on every institution of the society directly or indirectly. Modern education system in India came into existence during the colonial period. Traditionally, education was imparted in Sanskrit *Pathshala*s (primary level schools), *Gurukuls* (secondary level education including vocational education), and *Vishvavidyalayas* (institutions of higher studies). During the medieval period, Islamic education was introduced through *madarsas* (schools imparting learning and study of Islamic texts and literature). However, it has not affected much the existence of the ancient forms of educational institutions. During the colonial period, the Britishers introduced western education system in India who treated the existing forms of education system backward and irrelevant for the progress of the country. This resulted into the emergence of a western oriented 'new middle class' of modern occupation holders and stratified the education system into two strata of old educational systems and new educational system. This trend continued even after independence and forces of modernization further stratified the education system in India. The advent of globalization strengthened the private institutions in the field of education at all the levels and further stratified the education system. The present paper is aimed to understand and analyse the changes in educational system of India at different levels and the process of stratification in the educational system of the country in last few decades.

Ontoformativity: Reading Southern Innovations in Sociological Theory

Diverting from the current critique on the limitations of the hegemonic theories to deal with the global South, the paper aims to propose a specific mode of accounting for innovations in southern theories. Borrowing from R. Connell use of the notion of ontoformativity to describe specific contexts (e.g., colonialism) where new subjects (e.g., bodies) are assembled, I seek to propose the reading and analysis of southern theories through their capacities to build significantly new existences. Particularly, the notion of ontofomativity is extended here to describe the work of social scientists that live and research things normally incommensurable in the available hegemonic terms. Instead of merely adapting or translating the limited scope of global subjects built and protected by the Euro-American theories, some southern social scientist have worked on the manufacturing of ontologies or existences. The process of manufacturing requires a combination of conceptual and methodological tools. In order to demonstrate the challenges and advances faced by southern sociologies, the paper engages with the work of the so-called indigenous sociologies from Africa and research with indigenous groups in Latin-America.

What Can Karl Polanyi for the Sociology of Development?

An essential contribution of the attempts to understand the change processes in the developing world can be found in Karl Polanyi's reflections about the "Great Transformation". Polanyi's work can provide appropriate theoretical and analytical tools in order to make a dialogue between social sciences and better understand the causes and consequences of the social and economic transformation in the developing world.

In this contribution, I intend to question the political, economic, theoretical and methodological actuality of the Polanyi's work for the sociology of development. On a political level, the question is to understand on wich extent the "forms of integration" of the economy in the society are linked to some political movement (like the far-right ones). On the economic level, Polanyi's thought raises questions about the alternative forms of the economy as well as about *other* forms of economic integration, different from the market mechanisms. On a theoretical and methodological level, there is a need to specify the relevance of the Polanyi's conceptual body for the analysis of such themes as *the socialization of the productive forces in the developing societies, the social and solidarity economy and the role of Polanyi's* reciprocity, *the role of the state and international authorities in the management of local social, economic, environmental abuses.*

Thus, mobilizing various empirical studies on developing societies, this contribution is questioning Karl Polanyi's theoretical, epistemological and methodological conceptual body for the sociology of development enrichment purposes as well as a deep understanding of the modern developing world.

Labor and Social Justice: Can Digital Platform Work be Decent?

In the age of digital capitalism, a novel form of work organization emerges: the so-called uberization of work or work through digital platforms. The magnitude of the phenomenon can be attested to by the four million self-employed people who use the platforms as a source of income, a form of insertion that is already traditional in the Brazilian labor market: see-saw between formal and informal work, instability, improvisation. This calls for new reflections to understand the reality, status and working conditions of such particular type of – contradictorily independent and subordinate – worker. Can platform work, marked by precariousness – lacking regulation, labor rights and union representation – become a decent work? This paper aims to investigate the work through digital platforms as an emerging type of work organization – located in the so-called gray area of employment and labor – that poses a threat to the labor canons of the capitalist societies in the last century and points to new forms of social deregulation and instability. The concept of decent work is used to articulate social justice and independent on-demand work via apps. The scenario requires an analysis of the political implications of invisible technological surveillance over work and individuals. Our hypothesis is that, in the face of work carried out in isolation and whose risks are taken by the worker himself, social networks can function as a forum for solidarity, cooperation and organization of digital platform workers, so as to constitute a new public sphere. The methodological proposal to examine the structure and content of social networks formed by platform workers – both crowdworkers and on-demand workers – in order to explore their potential for collective organization; and to reflect on the possibilities for independent and isolated work to become organized as a collective and institutional force.

Educational Bureaucracy and Stigmatization of Students in Public Schools

This article analyzes the expectations of school principals in the city of Rio de Janeiro regarding the student body. The main argument is that principals build views on their students based on "virtual social identity" as Goffman defined (GOFFMAN, 1988). We consider "students virtual social identity" a set of expectations about students and their families reproduced by the principals. They make their bureaucratic actions oriented by this set of expectations and beliefs. We will demonstrate that these visions are based on multifocal stigmas because they are aimed at students, their families and their places of residence, not necessarily in this order or with these three forms of stigma in all settings. The results denote that the principals use the "student virtual social identities" to orient their daily actions. Consequently, it is possible to affirm that educational bureaucracy is not oriented exclusively by bureaucratic logic, characterized in the literature as rational and impersonal. We interviewed 23 principals who work in schools located in the city of Rio de Janeiro, Brazil.

WG08-726.2

ROSLY, MIKHAIL* (,)

George Simmel, Pragmatism and Sociology of Emotions

George Simmel's formal sociology is particularly interested in emotions as generating and sustaining interactions. Simmel does not use the term Vergesellschaftung in his "On the Psychology of Shame" (1901). Instead, he speaks of the opposition of one's subjectivity to the social norm as an "empty scheme", which can be filled with the most heterogeneous and polyvalent content. But clearly he discusses emotion of shame as a special form of sociation here. B. Nedelmann argues that emotions according to Simmel can be attributed to one of two different classes. Shame, for example, will be a secondary emotion because it arises in relationships. J. Gerhards claims that any emotion can take on a primary or secondary function. Everything that acts as a form in one context may turn out to be a content in another, as in Aristotle.

Study of affinity between Simmel's formalism and American Pragmatism helps to understand the intellectual tradition that informed contemporary sociology of

emotions and may provide a key to its unsolved theoretical problems. Application of the notion of "second-order forms", introduced by N. Cantó-Milà, to emotional phenomena is to be compared to Peirce's semiotic theory of emotions, as reconstructed by D. Savan.

The Photographer Photographed: Reflections on the Legacy of Jean Mohr

The humanitarian photographer Jean Mohr, who died in 2018 at the age of 93, is well-known for his collaborations with several major intellectual figures. His celebrated books with John Berger include "A Fortunate Man" (1967) an intimate portrait of an English country doctor, and "A Seventh Man" (1975), a meditation on the migrant labour economy of 1970s Europe. In the early eighties, Mohr also developed a close friendship with Edward Said; together, they collaborated on "After the Last Sky" (1986), using text and photography to construct alternative narratives of daily life in Palestine. And, soon after this, he worked once again with Berger on "Another Way of Telling" (1989), a collection of stories and reflections on the topic of photography itself. Arguably one of the most ambitious books on photography ever produced, it is organised around one central question: "can one think in terms of a truly photographic narrative form?"

This paper will reflect on various aspects of Mohr's life and work, including his collaborations with Berger and Said, as well as his own unique approach to photography. First, it will consider Mohr's empathetic capacities as a photographer and his ability to develop seemingly intimate and meaningful, however fleeting, relationships with his subjects. Secondly, it will discuss the nature of Mohr's collaborations and how they might offer a model for fruitful cooperation between photographers and social scientists. And finally, it will consider Mohr's body of work as the articulation of a coherent, alternative theory of photography itself. The paper will conclude that the work of Jean Mohr offers an important source of inspiration for those interested in constructing alternative photographic narratives that effectively combine scientific insight with political commitment.

Silence Hate: How to Combat and Prevent Online Hate Speech Using a Video Counter-Narrative

This paper describes the experience of a group of young high school student from Naples making a video about the online hate speech. Online hate speech is a complex phenomenon, which has deep cultural and social roots, bringing with it new ways to communicate as well as some challenges related to the issue of freedom of expression on the web. The project's main objective is to combat and prevent online hate speech against migrants and refugees, while also trying to fight against all forms of prejudice by developing innovative and creative counter-narratives. Moreover, this paper focuses on education and prevention, and how these kind of didactic projects enable young people to recognize hate speech. I analyse the importance of finding new ways to encourage them to react both at an individual and a collective level. The videos are the result of a didactic project carried out on two different groups of students. The first is a multi-ethnic group of young people from all over the world, working on bullying. Many of them have told their personal experiences of suffering from bullying. The second group is a high school group consisting of students who are around 18 years old. In this case the students decided to work on the issue of violence against women. Furthermore, I also provide an overview of the use of video methodology in educational practice and social research.

Class and Gender across Latin American Welfare Regimes

In the last 20 years, Latin American countries have gone through a transformation regarding gender relations. The massive entrance of women in the labor market, the introduction of care polices, the establishment of regulations for guaranteeing gender equality are somehow producing unprecedent outcomes in the performance of Latin America's welfare regimes in terms of gender relations. However, outcomes are usually stratified by class, since the reduction of gender inequality tends to favor women from some socioeconomic groups more than others. In this paper we argue that performance of different welfare regimes regarding both class and gender is an empirical question. Drawing on prior work that has extensively showed that Latin American social protection systems are very heterogeneous (Filgueira, 2007; Segura-Ubiergo, 2007; Martinez Franzoni, 2008; Pribble, 2011; Ocampo and Gómez Arteaga; 2017; among others), we undergo a new attempt to classify Latin American welfare regimes from a gender/class perspective. We work with a new set of indicators and observe the differential evolution of welfare regimes in Latin America during the last two decades.

The Politics of Social Policy Change:

Explaining Adjustments to Cash Transfer Programs in Latin America

In the last decades, left-wing and right-wing administrations in Latin America have implemented a variety of social policy reforms. Recent evidence suggests that ideological shifts have not necessarily translated into clear patterns of social policy expansion or retrenchment. While some governments have created entirely new flagship programs, others have engaged in processes of institutional layering and policy drift. We explore this variation in social policy change with a focus on cash transfers, one of the most prominent policy tools in the region, and an "easy" policy to implement in times of austerity. Prior work has extensively analyzed the determinants of the adoption of non-contributory programs in Latin America, but we know less about the transformations of these policies and their implications. Drawing upon an original database, we first study the range and magnitude of adjustments to cash transfer programs in the region, which include changes to focalization criteria, associated services, conditionality, transfer amounts, and conditionality enforcement. We then examine the determinants of the different types of social policy change, considering the role of ideological motivations, electoral incentives and structural constraints.

In between the Sociology of Cinema and Digital Sociology: Theoretical and Methodological Implications Analyzing Streaming TV Shows

This paper presents several questions and concerns about sociological research on SVOD - Subscription based video on demand - platforms (eg. Netflix; Prime Video; Hulu) TV Shows aroused in my recent investigation on the image construction of female leading characters in Netflix TV Shows such as Marvel's Jessica Jones; 13 reasons Why and Dear White People. Originally, the main methodological reference adopted was the sociology of cinema by Pierre Sorlin, regarding his orientations about defining a set of productions as sample; the concepts of fixation points and relational systems in order to analyse each production as a construction. Sorlin establishes that the sampling should consider two basic criteria: box office success and impacting specialized critical reviews. That is the first difficulty founded when it comes about SVOD TV-shows: there are different ways of measuring if a show is well succeeded, as well as distinguishing critical reviews that deserve the researcher´s attention. Here it can be found an intrinsic relation to the digital media specificities, regarding the great data volume produced, it´s multiple possibilities of flow, as much as it´s ephemerality. That may bring doubts about the sociological relevance of the analyzed shows after a short period of time. Other questions regarding the analysis of the construction of the shows are present, taking into account the ephemerality of possible fixations points, as well as slight - and not so slight - technical changes on the narrative, considering the time distribution of episodes and events, with the availability of whole seasons at once. So, we argue the implications of new ways of consuming audiovisual productions both for sociological analysis and for social construction of visual perception and symbolic signification networks nowadays, converging visual, social and digital media.

Contents of a Self-Contained Container. on the Guiding Distinctions of Organization Theory

Our global lingua franca, English, has a pronounced preference for putting everything into boxes – stress in higher plants, depression in dogs, compliance in schizophrenics, romantic love in female adolescents, and trust in God. Speaking of organizations, however, there is a thoroughly strong need to observe organizations as both containers and non-containers if we intend to both avoid the pitfalls of the traditional container metaphor and sustain the observation of the closed box that we need to satisfy our curiosity. The answer to our research question "*What is in organization?*"hence requires a systematic approach to the content of a closed box that must not be opened. To answer this question, the present paper pursues a seemingly paradoxical double strategy focused on guiding distinctions of organization (theory) that both distinguish organizations and indicate their contents. As theterm guiding distinctions refers to distinctions such as market/hierarchy, structure/agency, or male/female that guide theory-building, spark controversies, or dominate discourses in organization studies, the paper draws on the distinction between true and false distinctions to show that most organization theories are based on or made of false distinctions. The paper concludes that the prevalence of false distinctions in organization studies complicates the digital transformation of organization theory, a process that would, however, be required for the design of organization theories adequate to digitally transforming societies.

The Meanings of Autonomy in Aging Experience Among the Very Old

This paper discusses the perception of autonomy of the very old - those who are 80 years old or above. The objective is to comprehend how that notion affects the experience these elders have of aging. This analysis also aims to identify how autonomy, as a goal, is presented in their life story narratives. The ongoing research includes semistructured interviews with eight women and five men, aged 80 or more. By taking active aging as a contemporary paradigm to promote the integration and development of aging societies, this discussion addresses the focus on individuality as the foundation of autonomous and independent trajectories. In the context of sustainable development efforts, this paper highlights the preeminence of the perspective of aging that emphasizes it as a biological life cycle. That view overcomes the perception of social conditions of the aging experience. In their narratives of life, the long-lived participants remark the mutual-dependent relationships and the relevance of living together with people that shows different conditions of getting old. Their experience of successful longevity is due to a perception of autonomy defined as still being needed and wanted by the family, friends, and other social groups.

Notes Around the Film Son of Saul

The purpose of this paper is to analyze the film Son of Saul, following the thread of how the "concentrationary universe" is constructed in the plot, emphasizing the discussions about the "representation", since the film shows a day in the life of a character who is member of the Sonderkommando in Birkenau. Bearing in mind that the film is our prime study material and that the issues we raised have a philosophical and sociological background, the methodology will involve a two-fold requirement: the analysis of certain aesthetical elements of the film (such as shots, sounds, gestures ecc.) and a succinct bibliographical discussion related to the theme.

Romanian Women Politicians and Visual Communication Strategies on Facebook during Electoral Campaigns

In the current context of liquid borders (Bauman 2000, 2005), of identity hybridization (Macé 2015) and privatization of politics (Van Aelst et al. 2011), women's public and private lives are redrawing. At the time of personalization of politics, informalisation (Wouters, 2007), perpetual self-production and visibility, the triad woman / politics / digital social networks is likely to provide significant interrelations in strategic identity building The analysis of digital identity as a self-production technique with its corollary the *expressive turn* (Allard and Vandenberghe 2003, Allard 2008) underpinned by the 'feminine revolution' (Froidevaux-Metterie 2015) can be enriched by the discursive/iconic complementarity.We intend to see how Romanian women politicians express themselves visually on Facebook, put in other words how they use the Facebook pages at the interference of identity strategies and " strategic uses of technology "(Mabi and Théviot, 2014).Starting from the hypothesis of the traditional feminine ethos in the post-communist Romanian public space, we launched the hypothesis of professional over-investment and the narcotization of private life as main strategy for Romanian women politicians who prefer to adopt the boy's game model in order to be perceived as legitimate in the public space and win in political competitions.In order to confirm the hypothesis of the domination of the male model in the public space (individualism, competitiveness) we have analyzed the corpus of images (profile and publications) posted by Romanian women politicians during the Euro parliamentary campaign (May 2019).

ROY, ALASTAIR* (University of Central Lancashire, United Kingdom)

Learning on the Move: Exploring Work with Homeless Young Men through the Lens of Mobility

This paper discusses a practice context in which process and movement are central to the provision of care and support to homeless young men. It draws on data from a research project conducted with an arts and social care project in Manchester, England which used ethnographic and mobile methods to explore the complex task staff undertake in engaging and supporting highly vulnerable young men. The research explored the mobile practices of the organisation and how these responded to the movements of the young men as they experience and know the city. It focus on the ways in which these movements of practice and practitioners are central to the delivery of a relational and embodied form of practice and hence to the provision of care and support to young men who live complex lives. I begin by introducing the theoretical and conceptual ideas I refer to throughout, after which I introduce the organisation in which the research took place and describe elements of its approach to practice. I argue that the organisation's commitment to getting alongside these young men includes a mobile and highly improvised use of temporary city centre spaces for delivering its work. In this paper, I argue that these movements of practice are not simply a logistical necessity or a physical activity, but involve a kinetic way of attending, reflecting, thinking and knowing in which the organisation's movements are intrinsic to the provision of care and support.

'Re-Thinking Postcolonial Politics': Salvaging Democracy from the Religious Right-Wing Parties in India

The analysis of Indian history and politics by the subaltern and postcolonial studies school shows that British rule and its postcolonial legacy in the Indian National Congress (INC) was largely a case of 'dominance without hegemony'. After independence an alien idea of democracy, imposed from above, was adopted, but it remained largely superficial to the cognitive schema of the Indian masses. In postcolonial India, the INC did not really carry the values of a secular, multicultural democratic ethos to the grassroots by mass connectivity. Due to weak mass organisation, they ruled through the initial euphoria of independence and charisma and disregarded the religiosity and cultural roots of the masses. The religious, right-wing, populist Bharatiya Janata Party (BJP) and its organisational allies used this opportunity to politicise the grassroots to capitalise on the religious sentiments of the masses and mobilised them. The BJP rose because of the organisational failure of the INC.

In 2014, and now in 2019 the BJP won the elections in India and came to power; the past five years have seen an unprecedented transformation in the modality of politics and in narratives. Secularism and liberalism have become 'bad' terms and human rights and freedom of speech have come under attack. It has polarised the Indian national public, de-institutionalised all major Indian institutions, and completely mismanaged the economy, and the ethos of constitutional democracy and its inclusivity is under threat.

In this paper I argue that at this juncture, India needs a paradigm shift from left, right, and liberal politics and their various offshoots. It is high time that postcolonial theory comes out of its pedantic, academic mooring and back-up politics. I propose that we need postcolonial political parties, discourses, and practices that accept certain aspects of left, right, and liberal politics and give these a novel rendition.

Gubernamentalidad Extractiva y Enclaves Contrainsurgentes: Responsabilidad Social Corporativa y Criminalización En La Colombia Pos-Acuerdo

Los Planes de Desarrollo con Enfoque Territorial (PDET) son un componente clave del acuerdo de paz firmado en 2016 entre el gobierno colombiano y las Fuerzas Armadas Revolucionarias de Colombia (FARC). En teoría, los PDET deben articular los imperativos de participación política, desarrollo incluyente y paz sostenible. Tomando en cuenta las teorías políticas radicalmente diferentes, no solo de las partes al acuerdo, sino de los diferentes grupos sociales interesados en cuanto a democracia, desarrollo y disidencia, los PDET encarnan perfectamente el carácter paradójico e inconcluso del pos-acuerdo colombiano - y, para muchos activistas y defensores de derechos humanos, la persistencia de la represión y de la criminalización. Esta presentación muestra el papel fundamental jugado por el discurso de la Responsabilidad Social Corporativa (RSC) en una región del departamento de Antioquia en el cual se está implementando un PDET, y en la cual un actor transnacional – una empresa minera – ejerce una autoridad territorial decisiva desde mucho antes del acuerdo de 2016. En este contexto, la implementación del PDET va de la mano con un proceso de reorganización simbólica que compromete a todos los actores locales en su relación con el Estado y los poderes regionales, nacionales y transnacionales. Argumento que la RSC actúa como régimen de veridicción hegemónico al proporcionar "soluciones" a las paradojas mencionadas anteriormente. Asimismo, la RSC sirve para revitalizar y reorganizar la represión y la criminalización social al actualizar las categorías contrainsurgentes, delimitando lo que llamo un enclave de razón de Estado público-privada.

RUBIO CARRIQUIRIBORDE, IGNACIO* (Universidad Nacional Autónoma de México, Mexico)

El Riesgo y La Fundamentación Moral De La Justicia Ambiental

The paper discusses if and how contemporary social movements perform environmental and climatic risks as instances for collective action. It pays attention on how claims to distribution and/or recognition based on risk appear across the socio political spectrum, and help to forge collective demands for and ideals of justice. I claim that a sociological analysis should integrate at least three aspects of any risk as instance for collective action: Firstly, risks involve always a distributive problem, a set of damages projected in social time and space. Secondly, risks involve ontologies upon which demands for proper identity recognition can be based. Thirdly, it has been long demonstrated that attitudes towards risk entail a moral codification of the world that orient and even enforce social action (as distinct from collective). Demands for distributive and identity justice root in different politico philosophical traditions, so to unravel their articulations proved to be a rich source of theoretical debate (Fraser & Honneth 2003). From that debate I draw one central question: What sort of language best fits a consistent reconstruction and normative justification of current political environmental and climatic demands and mobilization? This paper sustains that the language of risk may play a major role in the answer.

To develop this argument, I explore the case of the construction of New International Airport of Mexico City, a piece of infrastructure of massive social and environmental impacts. The explosive conflict that emerged in 2001 as a clear distributive reclamation and eventually became a matter of environmental sustainability of the whole metropolis, will help to reflect on how risks become a problem of political and legal action, and of social organization.

Promoting Worker's Rights? the Global Unions, the Ilo and the International Financial Institutions (IFIs)

The Global Unions and the International Labour Organization (ILO) try to influence the system of global economic and financial governance to improve labour standards. The ILO is an important ally for the trade unions as it is the only inter-governmental UN organization where trade unions have direct access and both organizations have very similar mandates. Since its foundation in 1919, the ILO has arguably changed substantially in its character and the ILO Declaration of Fundamental Principles and Rights at Work from 1998 can in part be seen as watershed in this process. However, it remains an important point of reference for the Global Unions in their attempts to lobby for core labour standards.

Since 2002 a formalized dialogue has been established between the Global Unions and the IFIs (the World Bank and the International Monetary Fund). Following the 2008 global economic and financial crisis the IMF held its first ever joint conference with the ILO in Oslo in 2010. The following paper aims to shed light on the ongoing dialogue between the Global Unions and the IFIs and the more recently established 'interactions' between the ILO and the IFIs. The paper seeks to explore the joint effort by the Global Unions and the ILO and their attempts to promote a more inclusive economy based on fair employment, social protection and equality within IFI policies. The paper presents data from an ongoing qualitative study which examines the 'dialogue' between the ILO and the IFIs and the dialogue between the Global Unions and the IFIs. Since 2008 a total of more than 50 interviews have been conducted with senior representatives from the global trade unions and the ITUC, the IFIs and the ILO.

NETO, DAVID (Diretoria de Análise de Políticas Públicas - Fundação Getúlio Vargas, Brazil)

Weighting Crime: An Assessment of Different Ways of Measuring Violence.

Whether violence increases or decreases depends on how it is defined and how it is measured. In Brazil and other democracies, it is generally defined as intentional violent deaths and measured by the total of homicides and its rate. This metric, however, disregards other crimes that are violent, such as robberies and kidnapping, but that do not result in murder. Adding them to the homicide count, however, presents the problem of treating different cases as if they were equal. To circumvent this problem, various methods of weighting crimes were developed. A development from the critical criminology on social harm, such metrics hierarchize the various types of crime by the level of harm that each of them causes. In this paper, we have two objectives. First, we review the literature on the weighting methods. We argue that the various frames can be classified into two dimensions: 1) empirical or theoretical; 2) who suffers the harm - state, civil society or economy. Secondly, we calculated the Rio de Janeiro's Crime Harm Index (CHI), a weighted indicator which belongs to the theoretical dimension and has the state as the target of harm, in the period of 2003 to 2019. Developed by Sherman et all (2016), this methodology uses the sentences guidelines as weights and excludes cases whose registration depends on the proactive detection of the police. The results show that, if violence is measured as homicides, it has declined in Rio for the period under consideration. However, if its measured as CHI, it has increased.

RODRIGUEZ DEL BARRIO, MARIA LOURDES (Montreal University, Canada)

Les Espaces De Coconstruction De l'Action Publique En Santé Jeunesse Dans Le Territoire Du Nord De Montréal (Canada): Quels Défis Pour Le Dialogue Entre Les Jeunes, Les Intervenant.e.s Et Les Gestionnaires Des Milieux Institutionnels Et Communautaires?

Les services publics au Québec peinent à rejoindre les jeunes, répondre à leurs besoins, contribuer à leur bien-être, leur santé mentale et physique et promouvoir leur pleine participation sociale et citoyenne. Pour faire face à ces défis, le Centre intégré de santé et de services sociaux du Nord de l'île de Montréal en collaboration avec des partenaire communautaires et universitaires ont mis en place le Réseau santé intégré jeunesse Aire ouverte dans une perspective participative et intersectorielle. En vue de coconstruire ce réseau avec les jeunes du territoire et les acteurs communautaires, plusieurs espaces de prise parole ont été créés dont le Laboratoire d'innovation (LI) qui permet de regrouper une soixantaine d'acteurs durant des rencontres d'échange et de coconstruction. Les LI mettent ces différents acteurs en dialogue et mobilisent la pluralité des connaissances et des savoirs expérientiels au service du changement. L'intérêt pour ce type d'espace collectif se multiplie comme le montrent les travaux sur les espaces d'innovation (Grenier et Denis, 2017), les espaces de convivialité (Heil, 2015; Schwartz 2016) et les espaces expérimentaux (Zietsma et Lawrence, 2010; Cartel et al., 2018). En quoi les LI constituent des espaces de dialogue démocratique, c'est-à-dire des espaces agissant sur les inégalités sociales de pouvoir vécues entre les acteurs de manière à les réduire durant l'élaboration de problèmes et de solutions au fil de la mise en réseau et de la coconstruction? Cette communication propose d'éclairer cette question à partir de l'analyse empirique des dynamiques politiques et relationnelles qui ont pris forment au cours de laboratoires entre 2018 et 2020. C'est en décrivant minutieusement ce que les acteurs font en faveur d'une réduction des inégalités sociales de pouvoir qu'il est possible d'examiner des nouvelles pratiques en train de se faire dans les interstices des activités formelles et aussi informelles.

Ethnography on Gender and Higher Education: Researching Academia from within

My PhD research focuses on gender equality in higher education and I am conducting an ethnographic investigation in the same university where I attempt to get the degree, the National University of Ireland, Galway (NUI Galway). My fieldwork began the moment I enrolled and after two years I still feel many staff members know more about my topic than myself. Learning to navigate the labyrinths of passageways, acronyms, lobbies, committees and action plans proved to be fascinating. My supervisor has not yet signed the informed consent form, but I do hope to interview her as she was the only gender specialist in the Gender Equality Task Force established in 2015 to respond to high profile legal cases against NUI Galway and the feminist activism that surrounded them. As a feminist and a beneficiary of a scholarship from the Vice-President for Equality and Diversity, I am particularly interested in discussing sponsored research and how to simultaneously investigate and participate in contemporary efforts for transformation. As my engagement deepens, it becomes more and more obvious that 'the' university is not homogeneous, it is actually pervaded by competing logics mobilized to co-create its present and direct its future, offering diverse readings of its past. By naming those logics as managerial, academic, and activist, it is possible to stabilise the diverse interests that populate the institution, account for ethics concerns by detaching the individual from the post, and devise a researcher position capable of partially accounting for the collective and the processual dimension of change (and of knowledge production).

RUGGI, LENNITA* (Universidade Federal do Paraná, Brazil)

Lampedusa and the Glass Ceiling: Policies Against Gender Inequality in Irish Higher Education

Lampedusa's paradox advises us to approach change with caution provided it might be a strategy to reproduce the previous order. What sort of responsible research can be done to both investigate and participate in contemporary efforts for transformation? My PhD investigation focuses on gender equality in higher education conducting a case study of the National University of Ireland, Galway. As a beneficiary of a funded PhD, my position is one of the outcomes of previous efforts that lead to the visibility of inequalities and the creation of specific actions and governance structures for equality, diversity and inclusion (EDI). A broad consensus was reached regarding both the existence of gender inequalities in Irish higher education and the need to actively address them. What is the meaning of 'equality', why it is desirable, and how to promote it are, nonetheless, contentious. Different groups are mobilized to co-create this aspirational future and set the agenda in certain directions. Mapping these diverse interests is advisable to avoid designing a research that naïvely subscribes to a given frame or fails to account for the collective and processual dimension of change (and of knowledge production). Inspired by the work of Carol Lee Bacchi, the paper argues that 'the problem' of gender equality has been gradually narrowed to highlight the lack of women in senior positions, evading competing representations such as the issue of precarious work conditions in universities. This representation of the problem focused on the glass ceiling is related to forms of 'gender branding' or 'femvertising' aimed at internationalisation. In engaging in critical analysis, we hope to identify possible discursive and subjective effects of the currently hegemonic problem representation, as well as to participate in efforts to broaden the agenda of gender equality in Irish higher education.

RC52-638.4

RUGGUNAN, SHAUN* (University of KwaZulu-Natal, South Africa)

From Exclusion to Inclusion: The Development of Management As a Profession in South Africa

The aim of this paper is to show how management studies in South Africa has mirrored the country's political trajectory in its attempts to professionalize. It asks two central questions (1) How has management as a profession developed over time in South Africa and (2) How did patterns of inclusion and exclusion play out in the formation of management as a profession? Apartheid separated all aspects of South African life along racial lines. Management studies as an academic and professional enterprise was not immune to this. Universities regulated access to business qualifications by race. Only White South Africans could access Master of Business Administration Degrees. Universities were differently resourced during apartheid along racialized lines. Evidence indicates that management scholars reinforced the apartheid workplace regime. Research supportive of the apartheid workplace regime occurred in management research institutes outside and within universities. The discipline is dominated by White scholars and historically White universities. The professional and applied part of management studies, human resources management was also racially divided. Professional bodies divided along race shape the trajectory of the discipline. Post-apartheid South Africa allowed for democratic access to university education for all South Africans. The democratic state advocated for increased participation of public sector employees in management programmes. Such participation is part of the strategy to create a capable state. More racially inclusive participation in management programmes has occurred. Finally, this paper considers the extent to which a capable state is dependent on the professionalisation of the public services through the uptake of professional management training programmes.

RUIZ JABBAZ, SOLEDAD* (Universidad de Chile,)

Identidad Negativa, Reconocimiento y Estrategias De Autoprotección Simbólica

La presente comunicación busca mostrar la dinámica identidad/diferencia en un contexto de segregación urbana por razones socio-económicas, altos índices de vulnerabilidad y estigmatización territorial. Para ello se discuten resultados de un estudio cuyo propósito fue dar cuenta de las relaciones de reconocimiento social entre los habitantes de un barrio popular (población), y entre éstos e individuos o grupos externos. El concepto de reconocimiento se abordó desde la teoría de Axel Honneth, buscando analizar tanto las prácticas a través de las cuales los pobladores construyen una posición digna de ser estimada, como aquellas implementadas para enfrentar la falta de reconocimiento (humillación y desprecio).

La investigación, de corte etnográfico, fue realizada en una población de Santiago de Chile. El terreno se llevó a cabo entre septiembre y enero de los años 2010 y 2011. La técnica de observación participante se complementó con entrevistas biográficas a los habitantes.

Los resultados muestran que si bien externamente se tiende a atribuir una identidad a los pobladores, contrario a ello, las condiciones de segregación y estigmatización propician que las prácticas a través de las cuales construyen una posición digna de ser estimada, buscan subrayar las diferencias propias con los demás habitantes. Así, estas tácticas de autoprotección simbólica (Wacquant, 2007) frente al desprecio y la humillación, alimentan un círculo constante de comparaciones, evaluaciones y devaluaciones al interior del barrio, reproduciendo y multiplicando diferenciaciones y fronteras simbólicas.

De éste modo, si consideramos la propuesta de Honneth acerca de que las formas de desprecio o negación del reconocimiento que dan lugar a reacciones emocionales negativas tales como rabia, indignación o vergüenza, pueden ser el motivo de una lucha por el reconocimiento (Honneth, 2006, 2010), vemos que en éste caso de "identidad negativa" o estigmatizada y de alta segregación, se produce el efecto contrario.

RUMPEL, ANDREA* (University of Duisburg-Essen, Germany)

Self-Responsibility Regarded As Borders and Boundaries within the Health Care System

A welfare state should enable institutional accesses to the social system. According to the typology of welfare states by Esping-Anderson (1990), Germany is defined as a conservative welfare state, which is supposed to be very reluctant towards paradigmatic shifts. The German welfare state changed dramatically in the last decade: activation, self-respondent and autonomy are the new paradigms within the social security system (Klammer et al. 2017). The herewith connection of personal and public interests calls Lessenich (2008) the reinvention of the social. Whilst the literature focuses mostly on the new paradigms regarding paid work and education, my focus is on the meaning of the self-responsibility within the German health system and how this challenges the claim of equal access: the responsibility towards health preservation are transferred to the individuals and the introduction of terms like 'welfare consumers' in the health science reflect that. Increasingly, benefits depend on personal responsibility and thus the need to make individual competences and abilities of use has increased tremendously (Ewert 2008). Along the health care access of refugees, I present different kinds of borders and boundaries, like limited access by law, information lacks about structures and different conceptions of health and illness when trying to enter the health care system. By drawing on empirical case studies in different German municipalities and exemplified by substance using refugees on their way to the addiction care system, I can show, how subjects break through these borders and boundaries and open spaces.

RUNGE, PAULINE* (University of Applied Sciences Hamburg, Germany)

"and then They'll be Released into Homelessness" – Unclear Responsibilities of Institutions Considering Immigrated Youth and Young Adults in the Street Scene of Hamburg, Germany

Although child protection may not allow young people to live on the streets, there are about 37.000 young people in Germany who spend most of their time in the street scene – the in the German context so-called disconnected youth (Beierle/Hoch 2017). For many young immigrants in Hamburg the street is part of their life world as well. The practical work with immigrants who spend their time on the streets seems to face many uncertainties. The situations of the young people differ largely which means that different institutional bodies are responsible for them – the Youth Welfare Office, the Federal Office for Migration and Refugees and the Assistance for Homeless. That leads to inconsistencies in jurisdiction to the detriment of the needy and makes nobody feel responsible for these young people. Because of this lack of clarity, there is often no supportive offer for the youths and they'll be then, as one social worker said in the study, "released into homelessness".

Even though the disconnected youth are moving outside the system, they are nevertheless highly involved in social discourses (Kunz 2017). These discourses are shaped by media and follow regulatory and security policy demands. Thus, the young people are entangled in the discourses of the system, but their reality of life is disconnected from the system.

The paper explores the contradictions the young immigrants between the systems are faced with under the perspective of social workers in the fields of street work and migration work in Hamburg, Germany. The present contribution focuses on the entanglements of the complex lives of the disconnected immigrant youth with the insights gained so far about the structural conditions in the institutions.

RUNGE, PAULINE* (University of Applied Sciences Hamburg, Germany)

"They Choose to Live Outside Because They Have Nothing More to Lose" – Young Refugees in the Street Scene of Hamburg, Germany

About 37.000 young people in Germany are part of the in the German context so-called "disconnected youth" (Beierle/Hoch 2017). That indicates that they formally have a home but not an emotional one, which means that they spend most of their time in the street scene. Even though they receive no consideration in research so far, for many young refugees in Hamburg the street is part of their life world as well.

With the day of their 18th birthday, many young refugees are (wrongly) not any longer part of the youth welfare system in Germany. Sometimes they have chances for further measures but they have to wait at least six months for new measures by law. So they will be send to public accommodations for refugees which are often container villages. In these places, they live without pedagogical care and are missing privacy. As a social worker said during the study, the feeling of having "nothing more to lose" marks the time the young people spend in these accommodations. At the same time, feelings of waiting and hoping matter, too. A lack of perspective come upon self-efficacy in creating alternative forms of daily life. In such cases, the street can be an alternative place of social get-together and feel more secure for some youths.

The paper explores the social place *street* ethnographically, taking into account the perspective of young people by using methods of exploring social spaces. In this context, the experiences made by the young refugees in the street scene of Hamburg, Germany will be focused on.

RUOKONEN-ENGLER, MINNA-KRISTIINA* (Goethe University & Institut for Social Research Frankfurt, Germany)

„I Didn't Get That Interview!" Dealing with Feelings of Disappointment and Learning from Your Own Frustration in Biographical Research

Students learning biographical methods often feel unsure of how to start with the empirical research. Despite the methodological knowledge and research tools they have, they are worried about possible pitfalls and mistakes. The unpredictability of the biographical interview - the possibly upcoming issues as well as the interview interaction - makes the interview method both exciting and frightening. In most cases, these worries gradually disappear to some extent when the students start with their research process. In case of problems, like not getting access to the research field or after having received a rejection from a possible interviewee, the initial anxiety might transform itself into feelings of disappointment, sadness and even into an experience of personal failure. In order not to take these problems personally and to psychologise them, it is important to analyse those more closely. It is worth assessing what the encountered problems mean sociologically and to consider what consequences should be drawn from those experiences. In my paper, I focus on discussing the role of such disappointments and frustrations in a research process. I interrogate how and with which methods it is possible to turn them into a meaningful part of a creative learning process, not only in teaching but in research settings too. In my discussion, I draw on my own experiences as a student, teacher and researcher. Theoretically, I follow Sarah Ahmed's notion of emotions as relational social and cultural practices rather than individual self-expressions only.

RUSANOVA, NINA* (The Russian Academy of Sciences THE INSTITUTE OF SOCIAL AND ECONOMIC STUDIES OF POPULATION, Russia)

Assisted Reproductive Technologies: Infertility Treatment or an Alternative to Natural Conception?

After the first successful attempt of in vitro fertilization (IVF) in 1986, more than 25,000 children were born in Russia (> 3,000 newborns per year). Today there are more than 100 thousand cycles of assisted reproductive technologies (ART) per year (about 700 cycles per 1 million population), there are demographic, social and economic effects of ART. The most striking demographic results are qualitative and quantitative changes in fertility. National ART registers, 2007-2016: increase in the number of births after ART (IVF-births) significantly exceeded the same indicator for "natural births": TFR increased by 23.9%, the share of IVF-births — 3.8 times, the total number of births — 15.3%, the number of "natural births" — 13.9%. Although IVF-births do not exceed 1.7% of the total births today, it is among them that reproductive needs are realized, corresponding to the second demographic transition, such as postponing births to older ages and complete abandonment of children, as well as the choice of time of birth and children's biological characteristics. The process of conceiving and giving birth to a healthy child is increasingly medicalized. If in 2005, 17,242 patients who were first diagnosed with "infertility" had 52 thousand cycles of ART (they were enough for only 33.2% of infertile), in 2016, 92.8 thousand infertile performed 123.181 thousand cycles (there were 1.33 ART cycles for each case of infertility reported for the first time). Even taking into account the fact that the probability of conception by ARTY is about 30% and part of the cycles of the current year is applied to infertility diagnosed in previous years (according to the standard, the duration of treatment should not exceed 2 years), it is obvious that part of the cycles is performed in cases of reproductively healthy single women ("social infertility") or commercial surrogacy in post-reproductive age.

RUTH, MARINA* (Institute for Work, Skills and Training, Germany)

A Holistic View on Young Refugees in Germany: Challenges and Chances for Participation

Since 2015, Germany has been a major receiving country in terms of forced migration. Especially for young adult refugees, the change from one life course regime (country of origin) to the life course regime in Germany is accompanied by special challenges: Disrupted educational careers and missing certificates of education and training form difficult starting points for building up a long-term perspective in Germany – a country in which certificates play a decisive role in terms of access to education, training and work. In addition to the individual plans of the young refugees (*agency*), *structural* parameters and *time* aspects form the biographies of the newly immigrated (see e.g. Wingens et al. 2011). This multilevel approach is conceptualized in a qualitative dissertation project to achieve a ho-

listic view on barriers of participation for young refugees in Germany. Document analysis, expert and biographical interviews are being used to help understand the complex interplay of *structure*, *agency* and *time* and their impacts on participation chances for the young refugees. In context of the biography (*time*), regulations in various policy areas, e.g. education, social security, health and labor (*structure*) as well as individual competencies and objectives (*agency*) are included in the analysis. The presentation in the session will focus on the complex dynamics resulting from the integral view on the life course of the young fugitives and will give insight into the first results of the qualitative interview series (expert or biographical interviews).

From the South to the North: The Circulation of Latin American Dependency Theories in the Federal Republic of Germany

Sociological research into the transregional North–South circulation of knowledge in the social sciences and humanities has tended to have a unidirectional bias to date. The standard assumption is that as a result of globalization, theories and methods are spread from the global North to the global South. Based on this premise, many of the studies of circulation focus on the transfer of knowledge in terms of ideas, traditions, authors, and concepts from the North to the South. Thus far, little attention has been paid to the transregional circulation of theoretical approaches from the South to the North and their impact on the transformation of the European social sciences. Analysing the circulation of the Latin American dependency theories in the Federal Republic of Germany (FRG), my proposal addresses precisely this gap. The focus is on entangled processes of institutional consolidation of area studies, North-South mobility and the forms of reception (translation, modification, application in empirical research and rejection). Focusing on this little-explored direction in the circulation of social theory, the aim is to provide an innovative empirical case study regarding the conditions and forms of North–South exchanges within the unequal process of the internalisation of the social sciences.

Translating Latin American Social Theory into French and German: On Comparative Processes of North-South Circulation of Knowledge

The rise of Latin American social theory in the 1960s —and its deployment of concepts of "centre-periphery", "dependency", "structural heterogeneity", "marginalization" and "internal colonialism"— carved the way for deeper epistemological and political transformations within development debates and area studies in Europe, which implications continue to be felt today. Particularly between the 1968 and 1989, France and West Germany served as two parallel spaces of reception. The translation process of Latin American social theory into German, led mostly by the prestigious publishing house Suhrkamp and the discussions on journals such as *Prokla*, *Lateinamerika. Analysen und Berichte* and *Peripherie*, gave particular visibility to some Latin American authors. Similarly, the translation process in France focused on academia (for example by Presse Universitaire de France and Antrophos) and concentrated their efforts of discussing Latin American social theory on journals such as *Revue Tiers Monde* and *Politique Etrangère*. By analysing the parallel translation processes and discussions of Latin American social theory in the FRG and France, this paper explores the different intensities, hierarchies and intermediations within the circulation of knowledge from South to North. By paying attention to this little-explored direction in the reception of social theory—from 'semi-peripheral' languages to languages of the 'centres'—, the aim of this paper is to provide an innovative empirical comparative study of North–South intermediations and recognition processes within the unequal dynamics of the internalisation of the social sciences.

The Spread of Developmental Idealism through Diplomatic Ties and Its Impact on Fertility Transitions

The beliefs encompassed by developmental idealism (DI) have been touted as best practices for modernization and economic growth, where fertility decline is a crucial first step. While much of the research has focused on exactly what types of family formation behaviours and beliefs are aligned with DI, less light has been shed on the mechanisms through which these are spread. Oftentimes, the spread of DI beliefs flows from the West to the rest. In this paper, I seek to further

explore DI as a global phenomenon that spreads through the Global South as these nations become more engaged in the international political arena. Using data from the Correlates of War (COW) and the World Population Prospects (WPP) between 1965-2005, I trace the total amount of diplomatic representation each country has over the years, and how this number correlates with which year the country experienced the onset of fertility decline. Preliminary analysis conducted on only African countries showed a positive relationship between the trend in the amount of diplomatic representation and total fertility rate (TFR) over the years. The countries with the highest amount of diplomatic representation early on were also the first to enter fertility decline. These results suggest that a higher degree of international engagement facilitated a transmission of DI behaviours that lowered fertility. I further aim to investigate the North-to-South direction of DI spread by ranking countries according to the amount of diplomatic exchange specifically with the US and analysing how this affects the timing of fertility transition and the trend in TFR. I also aim to explore two possible explanations for the spread of DI through diplomatic ties: a) countries could have spontaneously adopted DI through sheer exposure to Western ideology, and b) countries could have deliberately enforced DI to facilitate political relationships with the Global North.

LARINA, MARIA (St.Tikhon's Orthodox University, Russia)

Areas of Work with Disabled People in Christian Orthodox Organizations

Today researchers grow interest in the problems of human body due to the spread of the healthy lifestyle, the availability of various ways to create the perfect appearance, the trend of body's commercialization etc. Sociologists note a tendency to the accumulation of body capital of people with its subsequent conversion into other types of capital, primarily, economic capital. In addition, the body reflects the social and economic position of a person, his (her) (non)successfulness, belonging to professional groups etc.

Accordingly the problem of social exclusion - ableism and stigmatization of people with disabilities and severe physical illnesses is becoming especially acute. Thereby increases the need for qualified personnel and organizations engaged in inclusive activities, in the development of social measures to mitigate these trends, improve the quality of socially vulnerable people's life and increase their involvement in public life. The paper discusses the activities and methods of the Synodal department for church philanthropy and social ministry of the Russian Orthodox Church and the Center for inclusive education at St.Tikhon's Orthodox University, namely, projects aimed at working with people with disabilities and people with serious illnesses. The Synodal department for church philanthropy and social ministry is working with HIV-infected, deaf-mute, children's rehabilitation with cerebral palsy, autism, mental retardation, as well as building an inclusive education system and inclusive volunteering within the framework of various structures of the Russian Orthodox Church. At this department operates the Society of orthodox doctors, the Coordination Center for deaf, deafblind and hard of hearing and many others. The Center for inclusive education at St.Tikhon's Orthodox University is actively working to ensure the accessibility of higher education to people with disabilities.

Thus, it is important to study the activities and specifics of these organizations to develop guidelines for working with socially vulnerable groups of the population.

International Academic Mobility in Russia: Tendencies, Types, State Stimulation

The presentation clarifies the term "academic mobility" in its conceptual understanding, suggests a classification of types of academic mobility, and also describes the trends of the main forms of academic mobility in Russia, outlines ways to improve Russian national legislation to stimulate academic mobility in the interests of developing the national system of science and education. It is revealed that at present in Russia, to a greater extent, it is the migration legislation that covers the issue of academic mobility, than the legislation on higher education and science. In addition, in the migration legislation, international academic mobility is considered from the perspective of attracting foreign students and teachers to the country, but not regulating Russian students and academic staff from leaving Russia abroad. The presentation proposes a broad interpretation of the definition of "academic mobility" as a set of installations and readiness for movement (potential), as well as the actual territorial movement (academic migration) in order to receive education, advanced training and scientific and educational activities of both students and faculty members. composition in the education system and science. The classification of types and forms of academic mobility according to geographical (territorial) basis, by activity, by duration has been clarified. Based on the classification, the article summarizes information in the context of two types of international academic mobility: incoming (entry) foreign citizens in Russia and outgoing (exit) Russian citizens from Russia. The factors that impede the realization of the potential of academic mobility in Russia are highlighted and recommendations are made for their elimination.

The Status of Foreign Labour Migrants from the Eurasian Economic Union in Russia: Has Economic Integration Eliminated Barriers for Migrants?

The Eurasian Economic Union (Russia, Belarus, Kazakhstan, Armenia and Kyrgyzstan) offers significant opportunities to the EAEU nationals. The creation of single market between these countries has allowed not only free movement of capital, goods and services, but also of people. Citizens of the EAEU countries can enter any EAEU countries without visa and have more simplified registration procedure. The EAEU labour migrants do not need to obtain any work permit and they have same tax rate as citizens of the country. In this paper, we explored to what extent the establishment of the EAEU has brought a benefit to foreign labour immigrants in Russia, which is the top receiving country in the EAEU zone, and what other barriers labour migrants meet, in spite of their legal status. Thus, we critically analysed Russian migration and labour policies, and explored migration data based on official statistics of Russia. We have determined that, despite more advantageous position, the EAEU labour migrants still have socio-economic and legal barriers in Russia such as the complexity of registering at the place of actual stay, thus difficulty with sending children to kindergarten or school. There are also incidents of exploitation and non-payment of salary due to the absence of employment contract and impeded access to health care for labour migrants' family members. Moreover, salient issue is a lack of a pension system for migrant workers and complicated and only partial reimbursement of family expenses for the repatriation of the body of the deceased abroad etc. Therefore, all these impediments are results of bureaucratic mechanisms and steps in migration policy, which are not always logical, consistent and clear, in addition, often politicized, aimed at unreasonable restrictions. Despite the EAEU integration, each state-member implements migration policy based on its own socio-economic interests, and often it is disproportionate.

Human and Nature: Land, Forest and Community of the Indigenous Peoples.

It is important to understand the relationship between human and nature before we talk about preserving our environment. Nature works to its own laws and processes; it is independent of human, yet, it is also related to the human's activities. Nevertheless, our ways of knowing the nature, how we perceive it, speak about it, and engage with it are always historically situated. Environment is what surrounds and co-evolves a particular organism, population. The paper aims to map the politics of nature; which among other things relates to the different voices struggling to define if, how and why the environment is being degraded.

Maximum of the 'forest-land' in the world were mostly occupied by the indigenous peoples of the world. I use 'forest-land' as they were understood as one entity by the indigenous peoples during the native times. It was after the colonial rule in the parts of the indigenous communities, the distinction between land and forest came into inception. Land settlement was introduced by the Colonial state in the indigenous peoples' land. The Colonial administration saw forest, suitable for timber plantation; plantation was introduced by expansion of commercial crops. To start the plantation, the colonial administration implemented forest settlement. The forest settlement was followed by demarcation and infrastructural development. More rules and regulations were implemented, viz., land tax, and forest reservation law were implemented. The law entire impacted on the eco-system, of what surrounds and co-evolves around these indigenous tribe. This further, paved the way for the establishment of mining industries. Thus, with the coming of development plans the relationship between human and nature has drastically changed; commodification of natural resources began. This paper will critical try to engage the tension between the colonial state and the indigenous peoples in the process of implementing the land management.

Why the Mother of the Martyr? the Newly Established "UAE" National Service and the "Debated" New Model of Motherhood

The paper examines the concept of "motherhood" and gender identity politics in the context of growing state-dominated UAE national service discourse. While the Western scholarship has extensively examined the concept of motherhood, little empirical studies have focused on the complex linkages between motherhood, state, and national service in the Gulf, particularly in the UAE. Using in-depth field interviews with national mothers, this chapter examines how national mothers have increasingly emerged as the new ideological "objects" of the state-led nationalist campaign to promote national military service in the UAE. The chapter also dissects the spatial boundaries of, and the complex relationships between motherhood and state, while simultaneously highlighting vignette of gendered narratives of various local UAE national mothers, and how they micro-view, sacrifice, cope, and respond to the ongoing state project. More importantly, the chapter analyzes how UAE national service has shaped the daily lives and sense of belonging of UAE national mothers and their families and how they interpret, understand, and foresee the UAE state's acts of "disciplining and governmentality" in times of ongoing unrest in the broader Middle East region.

'We Did so Many Projects Together': Rural Councillors, International Volunteers and Neo-Endogenous Transformation

External intervention in rural development is often criticized for its overbearing influence on local agency. Drawing on extended fieldwork in rural Ghana, I offer a perspective of agency for rural councillors – who have very limited political scope – through cooperation with international volunteers and external assistance. The study offers a new lens to understand how rural councillors assert agency for public action beyond official state rhetoric and the critique of external intervention. Through this cooperation, local agents strategically appropriate external support for local political action. Besides, rural councillors acquire soft skills to organize local farmers; promote joint supportive livelihoods schemes; and negotiate their farming needs with local state officials. These outcomes through cooperative networks offer a wider framework for understanding everyday local transformation beyond conventional state-led or bottom-up analyses.

Role of Social Media in Assertion Among Scheduled Castes in India: A Case of Haryana

The reality of Indian society is that caste still dominates in every sphere of life. The traditional Hindu society in India is divided into thousand of castes and sub castes. The scheduled castes are at the bottom of the hierarchy, described as the marginal castes.   As and when scheduled castes, who defy upper caste norms, face not only physical violence but also become victims of other oppressive tactics such as social boycott and others various social restrictions. They are not only discriminated socially, but also the issues that concern them are not raised by the media. Most of the Indian broadcast media are controlled by business houses that belong to upper castes. The evolution of internet in India has become a great boon to scheduled castes, particularly to educated youths.

The present papers tries to find out that social media has given a voice to the country's most deprived sections. Now they have opportunity of alternative media like Facebook, WhatsApp, websites and YouTube etc. Now educated youths get well connected with each other by using the social media and share their daily issues. The study also shows that due to social media networking they are able to acquire global visibility and accessible to the literature related to Lord Buddha, Sant Guru Ravidas, Jotiba Phule, Dr. B R Ambedkar, Peryar Ramaswamy and Sant Kabir along with other religious books highlight their subjugation by upper castes. Social media is very helpful in restructuring socio-culture identity and assertion among scheduled castes.

Key words: Scheduled castes, WhatsApp, Assertion, Global visibility, Hierarchy.

Shame as a Second Order Form: Weaving Emotions and Bodies. A Contemporary Review or Simmel's Sociology of Emotions

The main purpose of this paper is to show how shame can be understood as a second-order form. Simmel has a proposal to understand emotions as second-order forms (Cantó-Milà) that have not been sufficiently valued. Emotions as second-order forms constitute social mechanisms that explain how we carry the affective bonds in our memory, such as fidelity and gratitude (Simmel). That is, the affective bonds are forms by which society endures through time from the emotional plane. This approach can be related to Simmel's programmatic effort for the elaboration of the sociology of shame. In that point, Simmel establishes three considerations that will be of high relevance for contemporary debates in the sociology of emotions.1) Beyond Darwin, Simmel states that shame is an emotion that implies reflexivity (like Hochschild insists). 2) On the other hand, Simmel states that emotions like shame, play an important role in the enduring of asymmetric relationships. In that sense, he incorporates a relational dimension of emotions (like Kemper and Scheff do), as well as the element of temporality. 3) Finally, it is possible to identify an indication of the link between emotions and the body through Simmel's sociology of the senses. However, Simmel can be enriched if we consider the recent emphasis on the performativity of emotions, specifically the shame (Ahmed; Gaulejac).

SABINO, WITHNEY* (Associação Sócio Cultural Horizonte Azul, Mozambique)

Solidarity Initiatives of Young Mozambican Feminists

The organizational format that structures the feminist struggles and that has as key factor the funds, has implications for the movement itself that invests time and effort in the construction of requirements and organizational capacity to apply for, receive and justify funds in a cyclical way. This structure, produced by the North and large organizations, professionalizes feminist struggles and generates as capitalist consumer products their monitoring and evaluation frameworks, justification of funds, etc., which are very little adjusted for the inclusion and participation of young feminists.

Our proposal is to bring the perception of young Mozambican feminists to the institutional and hierarchic model of feminist struggle, and secondly, how they reinvent themselves and what alternative forms of solidarity they create in resistance and the sustenance of their struggles.

Populism, Fake News and the Immigration Issue

The latest European elections have confirmed that populisms are affirming themselves even in established democracies, by emphasizing people's fears in

the rapidly changing globalized world. In many Countries, they have specifically targeted immigration as a threat to the nation. In this paper we will analyze how the campaign has successfully developed a narration around the myth of a dangerous, consistent, immigrant invasion and how this issue has monopolized the campaign, while, on the other hand, the data shows us a very different picture. The immigrant population in Italy for example, hardly reaches a total of 10%; second generation students show a will for integration although the general political mood could leave them in a limbo between the cultural identity of their parents and that of their new cohorts that could slow down the integration process in host countries. As our latest research carried out in Italian secondary schools seem to indicate, schools and education in general, seem to be at the same time the radars through which we can monitor the changing political culture towards immigration and the pivot social agencies for developing a more inclusive and less conflictual social change.

SACCHETTI, FRANCESCO* (Universita degli studi di Urbino, Italy)

Italian Muslim Cemeteries: A Space for Memory and Policy for the Future

This contribution is the result of four years of ethnographic research that has touched several Italian cities: Firenze, Rimini, Gioia del Colle, Torino and Udine.In this work, we think about the Islamic cemeteries as symbolic place of memory and as a physical space to give proper burial to the end of the existence of believers of the Muslim faith. In this sense the study that was conducted covers aspects of the cult rituals, and those related to the recognition and legitimization of the "diversity". A place of memory is a land where somebody plant roots: therefore the burial rituals and sites are loaded with meanings that relate to the construction of a past for the benefit of the dead but also for the future of the living.

Argumentation will considers the Islamic concept of death and funerary practices connected with it. *Janazah* is the Islamic term which means 'funeral', but it is also use to indicates all the funeral activities since the death until the closing of the tomb. There are several steps of this peculiar funeral ritual that mark the right way to treat a Muslim and to prepare, in the right way, his/her mortal remains while his/her soul tackles the journey in the afterlife.

The reflection on the Muslim "urban and symbolic space related to memory" concerns the processes of citizenship relating to spiritual identity and strategies of appropriation, which assume a certain level inclusion. Therefore raises the question of how the cultural citizenship is represented both by immigrants both from the host society: on one hand we observe the opens up of space fora request religiously and culturally connoted, on the other we should consider the decision-making processes and policies that could produce facilities designed to meet that demand for the present and the future.

Movilidades Plurales. Desafiando Narrativas Esperadas y Ampliando Resistencias Indígenas.

Existen múltiples procesos de aprendizajes institucionalizados que son valorizados de diversas maneras y que implican una pluralidad de movilidades interdependientes. El aprendizaje institucionalizado/escolarizado es visto, en muchas geografías y latitudes, como un medio y mecanismo privilegiado que supone movilidad(es). Tener acceso a los conocimientos impartidos dentro de espacios institucionalizados como la universidad o en otros espacios especializados en temas específicos, es necesario y de suma importancia, sin embargo, reconocer sus limitaciones es fundamental.

Desde múltiples experiencias de encuentros y/en resistencias, me gustaría reflexionar sobre cómo algunos espacios de 'formación' son lugares visibles de ampliación, tensión y resistencia de formas de hacer, ser, pensar y conocer. Esta reflexión es fruto de mi acercamiento al programa de becas para representantes indígenas organizado por la oficina del Alto Comisionado de las Naciones Unidas para los Derechos Humanos, un programa que busca difundir el sistema y los mecanismos de derechos humanos y de derechos de los pueblos indígenas en el ámbito internacional. Tomando como referencia este espacio privilegiado, mi participación busca comprender el cómo dialogan, se intercambian y se valorizan diversos conocimientos, prácticas, vivencias y resistencias de los pueblos indígenas en relación a sus derechos. Es necesario mencionar que estos encuentros de formas de ver, estar, ser, entender y conocer el/los mundo(s) están permeados por historias coloniales y colonizadas, relaciones de poder entre 'tipos' de conocimientos e injusticias epistémicas. Estos encuentros situados son dominados por gestos, por diferentes tipos de 'experticias', por epistemologías dominantes y dominadas, y por cánones (re)productores de 'otros' seres y conocimientos. Asimismo, en estos encuentros, las resistencias y movilidades son epistémicas, son procesos constantes de ampliación de conocimientos, de prácticas corporales y discursivas en continua movilidad.

Medicalization of Pregnancy in Contemporary Turkey: The Effects of Risk Discourses on Turkish Women's Experiences

Turkish mothers' interactions with medical authorities during pregnancy has developed in a context of risk discourses produced by biomedical experts with surveillance justified by these discourses. Giving meaning to pregnancy through the search for the reduction of risks is a reflexive part of Turkish mothers' everyday life.

This paper discusses a study examining how pregnancy are socially constructed, how increased medicalization is experienced by Turkish mothers, and how they assign meaning to pregnancy. A phenomenological research was designed using depth interviews with 10 Turkish mothers with children aged 0-6, living in Istanbul who had high education and welfare levels.

The finding shed light on Turkish mothers' subjective experiences and how medicine as a profession shapes this experience. With the medicalization of pregnancy, how the trust towards the experts, the knowledge of preparation for maternity in an appropriate and responsible manner have become functional for Turkish mothers to create a sense of ontological security are examined.

SAEED, SHEBA* (University of Central Lancashire, United Kingdom)

The Role of Social Media in Mobilizing the Trans-Movement in Pakistan

In recent years there has been an increased visibility of transwomen within the Pakistani media. We see transwomen walking the ramp amongst cisgender women, reporting news daily as news anchors, presenting their own shows and employed in high end coffee franchises. These may be few and far between and some amongst us may also attribute this to a certain "tokenism", however, what we cannot deny is that a decade ago these pioneering transwomen were nowhere to be seen on mainstream channels.

Having researched the transgender community since November 2017, the author has noticed an evolution within the community. This has evolved from traditional roles which involved performing, begging within a cultural sphere and resorting to begging to a movement involving a self-identification as being transgender. The paper explores the rise of an urban transwoman and the role of social media in mobilizing the trans-movement in Pakistan and therefore empowering this community. It will also explore the complexities that this exposure brings to the community. In doing so, the paper will firstly explore how these transwomen are self-identifying their gender using feminist and queer theories in order to understand the complexities of gender and gender fluidity.(Beauvoir, 1949; Butler, 1990) It will then analyse socio-cybernetics in relation to the trans-movement and how a digital platform has brought a marginalized minority group into the public sphere (Habermas, 1962).

The paper will also explore intersectionalities amongst the trans-movement as well as an exploration of how social media is assisting it through the process of "scaling". (Mundt, Ross, Burnett, 2018)

SAEED, SHEBA* (University of Central Lancashire, United Kingdom)

Understanding Perceptions of Child Agency, Autonomy and Intersectionality through an Analysis of Adult Reflections on Acts of Childhood Rebellion: A Case Study of British South Asians

Whilst children are increasingly viewed as social actors whose subjective experiences and narratives provide knowledge on how childhood is socially constructed, we lack good qualitative research into the lived reality and experiences of childhood (Prout and James 2015; Andresen 2013; Bohne and Hunner-Kreisel 2016). Despite 30 years of the United Nations Convention on the Rights of the Child (1989), there is ongoing concern about insufficient attention given to children's voices. Through an exploration of adult reflections on their own childhood, this paper examines the notions of child agency, power and negotiation against a backdrop of perceptions of parenting styles and practices (Baumrind, 1966; Maccoby and Martin 1983). A total of 20 British South Asian women, aged 18-62, (Indian, Pakistani and Bangladeshi) participated in the study. Given the paucity of literature in this area, the paper's unique contribution is contained in its focus on British South Asian women's narratives on childhood rebellions against parents in Britain in the context of social and cultural constraints, and norms and values. The findings are located within debates on patriarchy, oppression, education, and inter-generational gap/relationships. In its problematizing of the axes of social class, gender, caste, religion, and age, the paper offers useful intersectional theoretical and empirical insights (Crenshaw 1991; Konstantoni & Akwugo Emejulu 2017; Johnson et al 2019). An intersectional lens helps highlight how factors such

496

denotes a presenting author. Abstracts are organized by first presenting author's last name.

as social class, gender, caste, religion, and age mediate in family dynamics and practices and childhood rebellions against parental norms and expectations. A focus on parenting practices intertwined with hybrid childhood identities demonstrates limited choices available to children, resulting in a lack of agency and subsequent rebellions (Schmeekle, Lynn and Creesey, 2018). Adult trajectories based on such formative experiences signal the impact of lived realities of childhood. The paper highlights policy implications in relation to child well-being.

The Social Construction of Environmental Expertise: Investigating Expert Engagement in Marine Aquaculture Management in Santa Catarina, Southern Brazil

To forward sustainability, planners rely on scientific input to understand the intertwined social-environmental aspects of development. Nonetheless, defining who is an "expert" and the bounds of their expertise can be difficult. Insights from the sociology-of-science suggest that internal norms within the scientific community shape the social construction of expert identity and the nature of scientific engagement. Nonetheless, whether perceptions of what constitutes "expertise" vary between scientists and science-users, and how differing views influence their collective behaviors, is uncertain. Through a case-study of expert engagement in shellfish aquaculture development in Santa Catarina, Brazil, we investigate, 1) how scientists and science-users socially construct what constitutes aquaculture-related expertise and 2) examine to what extent experts provide input on scientific or socioeconomic issues that are peripheral to their disciplinary or professional expertise. Data consist of fifty-five interviews with scientists, planners, and shellfish growers. Growers and planners consistently believed experts' singular status as "aquaculture scientist" made them credible sources of information for any aspect of aquaculture management – production, environmental, or economic-related. Science-users most often sought out scientific expertise related to production issues and were concerned that engagement by environmental scientists could impede development. Relatedly, they rarely sought out external expertise to address social or economic concerns. Among scientist respondents, we found that experts in production-related science were more likely to recommend management actions than those with environmental or impact-related expertise. Interestingly, production scientists were also more apt to provide input on topics outside of their area of scientific expertise (e.g. regarding environmental contaminants), and often discussed the economic aspects of aquaculture, independent of their lack of training in impact-related science, economics, or business management. These asymmetries among scientists and science-users regarding the status and roles of experts illustrate intriguing patterns, but further sociological inquiry related to the social construction of environmental expertise is needed.

SAGE, LUCAS* (, France)

Do Networks Contribute to Wage Inequality?

Sociological analyses of wage inequality have generally focussed on average pay differences between groups such as the gender pay gap (Leicht 2008), or what one may call, between group inequality (BGI). Yet, an increasing number of studies highlight that within group inequality (WGI) - inequality between observably similar workers - is at least as large as BGI (VanHeuvelen 2018). Interestingly, WGI differs between groups: more educated and more experienced workers have larger WGI (Western and Bloome 2009). Why similar workers are paid differently and why this is more pronounced in certain groups is puzzling.

Many papers reveal that side by side individuals' heterogeneity, firms' heterogeneity in pay policies contribute to workers' wage attainment (Card et al. 2018). The *sorting* of workers across heterogeneous firms is responsible for large amounts of BGI (Card et al. 2015), but also partly for the WGI patterns described above. Indeed, there are robust evidences of *assortative matching*: high wage workers tend to work in high wage firms.

This paper explores the mechanisms generating assortative matching. For this, I develop an agent based model (ABM) in which the heterogeneity of firm's and worker's populations are empirically calibrated French longitudinal matched employer-employee administrative data. Workers can either find jobs through formal applications or through their social contacts. Because social networks are homophilious, they are often expected to exacerbate inequality. Yet, things could be more complex since lower social status individuals tend to rely more on networks to find jobs, and in particular on their strong ties (Kramarz and Nordström Skans 2014). In contrast, high status individuals use a mix of job search methods and are better able to use opportunities offered by weak ties to reach high wage firms (Schmutte 2015). The ABM allows to explore how these different mechanisms contribute to the different forms of wage inequality.

HULIÑIR, VIVIANA (Universidad de La Frontera, Chile)

The Biographical Struggle on Belonging to the Mapuche We-Group: A Case Narrative

The Mapuche are the largest indigenous group in Chile and live in the southern region of that country. Since the return of democracy (1990), the Mapuche people have initiated a process of negotiation with the Chilean state concerning the recovery of stripped lands, the possibility for a self-determination from an economic, political and juridical point of view. Also, there has been a great deal of discussion regarding a sort of essentialist Mapuche identity (Bengoa, 2000 and 2011; Nahuelpán and Antimil, 2019), which appears to be static and rejects biographical narrations on how the Mapuche we-group is reflecting about themselves.

In the last decade, the conflict between the Chilean state and some Mapuche communities has worsened, especially in La Araucanía region (Mansilla and Melin, 2019). It is in this socio-political context that being and becoming a Mapuche has been constantly in tension, as is the case with those Mapuche people whose biographies and life histories make it difficult for them to reduce their life story to one identity (Rosenthal, 1997), although they share the political, social and economic principles of their we-group.

Our paper is a case study on the life biography of a young university Mapuche woman raised in an assimilated Mapuche rural community, who is changing within her community and is in search of a sense of belonging between her profession and her Mapuche heritage. We took an analysis approach from Rosenthal to examine the interviews of the life history and the life story of this young woman who reflects on the search to be and to learn to be a Mapuche as an attempt to generate bonds of belonging to her community. This life story reflects the complexity of a woman's life, in a region with political and identity conflicts, who also struggles with her own personal challenges.

Under Neoliberal Blanket: Caregiving/Care Provision in the Resettlement of Yazidi Refugees in Calgary

With millions of refugees fleeing the conflicts in Syria and the emergence of the so called Islamic State, commonly known as ISIS or Daesh, and their genocide against the Yazidi religious-cultural minority in Iraq, the most important issue became where the refugee would resettle. The majority of those forcefully displaced vanished in-between borders far from the "developed world". The UN-selected Yazidi refugee families who did make it to Calgary, Canada, under the Survivors of Daesh program, came via airplanes that brought them onto a cold foreign land found themselves rapped by services that although warming, surfaced a structure that pushed them to become "economic," "independent," and consumerist. The scarcity of services provided and the expiration date on Yazidi refugee families' financial aid, and most importantly the fall through of promised family reunification put mental burdens on already traumatized and Yazidi community in Calgary. What went in between the lines of insufficient budgets, long waits for child support benefits to kick in, unfamiliar "mental support," and confusing laws has been the *care work* the service provider staff and volunteer family friends put into doing the job and the pressure women/mothers take in to smooth the resettlement process for their families. This *care work* gets woven into the larger institutional resettlement practice and discourse and is often overlooked. This paper will recognize such labour and the relationships that form out of it. Although women tend to be perceived as the more nurturing ones, the resettlement experiences of Yazidi refugee families show that *care provision* in resettlement is not necessarily limited to women but that it is an integral part of resettlement of the Yazidi refugee families and is both offered and received by women and men.

Assessing Trajectories of People's Movements in Eastern India

Social movements and protests in contemporary India is the reflection of socio-political instability, emerging voices of dissents and rising aspirations of the people. Contentious collective issues triggered many violent 'cycles of protests' which had shown enormous repercussions on almost all the spheres of public life, sometimes emanating complete breakdown of order. Volatile movements, sluggish nature of the state, and sometime proactive temperament of communities often aggravate the problem. The state cannot accommodate all the demands, often competing demands by communities. The relationship between the state, communities and social movements in various parts of India require comprehensive understanding of protests and movements through which one can assess the broader socio-political structures in various sites of India. The present paper makes an attempt to review various movement studies and their theoretical

standpoints and tries articulate the dynamics of existing relationship between the State, communities and social movements in eastern part of India. Further, it also tries to articulate the role of caste, class, gender and ethnicity in the process of mobilisations.

Social Movements in Post-Revolutionary Tunisia: An Intersectional Analysis

Even though Tunisian new social movements were born before Tunisian 2010-2011 Revolution, the latter has invigorated the former. The Revolution gave hope to young Tunisian people, opened windows to their expectations and aspirations. Disappointed with a betraying parliamentary and governmental political class, Tunisian post-revolutionary young men and women come to decide to face their fears. Sociologically speaking, there was a double-faced socio-historical process: the first is the one of sentiments' social (de/re)construction, the second is of youth agency (re)building.

Between 2015 and 2017, Tunisian new social movements experienced coordination meetings, summer universities and national conferences enhancing their capabilities. The main slogan of all these bringing-together encounters was " Diversity, Resilience and Solidarity". Away from traditional parties, political associations and unions' means, new post-revolutionary Tunisian social movements were surfing on a surface of disappointments, fears and hopes, the very Tunisian youth mixed feelings and sentiments. Standing on a multifaceted social fed-up, the new Tunisian social movements path led their young activists to (re)forge their unity upon an intensive emotional integration.

Students, early graduated and newly recruited young men and women in both public and private sectors, showed up in big and smaller towns and urban areas, trying to bring together laid-off women foreign financed textile factories, victims of chemical and mining industries pollution, unemployed women and men, and even semi-legal sub-Saharan African countries migrants which attempts to reach Europe ended in Tunisia.

Build upon qualitative and quantitative data collection, participation observation and semi-directed interviews, the presentation will try to offer a sociological analysis of Tunisian post-revolutionary social movements considering two perspectives: intersectionality and socio-historical construction-deconstruction-reconstruction process of social hopes, fears and agencies. Will be privileged the point of view assuming that the birth of such new social movements is closely linked to multiple other end signs of the Post-Colonial Tunisian State.

SAIDANI, MOUNIR* (Tunis El Manar University, Tunisia)

Tackling Environmental Inequalities in Post-Revolutionary Tunisia. Actors Struggles and Challenges.

Environmental activism in Tunisia is neither new nor nascent of the post-revolutionary area. Environmental issues were raised in Tunisia since the late last decade of the twentieth century, launched by the official commitment in international environment safeguard agendas. Till the fall of Ben Ali, one can talk about a state environmentalism, characterized by a strong abroad-oriented propaganda. All other understandings of environmentalism were banned, repressed. Because of this official narrowing opportunities politics, environmental issues, as struggle axes and themes of mobilization, were no more than derived questions, strangled between other human rights activism issues. Urban settled NGO's, under masculine leadership, were the spearhead of this legalistic and conformist environmental activism.

After 2010-2011 Tunisian Revolution, two main changes are to be retained regarding environmental activism in Tunisia: 1- its commitment with the general activism of the widely diverse social movements struggling for more than one understanding of social justice; 2- its grounded position in the soul of a confrontational political opposition to the new established regime. Standing on a constitutional ground (articles 12, 44, 45, 129) considering environmental rights for the current and the coming generations, and on a strong political consciousness, the new environmental activism is tackling openly different issues related to environmental inequalities in Tunisia.

Based on quantitative and qualitative data collection and on semi-directive interviews, the presentation aims to define the actors embedding this new environmental activism, with a special stress on the role of youth, its inventive manners of organizing-mobilizing, its protesting-claiming strategies and the most important axes of activism. The challenges of diversification of the struggle means and activity areas, respectfulness of gender equilibrium among environmental activists, lobbying more efficiently for environmental causes among politicians and putting an environmental based political agenda will be raised.

Re-Socialization and Normalization: The Role of Adult Guardianship System on Elderly with Dementia in Japan

With the rapid graying of Japanese society and the increasing concern over the welfare of people with psychiatric disorder, mental retardation and dementia, a renewed adult guardianship system and a long-term care insurance system were established in 2000. The renewed adult guardianship system consisted of statutory guardianship and voluntary guardianship, was revised for the idea of respect for self-determination, practical use of remaining abilities and re-socialization. It was created to adopt to the change from quasi-incompetency system to a system of assistance(補助), curatorship(保佐) and guardianship(後見), and has built a social protection nest for elderly and mental disabled people.

This study aims to fathom how adult guardianship system as an element of social security in Japan contributed to addressing the social risks of elderly with dementia. Qualitative data from secondary data and semi-structured interviews was collected during fieldwork in Japan. The findings indicated that the adult guardianship system has not only contributed to the normalization of family relationship and social network, but also improved the ADL status of elderly and the re-socialization of people with dementia.

Furthermore, this study address a broad spectrum of geriatric social work practice with the elderly where lawyers, social workers, NPO and the local government collaborate. In addition, this study reveals the socialization of guardianship system provides a considerable contribution to welfare creation—which is enhanced by revitalization of local resources and the long-term care insurance policy.

Lagging behind Others: Exploring Transformation of Muslims' Educational Outlook in Modern Times

Franz Rosenthal in his seminal work *Knowledge Triumphant* describes *'Ilm'* as a defining characteristic of Muslim civilization , a supreme value for Muslim being , a value that touched all aspects of Muslim intellectual, religious and political life. Rosenthal endeavors to catch a glimpse of medieval Muslim civilization where he observes a predominant veneration of knowledge at all levels. Contemporary landscape of Muslim education however, presents a different picture altogether. The reverence of knowledge, once a trademark of Muslim civilization, seems to be lost completely. The attitude of Muslim world towards knowledge maybe gauged by the fact that 57 Muslim countries included in Organization of Islamic Cooperation (OIC) that make up around 25% of world's population, make only 2.4% of world's research expenditure, 1.6% of its patents and only 6% of its research publications.[1] The current study attempts to make sense of the transformation of Muslims' educational outlook in modern times. Focusing on the case of colonial India and modern day Pakistan, I explore how colonial intrusion of India dichotomized education into two separate, divergent domains; religious and secular, thus creating a rift in educational outlook of successive generations. With the help of a survey based on semi structured interviews of 236 students from 38 universities of Pakistan, I attempt to assess the impact of a fragmented education system on educational outlook of young Pakistani students. The study reveals the disruptive impact of a divided education system on educational aspirations, experience and achievement of students. Students express a strong desire to integrate religious and secular education to make their educational experience more meaningful.

The Sociologist Who Waits: Frances Donovan and Her Contribution to the Chicago School of Sociology

This presentation examines the works of Frances Donovan (1880-1965), who published monographs on women's occupations in American cities in the early twentieth century based on her own participant observations.

She moved to Chicago with her architect husband and then started to attend sociology seminars at the University of Chicago after he suffered a critical illness. Under the guidance of sociologists in Chicago, she conducted participant observations of ordinary women in urban environments. In 1920 she published her first book, *The Woman Who Waits*, which provides us with the detailed daily lives of waitresses in Chicago. Her second book, on salesladies in a department store in New York, was published in 1929 by the University of Chicago Press with a preface by Professor Robert E. Park. Her third book, about female teachers, came out in 1938.

In her books, she totally merged into women's lives and discussed the nature of their work, income, and relationships. As a female sociologist, she treated their

denotes a presenting author. Abstracts are organized by first presenting author's last name.

intimate lives differently from male sociologists. Her books had been repeatedly mentioned in syllabi on early Chicago sociology, but few people are interested in her contribution to the Chicago school now. However, her vivid description of women's lives still appeals to current readers.

I would like to discuss the distinguishing features of her method and interests in comparison with other contemporary sociologists. Additionally, I will consider how women's sociological studies could be practiced at that time in Chicago, where women played remarkable roles in the field of social sciences, especially in social welfare.

Mapping Disabilities By Multidimensional Scaling: Analysis of People's Subjective Ranking of Disadvantageous Bodily Conditions

This presentation explores people's ratings of different disability types based on the anticipated degrees of concurrent disadvantages. It is an extension of the subjective method of occupational prestige ranking to disability, which consists of different types of disabilities: visual, auditory, physical, intellectual etc. The focus of this presentation is the "distance" that people perceive between disability types and their underlying corporal meanings.

A random-sampled postal questionnaire survey conducted in 2018 in the Southern Kanto District of Japan measured the degrees of anticipated disadvantages for different bodily limitations. Out of 1,000 samples, 322 persons responded with 253 valid cases (25.3%). Respondents rated the extent to which they thought 33 different bodily conditions such as "inability to see" are an impediment to aspects of social life, e.g. work, school, and marriage. The options that earlier ranged from one ("not adverse at all") through six ("extremely adverse") were later converted to 0, 20, 40, 60, 80, 100. The mean scores for each bodily condition corresponding occupational prestige ranged from around 30 ("having no hair") to over 90 ("inability to see or hear"), demonstrating anticipated differential social severity for the disability types.

For further analysis of people's understanding of social disadvantages and the body, multidimensional scaling was applied to the distance matrix of response patterns. Based on the Euclidean distance, the disability types were distributed in a narrow band, suggesting a one-dimensional structure. Alternatively, based on product moment and polychoric correlations of response patterns as similarity, some clusters of disability types emerged: bodily dysfunctions (including not only physical and sensory limitations but intellectual and learning limitations), disorders (psychiatric disorders including addictions), disfigurement (e.g. a birthmark on the face) and pain (including fatigue). These indicate diverse aspects of the social body.

Thus, the analysis reveals both a hierarchical and a multifaceted structure of disability ranking.

From the Study of Users and Professionals to the Working Conditions of Practitioners: A Shifting Agenda for Sociological Research into Complementary and Alternative Medicine

Much research in the sociology of complementary and alternative medicine (CAM) in modern societies has focused on the characteristics of users, including features such as age, class, ethnicity and gender. Equally, there has been much interest in the typically rising numbers of recipients of CAM in both specific countries and for particular therapies. Although research has shifted towards the educational and professional aspects of CAM and the numbers and knowledge base of its practitioners, as well as the potential benefits (or otherwise) of particular therapies for the holistic living of clients, too little attention has been given to the working conditions of the diverse range of therapists operating under the CAM umbrella. In the UK, for example, are the typically full-time middle-class working patterns and relatively high earnings of groups such as the statutorily regulated chiropractors and osteopaths emblematic of CAM? Or are such groups more accurately depicted by the often sporadically employed and less well rewarded practitioners of herbalism and homeopathy? Irrespective of trends either from or towards marginalised precarity, it is argued in this paper that more research is required globally on the dynamic aspects of the employment of CAM practitioners themselves – going beyond simply the sociology of health and back to the classic traditions of the sociology of work.

The Professional Labour Market and Health Support Workers: The Politics of Exclusion

This paper considers from a neo-Weberian perspective the position of health support workers and their relationship to the health professions in the labour market, with a particular focus on the UK, but also with comparative reference to other societies. Health support workers like care assistants and allied health professional aides far outnumber those in the orthodox health professions, but are largely the invisible providers of health care. Those in this heterogeneous group typically take on the characteristics of a precariat, with short-term contracts, difficult working conditions and low pay. Importantly in this context, such roles are heavily populated by females, migrants and ethnic minorities. Unlike professions, this group is little regulated. While there are exceptions, they also structurally have few opportunities through such mechanisms as continuous professional development or state sponsorship either individually or collectively to become fully-fledged health professionals or professions. Equally, this marginalised group is treated by professions, with state support, as a way of cheapening health care and advancing their income, status and power through the delegation of 'dirty work'. As such, the position of health support workers in the labour market has implications for not only working conditions, but also the service to users. In contrast to professional inclusivity through social closure, this paper sheds light on the self-interested and discriminary politics of exclusion in relation to minority groups in health support roles. In so doing, it considers how far the consequent inequalities that exist in the dynamically changing health field are being overcome.

Gender Inequality and Politicization of Culture in Muslim Societies

Within the context of both Islamist and post-Islamist ideologies gender equality has long been debated as part of "countergender rethoric" which targeted gender equality as the opposite of gender justice thought to be emanated from religious rules and customs. In this framework of thought western cultural norms and legal rules, in a nut shell epitomized as cultural imperialism, hinder women's empowerment in Muslim societies. On the other hand, feminist researchers have long argued that women's oppression in Muslim societies can not be understood through religious verses or Muslim culture, for it is not inherent to Islam, but should be understood by looking at historically and institutionally defined modes of cultural control over women's sexuality which might be both informed and influenced by Islam as well as other social and economic factors, without imagining that some day their methodologically correct standpoint would be appropriated by Islamic countergender movements to replace gender equality with gender justice. This paper argues that to appropriate the concept of gender equality and empty its content Islamic countergender ideologies remanipulate, reinvent and regender what it has been thought to be cultural, and thus politicize it for the advocacy of religiously justified gender justice instead of gender equality. It argues that it is at least the case in a Muslim majority country like Turkey where women's human rights supposed to be secured by secular laws and international agreements, and shows how such a countergender rethoric became central to governmental gender policies in line with growing global right and populist authoritarianism.

SALATA, ANDRE* (Pontifical Catholic University of Rio Grande do Sul, Brazil)

Race, Class and Income Inequality in Brazil: A Social Trajectory Analysis

The paper deals with the relationship between race, class and income in Brazil, with the main objective of investigating the determinants of racial inequalities in the country's labor market. In making use of structural equation models, we analyze the process of establishing income differentials between whites and blacks, from their social origin to the definition of wages, through schooling and occupational allocation. The analysis, based on data from the Brazilian National Household Sample Survey (PNAD-IBGE), collected in 2014, allows us to compare the direct, indirect and total effects of race and social origin on the income from work. As a result, we could better measure and understand the main paths through which race and social origin affect income, and also the weight of each of these principles of stratification in explaining income gaps between blacks and whites in Brazil. The results show that although social origin total effects are larger than racial effects, the former cannot explain most of the disadvantages suffered by blacks nowadays in Brazil, which occur mainly indirectly – through education and occupation. Therefore, we can confirm that after 130 years since the abolition of slavery in Brazil, the black population still suffers a double disadvantage: due to the historical legacy of four centuries of slavery, they tend to be born into families with a lower stock of economic and cultural resources, which has direct and

indirect effects — especially through education — on their income in the future. Additionally, they face disadvantages due to their racial category, which manifest themselves at different moments of their life cycle: in school results, occupational allocation, and, finally, in the establishing of wages. Thus, the paper brings new, updated and more detailed evidence to a long-standing debate.

Landscape Transformations in Baixo Augusta

This paper presents some preliminary results of my Phd research on landscape transformations in "Baixo Augusta", a urban region located in Sao Paulo city, Brazil. "Baixo Augusta" is a social-constructed denomination for the downtown portion of Augusta's Street, famous in the city for contemplating shopping and leisure circuits. Since its inauguration, Augusta's Street has undergone a variety of transformations on its uses and spaces; generally, the literature points out three distinct phases of its history: the glorious phase, when the street held the most elegant shops in the city and was frequented by the city's elites; the degradation phase, when the lack of public and private investment stimulated the emergence of alternative nightclubs, brothels and cheap hotels; and the revitalization phase, when the emergence of leisure-oriented establishments in Baixo Augusta consolidated an young-leisure circuit in the city. Following the revitalization phase, in 2000, skyscrapers tear Baixo Augusta's landscapes in a real state boom, possibly pointing to a gentrification process. I analyze these recent transformations giving centrality to the concept of landscape, that can be articulated as: a) epistemological apparatus; b) symbolic form; c) reality of space production and reproduction. In this way, I propose a theoretical review of the term, revealing its potential to analyze certain particularities of a gentrification process in a South American city, whose reality is different from that of the cities of the classical gentrification model, as New York or London. In this sense, I argue that the Baixo Augusta's landscape transformations cannot be framed in a classical gentrification model, since it is possible to observe a juxtaposition of times in the spaces of the street – establishments of the three phases of Augusta's history coexist in the present, as the drawings remnants in a pentiment, and are experienced today in a variety of forms.

Economic Cycle, Female Employment and Household Income Inequality: The Invisible String of Inequality?

This paper explores the importance of socio-demographic forces in explaining recent trends on income inequality, a question of increasing relevance in current times. While there is a broad agreement at both political and scholar level on the importance of the activation of female employment from a gender equality perspective as well as on economic strands, its impact on overall income inequality among households is far less clear. Previous studies show mixed evidence regarding the expansionary period previous to the Great Recession in particular countries, largely the US, while there are no studies covering the most recent years from 2007 onwards from a European wide perspective.

These new contours of inequality largely depend on how families and households distribute labor supply *among* their members, which, as we argue, can be taken as the true invisible string of (economic) inequality. In this article we analyze the role of female employment in recent trends of income inequality across EU15 formally separating the different effects at work on the impact of female employment on income inequality over two contrasting periods of the economic cycle, pre and post the Great Recession (GR) –i.e., rising employment rates, changing patterns of assortative mating and the dispersion on earnings by population subgroup. Our study will bring not only novel information on the interaction between changes at the micro level, related to female employment supply within households and the overall distribution of household income along one of the longest expansive cycles in advanced economies in the post-war period, but also the opportunity to explore similarities and differences between European countries.

SALIDO CORTES, OLGA* (Universidad Complutense de Madid, Spain)
CARABANA MORALES, JULIO (Universidad Complutense,)

States Versus Markets? on Why Inequality and Income Classes Barely Changed in the EU15 during the Great Recession

According to the EHPS and EU-SILC data (Eurostat), neither the Gini index nor the middle class income quota have changed in the EU-15 since the mid-1990s.

Our own calculations with EU-SILC microdata show that the size of the middle classes has not changed since 2004 in the EU15 as a whole, with random oscillations of at most one point, mainly due to an increase of the poor classes and the decrease of the rich as a result of the impact of the Great Recession. This stability does not match well with narratives about a general increase in inequality and polarization and the decline of the middle classes as a result of globalization in advanced western economies. In this paper we analyze the extent to which socio-political institutions compensate for the effects of economic ones, taking all EU15 countries. To do this, we examine changes in the size of different segments of the income distribution and in the Gini Index, both at market income level and after taxes and transfers at different times of the recent economic cycle. This comparison provides an improved empirical test for theories that state that globalization and other market forces have induced in Europe income polarization and erosion of the economic middle classes in a similar way than in the US, reinforcing on the contrary theories pointing to the role of institutional forces and country-level as the most relevant factors in explaining recent trends of income inequality.

SINGH, SITA RAM (Ganpat Sahai Post Graduate College, India)

Globalization and New Media Technologies : Indian Context

Globalization is a process by which cultural and economic forces have come to operate on global as much as national levels and also refer to global extension of power of western corporations and to the increasing homogeneity of product on a global scale. It is a way of conceiving the world as much being a material phenomena. In economic terms the selection of certain people for certain media within certain countries or regions. It operates at both macro and micro level. Shifting alliances between nation states in 18th and 19th centuries and creation of empires is a shifting alliances and mergers between media corporations in the 20th century. Behaviors create ways of thinking global standing locally. Every country has a cultural location and identity because its cultural goods were brought back. An attempt has been made to find out. (i) How globalization is to model consumerism on market, economies and production ? (ii) Whether global media companies impose their production practices on local people – a one way flow ? (iii) Whether pluralist globalization with cultural diversity flows in many directions and lastly (iv) What are the impact of New Media Technology on culture ? There is a need of a model in which the relationship between the global, the regional, the national and the local is creative state of flux in terms of production and consumption.   Globalization is about much more than space and time.

SALLA, FERNANDO* (Center for the Study of Violence,)
ALVAREZ, MARCOS (University of Sao Paulo, Brazil)

Theoretical and Methodological Reflections on "Organized Crime"

Social Sciences are increasingly devoted to understanding the dynamics of illegal markets in a context of globalization and the role of organized criminal groups in these markets. Such groups require diverse theoretical and methodological approaches, since they have their own social or ethnic composition; its forms of internal organization range from rigid hierarchies to fluid network systems; such groups may engage in a wide variety of activities in illegal markets but may also be embedded in legal economic activities; may or may not resort to violence to exercise control over territories and their populations; may develop different levels of accommodation with state spheres. In fact, these are some aspects that challenge the analysis in the field of Social Sciences around this theme. From a research project under development at the Center for the Study of Violence at the University of São Paulo, we intend to point out some elements that could contribute to comparative studies between such groups - such as the experience of incarceration, involvement with drug trafficking, the protection of illegal activities by public agents, the social bases of member recruitment - especially in Latin American contexts. The proposal, therefore, is to indicate, from a large international academic production, some theoretical and methodological axes that would allow the construction of a comparative reflection on the so-called organized crime, having as its main objective an understanding of this phenomenon in Latin-American contexts.

Meat and the New Materialisms: Exploring Food Activism for Sustainable Diets in the Anthropocene

Meat consumption is increasing globally, threatening the health of populations and the sustainability of ecosystems. A call to action is challenged by the cultural

denotes a presenting author. Abstracts are organized by first presenting author's last name.

dominance of meat consumption, misaligning this threat with traditional public health approaches. A need was identified to explore the sociocultural meanings of meat, and the influence of dietary cultures in food sustainability.

A traditional ethnography was conducted, in which the researcher became a member of the Birmingham Foodie Community; an informal network of food activists in the West Midlands, using grassroots food activism to facilitate participant-led investigation of the cultural meanings of meat. A year-long period of overt participatory fieldwork generated a large multimedia dataset, explored using a bespoke post-human analytical process developed from New Materialist Social Inquiry (Fox & Alldred, 2015).

Resultant themes identified diverse cultural meanings of meat in the Birmingham Foodie Community, beyond that of a simple consumable product. The sociocultural role of food as a material of development, maintenance, transition and extinction of dietary practices, urban food systems, local communities and microcultures determined that meat, as a scarce but demanded resource, was both an object and stimulant of local micropolitics. Meat was a material which connected local activist-led solutions to global health challenges, through which activists negotiated local community development to contribute to global food sustainability. Activists, motivated by social justice, planetary health and community development, used meat to facilitate social activity, interactions and the re-imagination of local food systems, towards a future of sustainable consumption in the Anthropocene.

This presentation shares diverse sociocultural meanings of meat consumption, and the associated challenges and opportunities they present in the development of food policy and public health activity. It will also consider the role of activists in rethinking agrifood systems, through the lens of the new materialisms.

SALLAWAY-COSTELLO, JAKE* (University of Nottingham, United Kingdom)

Thinking Socially in Health Education: A Call to Rebrand the Sociological Imagination for the Post-Pandemic World

In The Sociological Imagination (1959), Mills described the social construction of employment during the Great Depression to illustrate his seminal concept. He argued the economic disruption caused by the Depression empowered jobseekers towards a realisation that their socioeconomic hardships were determined by wider social forces. This cognizance was the emergence of the sociological imagination: an awareness of the relationship between the self and society, and the ability to view that relationship from diverse perspectives. The COVID-19 pandemic replicates many conditions of the Great Depression, but in an era of globalisation, international media and a growing global demand for justice. The pandemic has exposed the fragility and precarity of social structures and institutions, and the systematic inequalities upon which they are often reliant. Arguably the most obvious uncovering is the brutal exposure of the social determinants of health, and their role in determining individual experience of the pandemic.

The teaching of medical sociology to trainee health professionals is situated in a complex educational micropolitics; it is "both everywhere and nowhere" in the allied health curriculum (Kendall et al., 2018). Students of allied health professions often have no prior study of sociology, and typically have educational backgrounds rooted in biomedical sciences which conflict with the epistemological pluralism required to think sociologically. Where biomedical science upholds a reality of single truths, sociology embraces the diversity of multiple truths that enable us to make sense of the relationship between the self and society. This conflict often leaves allied health students stranded in a confused curriculum (Brooks et al., 2016).

This paper presents a call to rebrand the sociological imagination in the teaching of allied health professions. Reflections and student feedback on teaching practice on a dietetics course in the UK will stimulate theoretical interrogation of the role of the sociological imagination in post-pandemic education.

SALLING OLESEN, HENNING* (Roskilde University, Denmark)

Psycho-Societal Empirical Interpretive Analysis. the Materiality of Human Subjectivity.

The paper will relate to questions about the material nature of learning and knowledge – how learning and knowledge is embodied in human beings and how they are embedded in social practices and artefacts.

Assuming that language(s) is(are) the fundamental medium of social interaction and cultural transfer we can see the lifelong process of learning in everyday life as an interactional experience which involves the participation in social practices (in a Wittgensteinian language game sense), at the same time as mediating the subjective experience of being in the world in specific places, contexts and interactions.

Departing from ideas of the specificity of individual lives, and the uniqueness of the (cultural) process of meaning making and identity construction life history approaches have focused on the individual life history as a reproductive and creative process. If we see knowledge and learning as language based (using language in a plural sense of semantic systems) dimensions of social practice these approaches allow us to study the dynamic tension between individual embodied memory and imagination and the participation in social practices, anchored in the materialities of on the one hand the individual body and psyche, and on the other hand historical/societal practices and their reification in artefacts. Socio-material approaches – espec. ANT and practice theory – have developed analyses of social practice in which human activity is studied from "outside", from a relational point of view. I shall refer to)a psychodynamic inspired interpretation of culture (in-depth hermeneutics) focusing on the boundary zones between language and sensual experience (narrativity, memory, scenic understanding). I want to explore these different ways of understanding subjectivity.

SALMAN, SCARLETT* (Université Paris Est Marne-la-Vallée, France)

Corporate Professions, Economic Uncertainty and Competition: Towards New Professionalization Competencies? the Case of Executive Coaches in France

Drawing on the "corporate professionalization" model (Kipping et al., 2006; Muzio et al., 2011) of new strategies adopted by managerial occupations, the template of "client professionalization" has been framed to analyze the case of independent professionals, who are not employed by large organizations but are freelancers and self-employed. It demonstrates the influence of the client organizations in such professionalization processes, at a collective and institutional level. This influence tends to favor new professionalization strategies of differentiation, regulation and dissemination (Salman, 2019). But what becomes the "client professionalization" at the level of the practitioners? To put it in other terms, what are the effects of independence on professionalism and professionalization, at an individual level?

Some scholars have argued that self-employed professionals do not seem to seek the "wider practices of professionalization" (Cross and Swart, 2017). Professionalization seems to be reduced as an "identity project" (Reed, 2018). However it seems that independent professionals are turning to "organized" forms of professionalism (Maestripieri and Cucca, 2018) to overcome market pressures in a context of austerity. What are the competencies developed by independent professionals to cope with economic uncertainty and competition? What role does the relationship to clients play in that configuration? Is it only a constraint on professionals or can it be a resource for them?

The paper draws on an ethnographic study of executive coaching in France, on in-depth interviews with coaches, human resource managers who select coaches and coached managers. It shows the constraints that are put upon these independent corporate professionals, but also the competencies and strategies that they develop to cope with economic uncertainty and competition. The paper also contributes to the broader debate about the new forms of work contracts and their effects on professionalism, divided between the promoters of "free agents" and their criticisms (Barley and Kunda, 2006).

Political Goals through Depoliticized Strategies? Cambodian Labour Movement and Two Decades of Struggles

The paper takes a historical-ethnographic approach to examining waves of politicization and depoliticization in the strategies of non-government-allied trade unions in Cambodia during the past 20 years. In particular, the paper analyses the role of different alliances and their implications to the long term success of labour's strategies. In the early 2000s, emergent unions were closely connected to local political opposition. Faced with violence and repression, the labour movement then adopted seemingly less political strategies drawing on transnational civil society alliances. These strategies, targeting international buyer companies to produce a boomerang effect (Keck and Sikkink, 1998) were successfully used to achieve political aims and to build labour's power locally. Nonetheless, the renewed political strength of the unions and their connections with local political actors in the context of the 2013 elections made labour again victim of repressive politics by the state. The recent crackdown has taken place amidst an overall turn towards open authoritarianism in Cambodia, and shown the limitations of previous strategies. The labour movement must again reflect on the way forward.

Based on 15 months of ethnographic research among Cambodian garment workers, their trade unions and other labour-related actors in Cambodia during 2016, 2017 and 2019, the paper emphasizes the importance of local politics to labour's strategies in the context of globalization. Theoretically, it brings together the debates on shrinking civil society spaces and on labour's new - symbolic or societal – power resources (e.g. Schmalz, Ludwig and Webster, 2018). It calls for

a renewed attention to the importance of associational power as *political* power, and to deeper analyses of the power that states continue holding in the context of transnationalized production and governance.

Tripartism in Chains: The Ilo, National Labour Law, and Trade Union Struggle in the Cambodian Garment Industry

Global value chains (GVCs) with factories in areas of weak labour rights enforcement fundamentally challenge norms and principles of the International Labour Organization (ILO). Low costs and weak legal frameworks have not only pulled production to the Global South, but also created a continuous problem for making effective rights claims based on national and international labour law. Tripartism as a leading concept mostly fails and state support for international labour rights is often low, due to international competition and national power relations. The interactions between GVCs, the ILO, national labour laws, and local trade union strategies are complex and often subject to separate strands of research. This paper analyses their interrelations through a single case study. Based on interviews and participant observation in Cambodia between 2016 and 2019, we study the Cambodian Arbitration Council (AC). Created under an ILO dispute resolution project funded by the US, the AC has been an exception among Cambodian institutions: free from the impact of political patronage and corruption. For several years, it has provided an effective mechanism for addressing collective labour disputes, especially for garment workers. This success stems from a careful institutional design, but also from an ambiguous role of transnational buying firms, which have created pressure towards suppliers to follow AC awards. An increasing struggle by the government to 'capture' the AC in recent years illustrates its vulnerable position, but also its key importance for national labour law and trade union strategies. We draw conclusions from this case for the wider debate on the power, norms and limits of the ILO in strengthening national trade union strategies in countries with weak state enforcement of labour rights.

SALVADOR, GILDO* (GJS-Angola, Consulting and service provision, Angola)

Sociological Investigation into Jehovah's Witness Abstention in 2017 General Election in Angola.

We intend with this text to reflect on the abstention of Jehovah's Witnesses in the 2017 general elections in Angola. As a religious phenomenon, the text seeks to delve deeply to understand the behavior of the Voters (Jehovah's Witnesses), who have chosen to abstain and remain on the fringes of the Angolan democratic system, by not participating in processes that say respect the right of citizenship.

Therefore, we have written this text to understand Jehovah's Witnesses' socio-religious phenomenon about electoral abstention, and as a contribution to the Sociology of Religion.

The methodological option adopted in the search for empirical information in the studied context, used as a foundation, is the qualitative methodology. It allowed us to get closer to our object of study (in this case the Jehovah's Witnesses of the Kingdom Hall in Luanda). We made use of bibliographic research, webographic research and documentary research, while research techniques made use of two techniques, namely: first technique, participant observation and in-depth interview.

We interviewed 20 Jehovah's Witnesses for convenience, we selected based on the immediate availability of the believers from the Kingdom Hall's Association of No. 1980 Northern Circuit in Luanda-Angola.

Mobility of Professionals: Between Frictionless Narrative and Complex Realities. Decisions and Experiences of German Professionals Living and Working in the UK.

Mobility of professionals is a growing phenomenon, an integral part for the development of knowledge-based economies. Countries and companies invest in policies to facilitate and attract this highly-desirable, global talent. Accordingly, these professional mobiles described as the ideal type of mover, invisible, young, highly-talented, competent in the local language, well-integrated, and contributing to the local economy (Beaverstock and Hall, 2012; Young et al., 2014). Indeed, due to these characteristics, they assumed to integrate easily and enjoy the mobile lifestyle. However, some empirical studies highlight complexities of this mobility suggesting that even those highly-desired mobile professionals are not immune to challenges associated with migration and integration (Ryan and Mulholland,

2014; Erel and Ryan, 2019). Such challenges may be associated with adjusting to the new culture (Butcher, 2010; Froese, 2012; Nowicka, 2012), as well as the temporary nature of contracts and mobility (Giorgi and Raffini, 2015; Carrozza et al., 2017). These may lead to instability, insecurity and stress suggesting that mobility of professionals is not as frictionless and easy as it may be suggested.

In my presentation, I would like to draw our attention into the complexities of the life of these privileged mobile professionals by showcasing a specific case study of German professionals in the UK. German professional moving to the UK may exemplify the notion of frictionless mobility, as they enjoy the right to move freely, they are educated, young, competent in the English language, employed according to their qualifications and well-integrated. In my project, I explored to what extent their experience can be seen frictionless, and what kind of challenges may these professionals experience before and after the relocation. Discussing these aspects may contribute to our understating of the particularities of their experience, as well as highlight the realities and complexities of mobility and life of these highly-desired professionals.

WG08-720.1

SAMARSKY, ELENA* (University of Oxford, USA)

Professionals on the Move: Between States, Labour Markets and Emotions.

Operating within the context of "war for talent", companies and countries alike design policies to attract highly-skilled personal and facilitate mobility of professionals. On the personal level, scholars suggest that such mobility may present professionals with more financial and employment opportunities as well as allow experiencing new countries and cultures and contribute to personal and career development (Beaverstock, 2005, 2012; Elliott and Urry, 2010). Accordingly, these professionals are young, educated, single, and ready to move where the best opportunities are. They also seem to enjoy frictionless mobility and integration.

However, the reality of such hypermobility is more complex. In my presentation, I seek to discuss the intersection between hypermobility of contemporary professionals and the diversity of emotional experiences of these mobile professionals and suggest that they are not immune to emotional challenges. Using the case study of German professional in the UK, I explore the experiences of these so-called privileged migrants, who enjoy transferability of education, competent in the local language and employed according to their qualifications.

In my presentation I will discuss the role of emotional capital (Skrbiš, 2008; Svašek, 2010; Albrecht, 2016) and the mechanism behind it. Then I will focus on several aspects that contribute to emotional hardships. First, those that are associated with the temporary nature of contracts, that are also prominent among various professional occupations. Second, the unexpected cultural differences at the workplace, and the need to adapt to the behavioral codes in the new country. Third, the need to reorganize family life, as many are moving with families. As such I contribute to the discussion of the emotional experiences of the particular "privileged" group of mobile professionals in the context of increased mobility.

SAMPAIO, DORA* (Max Planck Institute for the Study of Religious and Ethnic Diversity, Germany)

Caring By Silence: How (un)Documented Brazilian Migrants Enact Silence As a Care Practice for Their Ageing Parents

Drawing on multi-sited ethnographic research with Brazilian migrants in the United States and their ageing parents in Brazil, this paper argues that for understanding intergenerational ageing care in its entirety we need to pay careful attention to what is 'silenced' during transnational contacts and exchange, suggesting that silence is often enacted as a care practice. In so doing, I draw on psychoanalytic theory and deploy the concept of 'sublimation' to dissect the processes through which migrants across borders curate their lives abroad and convey their living experiences in 'purer' or idealised terms to their ageing parents back in the home country. Sublimation involves a practice of 'sieving', through which the adult children are able to communicate their lives abroad stripped of daily tensions and hurdles such as difficult labour and housing conditions, legal anxieties, and a permanent fear of deportation, thus shielding and caring about their ageing, and sometimes vulnerable, parents back home. The paper suggests that paying close attention to what is *not* being said in contexts of transnational ageing care will help us better weave together the living and ageing experiences of families across borders. This proves particularly valuable in contexts of vulnerability and ageing inequalities such as those prompted by current (im)mobility regimes, demonstrated through the experiences of (un)documented Brazilian migrants in the United States and their ageing parents in Brazil.

SAMPSON, HELEN* (Cardiff University, United Kingdom)

Understanding the Intensification of Work in the Global Shipping Industry

On the face of it, technological innovations combined with regulatory developments in relation to work-rest hours and minimum levels of 'safe manning' [sic] should have reduced the intensity of work for seafarers in the cargo shipping industry. However, this has not been the case. An analysis of accident investigation reports in the period 2002-16 indicates that fatigue is identified as a factor in just over 10% of all cases (Acejo et al 2018). When asked why they fail to get sufficient rest on board, around a third of seafarers indicate that it is a result of long hours of work (Sampson et al 2017). This paper draws on ethnography conducted with seafarers over a period of twenty years to highlight the ways in which loss of particular posts (e.g. radio officers and galley staff), new regulations demanding new roles for seafarers (e.g. as security guards), increased paperwork associated with regulations, and increased surveillance of ships and seafarers have all combined to increase labour intensification on board. It concludes with a consideration of why it is that minimum safe manning certification and work-rest hours regulation have been insufficient in resisting the amplification of work pressures in the cargo sector.

The Non-Prosecution (Dis)Agreement: An Analysis of Public Attorney's Office Practices of Criminal Prosecution

This article describes and analyzes the practical prosecution procedures adopted by the prosecutor with those investigated that may lead to the promotion of investigation filing. There is a great deal of institutional dissent and a broad discussion about the theory and practices regarding the non-prosecution agreement on criminal cases, especially regarding the legality of the institute, as it is not strictly federal law and mitigates the principle of mandatory prosecution. The objective is to analyze the way in which "understandings" regarding the implementation of agreements are constantly the subject of disputes and negotiations. From the description of the practical rules of work, we seek to analyze how power is exercised in the Public Attorney's Office through a political sociology of law. In Brazil, the practices of Attorney's Office members are particular activities that are not linked to state policies. The Public Prosecution Service and the Judiciary in Brazil do not have a protocol of action regarding the applicability of non-prosecution agreements. Negotiation, therefore, occurs in retail, which generates total unpredictability for society. In place of a hierarchical institution, we have a monocratic and horizontal prosecution. The different "understandings" related to the application of non-prosecution agreements in Brazil which occurs in the practice of legal operators. This practices implies certain arbitrary use of the rules. These "understandings" are the key to dissenting the meaning of rules. Thus, each Public Attorney "understands" and acts in a different way. In Brazil, there is no one who defines an institutional public policy for the Public Prosecution Service, because even   the Attorney's National Council cannot create this institutional policy because it is not able to constraint professional practices.

SANCHES, TAÍSA* (Pontifical Catholic University Rio de Janeiro, Brazil)

Struggle for Memory As a Tool of Resistance: The Cases of the Removal and Horto Museums in Rio De Janeiro

Social movements fighting for housing in Brazil are traditionally recognized for their occupation of abandoned buildings and fields on empty land located in large cities (Gohn, 1991; Tatagiba et al., 2012). In Rio de Janeiro, however, social museums located in favelas and communities at risk of removal can be understood as important action repertoires in the struggle for housing.

From research conducted in two of these spaces - Removals Museum in Vila Autódromo and Horto Museum in the Community of Horto - this article explores how the categories memory, belonging and life history are used as tools of resistance and permanence of communities. The Removal Museum was created amidst the removals made during the city's preparation for the 2016 Olympic Games and is directly related to the struggle for permanence and against removals. Activists use the ruins left in the territory, photographs and oral history to demonstrate their life story on the site. The Horto Museum was also born from the fight against removals, which have been threatened for over a decade. The museum, in addition, is an important tool for raising awareness of the region's own residents, who come to know more about the history of the neighbourhood from the information exposed by the initiative. This paper presents the results of an extensive research conducted with these two Museums, seeking to present them as daily coping strategies adopted by social housing movements carried out in both neighbourhoods.

SANCHES, TAÍSA* (Pontifical Catholic University Rio de Janeiro, Brazil)

The Residential Is Personal and Political: Experiences of Social Movements for Housing in London and Rio De Janeiro.

Struggles of social movements related to housing are traditionally analysed - albeit from different perspectives - from their directed demands to the state. This perspective is important, as the provision of social housing is recognized as a duty for public authorities in most of democratically governed countries. This article, however, seeks to explore which experiences, in addition to the precarious access to housing (also considered), led individuals to engage in social movements for housing as a way to struggle for recognition of their subjectivities, such as memory and voice. Therefore, this analysis is inspired by the sociology of experience as proposed by François Dubet (1994), who defines three distinct logics capable of embracing the heterogeneity of subjective actions: integration, strategy and subjectivation.

This article is based on a research carried out with four different social movements in London and Rio de Janeiro, cities that are quite distinct from each other, but are approached from the experiences of subjects struggling to broaden their understanding of social housing. Public policy for housing in both cities is increasingly anchored in the concept of affordability, which translates the social housing financialization phenomena that is common to many countries. The members of the movements, however, seek not only the democratization of access to housing by increasing the number of houses and beneficiaries, but also a sense of dignity, which includes sentiments of belonging, equality and the right to memory, in a way of fighting against the "territorial stigmas" (Wacquant, 2005) associated with those facing housing precariousness.

Interrogações Sobre As Reconfigurações Dos Movimentos Sociais No Brasil: Da Gramática Dos Direitos à Economia Solidária

El propósito de este documento es discutir la constitución de la economía solidaria como sujeto político y su relación con el proceso democrático brasileño y los movimientos sociales después de la década de 1980. Por lo general, se ubica la (re) aparición de la economía solidaria en Brasil como resultado de la redemocratización y las organizaciones y entidades que estaban presentes en la arena pública en ese momento. Sin embargo, se argumentará que es solo en la década de 1990 que la economía solidaria adquiere significado y presencia en el ámbito público y se constituye como un sujeto político resultante de las políticas neoliberales y las configuraciones consiguientes de los movimientos sociales en este escenario. Por lo tanto, la economía solidaria sería más el resultado de la dinámica de la década de 1990 y su contexto caracterizado por el avance del neoliberalismo y el reflujo de las experiencias democráticas que lo contrario. El argumento central de esta comunicación es que esto sucede precisamente debido a la reconfiguración más general de los movimientos sociales durante la década de 1990, el resultado de cambios más profundos en la sociedad brasileña, que hacen que estos movimientos sociales y varios de sus activistas lleguen a encontrarse en la economía solidária una nueva agenda que permiten (re) colocada en el campo cambiante del conflicto. Para llevar a cabo esta discusión, traeremos la trayectoria de algunos militantes que participaron en diferentes movimientos sociales (rurales y urbanos) durante las últimas décadas y que hoy participan de la economía solidaria. Por lo tanto, tenemos la intención de discutir la reconfiguración de los procesos de movilización originalmente organizados en torno a la gramática de los derechos a la gramática de la economía solidaria, tematizando el significado semántico de la democracia en ambos casos.

SANCHEZ, PHOEBE ZOE MARIA* (University of the Philippines Cebu, Philippines)

Philippine Social Movements and the Perpetual State of Dictatorship

This is a comparative analysis on Philippine social movements during the Marcos regime and its prospects in the recent Duterte regime. It looks into civil society political action during the period of Marcos authoritarianism and the possible path it would take in today's Duterte regime, its differences and similarities.

The first Filipino experience of dictatorship was that of the Marcos regime from 1965 until 1986. Marcos dictatorship stood on sultanism spreading himself in all affairs of government albeit its lackluster of legitimation (Sanchez 2017). It was the first time Philippines was introduced to the literature of extra-judicial killings with over 3,000 summary executions, political arrests, enforced disappearances and torture (Karapatan Alliance for the Advancement of Human Rights 1986).

The 1935 Commonwealth Constitution of Tydings-McDuffie Law was transformed into the 1973 constitution catapulting Marcos' "reign of terror." It had constitutional authoritarianism to start with. All other social and political actions in the era of President Marcos became illegal, such as: the right of labor unions to strike, the right of students to protest, and even the right of landless peasants to clamour for land. But an EDSA People Power Revolution toppled down Marcos dictatorship. The Filipino aggregate psychological clamour for justice ushered EDSA 1 as a political mobilisation that ousted a dictator. But did EDSA 1 offer a democratic transition that effected social structural change in Philippine society after Marcos? There were a new breed of politicians who came after EDSA People Power 1, but did they satisfy social structural change in the Philippines?

What is the difference and/or the similarity between today's Duterte dictatorship and Marcos' dictatorhip? Will a People Power revolution happen again in the future? What are the prospects of Philippine Social Movements?

A Shift to "the Right to the City"? Emerging Policy Instruments and Urban Governance Changes in the Case of Barcelona

The irruption of the crisis in 2007 has accelerated entrepreneurial urban governance paradigm tensions and cracks. In the context of the recession this urban governance model based on public-private management, that has prevailed since the 1990s in Western European cities, been weakened while the action of social movements and emerging political forces reintroduced the issue of social justice and the right to the city in the social and political urban agenda. In the Spanish cities, as in other south-european cities, social self-organized initiatives have emerged and have become laboratories on the ways to produce, govern and evaluate urban policies. In some municipalities, the new political forces promote coproduction policies of the physical and social space of the city that involve these bottom-up initiatives. As a result of the interaction between local governments, grassroots organizations and social movements have emerged new policy instruments during the last five years. Through the study of the case of Barcelona, this paper aims to study the nature of these policy instruments and seeks to analyze to what extent these novelties are driving a shift towards the right to the city in the urban governance model. The analysis is based on in-depth interviews and documentary analysis of local government, grassroots organizations and social movement's documentary sources.

Organizations and Meta-Organizations of the Solidarity Sector in Colombia

Under the term Non-Profit Organizations (ESALES in Spanish), the organizations of the solidarity sector are grouped in Colombia --cooperatives, employee funds, mutual associations, agricultural and peasant associations, foundations, and other civil society organizations. These organizations of people who *'have voluntarily joined to meet their everyday economic, social and cultural needs, and aspirations through a jointly and democratically controlled company*, have played a non-negligible role in the social and economic fields. By responding to the needs of population groups with the most varied economic and socio-demographic characteristics, they provide access to goods or services (credit, savings, housing, work, health, commerce, among others) within the framework of the market economy. The phenomenon of ESALes in its origins arises as a strategy to create opportunities and conditions of access for excluded social sectors. The principles that structure them (solidarity, equity, democracy, and mutual aid) allow extend-

ing its field of action to society in general. By this capacity, they hold promises as engines of social development. It is enhanced to a greater extent when these organizations integrate as meta-organizations. The analysis of existing statistics on ESAL organizations in Colombia allows us to establish, first, the role they play as mediators in the provision of goods and services, the volume of employment they generate, and the amount of assets they access.

This paper presents some of the opportunities, obstacles, challenges and potential contributions of Colombian social development articulated to the Sustainable Development Goals (SDGs)

MINERA, LISSETTE (Consultora, Guatemala)

Asentamientos Humanos Precarios, Mujeres y Ausencia De Estado

En la Región Metropolitana de Guatemala, paralelamente a las tendencias de urbanización que explican la sobrepoblación y el crecimiento urbano desordenado hay un incremento exponencial de escenarios de riesgo especialmente en asentamientos humanos urbanos precarios cuya población, además del alto índice de exposición al riesgo, se caracteriza por la persistente desigualdad y exclusión. Desde el enfoque sociológico y de gestión para la reducción de riesgo a desastres se investiga la amenaza y los factores de vulnerabilidad que afectan la cotidianidad de la población allí asentada.

El objetivo de esta investigación (2016-2019) ha sido identificar, desde la perspectiva de género, aspectos clave que definen la exposición y la vulnerabilidad de las mujeres, frente al peligro de deslizamientos, que se dispara durante el periodo de lluvias, así como la ausencia de acciones de mitigación del gobierno nacional o local, que explican sus condiciones de vulnerabilidad.

El método resulta de la combinación de una mirada específica del territorio en el que surgen los asentamientos precarios incluyendo tanto el área inicial de invasión con menos pendiente hasta las áreas donde este porcentaje define aquellas consideradas inhabitables. A ello se agregan preguntas que indagan específicamente sobre la situación y las condiciones de las mujeres, sus viviendas, su ubicación, sus medios de vida y sus estructuras sociales, variables que se combinan con aquellas demográficas no desagregadas que frecuentemente son la única base institucional para intervenciones que, en la mayoría de los casos, se reducen a gestionar emergencias o desastres.

Los hallazgos contribuyen a una mejor comprensión de las causas subyacentes que explican la condición de vulnerabilidad de las mujeres frente a una determinada amenaza, ahora incrementada por cambio climático y aportan a la planificación de acciones tanto de preparación para desastres como algunas consideradas de mitigación.

Civilizational Shatterings: A Perspective

The text *Civilizational Shatterings: A perspective* proposes the category of civilizational shattering understood as the breakdown of long-lasting structural frameworks and naturalized social imaginaries for centuries. It is a theoretical and epistemological proposal that aims to contribute elements of understanding to the unprecedented civilizational crisis that Humanity is experiencing. Starting from a complex and non-linear articulation of capitalism, patriarchy, and coloniality, the text suggests the need to deconstruct traditional analytical categories that, instead of helping to understand emerging realities, conceal them. The core civilizational shatterings are grouped into three areas: cracked territories and corporeities, dislocated symbols and identities, and unstructured institutional regulations. Territories and cracked corporeities alludes to the disruption of the material base of society, of its space-time coordinates and of societal corporeity. Dislocated symbols and identities refer to the ruptures of the cultural frameworks and of the subjectivities of individuals and collectivities related to technological processes, broken imaginaries, uncertain futures. Unstructured institutional regulations refer to the deconfiguration of the regulatory apparatus of society that is embodied in institutions and regulations. The three areas are related to the material and corporeal base, the symbolic referents and the political-regulatory logics that make up the structural networks and social signifiers of a community. The category of civilizational shatterings can be useful to delve into those underground tendencies to deepen our understanding of contemporary social logics.

Keywords: Civilizational Shatterings, structural and symbolic frameworks, underground tendencies.

El Retorno Del "Nizam": Política y Movimientos Sociales En El Egipto Post-Revolucionario

Charles Tilly (2004) advirtió que debemos ser conscientes de la especificidad histórica de los "movimientos sociales": representaciones políticas que surgieron

en Europa occidental y América del Norte después de 1750. En esta experiencia histórica, lo que se ha definido como "movimientos sociales" combinó tres elementos principales: la reclamación organizada y sostenida de un objetivo político; un repertorio de formas performativas, que incluye reuniones públicas, declaraciones en los medios de comunicación y diferentes maneras de desplegarse en el espacio público; y, finalmente, representaciones públicas de la justicia de la causa y el número de personas comprometidas con la misma. Dado que las teorías de los movimientos sociales dominantes se basan en estas experiencias occidentales, ¿en qué medida pueden ayudarnos a comprender el proceso de construcción solidaria de prácticas inconexas pero paralelas de actores no colectivos en contextos no occidentales políticamente cerrados y tecnológicamente limitados?

En esta presentación me propongo describir algunas prácticas juveniles, entendidas como "politizaciones" de ámbitos y espacios aparentemente sin dimensión política, que se convierten en la manera de ejercer presión de las juventudes egipcias como movimiento social sobre las instituciones políticas). Se analizarán las dimensiones políticas de algunas prácticas generalizadas entre las juventudes árabes que, a pesar de no ser movimientos colectivos, resisten a imposiciones represivas gubernamentales pudiendo cristalizar en movimientos sociales en momentos apropiados como enero de 2011. Esta manera de encarar el análisis pretende responder a la pregunta de cómo se mantienen los movimientos sociales y políticos cuando regímenes autoritarios muestran una gran intolerancia hacia el activismo organizado y cuando la represión de las organizaciones de la sociedad civil ha sido un sello distintivo del Estado Egipcio (Sánchez García, 2018).

Researching Youth Street Groups in Magrib: Violences and Resiliences

In Magrib societies violence is part of a broader setting where some type of violence is (at least occasionally) used to discipline individuals, shape their conduct, and restrict their choices and movements. In particular, the brutality of the state, which most young men are subjected to, should be central to any adequate understanding of the relationship between youth street groups and violence.

For young men in particular, engaging in some form of physical scuffles is often viewed as part of growing up and using violence in the right context could be the source of distinction and prestige. Fighting to protect and control female relatives, back one's friends, restore respect to older people, or support the weak against the strong are viewed positively and could contribute to boosting one's standing as a man in the case of lower classes youth.

In Standard Arabic the general term used to refer to "criminal youth groups" is iḍḥāba while to designate a youth street group the term *shila* is used. However, there are other related terms coming from the national and local contexts and expressed in colloquial Arabic such as: *hittistes* (Algeria), *tcharmils* (Morocco) and *baltagiyya* (Egypt), which designate different criminalized street groups from paramilitaries to organized drug clans. Using violence to protect female relatives, especially when they are threatened sexually, is socially expected, accepted and legitimized. So, two parallel methods used for resolving similar conflicts: the official legal system and the informal social norms that regulate the use and counter-use of force related with the construction of masculinity.

From the very first data producing by TRANSGANG project in the region, this presentation will discuss about the relationships between State violence, social structural violence and youth street groups as a way of resistance in a comparative way.

Living and Labor Conditions of the Road Transport Workers in the Global Agrifood Chains

The production of fresh fruit and vegetables is a global business dominated by large international corporations and business groups. Organised in global commodity chains, different actors -from small farmers to centres of technological innovation, agricultural labourers and logistics and transport companies- must coordinate their actions so that produce from the countryside reaches our tables in perfect condition. To this end, since the end of the last century, new forms of transnational regulation have been developed which, under the of new demands for food quality and safety, respect for the environment and social responsibility, organiseand regulate the process of production, transport and distribution of food. These are standards, protocols and quality certifications, both public and above all private, which represent a new form of governance of the agri-food sector (Bair, 2009; Loconto and Busch, 2010; Gereffi, 2018).

The aim of this communication is to explore the implications of these new agrifood quality and safety systems on the labor and living conditions of the road transport workers. One of the main agricultural production enclaves in Spain is taken as a case study: the Region of Murcia. This territory, which specialises in fruit and vegetable production for export, is an ideal place to analyse the impact that these new forms of corporate governance, marked by a greater weight of commercial distribution, have on the organisation of food transport by road.

Citizen Participation in the New Mexican Political System: Citizens and the Fight Against Corruption.

The democratic development in Mexico brought as a natural consequence the creation of institutions aimed at combating problems of the old political regime that have taken root in the country's political and social system. According to citizen perception studies (Latinobarometro, 2017; International Transparency, 2018), corruption has been one of the main problems in recent years, for this reason, in 2014 a constitutional restructuring was carried out that sought to articulate the various instances of the federal government, to the legislative powers and judicial, autonomous bodies and citizens themselves under a systemic transversal scheme to fight corruption. The result of this reform was the installation of the National Anti-Corruption System and the creation of 32 Local Systems. Each of these systems would be under the leadership of citizens through the Citizen Participation Councils which would be designed under the anti-corruption agency model.

The incorporation of citizens into the political sphere to combat a problem that was thought to be exclusively of an institutional nature was a good symptom of a democracy that seeks to advance in the development of its procedural and organizational rules. However, the separation of these anti-corruption agencies from citizens to the political power hasn't been achieved.

The main question of this work is: What has been the role of citizens in the fight against corruption in Mexico through anti-corruption agencies? This paper aims to account for the capacity of citizen involvement in the various anti-corruption agencies in the country and the influence of local and national powers in their control and performance.

In the end, what's intended with this work's to realize that there are spaces for citizen participation that aren't specifically disconnected from power and from which it seeks to orient its action towards a protection of the causes and consequences of the corruption in Mexico.

SANCHEZ GAYOSSO, RAMIRO DANIEL* (Universidad Autonoma Metropolitana, Mexico)

Presidential Elections in Mexico, between Democratic Continuity and Hopeful Change, 2000-2018.

The Mexican political system has undergone a remarkable transformation at the regime level, specifically in the procedural rules that have allowed political alternation in the head of the Mexican executive since 2000. The electoral rules have been constantly modified in each sexennium, but the essence of democracy has always been maintained and an attempt has been made to seek an evolution in the extension of political-electoral rights. With this institutional framework and with the constant progress in the protection of rights, in Mexico four federal electoral processes have been lived to renew the president of the Republic: the year 2000 where Vicente Fox of the PAN won, in 2006 Felipe Calderon PAN was the winner, in 2012 Enrique Peña of the PRI regained power and in 2018 Andres Manuel Lopez Obrador of MORENA led the left to power. Each of these electoral victories was represented a different narrative in the country that implanted in the collective imagination a couple of ideas ranging from democratic continuity to hopeful change.

The main questions of this work revolve around: what have been the causes that led each of these politicians to victory and how was their political campaign understood? The objective is to demonstrate the way in which, through a specific political discourse, the last four presidents of Mexico have similarities between them when they dispute power: Calderon and Peña Nieto represent democratic continuity, while Fox and AMLO represent hopeful change. Each one obtained different results in a matter of votes, but also each one presents similarities in the early exercise of power.

Beyond seeing the results of their governments, it's important to know the starting points of each of these politicians since their trajectories towards victory allow us to observe the cyclical form of the political history of Mexico.

¿Populista o Popular? Analizando El Discurso Político Del Partido Igualdad y Su Relación Con El Movimiento De Pobladores En Chile (2009-2019)

En la siguiente ponencia, se busca comprender las características político-discursivas del Partido Igualdad de Chile y su relación con el movimiento de pobladores (pobres urbanos). Considerando lo desarrollado en un trabajo anterior, buscamos reflexionar en torno al carácter efectivo de la lógica populista, centrada en el significante pueblo y elementos anti-elitistas, observada en el discurso de Igualdad. De este modo, tomando en cuenta la distinción teórica entre el concepto "populismo" y el concepto "popular", analizaremos discursos políticos oficiales, programas de gobierno, entrevistas a militantes, material de campaña y otros documentos producidos por el partido desde su formación en 2009 hasta la actualidad. A partir de lo anterior, queremos corroborar si el Partido Igualdad corresponde a un partido-movimiento populista inclusionario o un partido de izquierda popular. Finalmente, se establecerán las conclusiones y se reflexionará críticamente en torno a su articulación política dentro del Frente Amplio chileno (nueva coalición política de izquierda).

Discursos De La Vulnerabilidad-Resiliencia Ante El Proceso De Riesgo-Desastre: Análisis De La Política Nacional Para La Gestión De Riesgo De Desastres De Chile

Las nociones de vulnerabilidad y resiliencia se han instalado como categorías explicativas centrales del proceso de riesgo-desastre, tanto en lo académico como institucional (Aldunce, et al. 2014; Manyena, 2006). No obstante, ambas nociones se han configurado como significantes flotantes del campo discursivo de la gestión de riesgo de desastres, presentando distintos supuestos, expresiones, énfasis y formas relacionales (Macias, 2015; Ruiz, 2012). Bajo este contexto, nuestro objetivo es comprender los distintos repertorios interpretativos en torno a los fines, medios y funciones en la construcción discursiva del proceso de vulnerabilidad-resiliencia en el campo académico-institucional de Chile, indagando su interextualidad con la gestion y reducción de riesgo de desastre. Para esto utilizaremos un diseño de estudio documental (Peña y Pirela, 2007) utilizando como estrategia de producción la técnica de recopilación documental (Montero y Hochman, 2005), para lo cual seleccionaremos y analizaremos la política nacional para la gestión de riesgo de desastres de Chile y otros documentos institucionales vinculantes. En términos analíticos, utilizaremos la estrategia discursiva de los repertorios interpretativos (Potter y Wetherell, 1987) orientados hacia tres dimensiones relevantes del discurso de la vulnerabilidad-resiliencia: a) construcción, b) función y variación (Sisto, 2012). A modo de conclusión esperamos afirmar la importancia de incorporar en la discusión de la RRD, tanto el esclarecimiento conceptual, como la relación dialéctica entre vulnerabilidad-resiliencia a escala glocal, comprendiendo que el fortalecimiento de capacidades debe ir acompañado de la reducción de las injusticias espaciales y ambientales.

SANDOVAL ROBAYO, MARY LUZ* (Universidad de Caldas, Colombia)

Democracia y Conflicto Armado Interno En Colombia ¿Una Cohabitación Imposible o Funcional?

Las teorías sobre las democracias defectuosas (The Economist, 2019) como los conceptos de dictablanda (O'Donnell y Schmitter, 1986), democracias delegativas o plebiscitarias (O'Donnell, 1993), democracias iliberales (Zakaria, 1997) o más recientemente democracias parciales (Epstein, 2006), autoritarismos competitivos (Levitsky y A. Way, 2010: 32) y autoritarismos subnacionales (Gibson, 2006) y otras aproximaciones (Collier y Mahoney, 1997; Przeworski et al., 2000; Boix, 2003), aunque brindan opciones explicativas de los sistemas políticos no plenamente democráticos, son aún limitadas para explicar casos en los cuales existe convivencia explícita de largo plazo entre un sistema democrático formalmente establecido y un conflicto armado interno. Estos desarrollos han tenido impacto sobre los índices de democracia que emiten instituciones académicas y no académicas. En Colombia, han convivido dos fenómenos políticos aparentemente incompatibles por más de cincuenta años: un sistema democrático y un conflicto armado interno que ha constituido una dependencia de patrón (*Path Dependence*) de utilización sistemática de la violencia para fines políticos. Esta convivencia, sus implicaciones y graves consecuencias, han puesto en cuestión el concepto mismo de democracia a secas para designar el sistema político colombiano. Persiste un debate frente a las teorías de la democracia que no es sólo de interés doméstico,

cuando los índices de democracia, insisten en dar una calificación de simple democracia defectuosa a un país que muestra la tragedia de diez millones de campesinos desplazados, más de 200 mil desaparecidos forzados, asesinatos selectivos de líderes sociales, casi uno por día hasta hoy y ante las próximas elecciones regionales, amenazas y asesinatos de líderes políticos.

Palabras clave: teorías de la democracia, conflicto armado interno, Colombia

LECOCQ, XAVIER (University of Lille, France)

BEAUCOURT, CHRISTEL (University of Lille, France)

Co-Evolution Processes during the Creation of Multi-Stakeholders Meta-Organization

The concept of meta-organization (Ahrne & Brunsson, 2005, 2008) defines a high level of cooperation leading to the creation of an organization between similar members which also remain independents. More specifically, Berkowitz and Dumez (2015) introduce the multi-stakeholders meta-organization (MSMO) type, which defined an organization between dissimilar members (non-profit organizations, firms, local authorities, research centres).

The paper offers a longitudinal study of French MSMO dynamics (established since less than two years) in the aim to understand the creation and development processes of them. The paper contributes to reveal that multiple coevolution processes (Child, Rodrigues, & Tse, 2012; Jones, 2001; Lewin & Volberda, 1999) are simultaneously present during the whole construction process of MSMO and affect it.

First, coevolution effects are observed between organizations members of the MSMO. The process construction of MSMO allows to create influences between firms, associations, local authorities and social organizations. We show that firms are influenced about understanding of environmental issues, social practices and activities. In contrast, associations and social organizations are influenced about strategy making process and value creation practices. Local authorities are influenced about strategy making, understanding of environmental issues and project development practices.

Second, coevolution effects are observed between organizations members and the MSMO itself. Indeed, organizations members influence the creation process regarding to strategy making, forms of governance and social issues choices. The MSMO influences the members about development of activities and practices.

Third, coevolution effects are observed between the MSMO and the environment regarding to cooperation principles, experiences and process of institutionalization of themes, issues or practices.

Thus, the paper contributes to better understand a new form of meta-organization, the multi-stakeholder one, and its processes of creation. We show that these inter-connected co-evolution processes facilitate the construction of MSMO between dissimilar members, progressively creating similarities between them and an enabling environment.

Where Did I Go? Reflections on so-Called "Late Mothering"

Postponing mothering is a strategy some women use to be able to establish themselves in their careers, before undertaking the "double shift." Professional career women who opt to postpone mothering represent a generational shift in modern times. In the medical field, women who get pregnant in their late 30s or after are labelled in rather pejorative terms: "geriatric mothers" or "late mothers." This paper presents findings based on 18 mothers' reflections of their own experiences as so-called late mothers. These mothers come from across the Global South and North, have doctorate or equivalent high-level degrees (such as Ph.D., M.D., Ed.D., and J.D.), active careers, and gave birth for the first time after 35 years of age. I analyze the common themes of their narratives and reflections as late mothers and career achievers. High-achieving women with positions of authority and respect navigate the emotional and psychological shift of dealing with the myriad demands of child-rearing and often mundane aspects of mothering. For some, this creates a staggering conflict of identity. How does one, used to succeeding, confront her conflicted identity? How does a mother re-think her role in a society, which offers little time to juggle all responsibilities? The unfair names, burdens, stress, discrimination, anxiety, and societal judgments, endured by high achieving women who become mothers later in life are questioned in this presentation by explaining the conundrum of late mothering and demanding careers. The paper is also critical of the label "late/geriatric" mothers, considering a social construction and a form of ageism.

Le rapport de l'émotionnel au noyau divin spirituel

En examinant cette thématique : *Le rapport de l'émotionnel au noyau divin spirituel*, nous voulons rendre compte de certains aspects des travaux de penseurs ou de chercheurs scientifiques avec fidélité, humilité nous y oblige, si possible en reprenant leurs propos. Cependant, les conclusions que nous en tirons nous engagent strictement à réfléchir sur l'épistémologie de la sociologie, aujourd'hui, en considération des extraordinaires découvertes réalisées par ces penseurs ou ces chercheurs scientifiques, quant aux anomalies des phénomènes d'enculturation et de déculturation de nos sociétés modernes, ainsi que de l'intérêt des questions énigmatiques sous-jacentes à la cosmo-corporéité de l'être humain. De fait, nous faisons office de « synthétiseur ». Nous avons mis en relation des preuves et des données issues de champs de recherche très différents mais complémentaires les uns des autres. À mesure que nous reconstituons ce puzzle (ce patchwork, ce désordre de l'ordre), nous comprenons ce qu'il représente et nous en dégageons d'inquiétantes implications sur le corps de l'homme, mais aussi sur son devenir social. C'est dire ainsi que notre corps recèle des paquets de poussières d'énergies potentielles qui réclament notre participation consciente pour nous libérer de nos douleurs physiques, de nos souffrances morales et de nos affres psycho-spirituelles. Lorsque nous sommes totalement à l'écoute de notre *émotionnel* – affiné au corps, au sentiment, à la pensée, au désir, aux formes-pensées -, cette *énergie* dans sa vibration devient «dynamique» et le corps demeure plus vivant, soit positivement, soit négativement. Quelle est l'origine de cette énergie ? Est-elle insondable ?

Les effets pervers de la production sociale ou l'influence de l'inconscient sociologique en crise

Dans les sillages de notre investigation, il convient d'abord de retenir celui-ci : Le dressage social ainsi que le suggère Nicolas Berdiaev, dans son livre : Dialectique existentielle du divin et de l'humain, a rendu l'homme indifférent à la vérité. Il ne s'agit pas là d'une vérité-étalon d'un plan mathématique ou statistique. Ensuite, il est ici question pour l'observateur en se plaçant dans l'expectative la plus haute, d'exprimer dans ses propres termes la Vérité la plus élevée qu'il pourrait atteindre concernant le mot Esprit. En conséquence de quoi il sera à même de relier le thème Esprit à la cosmo-corporéité de l'homme, ce qui universalise ce thème. La Vérité met en résonance les réactions intimes de notre faculté de discernement et de notre conscience avec ses immenses capacités d'ouvertures sur la vie. Et ceci, à part entière dans l'Upanishad Brihad-Aramyaka, il est dit : « De l'irréel, conduis-moi au réel. De l'obscurité, conduis-moi à la lumière ». L'observateur décidera-t-il ainsi d'interroger sa relation aux centres énergétiques des chakras, leurs utilités et leurs valeurs spirituelles pour l'être humain. La tâche demeure alors très ardue, étant donné qu'il faut inversement et simultanément considérer la vérité-étalon d'un côté. De l'autre côté qualifier et adapter le Plan divin à la structure corporelle en l'homme. Pourquoi en est-il ainsi ? Pourquoi le Plan divin n'est-il pas imposé ? À ce stade-ci, l'attitude de l'épistémologue, en qualité d'observateur, consiste à adopter délibérément et consciemment des indices qui s'impliquent par interaction, par interdépendance et par interrelation afin de **s'élever jusqu'au Champ omniprésent de l'Esprit**. De quoi s'agit-il ? La connaissance sociologique, dans son approche épistémologique, s'intéresse à la description de ces centres énergétiques, à leurs fonctionnements équilibrés ou harmonieux, et dysfonctionnels, liés les uns aux autres.

Precarious Young Workers, Unionism and Collective Action: The Experience of Rio De Janeiro´s Strikes (2014-2017)

Trade unions have been historically an important part of the working class living experiences and organizational forms since the Industrial Revolution. In the most recent decades the process of globalization and internationalization of capital modified economic, political, social, and cultural patterns impelling significant reconfiguration in labor's forms and relations but also in the workers' actions and organizations. One of the main issues today is the way unions are dealing with the young workers. From different perspectives and dimensions we can witness that it has not been an easy relationship being marked by very tense moments. This paper examines the relationship between unions and young Brazilian workers, most of them in a precarious situation, through the analysis of some strikes that took place between 2014 and 2017, in Rio de Janeiro, rocking the local unionism.

We focus on three particular strike movements based on different working sectors: 1) call center attendants, 2) bus drivers and 3) supermarket workers. Two of these sectors are predominantly youth work. Thus, it compares the strategies used in the strikes, the ways union leadership and young workers participated, the tensions and the innovations generated by these movements. The analysis of these conflicts draws upon the contentious politics theory, in order to identify processes of approximation and distance, mutual criticism and reciprocal learning, creative tension and tactical innovation between unions and young workers.

SANTANA, MARCO* (Federal University of Rio de Janeiro, Brazil)

Social Networks and Elections in Today´s Brazil

The aim of this paper is to analyze the relationship between social media and politics in recent Brazil, mainly in the 2018 presidential elections. The right wing candidate Jair Bolsonaro gained notoriety for using social media as basis of his campaign. Bolsonaro's electoral achievements was drawn by the intensive and extensive using of social networks and also by the circulation of fake news, specially using Whatsapp. We consider that these results are due to many factors involved in Brazilian social and political context, such as, its long history of social and political authoritarianism, increasing crisis of representation, regular presence of allegedly political outsiders and anti-systemic candidates, Recent strong polarization at least since 2014 elections so on and so forth. Other relevant aspect is connected with the fact that in Brazil Whatsapp platform became more and more popular in every social class and is related with other social and political events, such as truck drivers strike and, in the case of Marielle's assassination, the spread fake news. We intend to understand the political and social function of this events and contribute to a critical view of the left wing response for this phenomena.

The Influence of Neighborhood Ethnic and Social Class Composition

on Latino and African American Youth's Exposure to Violence

This study investigates whether exposure to neighborhood and school violence is statistically related to the ethnic and social class composition of the neighborhood in which low-income Latino and African American youth were raised. Additionally, the paper examines the extent to which these neighborhood contexts produce differential effects by ethnicity. Data are from a natural experiment in Denver, Colorado, USA involving ~870 Latino and African American youth between the ages of 8 and 18 who lived in subsidized public housing for substantial periods of time during childhood. Standardized instrumental variable probit models with clustered robust standard errors were used to estimate the magnitude of neighborhood ethnic and social class composition effects on exposure to violence as well as to test the robustness of results by ethnicity. Study findings suggest that 26 and 37% of the youth, respectively, had witnessed school or neighborhood violence during childhood. Youth exposure to neighborhood violence was generally less likely in neighborhoods with greater occupational/social prestige. Greater concentrations of higher prestige or foreign-born residents was associated with decreased exposure to both neighborhood and school violence for African American youth only. For Latino youth, higher fractions of foreign-born residents and neighborhood disadvantage were associated with increased exposure to neighborhood violence. Increased concentrations of foreign-born residents, who are predominantly immigrants from Mexico and Central America, may increase the social avoidance behaviors among African American youth with their peers. In contrast, Latino youth may have greater exposure to immigrant neighbors, which may increase the likelihood of witnessing or experiencing altercations between foreign-born and U.S. born residents.

SANTIAGO GARCIA, ROSANA* (Universidad Autónoma de Chiapas, Mexico)

FONSECA BAUTISTA, CESAR DARIO (Universidad Autonoma del Estado de Morelos, Mexico)

Ética y Gobierno Universitario

En México, las universidades públicas estatales intentan formar integralmente individuos con los más altos niveles de conocimiento científico y la mejor formación en la práctica ética y los valores.

En algunos casos, el papel de la universidad trasciende con mucho a sus actividades sustantivas (docencia, investigación y extensión de servicios), es decir, su gobierno está más orientado por su función y responsabilidad social, que implica estar al servicio de la sociedad y responder a las necesidades más apremiantes

de esta- de ahí su carácter político, cuya implicación más importante es formar críticamente a sus estudiantes, la cual requiere una formación ética, que derive de la práctica de un gobierno universitario con esta característica.

El objetivo de esta ponencia es, a partir del modelo de gobierno de una universidad pública estatal mexicana, el cual según Baldridge responde a la denominación de modelo político, exponer como este no propicia procesos formales de organización y conducción colegiada, sino que asume la universidad como un sistema político a escala y se la conduce como si se tratara de una administración pública de gobierno, anteponiendo una racionalidad administrativa por encima de la formación académica.

Lograr la gobernabilidad universitaria, demanda una participación de sus actores bajo un esquema colegiado, donde la comunidad participen con un alto nivel ético para dirimir los problemas que la aquejan. La institución bajo estudio cuenta con instancias de gobierno universitario integrados por estos actores, sin embargo, el problema es su tipo y nivel de participación, donde predomina la negociación de índole política muy alejada de una práctica ética.

Se trata de una investigación cualitativo-interpretativa basada en la reflexión analítica de la articulación de tres conceptos: ética, gobernanza y gobierno universitario, que descansa en una revisión documental y la recuperación de la práctica en el quehacer de la institución bajo estudio.

SANTOS, CAROLINA VILA RAMOS DOS* (Instituto Federal de São Paulo, Brazil)

Teen Feminism and Social Networks: Expansion of the Public Sphere and Feminization of Culture

Since at least 2016, electoral processes have shown how the intensive use of social networks constitutes the turning point of political action in Western democracies; the street and the assembly, formerly references to the confrontation of differences and consensus building, are diluted as an alternative of political space in view of the ease and readiness of social networks (Dominique Chardon); If we assume that political action is a communicational and informational action, we need to question how changes in communicative action imply changes in political action. The analysis, besides political and social, must be socio-technical: how does the internet, especially social networks, produce political mobilization?

Feminism has received enormous attention because it is an important reference for the perception of this new way of doing politics by inserting social groups, invisible by the classic dynamics of democracy, in the amplified agora of social networks; In this sense, "teen feminism" - the political activism and feminist ethics practiced by teenage girls ages 14-18 - illuminates this novelty in a clear way. This paper aims to investigate how the motivations, practices and experiences of self-identified feminist adolescents are impacted by social networks. Based on semi-structured interviews with adolescent girls, we identified the privileged sources of feminist education on the Internet (channels on YOUTUBE and fan pages on FACEBOOK), and investigated how such social networks, through digital influencers, impacted the process of feminist formation of girls; The analysis of the collected data was performed based on the theoretical-methodological framework "discourse analysis" (Michel Foucault). The paper concludes that social networks, articulated with experiences in school, family, expanding the network of affections (dating and friendship) and church, have outlined a "feminization of culture" (Margareth Rago), a long historical process of change where respect for the feminine, human dignity and difference are core values.

Advocacia Popular (people's lawyers) and Transnational Legal Activism: Conceptual and Methodological Notes in Light of the Epistemologies of the South

Building on our trajectory as activist researchers in the fields of Sociology of Law and legal activism in Brazil, this paper examines the conceptual contours and the methodological challenges facing '*advocacia popular*' (people's lawyers) and 'transnational legal activism'. Contributing to the emerging literature on political mobilization of law in Latin America, we reflect on the specificities of, and relationships between, forms of legal mobilization, examining the knowledges and solidarities they construct, as well as the potentialities and challenges they face to promote cognitive justice. Our discussion draws on the 'epistemologies of the South' framework formulated by Boaventura Sousa Santos. We focus on two case studies that illustrate combined practices of *advocacia popular* and transnational legal mobilization: the Xucuru indigenous people case in Pernambuco and the *quilombola* community case in the Island of Marambaia, both relating to struggles for land in the contexts of Brazil and the Inter-American System of Human Rights.

SANTOS, EDUARDO* (Universidade de Brasília, Brazil)

Colonial Tensions in Mozambique and the Soccer Case

Colonialism is a theme that generates many discussions in the social sciences, being a valuable space for theorists who seek to decolonize social theories, which makes this an important aspect to take this theme as a subject of study in Sociology. Authors such as Said (2011), Loomba (2005) and Rodney (1972) discuss colonialism from a decolonizing base and reflecting on relations with Africa. From these reflections, it comes to the Mozambican case, a country that until mid 1975 lived under Portuguese domination. Thus, it is understood that the research problem is the Portuguese colonialism in Mozambique, with the objective of describing its developments in more specific scopes of Mozambican society, which in the case investigated is the sports scope from the soccer case.

A systematic literature review directed at two fronts was used: about colonialism and about mozambican soccer. It was sought in the contributions of postcolonial authors the way to understand colonialism. In order to research mozambican soccer, the objective was to make document analysis from the research in primary sources, but in face of the difficulties found to consult such sources about the soccer data in the country, the way was the investigation in secondary sources, mainly in scientific articles, as the primary sources were not identified at the Mozambican Embassy in Brazil.

The most significant search result was the existence of two soccer associations: one that represented branches of european clubs and which had mostly white athletes and the other that represented local clubs and formed mostly of black athletes. This second association was supported by the African Guild of Lourenço Marques, a group that helped spread the debate about the importance of anti-colonial struggle, which shows the political and racial character of mozambican soccer during the period of colonial tensions and the struggle for independence.

Online Biographical Research with Offshore Workers from the Oil and Gas Industry in Brazil

Interdisciplinarity has been identified as one of the most important grounds for building new understandings on how more sustainable safety cultures can be systemically produced and maintained in highly hazardous and complex social-technical work environments. Interpretative Sociology and Reconstructive Biographical Research are presented here as important contributors to a research project being undertaken by an interdisciplinary team from a multi-method approach about safety and resilience in the offshore oil and gas industry context in Brazil. This presentation offers an in-depth perspective of the process of data collection, from the on-site conduction of biographical interviews in offshore units in Rio de Janeiro, to the transition to synchronous online data collection with the beginning of the Covid-19 pandemic. Some considerations are made about the online interviews conduction process, the relational challenges faced by researchers and interviewees, the strategies adopted to maintain ethical practices, and primary results on the impacts of the pandemic on the work life and everyday life of the interviewees. We argue that the transition to online field research has brought many challenges, but also opportunities for accessing respondents that otherwise would not be easily available, and that the pandemic had different impacts over work and everyday life routines depending on the biographical situation of the respondents.

Popular Music at the University: New Approaches from Alfred Schütz's Sociology

This paper discusses the belonging of popular music in the academic field from a sociological perspective. Based on Alfred Schütz's paper entitled Making Music Together: A Study in Social Relationship, it is reinforced that making music in university should be the subject of both a sociological and a musicological discussion. The points brought by Schütz about the social relationships involving making music underpinned my doctoral thesis which revealed that students of new popular music courses seek higher education courses in music for different reasons which including being in touch and meeting new musical partners. In these interactions, understood by Schütz during the performance as moments of intimate attunement, new experiences of knowledge exchange arise and, consequently, the broadening of the understanding of what it is to do music. The awareness that making music is a social interaction and that musicians are agents of this interaction is little discussed in the academic music's world, much less by sociological

*** denotes a presenting author.* Abstracts are organized by first presenting author's last name.

view. Concerned about the technique of their instruments, the characteristics of the styles of the songs to be performed, the musicians do not understand their roles in the act of musical performance. Higher popular music courses emerged late in Brazil (1989) because it was understood that the repertoire of popular music should be learned in bars and nightclubs, not in the academic environment (it was just faced as an informal learning). Thus, as a professor of one of the most recent popular music courses in Brazil (2012), I dedicate myself to understanding, from the perspective of everyday-life sociology, how these students learn, teach and develop as musicians in higher education courses in popular music.

A Degrowth Praxis to Reclaim the Commons – Blue Degrowth and Small Scale Fisheries

Facing the emergent climate and socio-environmental catastrophes, potentiated by human activities - "the creative destruction of land" has Harvey (2011) conceptualizes it, comes a time for humankind to face their role upon the "second nature" status of the environment. To achieve a "third nature" state, in Bookchin's (1982) conception, which envisions an organic socio-environmental relationship amongst humans and nature, it is emergent to rethink the current subjugated and distorted human-nature relations.

The planetary boundaries have been established (Meadows, 1972), and the growth mania pointed has incompatible with holistic socio-ecological objectives (Jackson, 2009). Degrowthers argue for an equitable and democratic downscaling of production and consumption to achieve human and ecological wellbeing. Degrowth does not envision an adaptation to current development and growth narratives, rather argues for an alternative way of living in our society, focusing on simplicity and communality.

The work presented in this communication argues for a Degrowth *praxis* in the marine context - emerging as Blue Degrowth (Hadjimichael, 2018), which localizes the former theoretical discussion into the latter realm. Recognizing the problematic blue framing, the intention is to merely position small scale fisheries as allies in this sector, and their role in a potential transition for Degrowth society. These fisheries are of great socio-economic and cultural importance for coastal communities, and often represent a smaller ecological footprint, compared to larger scale industrial players. However, facing the current marginalization and everlasting temporal and spatial oppression over resource access, and disproportional allocation of subsidies and rules that favour larger players, these fisheries have been disappearing.

It becomes emergent to, again, question the subjugated political relations small scale fishermen face upon in their sector. Devising emancipatory epistemic strategies, following a bottom-up approach, whilst contributing to the degrowth theoretical discussion from their ontological perspective, is expected to contribute the degrowth *praxis*.

SANTOS, MARIA* (Faculdade de Ciências e Tecnologia da Universidade NOVA de Lisboa / MARE-NOVA, Portugal)

The Researchers Body Amongst the Fishers' Body

Restivo (2005) argues that for a new understanding of open scientific systems, it is crucial to include the voices of those traditionally excluded from elite science. This includes recognizing the value of all knowledge practices – from traditional and local ecological knowledge to technical knowledge, and their contribution to enrich the scientific process. Although there has been a surge in academic movements that recognize the value in these knowledges, the academic violence remains.

The researcher-subject dialectic relation continues a power stance amongst the current cosmopolitism of knowledge. The subject must not merely be heard, but seen at the same height as the researcher, to realize the distinctive feature as merely the origins of their epistemes. However, the academic "gains" continue to pour onto one side. The latter begs for new collaborative approaches, rooted on emancipatory strategies which envision bridging new common grounds for equitable and sustainable ways of knowing and living.

The process to decolonize the academy begins with ourselves – the bodies amongst the "traditional" research body. In this article, the focus will be on my recent work amongst the fisher's body, a process focused on human intelligibility to provide spaces for knowledge creation and emancipation, to break the hegemony of knowledge production systems. In it, my role as a researcher merged with the role as a fisherwomen, in a small scale fishing *companha*. This was part of the field work of a research project, grounded on Critical Ethnography as it's core methodology. The critical reflective process stemmed from this experience, was transformative and provoked a reflection upon my own praxis as a researcher and human being.

Biographies and the Limits of Censorship: Methodological Frontiers

The aim of this paper is to deal with methodological problems that arose in a empirical research about memories of metallurgical workers who lived during the famous strike cycle of the late 1970s and early 1980s in the ABC Paulista region. These are not questions of a substantive nature that were under analysis about the lived experience, is about the limits of the publication of the research results instead. It follows that the context in which these biographical narratives were collected is surrounded by enormous narrative disputes over which story deserves to be recorded and, on the other hand, who is responsible for telling it. When private life history transcends the boundaries and meets the public confrontation with other narratives, what are the limits of censorship in present the research results? We discuss in this paper stories of working women who have been silenced for many years in a trade union environment marked by gender cleavage. The intention to break with this silence, which include mobilizing the research results as a support to this goal, collide with the fear of public disputes for legitimacy and prestige. Their frequent refusals in interview requests, the drama in order to reveal divergent aspects of the "official narrative" and, on the other hand, the research results as potencial coin to exchange in this story market have exposed the limits of the so-called "ethnographic authority." The Field research was conducted between 2016 and 2019 at the ABC Metalworkers' Union with women who witnessed the historical strikes at the late 70 as a member of this union.

Sociotechnical Interactions and Agroecological Experiences of Family Farming in a Territory in Sertão Central of Ceará, Brazil

Agroecology represents an important alternative for changes in agriculture by contributing to the family farms strengthening in Brazil in face of the agribusiness model. The socio-technical regime analysis reveals that such systems involve a set of norms, values and actors that give more stability and influence farmers' practices. Thus, we aimed to understand how family farmers direct their strategies according to the different systems adopted. In this way, a Systemic Participatory Rapid Diagnosis (DRPS) was applied in the Forquilha basin river territory, in Ceará-Brazil. The DRPS included exploratory fields and semi-structured interviews with farmers, local cooperative and associations representative and an ONG. The historical context revealed that changes in the regime in 1990s drove local family farming to a more conventional perspective. Government technicians and representatives of agricultural products encourage external inputs and ensure assistance. Universities and local politicians also contributed to the stability of this system. Farmers pointed to the income as an important factor for the insertion in this model. On the other hand, federal regulations for the acquisition of organic foods have encouraged the agroecological transition but have been mentioned as "panelinha" (for restrict and definite group) and have suffered from disarticulation in recent governments. The new actors' engagement, notably ONGs, also encourage this new logic, but they have a restricted performance and they are dependent on government funding and international entities. Social organization and trade fair strategies were also factors that redirected farmers towards a transition, diversifying the regime. Public policies of the 2000s, with a focus on territorial development, were essential to expand the socioeconomic conditions of the populations and stimulate changes in both directions. The results suggest changes in the legal framework, values and actors that drove the agroecological system. However, weaknesses are still perceived and are considered as challenge to the transition.

Extreme Extractivism and the Fossil Fuel Corporate Elite in Eastern Canada

The expansion of extreme carbon extractivism in Western Canada has been the focus of sustained attention by critical researchers, as their expansion entails a steady increase in greenhouse gas emissions as well as continuous colonization and exploitation of Indigenous lands. However, Eastern Canada also has a

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

long history of dependency to carbon extractivism, that has lasting impacts on the environment and on Indigenous lands. In recent year, many extreme projects of hydraulic fracturation, offshore extraction and pipeline expansion have been the focus of public attention in all Eastern provinces, in addition to existing refineries and coal-fired power plants. These developments have become flashpoints where serious resistance has emerged from civil society, which cut across cultural boudaries to bring together Indigenous, French and English communities in a broad societal movement.

I will present initial results from a project to map out ongoing extreme extractivism developments in Eastern Canada, including project sponsors or shareholders, type of governmental involvement, and civil society resistance. The project uses a power structure/corporate mapping approach to draw linkages between interested corporations and the broader Canadian and global corporate elite, so as to provide a better understanding of the structure of the fossil fuel industry at the national and transnational levels. It also traces project ownership so as to acertain the constellation of financial interests in the sector within and outside of Canada. Finally, it looks at how extreme carbon extractivist projects turn into flashpoints of contention where local communities mobilize to defend the land, air and water on which they depend, and join together to create a broad movement of resistance across the country and the world.

SAPPIA, CAROLINE* (UCLouvain, Belgium, Belgium)

La Fédération Internationale Des Instituts De Recherches Sociales Et Socioreligieuses (FERES) En Amérique Latine : Mise En Réseaux Et Développement

Dans cette communication, je traiterai des liens entre la fondation de la Fédération internationale des instituts de recherches sociales et socioreligieuses (FERES) en 1958 et l'Amérique latine. Le sociologue belge François Houtart met sur pied la FERES afin de mener et de coordonner entre 1958 et 1962 L'Enquête sur l'état de l'Église en Amérique latine. Son objectif est de coordonner l'actions entre centres de recherche, voire des recherches communes. La FERES s'appuie ainsi sur des centres de recherche existants et collabore à la fondation de nouveaux centres dans les pays qui n'en disposent pas.

Cette première recherche aboutit à la publication de 42 volumes en espagnol entre 1960 et 1962. À la demande du CELAM, deux synthèses feront l'objet de publications en au moins trois langues (anglais, espagnol, français) : 1) *L'Église latino-américaine à l'heure du concile* (1962-1963) distribuée aux évêques conciliaires pour les sensibiliser à la problématique de l'Église latino-américaine ; 2) *Les tâches de l'Église en Amérique latine* (Houtart et Pin, 1965).

En 1968, le réseau de la FERES comptent vingt-deux institutions membres dont huit en Amérique latine (Argentine, Brésil, Chili, Colombie, Mexique, Pérou, Uruguay et Venezuela).

L'objectif de cette communication est de mettre en évidence la constitution de ce réseau de centres de recherches et de chercheurs en Amérique latine ainsi que d'analyser comment les recherches ont été menées (thématiques, personnels, financement, publications). Enfin, nous tenterons d'analyser les liens avec les réseaux des christianismes de la libération (Löwy, 2019) en cours dès les début des années 1960.

"a Strike of Cold": An Aymara Transnational Experience of Tuberculosis in the Southern Andes.

High prevalence of tuberculosis (TB) affects Aymara indigenous peoples living across the Bolivia- Chile border. Based on ethnographic work carried out between 2012 and 2013, I present evidence of Ujuk usu, the indigenous illness semantic network through which individuals and their communities interpret and act upon tuberculosis. I examine the the individual illness experience of TB emphasizing the role of emotions in shaping the illness experience and the socially accepted expression of pain. I argue that renegar (bitterness) and compartir (community engagement) are linked to larger indigenous discourses of suma qamaña or vivir bien ("living well") in both countries.

Uncertain Action: Transnational Temporary Contract Work As Risk

The concept of 'risk' as a resource for understanding contemporary human experiences of incertitude, especially in the arena of work and employment has become widespread in recent decades. While much of these discussions are driven by on-going changes in erstwhile stable employment relations in the global North, this paper explores how ideas such as dis-embedding without adequate re-embedding, and individualization might resonate with the experience of guest-work or transnational temporary contract work that brings millions of workers every

year from poorer countries to affluent economies in search of better livelihoods. Through a close reading of one or more life stories of temporary migrant workers from Bangladesh, the paper offers a unique glimpse into the experiential dimension of contemporary transnational contract migration, and reflects on what we might learn when we consider the idea of 'risk' from this specific socio-economic location.

SARKAR, MAHUA* (Binghamton University, USA)

Work out of Place

In recent decades, the idea (or ideal) of a "genuine proletarian" and the notion of "free wage labor" have come under increasing scrutiny by labor scholars. Historians have questioned, for instance, both the conception of wage-earners as "free" individuals and the implicit assumption that such workers were male. In a related vein, feminists have long criticized the tendency to discount the unremunerated labor of women in households, which, they argue, subsidizes capitalist production by generating hidden surplus value that keeps the living wage of workers low. As a result, it is now widely understood that actually existing forms of labor under global capitalism vary greatly–both historically and today–and that *all* forms of labor including unfree and convict labor, the wageless, and unpaid household labor that capitalism has historically utilized as variations of capital-positing labor should be included in the conception of the working class.

Work out of Place is a collection of essays rooted in the broad consensus emerging from these debates. The volume, which brings together the work of both established and young scholars, foregrounds a number of themes including forms of work that are constrained and are, therefore, *out of place* in some significant respect in relation to the ideal type, "free wage labor"; mobility—transnational and intra-national—and its relationship to the un-freedom of labor; the complex role played by states—capitalist and socialist—in underwriting the legal status of labor; the problem of "contracts"; and the racialized and gendered logic of a global division of labor that facilitates differential regimes of accumulation, consumption and displacement in different parts of the world.

The Right to Know Your Rights - Bourdieusian Perspectives

Human Rights Awareness. In order to enjoy one's rights, knowledge of their content and conditions is crucial. However, previous researches such as the one conducted by Canadian Coalition on the Rights of the Children (2012) or the Senate of Brazil (2013) shows that awareness of human rights is low, especially for the youth. This topic has been object of NGOs and International Organisations for quite sometime, and resulted in the Declaration on Human Rights Education and Training of 2011. This document, while not binding to member-states, clarifies a number of characteristics of human rights awareness, such as the difference between training, information and education of human rights, and the concepts of education about, for and through human rights (Sarli, 2017). On another hand, one right that has not been expressly and purportedly included is the right to human rights education, with the parties preferring a less stringent semi-obligation of "access" to human rights education. In this paper, I will explore the concept of human rights awareness and especially the circumstantial choices of the states to (i) structuring a non-binding document; (ii) rejecting a specific right to awareness, through the lenses of the Bourdesian perspectives on Education, most importantly the concepts of Cultural and Social Capital, and the notions of Habitus and Symbolic Violence (Bourdieu, 1985, 1996), and including its ulterior reflections and critics by other authors (Nash, 1990, Goldthorpe, 2007, Tzanakis, 2011). This is a theoretical paper, using data collected by countries, national human rights institutions and NGOs on the level of awareness of human rights and its connections with their exercise.

SARMA, KAUSIKI* (Lancaster University, India)

State Violence and Domestic Violence: A Case Study of Assam, India

Under the leadership of the ruling party in power – the Bharatiya Janata Party (BJP), India is currently undergoing changes at broader structural levels, through state controlled mechanisms with repercussions in interpersonal relationships. The BJP is the political arm of the Sangh Parivar, a union of Hindu nationalist right wing organizations headed by the Rashtriya Swayamsevak Sangh (RSS), whose ultimate aim is the establishment of a Hindu Rashtra, or Hindu Nation (Sarkar and Sarkar, 2016).

Hinduism embodies a heterogeneous set of religious practices, that encompasses multiple cultural roots and holds deeper meaning, against 'Hindutvavaad' or 'Hindutva' - a violent and masculinist political ideology that claims Hindus as primary citizens and non-Hindus as secondary citizens (Menon,2017); one in which women too feature as secondary citizens with limited means of assertion.

Hindutva masculinity propagates women as bearers of family honour and shame – paramount in the duty as a wife and mother is to maintain the sanctity of the family at the cost of personal well-being. Preoccupations with honour, shame and sexual purity of women are pivotal in facilitating gender inequality while simultaneously legitimizing violence against women and relying upon such violence in sustaining hegemonic systems of gender inequality (Bennett and Manderson, 2003).

My paper will highlight the juxtaposition of state imposed violence masked within Hindutva ideology, with domestic violence asserting that domestic violence is not reducible to interpersonal violence with the state playing a crucial role in aiding its perpetuation.Through qualitative data, it will specifically underpin rising statistics of dowry related violence in the state of Assam located in the Northeastern region of India – a region that once prided itself on egalitarian gender norms, relatively free of gender discriminating practices that were most prevalent in the 'mainstream' Indian landscape.

SARMA, PRANJAL* (Department of Sociology, Dibrugarh University, Assam, India, India)

Intersectionality and Leisure in Contemporary Mising Society of Dhemaji District, Assam, India

Intersectionality is the manifold interweaving ways in which different histories and locations based on tribe, gender, class etc position an individual's experiences and life-chances. In case of Mising tribe, they are the second largest Scheduled Tribe (ST) community in Assam next to the Bodos. Their tribal ST status, gender, age, sect, religion, ethnicity all shows their intersectionality. This intersectionality is a useful means of analysing leisure in terms of dynamic interplay of individuals and their social relations within Mising Society.

In this paper we will focus mainly on leisure activities of Misings of Dhemaji district on the north bank of river Brahmaputra which is vulnerable to floods. The main objective is to highlight the scenario of leisure and intersectionality in contemporary Mising society of Dhemaji. The analysis is based on primary and secondary sources of information and personal observation. We have interviewed 60 villagers of Mechaki Tongani, Ngomukhjan and Sechu Dighali villages, 20 scholars of the locality and 5 officers of the Mising Autonomous Council (MAC) by purposive sampling method. It was found that Mising tribe has several leisure activities and it varies with gender, status, age, sect and religion.

Playing football, cricket and other games by the youth, gossiping, boating, hunting, weaving, travelling, singing, dancing, watching television and listening to music are some of the leisure activities of Mising society. Both indoor and outdoor leisure activities are prominent.

In Mising society, we have found that leisure itself has come across different processes of de-skilling and re-skilling, as for instance, several traditional leisure activities like playing flute are now not that popular and new kind of leisure activities like playing mobile games, internet etc are getting popular which require new skills, symbolise postmodernism and celebrates consumerism as a vehicle for creative cultural activity.

SARMA, PRANJAL* (Department of Sociology, Dibrugarh University, Assam, India, India)

Work, Leisure and the Environment in Apeejay TEA Limited, Assam, India

Adequate leisure activities and suitable work environment is desired by every employee of an organisation. In case of tea gardens of Assam, the workers and staff do not have much time for leisure as compared to the executives.

Apeejay Tea is one of the oldest and largest tea producers in India which have Seventeen tea estates in Assam covering 50,000 acres and 27,760 employees. We have chosen three tea estates of Apeejay for the study, which are – Suffry, Khubong and Talup.

In tea gardens, executives get quality leisure time on Saturday and Sunday. On workdays workers get one hour break time during their work, and in the evening they get some more time for their leisure. Executives visit the nearby clubs and utilise their time by indulging in sports etc as leisure time activities. On the other hand staff and workers have different outdoor and indoor leisure activities.

We have collected primary data by observation and interview method. Different categories of respondents like 12 executives of tea gardens, 15 staff and 90 workers from chosen Tea gardens are taken by purposive sampling method. Secondary data is collected from the dependable sources. It was found that the employees have an appropriate work environment, but opportunities for their leisure activities are not sufficient. Industrial democracy exists and cases of disputes are not found. There is scope for better leisure opportunities to improve their work-life balance.

According to Marxian notion, the leisure is highly class-based as it carries the structured inequalities of capitalised class society, which is true for tea gardens.

At the same time it was found that to a great extent women help in men's leisure activities by performing the domestic work and childcare especially in connection with the working class of tea gardens.

SARRIS, NIKOS* (National Centre for Social Research, Greece)

Inequalities and Multiple Discrimination: The Gender Gap in Employment and How to Combat Poverty Among Women in South Europe

Gender equality is one of the fundamental values of the European Union. This is the core aim of the European Commission's strategic engagement for gender equality 2016-2019. The largest gender inequality can be seen in payments, where women earn on average 16% less than men across the European Union. The gender gap in employment is the headline indicator of the European Pillar of Social Rights' social scoreboard for gender equality. Moreover, women are often victims of discrimination and multiple discrimination.

The aim of this paper is to examine the phenomenon of multiple discrimination that women face within the labour market. It further aims to document that women having low work experience, working part time or with a temporary contract are most affected by the risk of poverty. It also seems that additional factors, such as parenthood or the weak support from the social welfare system, contribute and deteriorate living conditions for women, pushing them to unacceptable living standards and social exclusion.

Using a comparative descriptive approach based heavily on relevant indicators (e.g. at risk of poverty or social exclusion), it will be indicated that women suffering from most types of discrimination, face difficulty in sustaining themselves with a decent and adequately paid job. They usually accept part time jobs or/and temporary contracts at lower wages than men and under unsafe conditions. Besides, they have to deal with other risks, as many of them are lone parents or/and have been unemployed for a long period.

Using data from the EU SILC project and the Eurobarometer, it will be demonstrated that the countries mostly affected are those of South Europe, where the welfare state is weak and rudimentary and they have suffered the most from the crisis.

Ephemeral Media and Collective Memory: Activists at a Temporal Interface

In recent years there has been an upsurge in mass resistance spontaneously organized through digital media platforms. Although these platforms have been useful, accelerated communication flows also generate short-lived, *ephemeral* media that potentially affect social movements' construction and maintenance of collective memories. This conference contribution focuses on how digital activism can navigate this temporal interface between ephemeral media and collective memory. It takes stock of a growing body of literature concerned with diverse experiences and conceptualizations of time and temporality, highlighting the art of history writing, and its building blocks of collective memories, as a political instrument and resource. Previous research has pointed out the mobilization potential in building movement narratives, dynamically adapted to instigate enactment across historical contexts. Social movement studies have also come to explore the specificities of such subversive temporalities, documenting the usage of alternative timeframes and temporal multiplicity within social movements. Against this scholarly backdrop it becomes critical to analyze how social movements, in an era of accelerated communication flows and ephemeral digital media, continue to produce and maintain collective memory. In this presentation we will discuss the *mediation* of resistant temporalities and collective memories, the *political opportunities* carried by digital media platforms, the movements' *ambiguity* towards them, as well as the *prerequisites* for collective memory production in a changing timescape of historical archive and artifacts. We seek to answer how social movements are mobilizing temporal resources for the writing and making of their own history.

The Relationship between within-Country and between-Country Inequality in Globalization

Persistent and rising global inequalities are the greatest challenges to our world today. There have been numerous studies to investigate both within- and between-country inequality. Few studies, however, investigate the relationship

between them. This study examines whether within-country inequality causes the change of the position in between-country hierarchy. To this end, we will take the following two approaches.

Several studies suggest that global average of income inequality between countries has declined due to the economic growth of some countries, such as China and India, while income inequality within country has raised for some countries and not for others. First, we will examine the global average of income inequality within country overtime and its relationship with countries' position in the global hierarchy.

Second, we will develop a theoretical framework to capture the relationship between within- and between-country inequality. Among several possible relationships between the high-income country (HIC) and low-income country (LIC), in HIC, we assume that the rich become richer, while the poor remain poor; in LIC, the rich remain rich, while the poor become poorer. In this case, income inequality between the rich and the poor within both HIC and LIC raises, and income inequality between HIC and LIC raises. In another case, in HIC, the rich remain rich, while the poor become poorer; in LIC, the rich become richer, while the poor remain poor. In this case, income inequality within both HIC and LIC raises; but income inequality between HIC and LIC decreases. The second example suggests within-country inequality does not lead to the change in global hierarchy, indicating that global force does not affect within- and between-country inequality consistently.

Globalization may improve overall incomes, but this rise is not equally shared among countries. Applying the two approaches, this study examines the relationship between within- and between-country inequality.

SAVA, IONEL* (University of Bucharest, Romania)

The Past of Historical Sociology. Contribution of South Eastern European Sociologist to the Development of Historical Sociology in the First Half of the 20th Century

By mid 2000, Immanuel Wallerstein mentioned that the concept "core-periphery"- which is central to the historical sociology theory and methodology - it had been actually developed well before his magistral work of 1974 (The Modern World System). Eventually, sociologists in South Eastern Europe used this idea as early as 1920s. Among others, the Romanian Stefan Zeletin developed a preliminary historical sociology (1927) in order to explain the development dependence of the less advanced regions of Europe in relation with the Western metropolitan area in general, the English one in particular, during the "long 19th capitalist Century". Daniel Chirot followed this tradition in the late 1980s and discovered in the field (interviews with H Stahl) how much past sociology inspired historical sociology as we know it today. This presentation is dedicated to the memory of Immanuel Wallerstein by aknowledging the contribution of (South Eastern) European sociologist to the development of historical sociology and world-system analysis.

"Social Field" or "Social Space" in Transnational Migration Studies? Romanian Integration Experience in Italy and Spain

Migration studies have largely contributed to the development of transnational (social) concept. There are two main dimensions that split the transnational from both a theoretical and methodological point of view : "social field" stresses the importance of social embeddedness of migrants in the host country; "social space" underlines the dynamics of migrant flows. Romania is one of the countries of East Central Europe that has experienced rather large migration flows within the European Union yet social integration has eventually prevailed in at least two destination countries. There are almost four million Romanians living in Western European countries with some one milllion in each Italy and Spain. With the Brexit in 2016 the free movement of persons has dramatically changed not only in the UK but in the other EU countries as well. This presentation tries to argument "embeddedness" rather than "dynamics" is the main feature of Romanian migration flows after 1990s. In such an hypothesis, embeddedness better explains the current process of integration and the reducing of migration dynamics and of transnational participation as well.

The Contours of Organised Materiality in the Age of Disorganised Immateriality: A Case Study Regarding the ICT Workers' Trade Union Perception

The current literature on labour studies proliferates within the scope of immaterial labour, digitalisation, robotisation and the Industry 4.0 debate. In this context, the future of the organised labour movement and trade unions are relevantly im-

portant matters. Although the focus of the theoretical debates on immaterialisation of production processes, and labour revolve around core countries of the world, focusing on the semi-periphery and periphery of the world in this regard is a necessity. This paper focuses on trade union perception of the ICT workers in Turkey. This paper claims that the potentials of the organized labour movement, which might be built among the ICT workers of today, should be analysed within the context of the new forms of workmanship, the immaterialisation, the digitalisation and the transformation revolving around the debates on Industry 4.0. Although these transformations are not the direct causes of deunionisation, they are used by the neo-liberal centres as the apparatuses to oppress the organised labour movement. The findings of the case study conducted with a sampling composes of a-twenty-nine ICT workers, reveal the challenges of building a trade union solidarity among the ICT workers. The answers taken from the sampling give us a tip to grasp what the perspectives of the ICT workers are regarding the organised labour movement and trade unions. The perspectives of interviewees draw also a road map for trade unions to build an effective organising strategy among the ICT workers.

FELDMAN, MARINA* (Rutgers University, USA)

Gender and Generation: Policies and Practices of Education-Care in Early Childhood

We draw from research performed in two contexts, Brazilian and North American, to develop and intersectional approach both to early childhood care and education and to the life condition of women as caretakers. Our goals are to identify and critically analyze both policies that aim at assuring the well-being of children (and therefore affect the lives of women), and other social practices of education-care—specifically focusing on marginalized social groups, families in poverty, single-parent households, and immigrant families. We understand education and care as indissociable categories in early childhood and children as the bearers of rights to access both dimensions of this twofold concept. The studies presented here draw mainly from a qualitative approach, but we use statistical data to present a general picture of single-motherhood and of the population between 0 and 6 years of age and their enrollment in preschools. We seek to present a comparative overview to situate the social groups we focus on, as well as the policies aimed at their children and respective caretakers, which are majorly women. We use documental analysis to present the existing policies from a critical perspective and present initial findings drawn from listening to the research subjects, in the contrasting context of Brazil and the US. In both contexts, the policies are inefficient in guaranteeing the rights of children to education-care and women—especially single heads of households—have their life affected by the State's inefficiency and/or absence. Those women and their families consequently face poverty and stigmatization, to a greater degree when policies and political discourses place the responsibility for child-rearing almost exclusively on them (or absent male figures). We also point out, however, to a form of agency characterized by the association between families in generating networks of care through communities and in other informal setting of care-education.

SCALON, CELI (Universidade Federal do Rio de Janeiro, Brazil)
ESTANQUE, ELÍSIO* (University of Coimbra, Portugal)

Ambivalent Middle Classes: Rebellion or Consumption? Cases of Portugal and Brazil

Middle class has always been a controversial notion. In the late nineteenth century it was considered the intermediary level to those in process of empowerment when Tocqueville looked at the impressive upward mobility to the new entrepreneurial agents in search of the American el Dorado. And in Europe, after mid 20th Century, seen mostly as the buffer zone that would prevent dichotomic class struggles and could give a human face to western capitalism, in which social status could depend on merit and opportunities, offered by the educational system to give them new chances to reach upper status.

Considering the controversial nature of the concept in Sociological tradition, we propose to discuss the possibilities for move on with this concept in contemporary societies, assuming its ambivalent nature. Considering the labor relations debate by one side and the new social movement theories by the other, we also aim to discuss the contradictory role of these sectors on developing new mechanisms of consent towards economics and politics   which can help us to understand the new collective actions – far left or far right groups – that position themselves against the political systems. On the other side, new trends on social change and "social mobility" in Portugal and Brazil are important criteria to understand to which direction is moving our panorama of social stratification, either toward a more balance and cohesive society or moving toward a more dichotomist one.

Moreover, we will consider the changes that took place in both countries in the last decades, seeking to understand the new roles of middle stratum categories

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

and the meaning of their segmentation in the context of recent economic crisis. We will give examples of mobilizations and social protests along the current decade, especially in 2011 – 2012 in Portugal and in 2013- 2015 in Brazil.

SCALON, CELI* (Universidade Federal do Rio de Janeiro, Brazil)
PLA, JESICA (University of Buenos Aires, Argentina)

Income Groups: A Comparison between Argentina and Brazil 2003 – 2017

From the beginning of the new century, Argentina and Brazil were under the rule of progressive governments, also known as "turn- left governments" or "pink tide". Several discussions had been done about the effects of their policies on social and economic areas. There is certain level of agreement about the increasing in job positions and the improvement of living conditions for a significant proportion of the population, mainly those in lower classes. However, there is less agreement about the decrease of inequality throughout the last two decades.

In the paper, we will address this question from a comparative point of view, using quantitative data from *Pesquisa Nacional por Amostra de Domicilios* (IBGE/Brazil) and Encuesta Permanente de Hogares (INDEC/Argentina).

The study will be based on income groups, defined as: very high (401% or more), high (201%-400%), upper-middle (126%-200%), lower-middle (76%-125%), vulnerable (26%-75%), extremely poor (25% or less). Our aim is to analyze the groups distribution and their social characteristics in the period of 2003–2017. Using regression models we will consider the influence of social-economic variables in the probability of belonging to each group. Finally, we will analyze the association between income groups and class, as well as the decomposition of inequality through this period.

We argue that there is a significant stability on the income groups distribution, showing the resistance of inequalities. Moreover, we believe the chances to be included in the upper income strata are quite unequal between groups and the odds diminish at the same path as we climb the income groups pyramid. The comparative perspective can offer a more complex view of income inequalities, pointing out similarities or differences between Brazil and Argentina, for a better understanding of the trends experienced by each country since they share comparable historical and political trajectories.

Evangelical Women in Politics: The Election Campaigns of Councilwomen in Brazil

The political field remains as a space dominated by men. The reflection of this political inequality can be perceived through the lack of female representation in Brazil, where women occupy 15% percent of the seats in National Congress, a situation repeated in the regional and municipal spheres. A recent electoral phenomenon has been calling attention: the election of women related to evangelical churches and their constant political growth within the past two decades, especially in City Councils. In the year 2016, twenty-nine councilwomen who identified as evangelicals were elected, belonging mostly to the center-right ideological axis and distributed amongst 15 state capitals in the country. This occurrence instigates an analysis on the female representation connected to the evangelical field. In order to fulfill the purpose of this paper, the 657 political campaign videos shared in the 29 representative's Facebook pages were transcribed and analyzed, between July and October 2016. Then, we sought to identify the manner in which the "woman subject" was constructed in their political campaigns. We also checked how gender issues were presented in the councilwomen's speeches. The methodology adopted was of a qualitative nature, and through the use of the tool NVIVO it became possible to apprehend the meanings attributed to the selected variables. The analysis was conducted through the lenses of feminist theorists and the authors that debate the intersection between gender, religion and politics. From there, we concluded that maternity and gender stereotypes were fundamental in the construction of the "woman subject". Moreover, the majority of them defended traditional Christian values, especially the traditional heteronormative family.

Does Tertiary Education Pay Off? Gender-Specific Earnings and Returns on Higher Education in Health Care Occupations in Germany.

Throughout the last decades the German health sector saw substantive inroads of women in the male-dominated medical profession and a slight increase of personnel with tertiary education in the so far feminized and semiprofessional occupations of nursing and elderly care. Effects of these trends on the income levels for the male and female employees in the expanding health sector are still under-researched. Based on data of the German Socio-Economic Panel from 2010-2017 the author investigate income levels and higher education pay-offs for the occupational groups of doctors, nurses and elderly care workers. Results show for all three occupations that women earn significantly less and get less return on education. The gender gap is less pronounced within the profession of doctors than the semi-professional occupation of nurses. The occupational field of elderly care stands out with low wage levels for both men and women but comparatively high returns on education for male jobholders. These differences indicate the need to focus further research on occupation specific structures in order to better understand the reasons for unequal pay of equally qualified women and men.

Experiences of Junior Researchers Abroad: Appreciation and Devaluation in a New Field

When doctoral candidates are defined not only as (doctoral) students but also as part of the academic workforce (participating in research projects, publishing, teaching, etc.), they are indeed high-skilled workers and on the first step of the academic ladder. The university as work environment bears peculiarities in comparison to other sectors of the high-skilled - with their epistemological traditions and organizational realities in different countries and higher education systems. Therefore, graduates who went abroad to another country to pursue their PhD face specific obstacles and problems, not only in the PhD training, but also in the foreign academic labor market.

This paper draws on Bourdieusian capital and field theory to explain how the long-term relocation of doctoral candidates into another higher education system and labor market affects their social and cultural capital usability. This addresses i.a. social ties/networks, discourses in the discipline and organizational differences. In an idealized world of internationalization those factors should not have any significance, but my analysis will show how tensions and difficulties arise abroad and what kind of consequences and strategies the PhDs develop to soften those irritations.

The analysis draws on a comparative case study with 60 German doctoral candidates in France and the Netherlands. The biographical interviews allow not only to reconstruct the past problems and obstacles of finding a way into a new academic field, but also to identify the (dis)integration into the field of higher education of the country abroad under the theoretical framework of capital theory: How did the value of their domestically acquired capital change and how and to what extent capital was transferred and newly acquired in the new academic labor market? The analysis will include a comparative view between France and the Netherlands, as those two countries represent different traditions and directions in their academic labor markets.

Biography and Organization – Potentials of Biographical and Ethnographic Research Methods in the Field of Police Research

In this presentation I will show how I have combined biographical and ethnographic research methods and methodologies, and discuss the benefits of this combination with examples from my research project on the processes of becoming and being a police officer. My research focuses on the stock of knowledge and patterns of action in the German police from a social constructivist perspective. Based on this theoretical perspective and the outcomes of my fieldwork, I conclude that knowledge is internalized over the life courses of individuals and that work-related situations and occupational actions are defined not only situationally but also in the light of experiences. Accordingly, my study explains how police officers act and why they act the way they do – or as Alfred Schuetz formulates it: it explains not only the "in-order-to motives" of police actions but also the "because motives" of police officers. This approach makes it necessary to study the officers' biographies embedded in the socio-historical context and to consider their actions within the context of the police organization. It also provides us with insights into how biographical experiences shape the everyday actions of police officers, and how intertwined biographies and organizations are in general.

I will discuss the potentials of combining biographical and ethnographic research methods within the "closed" field of police research, both on an analytical and a practical level, and I will present some of my findings.

Economic Elites' Place in Inequality. a Comparison in Latin America's South Cone (Chile, Uruguay, Argentina)

This proposal aims to show the results of an ongoing research about the perceptions of inequality of the economic elite in the province of Córdoba, Argentina. Its main goal is to contribute to the understanding of recent dynamics in argentinean elites. To that end, we've studied the particularities of the historical unfolding of local principles in the exercise of economic and political power (Landa, 1999), and compared data with the work of colleagues in Buenos Aires, the nation's capitol. One of the main results, was a clear difference in elite's understanding of their own social standing: although there's a mix in every case, whilst local elites tend to emphasize "traditional" dimensions (family origin, symbolic status and so on), national elites put forward meritocratic explanations of themselves.

Nevertheless, both points of view were articulated as different ways of setting the ground for an understanding of inequality in moral or normative terms. In this sense, the construction of a justification of social stratification and their place in it by economics elites, referred to moral superiority and even close to the classical notion of "power" elite.

Taking into account the previous statements, we propose a comparison between our own results with those produced by other authors in Chile and Uruguay (Espinosa, 2010; López, 2018; Serna, 2013). These countries constitute the majority of South America's south cone and have had, with their differences, similarities in terms on historical and socio-political processes (independence, race composition, immigrations, alternation between dictatorship and democracy, economic perspectives, etc.). With this objective, we aim to detect disparities and common aspects in elite´s perception of their own social position, and generate comparative tools for further research.

On Talking Silence in Biographical-Narrative Interviews

There are many reasons an interviewer does not – or does hardly – talk during biographical-narrative interviews. Methodology is one: The researcher is not supposed to interrupt, but also not exactly encouraged to disclose her own biographical experiences or emotions. If she cannot help it or her interview partner asks her a personal question, she should delay her answers until the end of the encounter, when the 'official part' of the interview is over.

For the last few years, I have been researching a deeply emotional and personal experience: love. Because I was concerned with the asymmetrical knowledge that is produced during the interview, as one person knows intimate details of the other's life but not vice versa, I often allowed the interviews to encompass more interaction, questions and dialogue.

However, in the interviews for my PhD project, I decided to try to 'be more in line' with the method and mostly did not say anything during the interview unless my interview partners specifically addressed me.

In my contribution, I want to tell the story of my encounter with Rosa, an 18-year old woman who told me about an on-and-off relationship with a narcissistic person who treated her poorly. At the end of the interview, when I realized they were still a couple, I was shocked. I felt the urge to shake her and tell her to dump this guy, and had I been her friend, I would have.

However, I kept silent. Two days after the interview, she sent me a message to inform me she had ended the relationship. Did my silence speak after all? If emotions, as Sara Ahmed writes, move between bodies and move us – how can we trace communication beyond words in interviews?

Racial Disparities in Aging in the USA: A Prospective Approach

Rather than taking 60 or 65 as a 'constant' 'boundary' to old age; adopting a 'prospective' emcompasses dynamic changes in health and mortality between and within societies over time. This approach of fixing the boundary to old age by remaining life expectancy [RLE], as devised by Sanderson and Scherbov, has been influential in producing a more realistic micro- and macro-level view of aging and, in particular, in the development of better means of comparing societies and population groups which, in turn, can better shape the policy agenda. In this paper we produce, for the first time, prospective measures of aging by race for the United States. Our preliminary results show significant differece in 'prospective

old age threshold'. The findings will demonstrate the extent to which the USA is 'aging equally' and, as such, will contribute to the policy debate over differential needs and resource allocation.

The Struggles for the Survival of Outsourced Poor Workers in Ufrgs and Ufpr: Limits and Possibilities of Social Actors' Articulation to Construct Power from below

Universities are complex and decentralized organizations (especially when large), imposing difficulties for the organization of labour movements, as workers do not share the same physical space (and problems). Considering the outsourced workers, representing approximately one-third of their workforce, the strategies against mobilization used by the employees include changing people from unit to unit as a way to separate possible activists. That is a serious issue when considering that some outsourced workers report extreme deprivation, as they compose the poorest and more unstable part of the university's work force. Taking advantage of their vulnerability, intermediary companies that employ them often fail to attend their labour obligations, producing situations in which workers' survival is threatened. Such situations have occurred in several institutions in recent years, including UFRGS and UFPR (two important universities). In these spaces, workers organized struggles in order to survive, despite all difficulties related to poverty and their contractually weak labour relations in the context of neoliberalism. UFRGS and UFPR cleaning and maintenance workers are mostly mothers and heads of household, committed to a double workday, often submitted to moral and sexual harassment. To overcome the initial difficulties, without any support of their union, these workers articulated themselves with other social actors – groups of students, teachers' or technicians' unions -, temporarily and partially overcoming the fragmentation of actors usually observed in these decentralized spaces. In these extreme moments, solidarity appears to be the initial node of the articulation, producing collective actions mobilized by social medias as an alternative organizational space. Despite producing contradictory results and fading in the everyday, these experiences construct new organizational processes, highlighting the articulation between social actors as an essential step to the construction of power from below in precarious labour conditions, and for the constitution of these actors as agents of social transformation.

Strategies for Living Refugee Life in the Light of Immaterial Labor and Ethnic Enterprise

This article refers to the path of life in a situation of vulnerability. It aims to present and analyze the strategy of living the life of Syrian refugees in the light of the immaterial labor notion and ethnic enterprise. The main theoretical support was taken from the authors Bauman (2011), Gorz (2005), Lazzarato and Negri (2001), Aldrich and Waldinger (1990) and Cruz and Falcão (2016). The exploratory qualitative research was performed with Syrian refugees living in southern Brazil, who share experiences in two ethnic enterprises related to the food business referring to the notion of immaterial labor. For the data collection, it was performed five in-depth interviews with refugees, direct observation in their respective enterprises and monitoring of their virtual social networks. The data from the collection were submitted to content analysis and resulted in three axes of analysis: (i) paths and mishaps in the refuge; (ii) immaterial labor in the ethnic enterprise and (iii) being an ethnic entrepreneur as a strategy of living a refugee life. It is concluded that the immaterial labor in the ethnic enterprise is a central element to the (re) invention of life in a refuge situation in order to contemplate the territory of origin and destination.

Different Perspectives on Animal Welfare in Dairy Husbandry and Consequences on Landscape and Environment

The aim of this paper is to explain better different attitudes of farmers towards animal welfare and the consequences for landscape and environment. I construct a theoretical framework by combining three sociological concepts to

explain farmers' practices. I combine Bourdieu's habitus, van der Ploeg´s farming styles and the theory of conventions by Boltanski and Thevenot to shed light on the identity of farmers and their practices. Then I apply this framework to an empirical case from the mountainous province of Tyrol / Austria, where an organic retail brand demanded free run barns as a shorthand for animal welfare. Two different attitudes can be discerned as a reaction to this claim: "cowmen" and "dairymen". I analyse the different attitudes and their future trajectories according to the theoretical framework and embed it into the wider political landscape. Finally I deduct the consequences of these perspectives on animal welfare for landscape and environment.

Do New Due Diligence Policies Matter? the French Duty of Vigilance Law and Negative Externalities of Beef and Soy Supply Chains from Brazil

New human rights and environmental due diligence regulations have increasingly been emerging in European countries in the recent past and are currently under discussion at EU level. The French Duty of Vigilance Law was adopted in 2017 and has been celebrated by human rights and environmental activists as a particularly promising measure for regulating supply chains. In this paper, we analyze to what extent this new law has actually changed corporate practices and contributed to harden foreign corporate accountability.

For doing so, we selected ten corporations headquartered in France, which import or process soy and/or beef from Brazil and that have been classified as influential traders or processors of forest risk commodities. These commodities have also been associated with significant human rights violations such as land dispossession and pesticide poisoning. We systematically analyze a large volume of primary data from 2015 to 2020, such as corporations' vigilance plans, sustainability reports, NGO reports and a lawsuit against the Casino Group for an alleged breach with its duty of vigilance in Brazil.

Our preliminary findings suggest that corporate reporting and increased transparency have not significantly contributed to a continuous improvement of the environmental and human rights performance of French corporations, not least because rigorous state monitoring has been absent. However, the French law provides new opportunities for civil society actors to challenge corporate actions by producing better knowledge for attributing negative impacts to the supply chains of specific companies, by 'naming and shaming' lax companies and by filing lawsuits to French courts. We argue that such practices could contribute to harden foreign corporate accountability via legal, reputational and market forms of accountability. Our study aims to contribute to ongoing debates on foreign corporate accountability and transparency and accountability in global environmental governance.

How Russian Billionaires Explain Their Fortunes and the Misfortunes of Others

When Russian billionaires are prompted to explain their personal wealth, answers are quick at hand: Their journey to success was enabled by an entrepreneurial spirit, wittiness, a strong will and hard work; some simply refer to their supreme genes. Less welcome are questions about the origins of the billionaire "class" as a whole. Too vivid are the memories of the 1990s privatizations catapulting the most ruthless of them to the top, while both Russia's economy and its people ended in desolation and misery. Large-scale money-making has never managed to shake off associations of theft, corruption and crime. Not that their reputation bothers these billionaires too much. They live their luxury lives far apart from the rest, both physically and in their minds. Many perceive themselves as progenies of the pre-Revolutionary and Soviet intelligentsia. They use this provenance to explain their cultural and spiritual superiority as well as their social exclusiveness. Some have identified a calling to take on moral leadership, for example by enlightening the simple folk with their charity activities. Others regard it as their duty to demonstrate patriotism by sponsoring Russian artists, funding surgery for gravely ill children or promoting gifted youth. When it comes to the staggering inequality in the country, they all agree: to go about this issue is up to the state, not them. Such a view is shared even by those among them who keep advocating that Russia's social and economic policies should be modelled along those implemented in Chile during Pinochet reign.

This paper is based on the analysis of interviews with twenty billionaires, as well as on second-hand information on the remaining people of Russia's Forbes-200.

The Race to Connect the World and the Emergence of the Infrastructure State

The steady deterioration of China-US relations heralds a new Cold War according to some commentators. We argue that in contrast to the 19th and 20th centuries in which great powers sought to secure territory by reifying borders and containing adversaries, powerful multilateral institutions and nation-states such as the US and China are currently engaged in a race to expand their respective spheres of influence by integrating territory through large-scale transnational infrastructure projects (eg railways, roads and energy grids). China has taken a commanding lead in this race since its flagship foreign policy framework, the Belt and Road Initiative, was introduced in 2013. We argue that rather than a 'new Cold War,' this competition constitutes what we term the 'Great Race,' and our analysis subsequently shifts scales to explore the impact of its territorial logic on Laos, Nepal and Tanzania. We demonstrate that the claims to legitimacy of these governments rests on a supposed ability to manage large-scale connective infrastructure projects. These initiatives are meant to signal that the state is the primary agent of 'modernization,' and the transformation and integration of territory is the overriding objective of national development policy and considered a precondition for export-oriented economic growth. We borrow heavily from the work of Neil Brenner to demonstrate that in order to achieve these 'state spatial projects,' state apparatuses were extensively restructured. As a result of this extensive restructuring we have witnessed the emergence of what we term the 'infrastructure state,' and we conclude by exploring how this has impacted everyday life.

SCHLEE, THORSTEN* (University Duisburg-Essen, Germany)

Who `s the Bad Guy?

the Interplay between Migration Control and Social Policy Organizations in Local Fields of Labour and Asylum in Germany

Who `s the bad guy?
The interplay between migration control and social policy organizations in local fields of labour and asylum in Germany
Main Issue: Organizational rationalities in local fields of labour and asylum
Labour market access for refugees in Germany is caught between migration policies and an activating labour market policy. Migration policies intend to govern migration based on a push-pull model. In contrast, activation policies rely on investment in human capital intending to produce a self-responsible workforce and to increase the labour market supply side. Based on a field study in three German municipalities the contribution shows how local organizations rationalize and handle migration and especially flight migration.
Methodology and data base
Therefor the paper refers to the concept of *coproduction of local social services,* that depicts how local organizations with differing aims produce overlapping spheres of inclusion and exclusion (Mezzadra/Neilson 2013) for refugees. The paper bases on an investigation of three German municipalities differing in their organizational framework to govern labor markets and in their size. It relies on expert interviews (N=24) with the main local actors (the local employment agency, the municipal foreigner's office, the local job center and the regional branches of the migration and refugee office, as well as with social workers).
Findings
The paper first shows the organizational rationalities as well as the clashes between differing legal aims, organizational programs and practices. It secondly depicts modes of collaboration, conflict and misunderstanding between these organizations. Thirdly it highlights the nexus (Ataç/Rosenberg 2019) between migration control and social policies, as social policy organizations play key roles to regulate migration *within* the nation state and thereby produce precarious social positions for unwanted migrants.

SCHLEGEL, VINCENT* (Cermes3, France)

Empowering Chronically Ill Patients to Reduce Social Health Inequalities? an Ethnographic Study of Therapeutic Patient Education Programs in France

As health inequalities persist in France, new strategies have been devised to reduce them. From the perspective of the public authorities, educating people about health appears to be one promising strategy. It generates potentially significant savings by shifting responsibility for health from the state to individuals.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The development of therapeutic patient education (TPE) programs in France is part of this responsibilization approach. Such programs aim to help chronically-ill patients manage their disease by providing knowledge and skills through their rationalized training. If Bourdieu paid little attention to health issues, he was deeply interested in how institutions, especially the education system, reproduce social inequalities. His key concepts could therefore be useful to study TPE and its effects on health inequalities between patients. Based on an ethnographic study that includes three educational programs for diabetics as well as semi-direct interviews with health care workers (n=33) and patients (n=21) in France, I show that training programs maintain, if not reinforce, health inequalities in three different ways. First, doctors do not offer participation to all patients, and even when they do, they select trainings they deem appropriate to the quantity of cultural capital patients possess. By doing so, they create socially selective educative pathways for patients. Second, as Bourdieu pointed out, the success of teaching methods relies on predispositions which are not equally distributed among the participants. During educational workshops, patients of different classes adopt attitudes which are more-or-less likely to enhance learning. Last but not least, health care workers promote a way of life which resonates differently according to patients' habitus. As the "good" way to cope with the disease is socially situated, the degree of transformation expected varies greatly depending on patients' social position.

Global Professionals Integrating Labour Market in Montreal, Quebec: Paths, Strategies and Resources

In this communication, we will present the results of a research developed between 2016 and 2018 in Montreal. This research had four phases. First, a survey answered by a hundred of highly skilled immigrants allowed us to build a typology with four different professional integration paths. Building on this typology, a qualitative phase, consisting of semi-directed interviews with 24 professionals, resulted in the identification of the main barriers encountered and strategies used to address them. These results were used to co-construct, with carrier counselors, a cartography of pathways or trajectories of professional integration. In the last phase, the counselors tested this cartography and evaluated its efficacy.

SCHLOBACH, MONICA* (college Maisonneuve, Canada)

Transnational Families and Privacy Management

Intimacy refers, according to Jamieson (2011), to the quality of the links between close people and also to the process of building these links. We will argue in this communication that the contours of intimate practices between members of transnational families are qualitatively different from those of non-transnational nuclear families. The tyranny of distance forces members of transnational families to develop strategies for managing emotions and to develop new frontiers of intimacy to maintain the familyhood. These processes will be exposed from the results of a research conducted with highly skilled Brazilian migrants having migrated to Montreal between 2003 and 2013.

This study revealed specific dynamics concerning the management of intimacy where a culture of the emotional bond is constructed by a virtual co-presence and by the sharing of emotions. This circulation of emotions obeys certain practical norms (Olivier de Sardan) that play a role in the management of intimacy and in the construction of socio-symbolic boundaries within the transnational family itself. These new rules specific to the transnational family become necessary in order to make accessible particular spaces where a culture proper to the emotional bond can be lived.

SCHMALZ, STEFAN* (Friedrich Schiller-University, Germany)

Trade Unions Facing the Far-Right: A View from East Germany

The stability of the German political system is increasingly questioned by voter behavior in the East, where right wing populism has achieved social movement status and the 2019 Saxonia and Brandenburg state elections have seen the far-right Alternative for Germany (AfD) come out on top in some regions. In particular industrial workers and unemployed have voted for the far-right, thus, strengthening right-wing attitudes among (potential) trade union members. As a result, East German trade unions find itself in a paradoxical situation: there is a record numbers of workers in paid employment, but many workers are stuck in low wage employment and precariousness. In particular young employees show increased self-confidence and are reluctant to tolerate overexploitation at work and authoritarian management, but also often tend to right-wing positions. Trade unions are therefore facing the challenge of organizing young employees in East Germany's highly fragmented industrial landscape and collective bargaining system, while struggling with forms of exclusive solidarity among its membership and increas-

ing right wing discontent. Taking the example of IG Metall, the presentation will focus on how the union is keeping up with both its daily work and the confrontation with the far-right. The presentation is based on original research using a multi-method approach and referring to critical political sociology literature and labor process theory. It is based on recent fieldwork in Thuringia, a federal state in East Germany, and draws on a regional survey with 2.188 respondents and more than 40 qualitative interviews with trade union activists, political representatives, civil society organization representatives, employers and employees.

SCHMID, DOMINIQUE* (,)

Land-Based Climate Change Interventions As a Driver of Conflict in the Global South

As a climate change mitigation strategy, many industrialised nations have adopted policies to transition to a "green economy", which includes the reduction and offset of greenhouse gas emissions. However, much of the emission offset happens through the use of foreign lands in the Global South, such as through projects developed for the carbon market that generate certified credits for each ton of reduced CO_2. Some projects have been labelled as "green grabbing" and the phenomenon has been accompanied by an unprecedented political motivation backed by various institutional mechanisms, such as the UNFCCC REDD+ programme. Numerous academic studies have linked land scarcity to an increased likelihood of social conflicts in the Global South with some of the most cited motives for land scarcity being droughts, population growth or land acquisitions by foreign investors. Although cases of green grabbing have been analysed, only few studies have explored its consequences on a wider scale. This paper explores whether such cases of "green grabbing" contribute to violent and non-violent conflicts in the Global South. It does so by conducting an impact evaluation analysis based on geo-spatial information of Agriculture, Forestry and Other Land Use (AFOLU) projects registered under Verified Carbon Standard (VCS). Based on its data analysis, the paper argues that AFOLU projects indeed make the occurrence of violent and non-violent conflicts in their vicinity more likely. Therefore, although such projects are intended to be designed to simultaneously foster local development, these predominantly Western efforts to mitigate climate change can affect people in the Global South negatively.

Multilevel Climate Action: The Challenge of Monitoring Contributions from Cities and Regions

Over the last few years, local governments at worldwide level have developed strategies and plans for climate adaptation. Cities and regions are currently a major player in climate action, on par with national governments. They have made efforts to engage stakeholders in the implementation of climate-related measures across sectors, as well as build capacity among local communities.

Although multilevel climate action is assumed as a priority, it is still difficult to measure how such efforts contribute to national and international climate goals. It has been widely recognised, at the latest United Nations climate conferences, that there is a gap in accounting for the impacts of climate action taken by local governments and organisations, which ultimately may overshadow their potential. In parallel, local governments now face the challenge of articulating climate action with the Sustainable Development Goals for 2030, and are also designing integrated Measuring, Reporting and Verification systems.

In this paper, we share our experiences in supporting regional and local authorities in monitoring strategies for adaptation and sustainable development. Often, these imply creating new indicators and monitoring systems, along with local committees to promote public participation and capacity-building. Knowledge-sharing within national, European and international networks of cities and regions has proven crucial for success. We will analyse the results of three recent and ongoing projects, two on adaptation in the Algarve region, in Portugal, and a third one that is monitoring the implementation of the SDGs among pilot municipalities across the country.

Outputs and Insights of Climadapt.Local Project (Portugal)

In the global environmental governance panorama, there is an increasingly widespread consensus on the need to act against climate change. This consensus in part results from an increasing environmental awareness as well as the social assumption that fundamental socio-economic transformations are necessary for areas such as the use of water or energy (Bulkeley et al., 2011). In such context and based on their proximity to citizens and local problems, municipalities are key strategic actors in the process of adapting local communities to Climate Change consequences. Based on this assumption and seeking to take advantage of it, the main objective of ClimAdaPT.Local project was to lead off a continuous process of elaboration of Municipal Strategies for Adaptation to Climate Change (MAS-CC) and its integration in the municipal planning tools. To achieve such goals, it sought to create local resilience through the training of the municipal administrative apparatus, and the representatives of local communities, by using a broad strategy of involving both municipal (technical staff and policymakers) and local communities (stakeholders and general populations). ClimAdaPT.Local´s ultimate objective was to create conditions for the development of tools and products that would further the elaboration and the implementation of the MASCC. Focusing particularly on the results of some surveys conducted at different times (http://climadapt-local.pt/) this paper sought to analyze how the diversity of social actors involved to different degrees (i.e., directly involved technical staff; municipal decision-makers; general municipal technical bodies, local stakeholders) perceive project benefits at the local level and creates expectations regarding the importance and implementation of EMAAC.

SCHMIDT, MARINA* (Goethe University Frankfurt am Main, Germany)

Refugees for Care

Since 2015, thousands of people from the Middle East and the North of Africa have fled to Europe. Due to their legal status as refugees, they have only limited access to the labor market and thus to social participation. However, there is one exception, namely geriatric care work, a field of work which has been lacking sufficient numbers of employees for some time. Indeed, German policy is now actively working to counteract the shortage of skilled workers in the geriatric care sector by offering a training program specifically aimed at refugees. Such policies raise questions as to whether this economical approach to increasing the numbers of care work by immigration can work and how dimensions of social inequality and difference might be rendered visible. In order to getter a better understanding of the transformation of refugees into careworkers, this paper will report on an ethnographic study that investigates the transformation process through the concept of differentiation focusing on ethnicity, age and gender. A 'Doing difference' approach examines the practices of people at the nexus of social structures and discourses and how these corroborate with but also resist normative ideas of otherness. The paper will report on the findings gained through the observational material collected during training sessions that were part of a state-funded pilot project of the Hessian Ministry of Social Affairs and Integration. The results show, that there are various conflicts between the refugee students and the teachers. This is in particular expressed in the teachers' doing cultural difference of the students. At the same time, various modes of refusing ascriptions among the students can be found. Against this background, this research shows both, how inequalities are (re)produced and transformed.

SCHMIDT, MAX OLIVER* (Universität Potsdam, Germany)
KOCH, ANNIKA* (University of Potsdam, Germany)

Organizational Rules in People-Centered Service Organizations and Their Impact on Social Closure or Integration

The proposed paper is based on a research project about the change in people-centered service organizations' formal and informal rules in reaction to immigration. We – a group of researchers from the University of Potsdam, Wissenschaftszentrum Berlin, and Charité Berlin – undertake qualitative case studies in selected hospitals, schools and public swimming pools.

Our theoretical framework links the concepts of formal and informal rules in organizations and Frank Parkin's social closure.

Social norms and rules related to the regulation of the human body are particularly sensitive to cultural and religious differences. That also applies to organizations and their formal and informal rules. It is therefore important how schools, hospitals or swimming pools deal with the body and which rules they implement, for example, for physical education classes in school, for the contact between sexes on the schoolyard or between physicians, nurses, and patients in hospitals. We examine how different social groups or environments influence formal and informal rules of organizations and how organizations adapt to the growing cultural and religious diversity. Furthermore, we investigate how these rules affect conflicts between different clients and members and, if so, how the organizations address them. In conclusion, we argue that organizational rules could be an instrument either for social closure or for social integration.

Inclusive Postsecondary Education: Disability, Accessibility and Participation. Challenging Normativity and Ableism in Higher Education

This presentation will explore the potential of Inclusive Postsecondary Education (IPSE) to create accessibility and participation for young people with disabilities in an environment that has traditionally been exclusive and ableist. Universities in their very nature have historically only granted access to students who met the formally established admission requirements.

MountAbility is an inclusive postsecondary education (IPSE) program that welcomes students with diverse abilities to explore academic interests, engage in lifelong learning and make meaningful connections within the MSVU campus community in Halifax, NS, Canada. The program, funded by the Nova Scotia Department of Labour and Advanced Education, is the second IPSE site in the province. It has been operating on campus for 3 ½ years, and it currently serves six young adults with various disabilities accessing Higher Education at the undergraduate level. The students are enrolling in the courses in "participatory audits", and are using the portfolio method to record, and demonstrate their learning experiences. Beyond the course work, participation has also morphed into extracurricular participation in all aspects of campus life, which has progressively allowed students to develop a strong sense of belonging. The students' presence has at times disrupted ancient rituals and routines on campus, and questioned the way Disability culture has been invisible on university campuses.

In this presentation, we intend to explore how these programs across Canada came to exist (Bruce 2011) and their transformative potential of higher education. Using a Disability Studies in Education framework, we contend that this program challenges oppressive and ableist norms of teaching and learning in postsecondary settings (Hutcheon & Wolbring 2012), and that it can create transformative learning experiences for both students and faculty (Mezirow & Taylor, 2009).

Renegotiations of Gendered Selves: Transformations of Masculinity in the Life Stories of Eritrean Refugees

In the research about refugees and masculinity, flight is described for men as an «emasculation» (Lukunka 2012: 131) and «breakdown of everything that had formed their identity» (Schrijvers 1997: 74). In the Eritrean context of forced conscription to the national service the renegotiations of gendered selves already emerge before leaving the country and are interwoven with the process of fleeing and arriving in new host communities. Many of the transitional and permanent settings the refugees thereby experience offer them instable socio-economical positions, which challenge normative ideas of masculinity and lead to a constant struggle of the gendered selves.

In this presentation where the life stories of two refugee men, Temisgen and John, are analysed and compared, it will be shown, how education and employment as marker of masculinity will be adapted, redefined and transformed throughout the stages of the transition trough refugee camps, urban living, asylum institutions, labor markets and host societies. The two life stories represent thereby a larger sample of twelve biographical-narrative interviews conducted in Germany over the period of the last two years. Where Temisgen tries to reestablish his gendered self by the pursuit to finish his education and become a «good product» in the eye of his family, John's biography is characterized by the search for prosperous employment and the possibility to financially support his family.

The comparison of these two life stories can thereby help to understand, how masculinity in times of unstable socio-economical situations for refugeed men can be challenged, transformed or fulfilled within different settings.

"the Journey into the Unknown" – the Meaning of Flight in Biographies of Unaccompanied Minors and Refugee Families

People arriving in Europe after having fled from their home countries are a subject of public attention. The dominant perceptions assign a particular vulnerability to refugees, especially women, families, and unaccompanied minors. From a biographical perspective, refugees have experienced loss and repeated rifts connected with disorientation and feelings of strangeness. Besides this vulnerability, they are actively coping with these experiences by seeking social support, opening up educational opportunities, and independently taking care of the reorganisation of their living conditions. Thus, lived experiences between vulnerability and agency frame the meaning of flight in biographies. In consequence, the history of flight – beyond the forced narrative during the asylum procedure – is thematized in very different ways.

The planned contribution is dedicated to a comparison of the thematization and the significance of flight in biographies on the basis of two research projects: one focused on families, the other on unaccompanied minors. Based on biographical interviews, family conversations, and autobiographical material of refugees (texts, photographs, films) we will focus on the following questions: How do adults, young people travelling alone, and families tell their flight story against the background of their social positioning as refugees? And what significance of the narratives of the flight – or the journey as our interviewees often call it – can be reconstructed for the present?

Particular attention will be paid to the question in which way the experiences of flight are addressed in the interviews as rift, irritation, opportunity, and/or experience of strangeness. In addition, it will be asked which other artistic or literary forms beyond the interviews people include to give meaning to their experience of flight in their communication with the researchers. Accordingly, methodological and methodological challenges that may arise for biographic research in the field of "flight migration" are also to be discussed.

Coping with Work-Related Stressors – Does Education Moderate the Effect of Stressors on Work-Related Stress?

Stress is one of the main determinants on health in modern societies (Backé et al., 2012; Steptoe, 1991). Stress-related illness may cause damage on several dimensions: stress is a threat to individuals' well-being, it damages the economy by people being absent from work and it is a threat to the social security system when people receive payments for early retirement or sick pay. A central area of human life in which stress can affect a person's health over a long period of time is work (Siegrist, 1996) either in the sense of working conditions and work-related stressors or in the sense of unemployment (Voßemer et al., 2017).

From a health sociological perspective, it is expected that resources such as education have a direct and indirect impact on health (Leigh, 1983). Thus, our contribution deals with the research question if higher educated people cope better with work-related stressors by using data from the German National Educational Panel Study (NEPS[1]; starting cohorts 6: Adults (SC6)). Our results show that work-related stressors such as a bad working environment, a likely job loss or change in place of work are associated with a high level of work-related stress; whereas a likely career advancement or increase in salary reduces work-related stress. In general, higher educated people show a lower level of stress, net of stressors and several controls. Regarding the moderating effect of education, highly qualified workers are better able to cope with a high level of routine in the workplace. A probable career advancement also lowers their stress level. In contrast, higher educated employees report a higher stress level with high autonomy in the workplace and a probable job loss compared to lower educated employees.

[1] NEPS collects longitudinal data on education processes and competency developments in Germany.

Theorizing Migration in a Coloniality of Power Context - Why 'southwards Migrants' Experience Privilege Instead of Discrimination

This paper discusses the phenomenon of 'Southwards migration,' pointing out an important methodological flaw in migration studies – that theories of immigrant incorporation are based on cases of what we call 'Northwards migration.'

We define 'Southwards migration' as mobility from countries located further towards the Global North to countries located further towards the Global South. Based on a case study in Hong Kong (comparing 'Southwards migrants' of different racializations with 'Northwards migrants,' n=45), as well as on a review of the literature on populations that we identify as 'Southwards migrants,' we show that most negative outcomes that migration theory interprets as intrinsic to the migration experience as such are either absent or reversed in the case of 'Southwards migration.' Specifically, in the case of 'Southwards migration,' migrants' human and cultural capital often receives increased valuation and demand, they often encounter high-paying 'ethnic'/'sending society-driven' labor markets, they enjoy a positive/privileged societal reception, few pressures to acculturate, and rewards for pursuing ethnic/sending-society oriented strategies. This leads to 'Southwards' migrants often being sorted into socioeconomic strata above the receiving society and experiencing upward socioeconomic mobility compared to their country of origin. We argue that the discrepancies between these findings and conventional migration theorizing can be explained by the latter's lack of attention to global sets of power relations and stratification systems, as described in the coloniality of power literature, which argues that the global is stratified by various power relations/hierarchies, with economic, political, racial, cultural, and gender dimensions. Analyzing migration as taking place in the context and under the influence of such global power relations allows us to analyze how migration leads to privileged outcomes in cases of 'Southwards migration,' while they lead to disadvantaged outcomes in cases of 'Northwards migration.'

"Water Is Life, Sanitation Is Dignity": Social Movement Resistance and the Struggle Against the Commodification of Water

The privatization of water—led by global financial institutions working in collusion with governments and corporations–is documented time and again not to lead to more people gaining access to safe water. In fact, the opposite is true, with privatization leading to higher rates and lower quality water. For the past century, the dominant focus of transnational organizing has been "from the West to the rest" and the frequent attention to movements in the United States has led to the neglect of transnational linkages between movements. In this paper, I examine how movements are mobilizing for the right to water. As feminist scholars have pointed out, the "standpoint" offered by marginalized actors offers important insights into the operation of systems of power and the strategies of survival and resistance that less powerful actors adopt in order to survive and thrive. This project challenges the idea of the "West to rest" pattern and hypothesizes that today 1) more transnational communications and organizing are occurring around water and other basic rights, and 2)Northern movements are engaging with and learning from the South and vice versa, with Southern activists playing a more prominent role than previous scholarship demonstrates. Drawing on field-

work conducted on three right to water movements that nospan three continents (North America, South America, and Africa), this paper examines efforts to reclaim the commons of water. These struggles have been driven by grassroots movements demanding that democracy, transparency, and the human right to water are above corporate profit. This research advances understanding of large-scale social change by investigating how water policies are shaped through contention among social movements, national and local governments, and corporations. It also provides insight on how water activists in local struggles see themselves in relation to the larger national and global network of water activists.

The Protagonism of the Vegan Movements in the Construction of New Food Markets in Porto Alegre, RS, Brazil

The aim of this paper is to present and describe the dynamics of social movements around veganism in Porto Alegre and the trajectory that led them to build new food markets. The empirical universe starts from different strands of veganism in Porto Alegre, those are more or less articulated around three forms of social engagement. The abolitionists, who unfold into pragmatists and fundamentalists, with distinct social and political origins, but who possess some political actions conjoin; and the Animal-welfarists, who are dispersed in different forms of action and engaged in other themes, which consequently lead them to defend veganism, some of them are Raw-eaters, Environmentalists, Nutrichondriacs, Climaterians, etc. The basic theory, for the analysis of empirical data, will be the Theory of Social Practices, whose methodological perspective is based on 'follow social practices' and, from them, finding how activities (performed actions) are connect to material arrangements (organisms, people, artifacts and natural phenomena) in the stabilization of certain social orders. The data are being collected since April 2018. At first, we participated of different vegan groups in Porto Alegre. A second moment we conducted a study that included interviews with owners of 10 vegan restaurants in Porto Alegre, and the application of a survey of with 374 consumers of these restaurants. At a third moment, we interviewed organizers and exhibitors of vegan fairs in Porto Alegre, which have been around since 2014, and has been expanding. By preliminary analysis, the data indicate that the vegan movement has been diversifying the food markets in Porto Alegre. These movements establishing a greater connection with other political agendas (feminism, lesbian movement, agroecologists), with a profile very connected to health issues (massive consumption of food organic food), and with an inclination for aesthetic differentiation and culinary innovations, and differentiating from products from traditional markets.

SCHUBERT, TINKA* (Universitat Rovira i Virgili, Spain)

Social Dynamics and Masculinities. the Mass Rape at the End of WWII and Its Implications for Today.

At the end of World War II approximately 1.9 million women and girls were raped in Berlin and Eastern Territories by soldiers of the Red Army. An estimated 10% of victims committed suicide or died as a consequence. Among the causes for these mass rapes Naimark (1995) mentions revenge for the atrocities of Nazi soldiers, but also race as crucial element. As part of the "Soviet masculinity" under Stalin rule, women of the enemy had to be raped to restore their honor (Messerschmidt, 2006). However, testimonies also evidence that not all Soviet soldiers engaged in these mass rapes. Whereas some actively participated in rapes and murder, others stood up against this violence. Departing from this silenced historical event, we use the approach of New Alternative Masculinities (Flecha et al., 2013) embedded in a larger research agenda on preventive socialization of gender violence, to analyze the different behavior of men of either preventing or encouraging and perpetrating rape. Based on this distinction we present evidence that soldiers of the Red Army committing rapes respond to the characteristics of a Dominant Traditional Masculinity. While those who oppose these rapes and confronted rapists respond to the category of New Alternative Masculinity. Third, men who did not rape and neither confronted rapists can be classified as Oppressed Traditional Masculinities. This incident shows that men in these situations have certain agency to act in one way or the other. Shedding light on this reality contributes to the understanding of group processes that reinforce toxic masculinities capable of unimaginable atrocities.

Intellectual Activism of Black Women in Southern Brazil

The construction of knowledge produced by black women, regarding gender and race, has been reproduced in many ways as a means of making this literature accessible and at the same time an emancipation agent of Afro-Brazilians, once that historically they have gone through an epistemic racism in which black women are the main victims, a fact that results from the negative representation of black women in the Brazilian social imagery (GONZALEZ, 1985). However, individuals from Brazilian civil society, through collectives, have been acting on this issue by proposing training - both in person and online - as a way of developing political and intellectual thinking, encouraging the sharing of knowledge of black women's interest, and motivating leadership formation. For this research under development, we are interested in understanding how these collectives articulated their goals and which bibliographies were used for such objectives. In an initial survey of the bibliographies used by two collectives, we identified a similarity in the authors worked, highlighting at first two different lines: authors of black feminism and authors of womanism. Among these authors, we find yet another subdivision that concerns to three intellectual traditions of black feminist thought: (1) that of Brazilian and Latin American intellectuals, (2) that of North American and (3) that of African. As from these results, our research pursued to explore the themes of the authors chosen for the collectives, seeking to observe the purpose of applying the bibliographies to the meaning of the participating black women. As a preliminary result, what we realize is that there is a practical process of decolonization from this intellectual activism promoted through the training courses.

Socioeconomic Development in the South: Business Schools' Discourses in Senegal

This paper intends to reconstruct the development discourse of Business schools in Senegal. These schools have often strong links to business schools in Europe and the USA so that their teaching neglects to take into account local socio-cultural systems and socioeconomic patterns that differ from the neoliberal economy of the countries of the global North. Individualism and private property are underlined even if these patterns are challenged in countries of the global South. The paper intends to reconstruct the meaning and content of this discourse in the curricula of the Business schools that should instead look for an adaptation of local socioeconomic patterns to neoliberal economies spread by globalization. Some ten Business schools were studied in Dakar, based on discussions with their leadership and on content analysis of the websites of these Business schools.

SCHULZ, MANUEL* (University of Jena, Germany)

Being Seized By the Not-Yet-Existing – Bodiliness As the Enlivening Agency of Hope

This presentation aims to introduce the neo-phenomenology and its concept of bodily sensations as a fruitful epistemological approach for time-sociological research. Its characteristic concept of bodiliness as a third way of self-givenness (beyond conscious reflection and physical objects) attracts notice to the vibrant intermediation between these two Cartesian categories and its role for subjective agency.

Following neo-phenomenological research, being deeply moved or involuntarily seized, as it is typical for sensations like fear, desire, joy, dejection, hope, enthusiasm etcetera, analytically, cannot be itemized within the Cartesian dualism. In contrary, this sphere of affectedness encounters the subject as an idiosyncratic dimension of vibrant self-sensing and, subject-theoretically, arises as the mediating dynamic between consciousness and the material world. Furthermore, phenomenological research shows that bodiliness itself, essentially, is structured by a tension of sensed narrowness and extensiveness which should not be unilaterally interpreted as physical terms. In a broader sense, this tension, neo-phenomenologically, is the fundamental dynamic of the subjective self- and world-relation which finds its expression in the respective material and ideational world-evolvement. While the sphere of bodiliness, accordingly, can be triggered either consciously or physically, such bodily sensations, I will argue, are the enlivening entanglement in which conscious constructs and the physical world converge and provoke subjective agency.

Considering these epistemological insights, bodiliness and its perceptions like hopefulness, as well as any other form of affectedness, plays a key role in all social actions; it even arises as the enlivening sphere of sociality in general. While phenomenological research, finally, shows evidence that fear is subjectively percepted as a narrowing experience that can lead to conscious and physical paralysis, its opposite, hope, entails a perceptible extension of future-related latitude. Thus, hope attains agency by the medium of bodiliness, and is able to empower subjects and societies, even in the light of desperate challenges.

SCHULZ, MARKUS S.* (Max Weber Center for Advanced Cultural and Social Studies, Germany)

Sociological Futures Research and Climate Change: Epistemologies, Ontologies, and the Politics of Scenarios

This paper explores practices of imagining futures with a focus on selected case-studies of climate change. Scientists have discussed the greenhouse effect since the 19th Century. There is an overwhelming scientific consensus about anthropogenic global climate change and its profound consequences since at least the 1990s. In 2015, 196 national governments agreed to limit global warming to well below 2°C or even 1.5°C, though recent research holds these target for insufficient. The acceleration of global heating and the increase of severe weather events have pushed climate change towards the top of political discourse in an increasing number of countries. A new generation of activists, including the students of Fridays for Future, are demanding swift policy changes, as the coming decade is seen as crucial for avoiding tipping-points. Despite the policies of the Trump and Bolsonaro administrations, the denialist movement wanes. Even fossil fuel corporations increase their post-carbon investments. The political contestation mutates. This is the context in which techniques of imagining futures play salient roles. The models and scenarios as prominent as those of the Intergovernmental Panel on Climate Change (IPCC) are being shaped by underlying assumptions about social dynamics and epistemes that are often only implicit. In contrast, critical sociological futures research brings social dynamics, intersectionality, power and climate justice to the foreground, and it provides a tool-kit from iterative future labs to strategic scenario practices for broader engagement and visioning.

Behaviour of Very Large Social Units after ‚Religion' and ‚Society'

After the deconstruction of key terms as ‚religion', ‚society' and ‚nation' as un-helpful to investigate neutrally, the scientific interest still is there how to deal and analyze social phenomena, including large and very large social units. In the last century the german macrosociologist Norbert Müller („Civilization Dynamics" I, II, 1989, 1991) has given remarkable inputs how to use the findings of materialistic US-american cultural anthropology to describe „Very Large Social Units" which we live in. Climate change responsability is just one indicator to show that even after scholarly deconstruction of terms we cannot stop investigating. This paper contributes to postdeconstructivist understanding and prediction of Very Large Social Units. „Over the last two decades, a growing number of academics who study 'religion' have noticed that the idea that is foundational for their

scholarship is fiction as something that is made, built, or constructed. This insight opposes notions of 'religion' as a thing or phenomenon that has always existed everywhere in one form or another and that continues to manifest itself in different traditions and configurations throughout the globe. Proponents of ‚critical religion' understand religion to be a somewhat incoherent, rather recent concept that is projected as an anachronism onto history. According to this view, 'religion' is a modern, discursive product of differing, context-specific, dynamics of power with particular relation to the politics of colonialism and statecraft." (Naomi Goldenberg, 2019) Similarly, this paper attempts to deconstruct ‚society' and ‚nation' to come up with a suggestion how to adopt anthropological terms and findings. –

SCHULZ MEINEN, HAIMO* (University of Hannover, Germany)

Human Rights As a Cause for Environmental Degradation in Marginalized Sections

Scholars like Emile Durkheim, Marcel Mauss, Louis Dumont, Hubert Seiwert and Heinz G. Kippenberg have contributed to a concept called pragmatism of religion. Disregarding what is individually believed here it can be studied what groups in fact consider to be important. Starting from here a very different, critical approach to important terms in our own society becomes possible, the consideration of two important norms of the modern state, Human Rights and Conservation. Conservation requests to reduce or stop totally activities on certain areas or places that contribute to the artificial, technically enabled metabolism of humans: the stream of material that is not digested inside the human body, but is being used outside the human body by members or all of the group of humans. Human Rights, in opposition, request to enhance and guarantee this metabolism where humans settle and live, because it is only this way that every human can enjoy the achievements of modern states. Hence, implicitly it says how humans should live together: In large, sedentary groups with organizational and cultural features called 'modern'. The philosophy of Human Rights draws on a metaphysical concept of humans that has clearly a christian heritage. Persons are endowed with dignity, reason and conscience. 'Modern' serves as a legitimating label. Human Rights and Conservation, thus, are juxtaposed in a contradiction that can be analyzed drawing on findings of the history of religion. Environmental degradation is an unavoidable byproduct of Human Rights. Pragmatically seen it is indicated to a third of world population that order is maintained just to enable them 'incomprehensible' individuals to have their share, here called ‚right', meanwhile to the other two thirds that this 'order' if necessary will be defended militarily. Illustrating the result practically shows the shift to a different set of norms would be possible. –

The Innovation Imperative: Steps Towards a Conceptual Approach

In our paper, we aim to conceptualize one of the most potent implications of the nearly unopposed 'pro-innovation bias' in contemporary societies: the ubiquitous drive for constantly creating and implementing something new and/or for symbolizing newness; an implication which can be termed innovation imperative. We propose to distinguish at least four different dimensions in which the innovation imperative can be empirically observed and which can be used to guide the analysis of how the innovation imperative works: (1) The role of the innovation imperative in economy, where it is well-established as driving force of economic development (Schumpeter 1911; 1939; 1942). (2) The role of the innovation imperative in other social fields like in politics (e.g., OECD 2015), where previously other strategies prevailed and different terms (like 'reform') were used. (3) The surprising increase in striving for newness in social fields whose basic values and procedures are rooted in tradition, such as religion. (4) The exceptional urge for changing existing structures or processes even when are doing their job quite nicely. And (5) the phenomenon of innovations getting implemented by actors simply for their own sake: to demonstrate that one is innovative, which is for example true for advertising agencies and public relations offices. In addition to this conceptualization, we aim to shed light at some of the salient features of the rationalities behind the innovation imperative in each of the dimensions, pointing towards the widespread neglect of the destructive side of innovation and its underlying economic mental models.

The Political Content of Protest in Recent Argentina.

Social protest is considered today in the scientific literature as a quite regular informal expression of social demands and is assumed to be proper and consti-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

tutive of contemporary democracies. It is characteristic of complex societies and often has transnational significance. In Latin America, social protest has a strong historical background and a very relevant impact on the present. Its study and consideration are of the utmost importance for the better understanding of the social demands existing overtime and the configuration of social subjects of political impact. Studies of social protest today form a prolific and relevant subfield within the research on collective action and social movements. Is social change a result from politics? Or is it an embedded property of society itself? Which is the role played on it by social mobilization? This paper will analyze these questions from a theoretical perspective but under an empirical consideration of a case, namely Argentina's events from 1989 to the present. We aim to reconstruct the configuration of recent collective action, with special reference to protesting actions as the emergence of demands and subjects in the public space, with an impact on the political system. Taking advantage of its complexity and the diversity of sceneries during that period, we are to state the mutual imbrication between political and social, agency and structure in the study of social change. What happened then and there is quite a laboratory for social and political studies. Within social mobilization, our empirical research shows how social protest, politics, policies and society mutually imbricate themselves. We expect to discuss a few relevant issues, not only of collective action, of the forms of social claim, of relations between society and politics, but also limits (circumstantial or structural) of party systems and, ultimately, of the perspectives of our democracies.

SCHWARTZ, DAVID* (Writer at Large, USA)

Getting to North South Redistribution Policies

The objective is to allow developing countries to print new, more currency without weakening their own currency's value in Forex. The strategy is to convince wealthy nations to purchase 3rdworld (Southern) currencies with the purpose of investing their purchase either in 3rd world, that state's bonds, or in their banks. So as to allow the printing of equivalent amounts of their currency without its suffering relative weakness in foreign exchange, with the currency of the purchasing country. Developing countries need to have strong currency relations with technologically advanced countries, in order to reduce the costs of technological imports that they are currently unable to produce either on their own, or with the help of corporate subsidiaries. Such imports include refrigerators, telephone technologies, computers, televisions and broadcasting equipment, water purification technologies....

This development strategy stands in contrast to the current operant strategies employed by both the US and the Chinese, in their Belt and Road initiative. Both strategies but especially the Chinese seems to involve the extension of loans with rising interest rates, to poor countries with high levels of demographic poverty, therefore low and weak levels of aggregate consumer demand. The result is that the Chinese loans tend to be forfeited, state or institutional bankruptcies tend to result followed by the seizure of 3rd world country assets, like shipping port facilities. US foreign assistance strategies apparently have too often involved extending assistance that is equivalent to bribery of 3rd world elites, which then tend to be deposited in private bank accounts in various tax havens. That at least is my current understanding of current levels of US foreign aid, which also involves sales of subsidized military equipment which does not aid the causes of poverty amelioration or development. Establishing such a North South link would facilitate dependent levels of trade.

SCHWARTZ, GERMANO* (UniRitter, Brazil)
COSTA, RENATA (Unilasalle, Brazil)

Are Constitutions Dead?

This paper proposes a new categorization of social movements: the New Social Movements of the 21st century (NSM21). In order to do develop such category, our methodological design will follow the Social System Theory Applied to Law (STAL), for the following reasons :
(1) STAL is predicated on the differentiation of the partial systems of society.
(2) STAL consists of a theory which observes systems also from the perspectives and relations that they establish with each other, considering the extent in which their autonomies are preserved in such relations. In this way, it considers Constitutions as the structural coupling between Law and Politics, thus allowing the understanding of the NSM21 as constituent moments which (re) produce constitutionalising communications.
(3) STAL is based on the observation of paradoxes - specifically in the case of this book, the paradox of the necessity of Unrecht (NSM21) for the (re) configuration of the Recht (Constitutions).
Such potentials of the use of STAL in the observation of the NSM21 leads to the question addressed in our title: what are the NSM21 and how do they differ from the classical theories of social movements, including those emerging from new social movements? These are, in short, movements that, evidently, incorporate the characteristics of the new social movements but which adapt them to the twenty-first century - and for which they evolve.

In this line of reasoning, this chapter will try to demonstrate that the NSM21 are true constituent moments, that is, they consist on those moments in which the proper foundations of Law and Politics are (re) discussed. But that is not enough, NSM21 are constituent moments in a very specific time, a time when the Constitutions themselves are in transformation,and forced to communicate beyond the physical borders and concepts of hierarchy and sovereignty

Internet Freedom in the Digital Age: The Measurement, Challenges and Results

The measurement of internet freedom is a difficult matter and there are only a few datasets available which can be applied for scrutinizing theoretical propositions of the antecedents and consequences of this liberty. Freedom house as one of the big data providers delivers only a small number of countries data for the "Freedom of the Net". In my presentation, I show the difficulties in measuring the liberty of using the internet. These difficulties (and also the drawback of the small number of country cases) were surmountable by a process-oriented construction of freedom data in analogy to administrative mass data.

With new data set derived from qualitative reports on internet liberty I show that internet access is hardly related to the freedom to use the internet. By this, I refer to the known phenomenon that there are several countries that are considered political enemies of internet. By referring to this new data set it can be shown that the more opportunities in a country are available to access the internet, the more likely it is that these opportunities are being restricted by the state if the government has a low preference for the individual freedom of citizens.

My study makes both a methodological and a theoretical contribution. One the one hand, it highlights the benefits of a theory based construction of quantitative data from qualitative information. On the other hand, it refines the theoretical propositions of negative freedom in application to modern societies.

Religion Among American Adolescents: New Data, New Questions

Social scientists regularly study religion among adults in the United States, but we know much less about religion among adolescents. We rectify this dearth of knowledge with data from a new Pew Research Center survey of American teenagers.

Much of what we know about adolescent religion in the U.S. comes from the first wave of the National Study of Youth and Religion, but much has changed since that data was collected. The 2019 Pew Research Center survey shows how teens fare today on a number of religious fronts, including affiliation, service attendance, prayer, salience, belief, and participation in various other religious activities.

Moreover, the new Pew study allows us to examine how teens navigate the intersection between religion and the social context of school. How are religious beliefs reflected in school, if at all, particularly in public schools, which constitutionally do not allow for school-sponsored religion or prayer? The Pew survey shows that many teens witness certain religious expressions in school, such as the wearing of religious clothing or jewelry, or praying before a sporting event. But other expressions, such as praying before lunch, are less commonly seen. The survey also indicates that religiously motivated bullying is less prevalent in schools than bullying in general, but that teens still perceive hostility toward their religious or spiritual views in the form of comments from their peers or teachers. The findings on all of these questions help illuminate the ways in which religion plays a role in the lives of adolescents, the impact it has, and the larger implications for society as the religious landscape continues to shift.

This presentation provides an overview of findings from the new survey, focusing on both religious beliefs and practices, as well as the role of religion in school, the primary institution in adolescents' lives.

Human Being? What Do You Mean? the Sociological Crisis from the Subjective Point of View.

If sociology faces a crisis, it is because society is going through profound transformations. Within the framework of the consolidation of the normalized societies in the immediate enjoyment through consumption, the notions and practices regarding of what should be understood by the social subject are being vertiginously modified.

In the second part of the last century, Bourdieu, Giddens, Archer, Habermas, Bhaskar, Melucci, and many other sociologists and social scientists have discussed and developed various ways of understanding what it means to be a social agent.

This paper seeks to propose an approach to the notion of the person as a basis for discussing the necessary and urgent changes in the current sociology crisis.

To achieve this objective, the following argumentative strategy is proposed: a) The connection between society crisis and crisis of sociology is summarized, b) the differences and similarities between individual, agent, actor, subject and person as central nodes of the crisis in society is explained, c) is indicate how the above situation is connected to the missions and visions of sociology and, finally propose a possible discussion agenda.

The paper proposes a dialectical view of the social person as a clue to reconstruct a notion of sociology that allows us to elaborate a utopian view of a possible society.

Class, the Labour Market, and Paid Care Work in South Africa and Ghana

Over the past year in Johannesburg, South Africa there have been a number of high profile cases of over-crowding, abuse, and even deaths of young children at unregistered private daycare facilities, prompting the provincial Department of Social Development to declare that there is a "crisis" in the childcare sector. In the same city, it is not uncommon for wealthy households to employ multiple full-time caregivers to provide childcare in a single private home. This stark contrast highlights the need to better understand the relationship between paid childcare work and inequality. Paid childcare is the hidden backstage of the wage labour market. In countries with little public provision of childcare, workers(and especially women) must often pay for care in order to work for wages. While there is significant work on labour market inequality—including analysis of unemployment, wage inequality, etc—there is relatively little empirical or theoretical work on the relationship between paid work and child care.

Our paper uses paid childcare a lens for examining class inequalities in South Africa and Ghana. We aim to map the various layers of paid childcare, from informal unregistered daycare centers, formal private preschools, to private domestic nannies. We are interested in both "consumers"—meaning who sends their children to various types of care facilities, including what types of paid work these parents are involved in—as well as "providers"—including who owns and works for various types of child care centers. We think of this mapping as an alternative approach to the concept of "care chains". Rather than focusing on the direct relationship between various levels of caregivers, we aim to understand the broader social relations of class that are reflected in the institution of paid care.

Social Welfare, Elections, and Urban Politics: The Case of the Epwp in South Africa

This paper will examine the political effects of the EPWP in South Africa, the country's largest public employment programme. Many scholars working on the rise of new forms of social welfare in the global South have argued that there is a close relationship between politics and welfare provision. South Africa has one of the most extensive social welfare systems in the global South, and one that is highly politicized. During election campaigns, parties regularly tout social welfare and warn of its potential removal or mismanagement by rival parties. As a result, there is a popular perception that social welfare, and the EPWP in particular, is a political tool, used by the ruling party to win electoral support, particularly among the unemployed in the townships and urban peripheries where the programme has a major presence. However, our initial research on EPWP projects in Johannesburg and surrounding areas suggests a more complex picture. Rather than fostering clear loyalty and support, the programme is the subject of frequent and intense social conflict, often pitting groups from one specific location against those from another, or against their own political leaders over the criteria of inclusion. Our paper will draw on electoral data as well as data on the location, timing, and size of EPWP projects to examine the relationship between the EPWP, voter turnout, and electoral outcomes. We will combine this with data from interviews/focus groups with participants and officials from the programme. This mixed-methods approach will allow us to interrogate the complex socio-political effects of the programme. We aim to uncover the relationship between public works employment, formal electoral politics, and informal protest politics in urban South Africa.

Local Hostility Effect on Immigrants' Wellbeing: Does Population Composition in Neighbourhood and Neighbourhood Contact Matter?

Current research suggests that contact of migrants with the native population can affects their wellbeing both positively and negatively. Similarly, studies show that individuals perceiving discrimination score lower on life satisfaction scales. One potential but under-researched driver of this effect is the native population's attitudes towards immigrants (ATI).

My paper explores the effect of neighbourhood hostility towards immigrants on migrants' life satisfaction in England and Wales. Using individual data from wave 3 of the UK Household Longitudinal Study including measures of neighbourhood interactions, matched to aggregate data on attitudes to immigrants derived from the Citizenship Survey (2010/2011) I focus on attitudes at the small area level of LSOAs (areas containing around 1500 households). Controlling for neighbourhood level characteristics, which may be associated with attitudes towards immigrants (such as unemployment rates) and for individual level characteristics related to life satisfaction, I estimate the relationship between neighbourhood ATI and individual life satisfaction. Additionally, I explore the moderating effect of neighbourhood ethnic composition, close ties in neighbourhood, and neighbourhood interethnic mixing on this association.

By exploiting measures of both contact with and exposure to other ethnic groups (i.e. neighbourhood ethnic composition, neighbourhood mixing, interethnic friendships), I am better able to identify the mechanisms linking environmental attitudes to wellbeing. Specifically, I test the claims from cultural threat theory, neighbourhood effect theory, and intergroup contact theory. I thereby shed further light on heterogeneity in the life satisfaction of immigrants.

Learning to Acquire Knowledge in Large Classes

What was once a comfortable university class of 100-200 students has now increased to classes in access of 1981 students. The resources, staffing and equipment remain unchanged, yet the expectation of excellence in teaching remains the same. The changing learning environment affects, students, academics, learning and a series of other critical sociological factors. While student numbers continue to increase at universities around the country, the number of academics that service students remain constant; infrastructure is not prioritised and the challenges within universities are increasing annually. This paper addresses the challenges that academics face with an increasing number of learners in the classroom. This paper adopts a qualitative method, utilising participant observation through teaching and interacting with first year students; at two universities in South Africa over a period of five years from 2010-2015. Both universities had first year classes in excess of 1000 students.The results from this study indicate the challenges that both academics and students face in attempting to maintain academic standards in an increasingly challenging university environment. Through the analysis of results and impact from 2010-2015 this paper seeks to provide a sociological insight into the impact of the complexities, challenges and possibilities that lie ahead of us.

SEELY, STEPHEN* (Newcastle University, United Kingdom)

Queer Theory from the South

This essay draws on the turn to 'southern epistemologies' in social theory as a provocation for rethinking the problems and possibilities of 'sexual democracy.' Over the past three decades, the global politics of sexuality have been increasingly articulated through the terms and instruments of liberal democracy, a model that has proven quite successful at securing recognition and protections on the basis of 'sexual orientation and gender identity' at the national and international levels. While appealing to a more inclusive democracy, the incorporation of sexuality into immigration and asylum policies, foreign policy, development and aid initiatives, human rights resolutions, and other political mechanisms systematically encodes certain Euro-American sexual values as synonymous with the values of 'democracy' itself, thereby positioning other sexual value systems—particularly those of Africa and Islam—as inherently anti-democratic. The complicity of 'sexual democracy' in consolidating racist, xenophobic, and imperialist projects raises serious questions about its continued viability as a framework for sexual emancipation. If sexuality is indeed emerging as the fundamental 'cultural fault line' dividing the west from the rest, it becomes one of the issues that most urgently calls for alternative modes of theorization capable of negotiating between competing cultural values in a way that opens even the most ostensibly 'universal' ideals (e.g., sexual freedom) to reconceptualization vis-à-vis other modes of being and thinking. First, I develop and situate the notion of 'queer theory from the South' in relation to ongoing queer and decolonial critiques of sexual democracy. I then turn to the case of South Africa, examining *ubuntu* as an alternative framework for developing a sexual politics that can negotiate between the Euro-American liberal rights frames and indigenous values. Finally, I conclude by illustrating this with the work of a Zulu lesbian *sangoma*, whose theory and practice offers a profound vision of decolonizing erotic justice.

Finnish Swedes and Titular Finns – an Imitation Game Study of Blurred Categorizations

In sociology, the role of culture for the definition of ethnic groups is a contested one. Research on social boundaries have underscored how cultural differences do not cluster neatly along ethnic lines. Yet, in lay perceptions, politics and media, ethnicity and ethnic membership is understood and categorized according to distinct cultural features such as language, dialect, rituals and cultural practices. I use a novel method called the Imitation Game to analyze how Finnish Swedes and titular Finns appropriate and use cultural repertoires for categorizing whether somebody is a member of one or another category. Although the term "ethnic group" is not a common term for describing Finnish Swedes, they do meet the four standard criteria of ethnicity: Self-identification, shared culture, ancestry and organized interaction among members and non-members. According to surveys, 82% of the Finnish Swedish adolescents consider themselves to be Finns, but also belonging to another culture. The proximity of the Finnish Swedes to the majority population makes them salient for research on blurred categorization of multiple belongings.

In the Imitation Game, participants from two different groups attempt to distinguish the group membership of anonymous respondents through computer-mediated, typed questions and answers. One of the respondents is an imitating non-group member. The crux is to distinguish the imitating non-group member from a genuine group member. According to theory, members of a minority who live in the culture of a majority should be better at passing as majority members than vice versa. Preliminary findings indicate the contrary. I analyze the participants' questioning strategies for telling group members from outsiders and observe how actors appropriate cultural repertoires to make boundaries between "us" and "them". The results indicate that the Finnish Swedes have a "false consciousness", blurring their understanding of cultural similarity and difference in relation to the majority.

Análisis Comparado De La Movilidad Social Entre Chile y España y Su Relación Con Los Itinerarios Educativos y Las Trayectorias Laborales

La comunicación presenta los avances de un trabajo de investigación en curso que tiene como objetivo analizar la desigualdad social desde la perspectiva de la movilidad social comparando España y Chile, países que presentan en común un proceso de industrialización tardía. Bajo la perspectiva analítica del modelo AMOSIT (Modelo Analítico de Desigualdades Sociales y Trayectorias) desarrollado en el contexto de la red internacional INCASI (International Network for Comparative Analysis of Social Inequalities, Horizon 2020 Program, GA 691004), se busca comprender los procesos de movilidad teniendo en cuenta las trayectorias laborales y los itinerarios educativos complejos. La perspectiva adoptada es innovadora pues se entremezclan aspectos y variables tratados habitualmente en una sola mirada de investigación en análisis independientes, ya sea de la movilidad social intergeneracional o intrageneracional.

En este sentido, además, se plantea un diseño de análisis basado en un método mixto secuencial correlacional, para obtener las potencialidades de lo cuantitativo y lo cualitativo (QUAN-qual). En contextos socieconómicos distintos con diferentes modelos y niveles de desarrollo de sus Estados de Bienestar, se busca profundizar en los mecanismos sociales que ayuden a entender el papel mediador que juega la educación en las dinámicas de movilidad social y como vía para disminuir las desigualdades sociales. Además de ello con los primeros análisis de los datos disponibles se espera aportar con insumos para la comprensión de los distintos tipos de movilidad, al observar similitudes y diferencias en los contextos sociales chileno y español.

Resultado de esta práctica de investigación cabrá plantear asimismo cómo se puede aportar elementos de diagnosis y orientaciones para las políticas públicas con un objetivo de justicia social para disminuir las desigualdades sociales desde las potencialidades y rezagos que existen en cada territorio comparado, ya sea el español o el chileno.

JARPA SANDOVAL, BEATRIZ* (University de Concepción, Chile)

Logro Educativo Intergeneracional En Perspectiva Comparada Entre España y Chile

Existen ciertas evidencias que indican que el papel del sistema educativo es trascendental para la movilidad social y que la educación superior es el nivel que mayores elementos puede aportar para esa movilidad, ya que tiene implicancias directas en la desigualdad de origen (Herrera, 2001; Benavides, 2004). Diversos estudios sobre el acceso al nivel educativo superior muestran que el origen social es aún un elemento central para prever la posibilidad de transitar con éxito el desafío que significa una carrera (Langa, 2005; Rahona, 2005; Torrents, 2015). Si bien la democratización del acceso a la universidad ha permitido una reducción paulatina del efecto de las diferencias de origen y que la elección de la carrera no sólo está determinada por los factores familiares, si no que sería resultado de un balance entre preferencias personales y determinantes sociales (Troiano y Elias, 2013, citado en Torrents, 2015), la situación actual tiene, todavía, un considerable margen de mejora (Calero y Choi, 2012).

La siguiente investigación tiene como objetivo central realizar un análisis comparativo entre España y Chile, en base al logro educativo en padres y madres cuyos hijos comienzan su formación universitaria, para de este modo, identificar los movimientos intergeneracionales en la educación, conectando con las políticas sociales que se implementan en cada país, que pudiesen aportar a la comprensión del aumento o disminución en los niveles educativos que tiene la nueva generación.

Imagining Europe from Outside: New Technologies and Social Media in the Construction of Narratives and Migrant Imaginaries

This paper focuses on perceptions of Europe by prospective migrants and the role of novel technologies and social media in the knitting and consumption of these narratives. Employing the conceptual lens of 'migrant imaginaries', the authors explore in what ways specific places within Europe are imagined, how these imaginaries travel, and how they shape attitudes towards cross-border mobility.

The paper builds upon preliminary findings from qualitative interviews with recent and prospective migrants in/from North Africa, as well as upon a quantitative data collection (using a keyword-based content analysis) pertaining to the role of social media in the construction of narratives and images about Europe and its various regions. This paper is developed within the larger project PERCEPTIONS, funded by the European Commission.

SEILHAMER, MARK* (National Institute of Education, Nanyang Technological University, Singapore)

Teaching and Learning the Language of Mathematics in Multilingual Singapore

The appropriation of academic register mathematics vocabulary is arguably essential for mathematics success in most contexts, and this is decidedly the case in Singapore, where word problems dominate the mathematics section of the Primary School Leaving Exam (PSLE) – a high-stakes exam which determines pupils' streaming for subsequent schooling. Although the medium of instruction for Singapore mathematics classes and the language used for word problems on the PSLE is English, English is not the dominant language for a sizeable (but shrinking) portion of the pupils in most Singapore classrooms. The vast majority of Singapore primary school pupils, nevertheless, score high enough on the PSLE to enter academic streams and Singapore routinely ranks at or near the top of global league tables for pupils' mathematic ability, provoking envy from other countries and attempts to emulate the city state's pedagogical approach to mathematics education. In this talk, I will discuss findings from a qualitative study examining teachers' and students' perceptions and experiences of teaching and learning primary school mathematics and English in Singapore. Presenting data from teacher interviews, lesson observations, and focus group discussions with pupils in primary levels one, three, and five at three different schools, I will highlight the challenges teachers face in preparing their students for the emphasis on word problems in the Singapore context – particularly the many potentially confusing English constructions that can be used in test items to represent relations. Although some teachers employed a 'key word' approach in their classrooms, drawing straightforward associations between particular words and corresponding operations, others acknowledged that such an approach is problematic, especially at the upper primary levels, when problems become mathematically and linguistically more complex.

Challenges to Conserve World Agricultural Heritages in Market Economy: Experiences in Japan

Globally Important Agricultural Heritage Systems (GIAHS), known as World Agricultural Heritage, was established by the United Nations Food and Agriculture Organization (FAO) in 2002 in order to conserve traditional agro-ecosystems linked with agricultural biodiversity, natural resources, outstanding landscapes and cultural heritages. This certification also aims to contribute to raise awareness of values sustained in the designated sites such as cultural, ecological and agricultural diversity, sustainability in agri-food production, ancestral identity, contribution to livelihood of small-scale farmers etc. However, these values recognized in GIAHS program are not always explicitly codified for agri-food products produced within the sites. Therefore, often these agri-food products are not appropriately valued in the market economy to sustain livelihood of local stakeholders and the agro-ecosystems.

To overcome this challenge, there are some newly created initiatives by local stakeholders, such as producers' organizations, municipalities, and/or consumers' groups, that standardize GIAHS products according to their local criteria. In some cases, local stakeholders develop their own agri-food labeling systems or employ national Geographical Indication systems.

Employing case studies in Japan, the second country in the world in term of designated number of GIAHS, this paper aims to illustrate the development of local agri-food labeling systems within GIAHS sites, that codify or does not codify the concepts of GIAHS and examine contradictions in the endeavor to conserve traditional agro-ecosystems within market economy. The paper includes a case study of millet produced in steep slope land agricultural system in Tokushima Prefecture.

Social Exclusion and Honour Killing: Reflections for Remedy

Orientation towards modern lifestyles taking advantage of the benefits from policy of protective discrimination and affirmative action by lower caste groups particularly dalits accelerated disparities between caste Hindus and Dalit. It further caused dialectics between these segments. Higher education of dalits facilitated integration between male and female students to interact on common platforms and similarities of mind sets united them leading to their love based marriages, breaking the conventional caste barriers. In the event of resistance by parents of upper caste, it led to conflicts and killings not only the young lovers but also murders of lower caste by upper caste. Reviews :Studies on caste conflicts in various parts of Tamil Nadu reveal the empirical reality of honour killings. The crime records bureau of government also indicates the killings and murders on account of love based inter caste and international religious marriages. NGO s survey on this problem supplements this reality. (Gurusamy, Venkatachalam, Karuppaiah, Rama Krishnan, Vivekanandan). Methodology :FGDs, case studies, interviews in Salem, Dharma puri, Erode, Madurai districts. Findings:1) Casteism of upper castes 2) Perpetuation of conformity based values and norms3) Static mind set of upper castes 4) prevalence of social distance and disparities 5) Social Exclusion based alienations 6) Higher education of girls 7) Flexible mind set of youth irrespective of castes 8) Dalit aspiration for civil liberties 9) Generation gap between lower and upper caste parents 10) uncompromising attitude and need to preserve purity by upper castes. Conclusion: Honour Killing is a social evil in civil society which needs to be eliminated through collective action to promote social justice which implicates the policy of inclusive growth with mutual understanding between caste groups. Prejudices affecting communal hormony should wither away from people and social integration penetrate in the mind set.

Tracing the Emotional Roots of the Populism Vs. Anti-Populism Gap: Two Case Studies from the US

There is an increasing interest in the interplay between emotions and politics, in the context of political and social processes but also from a psychological point of view. In effects, some scholars have talked about an "emotional reflexivity" to describe the tendency to study the social world through the lens of emotions and affects. In such a context, the rise of populist movements and parties has been linked to an increased emotionalization of the public sphere. The drop of public trust, in particular, and the fall of historically consolidated ideologies, seem to have contributed to push the public towards a more individualistic approach towards politics. While a populist-emotional paradigm has emerged in the study of contemporary political communication trends, the rise of anti-populist leaders seems to challenge it, showing the emergence of different emotional regimes.

The study takes under scrutiny how two different leaders have addressed the pandemic using emotions in their political communication: Donald Trump and Joe Biden. The two case studies could not be more diverse in terms of leadership style, rhetoric, and ideological leanings. Indeed, they can be analysed through the lens of a populist/anti-populist gap, constituting a quasi-experimental situation for testing an anaytical approach focused on emotions in discourses. The research is based on an interpretive approach to all discourses by the two Presidents of the United States, aiming at identifying the spectrum of emotions recalled by the two leaders when addressing the people and the democratic institutions. The paper exemplifies the key traits of the emotional regimes used by populist and anti-populist actors as a first step for a wider comparative research project.

What Is Being Original? : Art As a Tool for Understanding Japanese-Filipino Second-Generation Youth Life World in Japan.

The purpose of this research is to examine the real life world of Japanese- Filipino Youth, second-generation immigrant who grew up in Japan after 1990s (JFY).

I attempt to co-create a research project with JFYs, using Arts-Based Research (ABR) methods in order to establish an alternative sociological approach. ABR is a newly emerging methodology with artistry and art knowledge for the purpose of understanding, processes, and communication in all aspects and stages of the research process.

I had held two series of art exhibit experiments with two JFYs, Sayaka and Akemi. This paper is based on the observation of the planning, preparation, individual working, publications and exhibits themselves. In particular, I observed how these two girls express themselves through their art works and interact with others. I also considered myself both as a researcher and artist, in order to reconsider the relationship between researcher and researched. ABR encourages the presence of each researcher's personal inclinations, preferences, orientations, and practices.

In the prior researches, JFYs are defined as "the children who connected to foreign country" or "cultural minority", and the subjects of "ethnicity" and "ethnic identity". However some JFYs and other immigrant second-generation youths have already started to show their own thoughts against the power of categorizations by the researchers. One of my research subjects whom I interviewed in 2016 stated that "I feel myself as a Filipina, I am excited and making noise. I feel myself as a Japanese when I become silent in the meeting for club activities. In fact, I feel myself as an original!"

In this presentation I will present concrete details of my analysis and argue the possibility of art as a methods of co-creative research to expand the horizon of sociological inquiry and terminology.

El Frente Amplio En La Ruptura. La Emergencia Del Frente Amplio Chileno y Su Relación Con El Movimiento Estudiantil.

El ciclo de movilizaciones experimentado por la sociedad chilena durante la última década, en el que adquirió protagonismo el movimiento estudiantil, ha tenido innegables efectos en el sistema de partidos, siendo clave para la emergencia del Frente Amplio en las elecciones del 2017 y para la ruptura del esquema de dos coaliciones predominantes existente desde la recuperación de la democracia. En un contexto caracterizado por el distanciamiento entre los partidos políticos y los movimientos sociales, el presente estudio se orienta a caracterizar la relación entre el movimiento estudiantil y el Frente Amplio, en el marco de su emergencia en el sistema de partidos. El enfoque teórico que lo guía enfatiza en el carácter difuso del límite que es posible establecer entre el sistema de partidos y el campo de la movilización social, especialmente en contextos de emergencia de nuevos partidos políticos. En tanto, el diseño metodológico se basa en la realización de entrevistas a dirigentes políticos del Frente Amplio, siendo aquellos que han ejercido posiciones de liderazgo al interior del movimiento estudiantil la principal fuente de la información generada. Los resultados de la investigación se orientan a dar respuesta a tres interrogantes: (1) Comprender cómo la participación del Frente Amplio en el movimiento estudiantil ha influido en su proceso de conformación y en su emergencia en el sistema de partidos; (2) Identificar las principales tensiones que la emergencia del Frente Amplio en el sistema de partidos ha generado en su participación en el movimiento estudiantil; (3) Indagar en cómo los cambios en la participación del Frente Amplio han influido en la profesionalización y formalización del movimiento estudiantil. Finalmente, se plantean conclusiones generales relativas al aporte del caso investigado para el estudio de la relación entre partidos políticos y movimientos sociales.

So Far, so Similar? Labour Market Feminization in Italy and Chile

The goal of this paper, elaborated within the INCASI network, is to make a comparison between two labour markets in Europe and Latin America following the segmentation theory, in order to explain the process of inequalities from a gender perspective. From the comparative methodological perspective, we selected two national cases (Italy and Chile) belonging to the different continents.The general hypothesis is that the two continents, which clearly have different characteristics both in the economic structure as in the level of development, institutional configurations and socio-historical processes, show similar dynamics. In other words, we envisage that the mechanisms of labour market inequalities, and ranking and sorting processes which tend to reproduce a primary and secondary segment (where women are more often concentrated), are stronger than other influent exogenous variables, such as the national and institutional settings and become a recurrent universalistic feature crossing both countries and continental borders. Sexual segregation of labour, both the "horizontal segregation "(concentration in few specific activity sectors) and "vertical segregation" (concentration at only some intermediate levels within the hierarchic structure of organitions), impresses for its similar diffusion in different societies and for its constancy over time.

The article propose two specific objectives. The first is to make a descriptive and comparative analysis of the two labour markets trends (through an historical series involving the period 2008-2018) using labour force indicators, following the gender dichotomy. The second is to explain the patterns of labour inequalities: why the effect of gender segmentation are similar in so different national and continental contexts?

Knowledge, Attitude, Preparedness, and Skills: A Disaster Training Approach for High-Risk Communities

Communities along the United States Gulf Coast are at high risk of natural and man-made hazards. We developed a disaster training designed to increase Knowledge, Attitude, Preparedness, and Skills (K.A.P.S). We held a series of six identical training sessions in Geismar, Louisiana, a community that faces multiple hazards. Residents (n=34) were trained using a community-tailored approach that combined constructivist (hands-on) and traditional (lecture) methods of instruction. Pre-test and post-test surveys demonstrated that the instructional content was effective (p<0.01), and that individual preparedness knowledge increased significantly because of the constructivist teaching approach (p<0.047). The results indicate that this high-hazard setting called for more extensive instructional content, constructivist teaching methods, and the inclusion of residents at all education levels.

Lone Mothers –Inequality and Intersectionality, in the Context of Vulnerability to Mental Health Disparities

In recent years there have been a plethora of research studies on *intersectionality* particularly with regard to discrimination, disproportionate caregiving burden, unpaid domestic work, poverty and associated stress faced by women and consequences for mental health. Work is growing in the field of the sociology of mental health and health disparities. There is a significant body of work which indicates that larger numbers of women (compared with men) suffer from depression though limited evidence of mental health challenges faced by specific categories such a *lone mothers*, exist, despite their growing presence in the labor force. Resources to improve mental health worldwide are scarce but there is a huge loss in productivity and economic and social cost of not tackling this issue according to the World Health Organization and the International Labor Organization. 17% of children aged 0-14 live in single parent households worldwide. Women head approximately 88% of these households. (*OECD, 2014*).Almost 320 million children worldwide are raised by single mothers, underscoring the importance of attending to mental health of these mothers.

My paper focuses on lone mothers, vulnerable to mental health disparities due to social forces that intersect to perpetuate inequity. These may be in the form of social stigma, lack of social support, financial hardship, pay and pension gaps, excessive work and family demands in comparison with married women or men. Theoretical models used to frame my analysis include Pearlin's Stress Process model and life course models to illustrate cumulative (dis)advantage over the life course. Empirical work from USA, Britain, Canada, Sweden and other European countries were analyzed including studies on racial minorities, health and social security policies to unpack the risk in a more nuanced fashion and highlight possible strategies to ensure psychological well-being and reduction in health disparities.

Women's Writings, Social History and Ways of Knowing: When Disciplines Are Democratized

Women's self writings or autobiography has been a project towards engendering and democratizing disciplines—both history and sociology. Writing the self is an exercise of writing about the times as well—it is about connecting the memory and immediate, public and private, self and other (Liz Stanley, 1993). By reading women's autobiographies from India which have been translated into English, and reflections written by feminist anthropologists of their field work in different locations in India, this paper proposes to suggest that women autobiography writers and anthropologists were constructing the social/political histories through reflexive journeys, challenging thereby knowledge that mainstream sociology/ social anthropology otherwise was practising. These narratives of scripting the self in connection to the social were also about rearrangement of spatial relations in scholarship, in knowledge production per se and not only about reading/ knowing women's lives. The feminist project towards democratizing knowledge across boundaries has interrogated who is producing knowledge and which insti-

tutions are legitimizing hegemonic knowledge? Democratizing pedagogies (Friere, 1970), recognizing plural citizens within classrooms (Rege, 1995) and engaging with processes of re-memory (Morrison, 1987) are emancipatory exercises. Autobiographies written by the Gandhian Sarala Debi (The Fallen Leaves of Life) or Ambedkarite Urmila Pawar (The Weave of My Life: A Dalit Woman's Memoirs) are ways of knowing the social and cultural histories of caste and patriarchy ridden Bengali and Marathi social histories of colonial and post independent India. On the other hand Anthropological Journeys: Reflections on Fieldwork is one of the first books in the South Asian contexts that interrogate methods of knowing in the field. Through these two kinds of texts, this paper intends to democratize the meanings of 'field' in disciplines like sociology.

Home, Belonging and Values: Toward a Social Construction of Ageing in India

Scholars observed that urban spaces in South Asian cities are layered with meanings, values, and norms mediated by shared language and cultural moorings. Homes are not simply shelters but spaces which shape and are shaped by social interactions and cultural values. The importance of 'ageing in place' (also 'dying in place') highlights that environmental experience of growing old is fundamental for both individuals and communities. The crux of this paper advocates a greater sensitivity and awareness of lived experience of older adults and their patterns of adjustment within private space. Home is considered to be a coveted place of belonging and strongly attached to it is a sense of ownership. In lieu of this, a sense of continuity helps to recapture places of the past through familiar and treasured artifacts, especially in the case of migrants' and refugees' attachment to one's roots, language and memories. Through qualitative fieldwork in the eastern metropolitan city of Kolkata (India), my work argues that the Partition of Bengal and migration of people thereafter has shaped everyday life of displaced individuals who moved to the city and even contributed to their sense of home. Meanings and values that individuals attached to their "new home" were conditional to the memory of their "old home". Aged interlocutors often fondly refer to their ancestral house in the village ('*desh'er bari*'), at times in East Bengal (now Bangladesh) and in some cases in suburban parts of West Bengal (in India), from where they have been displaced and relocated in Kolkata. Those who have shifted during the Partitions (in 1971) often lamented of not being able to revisit the house of their childhood memories. It is at this intersection that this paper will be a study of ageing in place, memories, values and meanings attached to home in everyday life.

SEN, SREYA* (Jawaharlal Nehru University, New Delhi, India)

Homes and Houses, Senses and Spaces: The Politics of Memory in the Making of Everyday Life in Kolkata (India)

Scholars observed that urban spaces in South Asian cities are layered with meanings, values, and norms mediated by shared language and cultural moorings. They assert that property is not only a political or economic relation between persons but a social relation as well. In this paper I argue that underlying the visibly changing aspirations and anxieties related to property are the concomitant changes in values and meanings that people attach to houses and family dynamics of the middle classes. The research presented here is based on two rounds of qualitative fieldwork conducted in the eastern metropolitan city of Kolkata (in India) between September 2017 and December 2018, where I intend to develop a sociological pathway to understand how 'home' as a space is imagined, conceptualized and assimilated. Therefore complex entanglements between temporal politics, practices and imaginaries arising from a range of contexts call for a subject-centred perspective. In my work I discuss that as the highly hyper-mobile sector of young professionals involve in continuous buying and selling, there are marked intergenerational shifts in terms of housing and home ownership in Kolkata. Disintegration of old joint families and demolition of family homes ('*poitrik bari*') in favor of multistoried apartment buildings ('*flat bari*') portray spatial transformation without any apology. Consequently the changes in the city's built environment not only exert a powerful force on city development but also influence the urban way of life. With the changing values and meanings that people attach to homes and houses, I argue that the role that the house plays in creating urban subjectivities could be a probing question in a given city.

How Do Cultural Changes Shape the Environment? a Study of the Apatani Tribe in India

This paper focuses on the impact of cultural and structural changes on the natural environment of a tribe named Apatani. The Apatani tribe resides in Ziro valley

of Arunachal Pradesh, a north-eastern state of India. Because of nature-friendly traditional practices of maximum utilization of land and other natural resources, Ziro valley has been proposed as a World Heritage Site by the UNESCO in 2014. Nonetheless, the tribe and this valley are not free from challenges and issues of the present millennium. For instance, one of the significant challenges threatening the natural habitat and the tribe's indigenous knowledge system is the hegemony of so-called modern institutions, inequality and the urge for one-sided development. How can the tribe maintain the habitat in its indigenous form in the face of competition for 'development'? Entry of new lifestyles and impact from the rest of the world have brought about serious changes in the reservoir of natural resources and their livelihood patterns.

This tribe has undergone several cultural changes in recent times, owing to the new economic and political trend in the valley. This paper, based on in-depth personal interviews with 110 respondents, demonstrates how this adversely affected the indigenous knowledge system of the tribe and consequently its relation with environment. The data used in the study have been collected during the nine months of stay in the field while undertaking research work for PhD. The study contributes to our understanding of how indigenous knowledge can support in promoting the development of a society to keep it environmentally sustainable. Uncritical rejection of indigenous knowledge systems itself is a severe attack on the sovereignty of critical inquiry.

Health Professions between Autonomy and Interprofessional Sharing. Results By an Italian Inquiry

The development of different and specialised health professions in many health contexts has led to to reorganize many health services and treatment approaches for chronic and complex diseases, enhancing the role of interprofessional teamworks and collaborative and shared decision-making processes. This challenge, hovewer, involves the transition from a mono-professional approach of healthcare to an interprofessional one. This is not an immediate process that can be taken for granted by medical and health professionals, but requires some organizational, cultural and training measures, that are often not considered adequately. Each health care profession establish its own identity, values, spheres of practice and specific roles in the care through the education system, raising cultural barriers and developing closed attitudes to the interprofessional collaboration. This paper focus on these issues and presents the results of a first research on interprofessional knowledge and attitudes of students in health academics courses, health professions, doctors and practitioners in the Italian context. The collection and the analysis of information was conducted within a multi-method approach through: 1) a survey on a sample of students and teachers of academic courses in health care; 2) a delphi analysis on different panels of healthcare experts 3) case studies of health services based on interprofessional organizations. The research results highlights how the role of health professions is currently living a conflict between the need of professional autonomy and the necessity of interprofessional sharing in the context of new health services based on teamwork and how the health education system requires a re-organisation of programs, aims and interaction model between health professionals. At the same time it show as the concept of interprofessionalism is considered in not in a non-homogeneous way among the various professionals and experts feeding different visions and models of interprofessional care.

How Did the Development of the Platform Change the Job Advertisement?

The purpose of this study is to consider how the development of the platform have changed the labor market, focusing on Japanese employment information services.Employment information services have become a medium connecting job offerers and job seekers. Before the Internet became popular, people were getting information through weak ties (Granovetter 1973).Moreover, the job offerer put information on media such as newspapers, flyers and magazines.These job information services have changed their stage into search engines(Ex. "Indeed") since the spread of the Internet.As can be seen from the recent developments of HR technology, the platform can significantly change the labor market. I will discuss changes in the labor market in the case of Japanese search engine "Rikunabi", a platform that has been used by a large number of people since a relatively early period. And the conglomerate that operates "Rikunabi" acquired "Indeed."

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

As for new university graduates in Japan, "Rikunabi" began to spread around 1998, and in 2000, almost all university students who wanted to find job registered. "Rikunabi" became a problem in 2019 because information on job seekers was leaked to the company without permission.

When analyzing the case of Japanese new graduates and "Rikunabi", it can be pointed out that the employment of new graduates changed to "an alternative media event" pointed out by Nick Couldly around the 2000s. In particular, large companies have started recruiting activities as like public relations to attract the attention of audiences (job seekers).

From the consideration of the results, this study considers the possibility that "the central myth mediated by the media" has been established in the labor market. These may (1) make "labor" invisible during the employment-recruitment phase, and (2) provide information to some privileged people.

Negotiating Being Mapuche and Middle-Class: The Experiences of Social Mobility of the Mapuche Indigenous People in Chile

This paper explores how upward social mobility impacts on the racial and class cultures of Mapuche indigenous people with higher education in Chile, and how this affects their social identities. The research focuses in particular on a sample of socially mobile Mapuche, the biggest indigenous group in Chile, who have managed to achieve a university education and experienced some degree of upward social mobility in their subsequent occupations. This experience of social mobility is often challenging and creates cultural and social tensions, which requires the complex negotiation and renegotiation of identity.

This research adopts a qualitative perspective, examining the life trajectories of the respondents in order to explore the challenges that social mobility creates for groups who are disadvantaged in terms of both their class and ethnic position. It is built on data collected through interviews with a group of 40 educationally mobile Mapuche people who live (i) in the Metropolitan region, and (ii) in the predominantly rural Araucanía region in southern Chile.

The argument of this paper contributes to the understanding of social mobility of indigenous groups from a multi-dimensional perspective, examining how mobility affects both class and ethnic social positioning. I show that the participants faced considerable difficulties and disadvantages during their attendance at university, but despite these difficulties, they all experienced some degree of upward social mobility. However, their experiences of mobility meant that had to face the tensions of racism as well as class and ethnic boundaries which meant that they had to renegotiate not only their class but also their Mapuche identities.

Niñas, Niños y Adolescentes Trabajadores De Bolivia. Un Caso Paradigmático y Contra Hegemónico.

La erradicación del trabajo infantil es un objetivo central en la agenda de la comunidad internacional, con la OIT y la Unicef a la cabeza, y ahora asumida también por los Objetivos de Desarrollo Sostenible. Vale decir, es una meta fundamental del proyecto de desarrollo moderno. Sin embargo, las infancias del Sur se desenvuelven en contextos materiales y culturales en que el trabajo puede llegar a tener un lugar significativo y esencialmente necesario. En América Latina, la infancia trabajadora tiene presencia a través de diversas organizaciones agrupadas en el Movimiento Latinoamericano y Caribeño de Niñas, Niños y Adolescentes Trabajadores, a partir de las cuales se han establecido luchas por el reconocimiento tanto del trabajo como de la actoría social de los niños, las cuales trascienden el interés particular y ponen en cuestión asuntos relativos a la pobreza, la desigualdad social y los modelos hegemónicos de desarrollo.

Este trabajo presenta el caso de la Unión de Niñas, Niños y Adolescentes Trabajadores de Bolivia (UNATs´Bo), organización que en el último lustro enfrentó una serie de conflictos y negociaciones a nivel gubernamental para regular y proteger el trabajo realizado por los niños en dicho país, comprometiendo al Estado boliviano en una tensión de ribetes internacionales frente a la OIT, la Unicef y el Parlamento Europeo. El caso se analiza sobre la base de información secundaria, a la luz de los aportes del giro decolonial y postcolonial al debate sobre "trabajo infantil" y paradigmas de la infancia (Liebel 2003, Canella y Viruru 2004, Nieuwenhuys 2007, Pedraza 2007, Schiboto 2015), poniendo en cuestión el proyecto moderno de la niñez.

Critical Factors in the Co-Production of Elderly Care Policies: A Study Case from a Portuguese Municipality

Since the 1990s a number of alternative approaches to administration and policy, either to the bureaucratic-centralized model or to the New Public Management have emerged in an attempt to solve complex problems such as poverty and aging,or tackle crises and sistemic challenges such as climate change and disease outbreaks.

Terminology varies according to specific national contexts: "joined-up government"; "horizontal management/government" "integrated government" and "whole of government". Despite the differences, these perspectives have common attributes and they are attempts to developed and deliver public goods and services in a more inclusive way. They are processes of co-production in order to bring together not only government departments but also a number of private institutions and voluntary organizations working with each other and across aiming at a common goal. With is they

But this is not a spontaneous or immediate process and the good will of the stakeholders is not enough. Some critical factors, either inhibitors or facilitators of co-creation have been identified in literature. More directly related to elderly people policies, empirical evidence on co-production begins to be available, but is not yet consistent.

Drawing on a participatory monitoring/evaluation conducted in a Portuguese municipality facing severe demographic aging and poverty this paper aims to explore the local welfare policy for elderly people in the domains of basic care (basic), community participation and inclusion (eco), lifelong learning and cultural fruition (civic). Preliminary results show that there are a number of critical factors of co-production governance at diferent levels: from societal to small teamworks of stakeholders. The paper sheds light to the difficulties in maintaining interorganizational collaboration and the interim solutions partners find to overcome them.

Post-New Public Management: Multi-Professional Teams in the Context of Health Sector Reforms

Health reform initiatives linked to New Public Management (NMP) have been criticized as boosting, rather then diminishing professions autonomy in healthcare. Although the NPM manifests itself differently in different countries, increased fragmentation has been a persistent consequence. Frontiers between health professions act as articulating mechanisms to be found in the division of health work and, at the same time, as barriers to the interactions of the various skills (Serra, 2011). In contexts of strong economic and efficiency controls resulting from NPM reforms, new questions arise concerning the understanding of how cooperation between different health professions is construct as they work together in the best interest of patients. Contemporary post-NPM developments in the organization of healthcare triggered increasing collaborative projects and practices (Liff & Andersson, 2012), with the aim of integrating dispersed functions and units (Christensen & Lægreid, 2007). Multi-professional teams are pointed out as a contemporary organising principle for healthcare and are considered to counter fragmentation and obstacles in traditional cross- professional collaborations (Mitchell *et al.*, 2010; Andersson & Liff, 2012). Multi-professional teams are not new in healthcare organisations. However, they are able to achieve their goals only when cooperation mechanisms are in place and if all the team members share the same vision and purpose. Focus on collaboration have found it difficult to regulate professional practices dominated by independent professionals belonging to different professions. These several professions, despite adhering to specific institutional logics, interpret these logics in practice, differently.

The aim of this paper is to provide a comprehensive explanation of how Post-NPM health reforms impact on micro-level relationships on health organizations. How distinct roles and therefore, diverse perceptions of what is seen as high-quality work, affect cooperation mechanisms?

Reproductive Technologies: Ambivalences and Social Impacts of Contemporary Medicalization

This research discusses the social impacts of reproductive technologies, considering an increase of use in Brazil, where the number of fertilizations doubled from 2012 to 2018 (ANVISA, 2019). As methodology, it was made the reading, systematization and problematization of concepts of two works - Beck-Gernsheim (1995) and Haraway (1991).

Beck-Gernsheim points out that reproductive technologies (re) produce the process of individualization, around three central notions for reproduction: compulsion, for expanding the supply of technologies; rationalization, inserted in the planning of the ideal moment of maternity /paternity and the choice of child characteristics; compulsion for prevention, which broadens the notion of health and disease, resulting in the search for health and better performance of the body, including the child body, according to genetic profiles of sperm donors, for example. Haraway discusses the emergence of the hybrid as a product of the advance of high tech culture, which conformed to a new interpretation of social reality because the boundaries between machine and organism become blurred. Assisted reproduction is an example of this because organic elements (eggs / sperm) are manipulated in an artificial place. The author highlights the ambivalent nature of technologies, as they are simultaneously instruments of domination and fulfillment of desires.

Conclusion: Reproductive technologies reinforce the production of an optimized body, with modifications that make up a hybrid. In the context of individualization, technologies create ambivalence in the traditional frameworks of assisted reproduction, simultaneously producing new freedoms and pressures on individuals.

Sociogenèse Du Journal Télévisé En Perspective Transnationale

Le but de ce travail est de fournir des éléments de compréhension des particularités des logiques sociales et culturelles qui régissent les premières productions du journalisme de télévision dans les contextes européen et latino-américain à travers l'étude des cas français et brésiliens. Le premier des genres journalistiques à avoir été intégré à la télévision est le journal télévisé; c'est donc aux à sa production que l'attention se concentrera ici. Compte tenu du caractère novateur des productions pionnières, le recrutement pour ces activités n'est régi par aucun type de codage professionnel basé sur, par exemple, des instances de préparation au métier ou d'expériences antérieures exception faite de celles étrangères. Par conséquent, la composition des équipes pionnières se caractérise par des agents ayant des parcours internationaux, issus de métiers « proches » aux langages naissants de la télévision et dont le rapport avec les métiers journalistiques n'est que relatif.

C'est à travers une incursion dans l'histoire spécifique de la constitution des espaces de production d'informations télévisées, en analysant les trajectoires de ses principaux artisans, que nous identifierons les principaux espaces de production culturelle qui fournissent ses professionnels aux production des informations télévisées pionnières et qui serviront de référence à des expériences ultérieures.

Toutefois, compte tenu du caractère novateur du langage télévisuel dans le traitement de l'information, mais aussi des différences remarquables qui caractérisent les cas comparés ici, il est nécessaire de prendre en compte les développement spécifique de métiers culturels en développement – la publicité marquera le cas brésilien -, mais aussi la nature autoritaire des gouvernements en place et le contexte géopolitique pendant et après la 2ème Guerre Mondiale – les cercles des Résistants marquera le cas français -, et les disputes économiques et politiques qui accompagnent l'avènement des technologies de télécommunication.

SERRANO ZAPATA, ANGELA* (University of Wisconsin-Madison, USA)

Peasant Resilience in Capital-Intensive Crops: Agroecology and Collective Agency Growing Oil Palm in Colombia

A long-standing debate regarding agrarian change concerns whether small holdings can survive in capitalist markets. This debate has gained renewed attention due to the role of small-scale farming in building more environmentally sustainable and economically fair practices in agriculture. The debate has centered on the characteristics of world-scale processes that enable and limit peasant farming, at one extreme, and ideal local conditions that protect it, on the other. My paper addresses the possibilities that small-scale farmers have for persisting in capital-intensive crops destined for global markets. It focuses on the participation of small-scale farmers as growers of oil palm in the region of Magdalena Medio, in Northeast Colombia. Oil palm causes ecological damage that affects the long-term sustainability of soil, is a capital-intensive crop, and has caused violent displacement to small-scale farmers in Colombia. Yet, 70% of oil palm growers in the country are small-scale farmers. The paper inquires how farmers, who vary in their modes of farming, peasant background, forms of association with other farmers, relations with extractive industries, and state, NGO, and social movement support, are differently prepared to address the environmental and economic risks associated with oil palm crops. I argue that small-scale farming traditions have been central to farmers' possibilities to build resilient livelihoods while immersed in a capital-intensive and environmentally harmful crop. Additionally, the support from the state, and regional and transnational institutions is crucial for the persistence of these farmers. By analyzing the interactions of environmental and global economic factors with farmers' relationships, practices, and institutional support, my research informs the agrarian question in relation to current efforts to incorporate small-scale farmers as suppliers of global industries. It illustrates small-scale farmers' possibilities to maintain economically viable and environmentally sustainable livelihoods in this context.

SERVAIS, OLIVIER* (UCLouvain, Belgium)

The Guild Type : An Emerging Group Shaped, between Affordance and Self- Aspiration, By the Virtual Worlds

Through a long ethnography of emerging groups of intensive video game practices, my work has focused on new modes of sociability created online. By observing over the long term the guilds of intensive and casual gamers, the idea emerged that virtual worlds were places both constrained and open to the creation of new social organizations. On the one hand, these are shaped by the affordability of the machine and the models developed by the designers, and from which one can only marginally abstract oneself. On the other hand, they are open worlds where users can technically free themselves from multiple social norms to develop new communities based on unique principles.

From this empirical field, we will see that the tension between freedom and reproduction is at the heart of this online life. These hypotheses will be tested on three land cases: online mass funerals, virtual common property sharing rules and power stratification mechanisms. On this strong empirical basis, we will then question the theories of virtual communities and mainly Turkle, Preece, Rheingold, Casili, Parsell, Craipeau, Yee, Duchenault, and Berry.

SEVANEN, ERKKI* (University of Eastern Finland, Finland)

Crimes, Violence and Pathological Behavior. Critique of Modern Economic Rationality As a Sub-Genre of Western Novel

In her novel *Purge* (2008), the well-known Finnish-Estonian author Sofi Oksanen describes Estonia's history from the 1930s to the 1990s. Since 1918, Estonia was an independent state, but in the Second World War it was first occupied by the Nazi-Germany and then by the Soviet Union. The Soviet rule continues until 1991, when Estonia declared its independency. This was not, however, a happy occasion for all of the Estonian women, since they had to enter a ruthless capitalist-patriarchal economy where human trafficking was a rising business branch. Zara, the protagonist, ends up as its victim when mafia coerces her to act as a prostitute. At the end, she succeeds to get rid of it by violence.

Purge's picture of current economy's criminal forms is not unique. Since Honoré de Balzac's *Father Goriot* (1835), Western novel has often represented capitalism as an economic system whose practitioners are ready to promote their interests by crimes and violence. This line continues, for example, in Bertolt Brecht's *Threepenny's Novel* (1934), Miguel Ángel Asturias' *The Banana Trilogy* (1950–1960), Bret Easton Ellis' *American Psycho* (1991), Don DeLillo's *Cosmopolis* (2003) and Sofi Oksanen's *Dog Park* (2019). Oksanen's novel deals with infertility treatment business and its questionable forms in Ukraina. It shows how current economy exploits female bodies.

Modern Western novel has often represented capitalism as an economic system that tends to be relatively indifferent with regard to moral, social and legal values. Crimes, violence and pathological behavior are, therefore, rather constant ingredients in novels describing modern economy and its instrumental rationality. Consequently, Ellis, DeLillo and Oksanen stand on the shoulders of a long tradition. We may regard this tradition as a sub-genre of a wider tradition that deals with anomalous behavior in society. This sub-genre is partly overlapping with the sub-genre that describes violence in society.

SGORLA, ANDREY* (Pontifical Catholic University of Rio Grande do Sul, Brazil)

Beer Narratives: Authenticity, Crafts,and Professional Identity

The research analyzes the construction of the craft beer market, starting from the professional brewers, who turned a hobby into a business activity, through the characterization of this craft market, the identity and authenticity for the craft beer and the role of the brewers in the construction of the market narrative. To conduct this research I conducted ethnographic forays through mapping of breweries, visits to breweries, participation of brewing events and netnographic forays into brewery groups and pages on Facebook, and in-depth interviews with craft brewers. The expansion of microbreweries in this decade is due to a career of craft brewers, who turn a hobby of brewing at home, in pots, into a new career, reconverting their professional trajectories for identification as a craft brewer. The desire to be a self-entrepreneur gives visibility to a belief system based on autonomy, initiative, and individualization, in which the formation of the market goes through their professional and organizational identities, their relationship with consumers, and their close collaboration. In this sense, the brewer as an artisan has the skill of an expert, being a component of craft work, which is identifiable through two subjective dimensions, interrelating: quality and passion. According to Banks (2010) craft is a skilled workforce that is quality oriented, specific and materially motivated internally, as well as external rewards (recognition, identity, interpersonal relationships). Craft breweries, as opposed to industrial breweries, having a passion for an asset, quality and differentiation as a guarantee of authentic beers, as each bottle contains stories that tell the formation of the craft beer market.

SHABUNOVA, ALEXANDRA* (Vologda Research Center of the Russian Academy of Sciences, Russia)

Balance between Work and Personal Life of Successful Working Parents

The full satisfaction of the working human's needs becomes today the key condition for economy's sustainable development. One of these objective needs is the proper correlation (balance) between work and personal life. And there is a reason for that. The intensity of labor activity is increasing. Work starts to affect human's life mostly beyond the time frame of the official working day, it becomes increasingly difficult to reconcile the requirements of work and personal life, making the topic of balance between work and personal life extremely relevant.

The research is aimed at analyzing the balance between personal life and work in the group of successful working parents in the context of cross-country comparison.

The study's information base is comprised of the data from the exploratory sociological survey of population from different cities of Russia, Belarus and Poland. The sample of 100 people in each territory, proportionally representing the population of these cities by gender and age (from 18 to 70 years), has been made for carrying out the pilot study.

The conducted research has shown that successful people feel more satisfied with life and work. Nevertheless, the birth of children is not seen as an obstacle for parents to achieve success at work. The analysis has revealed the most balance of satisfaction with labor and life in the group of successful working parents compared to the total sample.

It has been noted that there is no complete balance between work and personal life in the estimates of population in different countries. More complete satisfaction with both parts of people's life can be seen using the example of respondents from Poland.

The scientific significance of the study is determined by the cross-country comparison analysis of balance between work and personal life of population.

The study is supported by RFBR, project 18-011-01039.

SHAHROKH, THEA* (University of Sheffield, United Kingdom)
WHEELER, JOANNA* (Centre for Trust, Peace and Social Relations, Coventry University, United Kingdom)

Storytelling and the Construction of Layered, Creative and Decolonial Knowledge

This paper introduces the idea of methodological layering within storytelling as an approach to sociological research. We refer to layering in three ways. First, layering includes the different versions of a story that bring together affect, relationships, events and place. Second, the layering of the story reflects an evolving understanding of the self (what is my own story?). Finally, layering is informed by an understanding of wider structures or frames (how do wider systems interact with my story?). We trace how these layers are iteratively developed through visual, discursive and embodied forms of knowledge within a creative storytelling approach.

This approach emerged from practice, particularly in Africa, in contexts characterised by oppression, precarity and injustice. Within these contexts, research is often informed by colonialism and reinforces hierarchies between researcher and researched, among others. We argue that layering within storytelling is necessary and helps us to work with the complex social issues bound up with deep and persistent injustices, but also to directly challenge the colonial nature of research.

While some methodological practices fix or reify the frame of identities, this paper explores how methodological layering engages critically with notions of identity. We trace how identity is framed in a complex and constitutive way through iteration and layering within a storytelling process. This offers the possibility that through cycles of telling, listening and re-telling, storytellers witness the stories of others and in doing so, see themselves, others and society differently. Layering in storytelling then enables the construction of counternarratives that contribute to the decolonising of knowledge by the storytellers themselves.

RC57-JS-55.5

SHAHROKH, THEA* (University of Sheffield, United Kingdom)

The Role of Visual Storytelling in Knowing the Textured Lives of Young People with Migration Experience

Young people with migration backgrounds from the global South are often reduced to stereotypes within political and public narratives. Their youthful identities lead to their construction as a problem to be fixed or a victim to be saved. These binary logics are reinforced through power relations that position young people with migration experience as Others, as lacking identities and undeserving of belonging. The creation of counter-narratives by diverse young people with migration backgrounds is an important way of disrupting assumptions about who they are and how they make meaning in their lives.

Drawing on research in South Africa which employed a participatory visual and story-based approach grounded in a critical ethnography, this paper shares young people's own visual narrations and reflections on their sense of self and construction of belonging. The methodology was centred around the importance of participation and creativity in lived experience and how this helps to go beyond exclusions. Through visual, embodied and discursive knowledges young people created narratives that reflected their unique social imaginings and lived realities.

I argue that the visual in this methodology enabled the multi-textured voices of young people with migration backgrounds to be heard. In this process, young people themselves centred the texture and complexity of their identities. By making visible their lived experiences they problematised constructions of their lives as un-childlike and reclaimed their identities, histories, including their childhoods. At the same time, through a discussion of the use of visual imagery in young people's creative expression this paper reflects on the tensions that emerged in relation to self-expression and self-representation in the production and dissemination of visual knowledge. These findings have important implications for work with young people to address their experiences of marginalisation, and to influence the complexity of discourse around who young migrants can be in society.

Women in Place: The Politics of Gender Segregation in Iran by Nazanin Shahrokni (2019, University of California Press)

Women in Place examines the impacts of the Iranian revolution on the everyday life of women through an inquiry into gender segregation policies. It explores the ways in which cultural norms, power relations within households and state surveillance practices intersect and shape gender inequalities in access to the city

and its public arena. *Women in Place* pushes us to rethink the changing place of women in a context where Islamism, urban modernization projects, and debates about women's rights are in full swing.

Allyship and Solidarity Against Racism and Colonialism in Women's Organizations: Insights and Possibilities of Institutional Ethnography for Racial Justice

This paper begins by describing a recently completed IE/PAE which offers many insights on building solidarity amongst women who work against inequitable relations of racism, colonialism, imperialism and white supremacy within feminist non-governmental organizations. In the study, I began by exploring racialized women's accounts of their everyday antiracist-feminist work within women's organizations as they challenged racism within women's organizations in Ontario, Canada (Shaikh, 2013). I found that racialized women mapped intertwined institutionalized relations of accountability, as racialized women negotiated worked to build feminist and anti-racist solidarity, and challenging whiteness, colonialism and racism. I end the paper by critically reflecting on the strengths, possibilities and unactualized potential of IE/PAE for those of us committed to transnational racial and colonial justice.

Development Vs Anti-Development-Case of Indian Widows

Widows are the part of our society facing social boycott and extreme deprivation. In practised rituals, their status becomes profane. This is true for many traditional layers of Indian society. Thus the concerning agencies (government and no-government) toed the line of reformatory movement and came to their rescue as an important issue based problem of social development. However, their internal approach is anti-developmental and despite their pains, emotional trauma, disengagement from their family, neighbourhood, community and erstwhile purpose assigned to their pre-widow role they would not return to mainstream. Only redeeming feature is development policies in vogue for reducing the suffering of widows with the provision of shelter, food, cloth and other miner facility of health care and community entertainment. Sociology of development venture would not be acceptable unless taking the analysis of for citing one example only of Varanasi city where the recorded number of widow status was 38,000.* The paper raises the major dilemma when development is blocked or restricted due to cultural response of human targets of development.

The Dialectics between Workplace and Workers' Power: The Case of Paid Domestic Workers Under Neoliberal Capitalism

Workers' resistance and its efficacy to shape class relations have been a matter of intense discussion and debate over the past decades and Erik Wright's theory of workers' bargaining power was a critical contribution in the same regard. This paper applies Wright's theory of workers' power (Wright, 2000) to examine domestic workers' struggle to claim labor rights in India. Domestic workers—the workers who work in or for households—have long represented the quintessential informal-sector workers who were seen as 'unorganizable' and therefore at the bottom of bargaining-power hierarchy. The lack of power among this group of workers was attributed to the nature of their workplace, i.e. homes of private citizens, and the relation of these private sites with the larger social relations under capitalism, i.e. of 'reproduction' (of labor power) instead of accumulation driven 'production'. Historically, workers' ability to disrupt production (or distribution) has been seen as a critical axis of bargaining power. However, what could be achieved by disrupting, if at all, the reproduction in private homes? Over the last two decades, the organizing strategies among domestic workers, however, show that the workers' organizations are coming up with innovative ways to assert their class interests by building new forms of collective power. Drawing on the case of India, I demonstrate that the domestic workers' organization are increasingly directing their struggle at upper- or upper-middle-class gated neighborhoods. In other words, the workers' strikes are aimed at disrupting the running of domestic work *in entire localities—a set of households—instead of one individual household.* Based on these findings, I argue that the workers' power or its structural position do not have to be seen as pregiven categories, rather as relations that are historically specific which need to be located in particular times and places.

Compelling Responses to Systemic Crisis: Using Participatory Video to Make 'Visible' People's Realities and Mediate Micro-Level Exchange across Social Levels

Systemic social problems such as unaccountable and corrupt governance, environmental exploitation and degradation and insecurity from conflict, which can arise from neo-liberal development policies, play out at through 'small' personal crises at the micro-level. Given the global context of closing civic space, societal disintegration, and climate change, what can be done to build the needed dialogue across interests? The assumption is that if inequity is perpetuated through 'everyday' relations it can also shift through micro level exchange. This paper explores how people living at the rural and social margins in highly inequitable contexts have been supported by creative practitioner-researchers to use lens-based practices to push back against their lack of hope, frustration, ambiguous identities and lack of visibility in the public domain. I discuss participatory video and DST projects with Indian street and slum dwellers, and Kenyan people living near large-scale geothermal and windfarm developments, to consider the performative function of these visual practices. How did they surface and visualise *small* stories of personal experience, re-frame more productive collective identities, and instigate dialogue with influential audiences? However, this paper is not celebratory and draws on my previous research on the inherent tensions in these kind of approaches, to raise critical questions about practitioner positioning in co-construction, the ethics of exposure, and audience responses to difference and contestation.

Institutional Factors Affecting Lay Plausibility Evaluations of Scientific Findings

There is a growing concern about public support of science, continuous decline of which has led to the "crisis of trust" between science and society. For this crisis to be overcome, scientists need to deepen their understanding of the wider publics interests and determinants of ordinary judgements, as such understanding might be conducive to more effective communication with lay audiences. We conducted our study aiming at broadening our understanding of the information cues influencing such judgements, and thus, determining the public authority of science.

Our main research question is how such institutional factors as the scientific field, research funding and institutional prestige may influence lay perceptions of plausibility of research results. We address it by examining whether plausibility perceptions of research results vary depending on what information about the research is provided. We conducted two separate factorial surveys among university students (429 and 344 participants) in which they considered a number of scientific research studies from different disciplinary fields: sociology and neuroscience (Study 1), sociology, criminology, neuroscience, genetics and physiology (Study 2). Participants were from different disciplinary domains, i.e. not specializing in the research fields used for vignettes construction.

Based on our analysis, among those three factors, the disciplinary field plays the only significant role in perceived plausibility of research results for the audience studied. We were able to discover that sociological and criminological research results are perceived as less plausible compared to neuroscientific and physiological research, but as more plausible compared to research results from the disciplinary field of genetics.

Some limitations of our research are discussed as well as possible directions for future research.

SHETTIMA, ABBA GANA* (University of Maiduguri, Nigeria)

Confluence of Complex Vulnerabilities: Environmental Crisis, Poverty, and Insecurity in the Lake Chad Basin

The Lake Chad, which is a major wetland in the semi-arid Sahel corridor, has for centuries provided means of livelihoods for millions of people in the West and Central African regions, in particular the countries of Cameroon, Chad, Nigeria, and Niger. It has supported agriculture (food crops, fishing and livestock) as well as trade and commerce; thus providing the suitable social, political and economic climate for the inter-mixture of cultures and civilizations. However, in the recent past, particularly in the the last few decades, the Lake Chad Basin and the livelihoods and cultures it supports has been threatened by the confluence of three major crises namely, environmental fragility including climate change, poverty and insecurity. The lake has shrunk in size by about 90% since the 1960s due to a combination of complex but interconnected factors including climate

change, a phenomenal increase in the population of humans and herds and un-planned irrigation. An attempt is made in this paper to establish the links between environmental crisis, poverty and insecurity in the Lake Chad Basin and how they have impacted on human livelihoods in the region and beyond. The confluence of vulnerabilities confronting the region represents the epitome of an ecological disaster with huge social and economic consequences. The historical trajectories of long term environmental change, dwindling resources, and competition and conflict between different resource users in the basin are discussed. In what ways is the present conflict and insecurity in the region as manifested in the *Boko Haram* insurgency related to the long term processes of environmental change and the collapse of livelihoods? What are the short and long term prospects of addressing these complex vulnerabilities? What are the pathways to building community resilience in the face of these daunting challenges? These and related questions are addressed in the paper.

RC32-414.3

SHEVCHENKO, YULIA* (Ben Gurion University of the Negev, Israel)

"Donkey Work": Israeli Post-Soviet Women in the Peripheral Labor Market

This paper presents the complex lived experiences of post-Soviet women in the blue-collar unskilled Israeli labor market in the southern periphery of Israel (the Negev region). The research is based on mixture of qualitative and quantitative methodologies.

The vast portion of the academic literature in Israel concerning the post-Soviet population portrays them as a homogenous and hegemonic group, while ignoring the heterogeneous characteristic of this population. Such perception is compatible with the discourse of the Israeli formal institutions which describes the post-Soviet immigration during the 90s as "the most successful immigration wave" of the Israeli state. This "successful immigration" supposedly was meant to elevate the Israeli professional labor force.

Researching the lived experiences of post-Soviet marginal women reveals that these women entered into the secondary labor force in which they dispossess economic and symbolic capital. These women express high levels of loyalty to their workplace, and at the same time, they experience exhaustion in their line of work. Their loyalty is grounded in their Soviet past, where their identity was formed around the concept of "the worker" and the ideals of high work ethics. As immigrants, their work ethics made it possible for them to accept any job at hand and become the new desired labor force. At the same time, it also exposed them to the gendered neoliberal labor market which praised their work ethics and exploited it in order to establish an obedient and cheap labor force.

Racialized Schools and the Course Attainment of Black, Latinx, and White Youth

Racialized institutions are central in the educational experiences of Black and Latinx youth in the USA but the emphasis is often on documenting disparities rather than identifying the school contexts that support the achievement of diverse youth. We frame the racialized allocation of supports for course attainment across and within high schools by integrating Victor Ray's (2019) theory of racialized organizations with a review of categorical inequality in schools by Domina, Penner, and Penner (2017). Using multilevel data from the large nationally representative High School Longitudinal Study of 2009, we find that private schools, and ninth grade course placements that reflect progression, are the supports that relate most closely to math and science course attainment. We also find Black and Latinx youth are less likely than White youth to experience these school supports. Finally, benefits from school supports for Black and Latinx youth depend on the share of their school peers who are White, whereas White youth reap similar benefit regardless of the Whiteness of their school.

The Intersection of Disability, Race, and Socioeconomic Status in Ninth Graders' STEM Academic Readiness

Disability, race, and socioeconomic status closely intersect and are key factors in achievement disparities. Nonetheless, disability is often disregarded in research focused on diversifying science, technology, engineering, and math (STEM) fields, and even in research using an intersectional framework. This study applies intersectional theory to data on 15,000 USA ninth graders from the nationally representative High School Longitudinal Study of 2009. Youth with autism or med-icated attention deficit hyperactivity disorder exhibit higher levels of STEM academic readiness than youth with learning or intellectual disabilities. Regression models with statistical interactions show that understandings of disability based predominantly on White youth are incomplete and even inaccurate, building intersectional theory and knowledge on STEM disparities.

SHILOVA, VALENTINA* (Institute of Sociology of the Federal Center of Theoretical and Applied Sociology of the Russian Ac, Russia)

Communication Features of Inhabitant's Cohesion in Rural Areas

Today we observe cases of spontaneous emergence of groups with a high degree of cohesion, mobility and readiness for action, on the one hand, and the variety of different forms of social division and conflict potential, on the other hand. There is no doubt that the a huge role in these processes play communicative practices as specifically aimed at the achievement of certain results, so spontaneously arising, uncontrollable, unpredictable. The virtual environment takes on special significance and allows to replicate the communication platforms for communication of different social groups, including for antistate, criminal, anti-social. In society there is a serious need for a study of the communicative aspects of the formation, maintenance and destruction of group cohesion. Communication features of cohesion are considered by author through the prism of the Manuel Castells' theory of the space of flows. By spatial streams implies purposeful, iterant, programmed sequences of exchange and interaction between the physical separation of the position taken by social actors in the economic, political and symbolic structures of society[1]. In the report there will be presented the measurement model of communicative cohesion, based on the following indices: index of stereotypes unity (SU); index of observance/non-observance of moral code (OMC); index of the top management' communicative accessibility (CA); index of group sanctions for "apostasy" (GS); index of interaction with the outside world (IW); index of the character of intra-group communications (IC) - the frequency, content, emotionality. The author will state the basis for the classification of rural communities to describe them by the type of cohesion. There will be designated the groups which may take place in a temporary space at all levels of communicative cohesion (communication from disunity to the highest communicative cohesion), and the groups which cannot reach certain positions because of their nature.

The Problem of Management of Preservation of Historical and Cultural Heritage in Russia in the Regional Context

The report presents the results of a comprehensive study of the evaluation of the power-management vertical in 12 regions of Russia with different level of socio-cultural modernization (according to N.I. Lapin), conducted by the Center of sociology of management and social technologies of the Russian Academy of Sciences (2015-2017). The authors focus on the analysis of the population's assessments of the state of affairs in the field of preservation of historical and cultural heritage and assessments of the authorities' activities about it. Unfortunately, Russia management system still is not verified and adjusted. Almost the only opportunity to apply the world experience in the restoration to use cultural heritage not only for the benefit of the monument, but also for the safety of territorial unique – is, first of all, the privatization of the monument by businessmen-enthusiasts, who does not aim to get large profit from it. It is connected with the difficult and slow governmental system for the preservation and restoration of cultural objects. Meanwhile, restoration of cultural monuments could give the regions an advantage in development. Regions that do not have a strong industry should focus on creating a system that protects the interests of investors and links them with the interests of local residents. To make it perhaps using a package of measures, on the one hand, organizing continuous monitoring of requests of the population for different types of commercial / sociocultural and other activity in a particular point of the city / settlement, providing these data in open sources, on the other hand, realizing technology of social participation of all stakeholders in the management of preservation of ICT.

SHINADA, TOMOMI* (, Japan)

A Comparative Study of Vegetarianism in Japan and the US: Plant-Based Diets and Value Sensibilities of Millennials

Dietary habits of younger generations in Europe and the US have been changing. However, in general Japanese people are not aware that dietary choices in terms of foodstuffs are crucial in creating a more sustainable society. This study focuses on the plant-based dietary habits of the millennial generation in Japan and the US. Several attribute variables and the variables of consciousness concerning food are considered. The average number of those who follow a plant-based diet is higher among the US millennials than in Japan. The results of regression analysis demonstrate that social class variables impact positively on the choice of a plant-based diet in both societies. Gender and family have a very different impact on who will choose to follow a plant-based diet. For instance, in Japan it is only females who consume a more plant-based food. Living with a partner or children is a positive contributor in the US, whilst in Japan living with a partner is a negative contributor and living with children is neutral. Integrated regression models suggest that the hope of communication at mealtimes is relevant to the choice of following a plant-based diet in both societies.

SHIRAHASE, SAWAKO* (University of Tokyo, Japan)

Families and Wealth Accumulation in Japan: How Is Wealth Passed on between Generations?

In almost all counties, a much higher extent of inequality exists for wealth distribution than for wage and income distribution. At the same time, it is more difficult to accurately measure the amount of wealth. Despite the difficulty of gathering information on wealth, many reviews (Keister & Moller 2000; Spilerman 2000; Killewald, Pfeffer and Schachner 2017) have highlighted the relevance of wealth in social stratification processes. Wealth has become a fundamental dimension of inequality, especially in highly aging societies like Japan because economic inequality among the elderly who are no longer in the labor market is affected mainly by family wealth.

Our study focuses on Japan, the most aged society, and examines trends in the distribution of family wealth and the determinants of accumulation of wealth in families. The data analyzed in this study come from the 2004–2016 Comprehensive Surveys of People's Living Conditions (CSLC) and the 2015 National Survey of Social Stratification and Mobility (SSM). We use CSLC to document the overall picture of wealth distribution and SSM to examine factors that influence the inheritance of wealth. We analyze the pattern of wealth inheritance by age group because inheritance of wealth takes place later in the life course, and socioeconomic well-being among the elderly is dependent on wealth rather than income. We consider a wide range of social background factors available in SSM, including the father's and mother's educational levels, class, economic well-being, the number of books at home, and sibling variables (e.g., single child, the number of siblings, and birth order). We show the relative importance of social background factors in the pattern of wealth inheritance.

Jihad As a Form of Political Protest: Genesis and Current Status

The presenaion presents the evolution of the concepts of jihad from the minimalist and maximalist approaches. In the first case, a Muslim is obliged to protect himself from an external threat, if it is understandable and obvious. The second approach, on the contrary, proceeds from the position of spreading the Islamic principle of justice to all mankind, and therefore the means of protecting and upholding this principle through jihad are mandatory everywhere for all Muslims and in all forms prescribed by Sha'ria. As in the Middle Ages, today both interpretations of jihad are permissible; the choice of interpretation is a personal matter for every Muslim. Also in the presentation one can find two conceptions: the conception of "liminality" and the conception of "re-islamisation". Liminality is a form of structural crisis, that appears as a result of the split within Islamic spiritual elite and Muslim community itself. The period of liminality is characterized by political and social instability, crisis of social and individual forms of self-identification and sharp cognitive dissonance among many ordinary believers who conduct their own search for fundamentally new forms of Islamic political existence. Re-islamisation is the post-liminality period, that happens if the maximalist block of Islamic elite wins political power. The events of the "Arab spring" can be seen as the re-sult of the appearance in the Islamic ideological space of two different ideological platforms, around which representatives of not only the Islamic elite, but also the "popular" Islam gathered.

Public and Private in "Women's Issue" of Post-Soviet Dagestan

This paper aims at analyzing the role of women in Dagestan through the prism of public-private dichotomy. The attitudes of traditional society and pre-Islamic period are studied, as well as early Islamization, Soviet emancipating practices and Post-Soviet re-Islamization. Thus, the authors come to conclusion that the "new" wave of Islamization of Post-Soviet Dagestan bears a truly new phenomenon with it, one which was not characteristic even of the period of early Islamization of the region—the closure of women within the private space, contrary to historical experience (which implied a rather active participation of women in the public sphere)—a phenomenon which occurred simultaneously with the rapid urbanization and informatization of Dagestan's society.

Key Factors of Objective and Subjective Academic Career Success

The study considers career patterns of researchers and the ways to assess their career achievements on the academic and non-academic labor markets; both objective and subjective assessments of career success and their interrelations are analyzed. The concept of "career" applied in academic literature is constantly reviewed, acquiring new meanings and losing old ones. Ambiguous interpretation of the career concept creates problems with assessing career achievements. Success of a research career cannot be measured using a single variable; not just isolated variables distributions, but also their interactions must be analyzed. The study is based on the data obtained during a survey among 828 Russian researchers carried out in 2016-2017 as a Russian counterpart of the international project "Careers of Doctorate Holders" (CDH). The research career model is based on the principles developed in the scope of sociology of science and the approach adopted by the CDH project. The list of analyzed variables combines "objective career" indicators (the sequence of statuses the researcher obtains over their career paths) with "subjective career" ones, such as the researcher's assessment of their abilities and opportunities, personal prospects, and work-related achievements. Characteristics of researchers' employment in different types of organizations (research institutes, universities, industrial and service sector companies) were compared. The exploratory factor analysis revealed the main factors determining objective and subjective research career patterns in academic and non-academic sectors. The results of the study attest that the factors affecting career patterns are closely linked with the recognition that researcher obtains or expects at three levels: (ranging from individual to global): (1) specific individual (self-recognition); (2) professional community (recognition by peers); (3) whole society (nationally and internationally).

SHMIDT, MAYYA* (Uppsala University, Sweden)

From Do It Yourself to Do It Together: Sociological Analysis of Knowledge Sharing in Stockholm Makerspace

Strong civil society coupled with the Swedish innovative capacity created a dialogue between many stakeholders, which resulted in a creation of socially and economically important projects. The study focuses on one of such initiatives - Stockholm Makerspace –a community of nonprofessional makers. Through interdisciplinary collaboration and shared access to tools, classes, and each other's knowledge, the members of the makers' community promote knowledge sharing and grassroots innovation. The paper pinpoints the key elements of member-driven organisation functioning and answers two research questions: (1) Why do members become part of the sharing initiative? And (2) What are the collective outputs the members seek to create?

The study is informed with the multiple kinds of data: (1) 11 in-depth interviews conducted with active members of community and experts, (2) ethnographic

observation in situations of planned workshops and everyday life of the Maker-space, (3) systematic online observation. Triangulation of these materials provide more holistic view on the phenomenon under study.

Results revealed members of Stockholm Makerspace, acting as prosumers, attempt to benefit not only community under study, but also contribute to societal development at large, by creating a public good. The collective outputs that Stockholm Makerspace community seeks to create are: (1) to sustain the non-for-profit organization through active communal involvement into care and maintenance practices and spreading "word of mouth" about the community to make it more visible, as such associations are significant for the civil society; (2) to enable forms of exchange, embedded in social structure and connectivity, based on weak ties; (3) to complement formal education sites by knowledge sharing, thus contributing to informal learning; (4) to provide involvement into STEM for diverse group of participants. The main incentives of sharing, vocalized by participants in the study are open-ended socializing and community commitment, as well as self-expression and belonging.

RC26-JS-46.1

SHMIDT, MAYYA* (Uppsala University, Sweden)

What Is 'Sharing' in Sharing Economy?

The sharing economy gained considerable scholarly attention recently, however the current scholarship on sharing remains analytically incoherent as there is a widespread ambiguity about the notion. Some authors narrow the sharing initiatives to local exchange platforms (thus bracketing out the ICT aspect) such as freemarkets (Albinsson and Perera 2012), cooperative subsistence farming (McArthur 2015), toy libraries (Ozanne and Ballantine 2010), bookcrossing (Widlok 2017). The other pool of literature defines the sharing economy in terms of the short-term lease market (Vaughan& Daverio 2016), thus excluding trade of services and labor, and sharing of consumables. Lastly, the most cited classification of the sharing economy platforms (Schor & Fitzmaurice 2015) suggests that they may take almost any organizational form and market orientation.

This contribution adds to the debate by addressing the key conceptual issues: terminology, individual practices and experiences in various settings, motivation and goals. Materials informing the contribution include state of the art review of sharing economy literature and findings from author's case studies from non-for-profit sharing economy sites in Russia and Sweden. The paper puts forward a definition of sharing as a separate mode of resource allocation resting upon the following characteristics: (i) counteragents do not enter a straight swap, (ii) equivalency of services is not sought, (iii) arrangements are not evened out: individual can occupy a strict donor role, only providing services, (iv) ownership is not transferred in sharing, and thus the informal debt (or expectation for reciprocation) cannot emerge, (v) profit one gets is often of non-monetary nature. The case studies revealed the prosocial motivation behind sharing practice, as it has a social function of developing a sense of belonging to community, overcoming social alienation and providing means for self-expression. Sharing responds to the logic of sustainable consumption and production and contributes to creation of public goods.

The Feasibility of a Reciprocal Health Care Agreement between Australia and South Korea: An Australian Analysis

This study provides a critical analysis of the feasibility of a Reciprocal Health Care Agreement (RHCA) between Australia and South Korea. Reciprocal Health Care Agreements (RHCAs) enable the provision of medical treatment between countries when the people of these countries travel or visit their counterparts. The medical service is to be provided within the country without purchasing additional travel insurance or being resident in the country party to the agreement. The study asks how does the current feasibility of a reciprocal healthcare agreement between Australia and South Korea likely to affect access to health services in light of the culturally and linguistically diverse backgrounds both countries have? In December 2014, there was the historic Korea-Australia Free Trade Agreement that came into force between these two major trading partners. The research utilised a social scientific mixed-methods methodology. First, document analysis was conducted on government reports, official statistics and media articles in English and Korean. Secondly, informal interviews were conducted with key stakeholders in Australia and South Korea. The paper uses a comparative sociological framework in looking at the policymaking process and health services access in both countries. In Australia, the Health Insurance Act 1973 enables health care agreements with 11 nations, however, Korea has no similar legislation in place. Therefore, Korea would need to build a broader consensus on the need

for a RHCA in full, based on the precedent of Australia's agreements with other nations, as well as on the Korean Pension Act. Our study finds that the active government commitment and involvement of the Ministry of Health and the Department of Foreign Affairs and Trade in Australia, and of the Ministry of Health & Welfare and Ministry of Foreign Affairs in South Korea, would be essential for a successful RHCA process to come to fruition.

Culinary Sociality: Food Culture, Identity and Inter-Group Relations of the South Asians in Hong Kong

Hong Kong, an "Asia's world city" in China, accommodates migrants of various nationalities and cultural backgrounds. Although the city promotes itself as a multicultural society, numerous institutional barriers continue to limit the integration of migrants. The integration policies proposed by the government over the years have been focusing on how to help the migrants to learn local language, without much acknowledgment on the importance of preserving traditional cultures of migrants, which is the most important element in building an inclusive society. Among the different migrant groups, South Asians (Indian, Nepalese, and Pakistani) have received most attention from scholars and policy makers since they are often perceived as being underprivileged. This research aims to examine the integration experiences of the South Asians in Hong Kong. Specifically, it explores the role of traditional food culture in their identity construction and inter-group relations.

Based on interviews and participant observation with the South Asians in Hong Kong, this research proposes the concept of "culinary sociality" to examine how the migrants utilise various individual and group resources to practise and preserve their own traditional food culture in Hong Kong, and under what conditions they are willing and able to use their traditional culture to initiate cross-cultural contact with Hong Kong Chinese. It reveals the dynamic relational milieu in South Asian culinary fields – cuisines and everyday food cultural practices – within which the South Asians are constantly interacting with people and situation around them in ways that are co-productive, through which they reconstruct their social identity in diasporic conditions, and generating cultural contacts with Hong Kong Chinese, which aims to promote inclusion at the community level.

Work of the Future: Challenges of the Technological Perspective in the Context of Globalization and De-Urbanization

At any time of the day or night – under the roofs of skyscrapers and in the rural wilderness, underground and even in space – people are constantly working. For centuries, work has been the basis of human life, has been its meaning. But what will happen tomorrow? How exactly will we work in a world that has changed because of technology, in a new digital space?

Technological progress determines ways of development and organization of social life. The influence of technology is everywhere. Technique as ideology (J. Habermas), art in conditions of technical reproducibility (W. Benjamin), the end of labour in its classic sense, "liquid modernity" (Z. Bauman), information epoch and network society (M. Castells). All this creates a portrait of modern time. Labour no longer determines a way of life. Success comes to people who can adapt to the changing modernity, its fluidity, who are able to tune their abilities, talents to the wave of modern demands, become creative and create something new and popular. Modern person has begun to choose freedom and creativity as a way of life.

In modern society, a lifestyle and a way of life changes significantly. Today, creativity enters the life of a person and shapes it. The thesis "from each according to his ability, to each according to his needs" is quite relevant today. Now there is a demand for abilities; and abilities, in turn, provide needs.

Emergence of the Middle-Class Dispositions in Socialist Poland: Analysis of Biographical Interviews. Toward the Genealogy of the Polish Middle Class.

The paper investigates 'embourgeoisement' of the socialist culture in Poland that took place in the 70s, through the perspective of intergenerational change. Through biographical interviews, we wanted to show that middle-class dispositions in Poland emerged during the socialism, not during the transformational period (after 1989), as is usually theorized in the literature. We selected interviewees under the following criteria: being born between 1947-1955 in the families of

white collar workers of the social origins placed outside of the pre-war intelligentsia. The preference towards children of the parents with no origins in a pre-war intelligentsia was important in order to verify the proposition that socialism, being a type of modernization project, produced class divisions that were not simply 'inherited' from the pre-revolutionary period, but inscribed more in new, more professionalized forms of the division of labour.

The youth of our interviewees is placed in the 1970s, the decade that constitutes an important change in the politics of the Party. The additional research question to be asked is therefore whether coming of age of the first generation born in socialism influenced the politics directly or indirectly. We identified that with the emergence of political opposition constitutitng an alliance of the workers with the anti-communist intelligentsia, the Party turned more in the direction of the group that was the most indigenous to the system and yet, nearly completely hidden from public discourse, that is the socialist middle class. Therefore, during 1970s the project of re-evaluation of the socialist culture as middle class-based was taken up and one of the aims of our research is to investigate its emergence, its consumerist orientation, how it actually added to the implosion of the supposedly egalitarian system and how the failure of creating auto-identification of the middle class back in the 70s influenced Polish post-1989 society.

SIECZKA, EMILIA* (Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland)

Polish Middle School (gimnazjum): Between National Habitus and the Process of Civilization. Analysis of School Newspapers (1999-2019)

The paper analyses the school newspapers published in Polish middle schools from 1999 to 2019. We are particularly interested in the process of civic socialization undertaken at the Polish middle schools with particular emphasis on the ways the concept of civic participation, the community and social integration were understood and executed in those educational institutions.

Our investigation will combine 3 approaches : that of transformational studies, Elasian (figurational) and Bourdieusian. The middle schools were themselves the object of debates regarding the priorities that should be executed through educational process in Poland after the liberal transformation – both at the time of their creation and their recent closure. Their creation might be understood as a part of a broader process of integrating Polish education with a globalized system, where the results of the pupils and the programmes of education were to be assessed in international context. From the perspective of the educational policy promoted by the current government, the closure of the middle schools constitutes a return to the protection of community and deepening of the social bonds that were to be compromised by globalization and promotion of mobility. Therefore, in the analysis of the newspapers produced 'form below' we want to see firstly, how the local and Europeanized civic identities interacted with each other on the micro-level of the school environment. Secondly, how the relationship between European civilizing process and creation of national habitus played out in certain communities (Elias) . Thirdly, what was the impact of social and class composition of the school in the perception of combatibility or incompatibility of the Polish national habitus with the European one and whether underprivileged school communites favoured the national culture as distinct from the European one? If so, how does it affect the process of cultural reproduction in Poland (Bourdieu)?

Human Resource Management As Systems to Improve the Working Inclusion of Disadvantaged People. Case-Studies from Social Agruculture

People with psychic disabilities struggle to enter in the labour market and to stay in it. These difficulties are due to the fact that companies often adopt pratices of work organization and human resource management that cannot be sustained by mentally ill workers. Non-Profit organizations constitute an important tool to support the working inclusion of these people since planning and implementing adequate practices taking into account both their potentialities and vulnerabilities. Nevertheless, few studies have inquired the dimensions related to the deployment and promotion of mentally ill people into non-profit organizations. Moreover, these few studies have focused on single practices while the literature has highlighted the importance of folowing a systemic approach in the analysis of human resource management. By relying on case-studies concerning small enterprises active in the social agriculture sector, we inquire and identify systems of human resource management practices which are able to ensure the working inclusion of mentally people.

SÍGOLO, VANESSA* (Universidade de Sao Paulo, Brazil)

Recuperación De Empresas y Autogestión Del Trabajo En Brasil Actual: Reflexiones a Partir Del Caso De La Planta De Azúcar Catende En Pernambuco

El artículo busca contribuir al estudio sociológico sobre las clases trabajadoras y sus formas de resistencia y acción política, con análisis de experiencias de recuperación de empresas por trabajadores/as y autogestión del trabajo en Brasil. El fenómeno surge en los años ochenta y noventa, en el contexto de redemocratización y de fuerte crisis económica – relacionada a apertura del mercado nacional e integración del país a los procesos de globalización de la economía e implementación de políticas neoliberales –, y se mantente activo en la actualidad. En muchas regiones, trabajadores/as han resistido a sumarse al creciente contingente de desempleados, impulsados por la lucha por supervivencia, organizándose colectivamente para ocupar y recuperar empresas fallidas en que trabajaban, de diferentes sectores. Este trabajo busca: 1) situar los casos contemporáneos en el rastro de la historia de experiencias laborales de autogestión, que va más allá de fronteras nacionales y nos lleva a luchas asociativas del comienzo de la Revolución Industrial; 2) presentar una visión general de las recuperaciones de empresas por trabajadores/as en el país, con base en estudios realizados con investigadores/as de diez universidades brasileñas; y 3) analizar la historia de lucha de los/as trabajadores/as de una de las más emblemáticas experiencias de autogestión de América Latina, la Planta de Azúcar Catende, en Pernambuco, como afirman Singer, 2000; Nascimento, 2005; Faria, 2011. Inspirado por los conceptos de historia de Walter Benjamin y sus desarrollos en la sociología, este texto analiza los significados de estas experiencias asociativas que crearon prácticas concretas de resistencia al desempleo, aunque marginales en el sistema hegemónico capitalista. Finalmente, el estudio señala que el fenómeno, en medio a contradicciones, presenta relaciones sociales que se distinguen de la relación asalariada, de jefe-empleado, en el sentido de la democratización de las relaciones de producción y reproducción social, que requieren mayor atención.

Scholarly Culture: The Influence of Home Libraries on Pre-Adolescent Numeracy

Data from large standardized surveys supports scholarly culture theory in its claim that immersing children in book-oriented environments benefits their later educational achievement, attainment and occupational standing. These findings have been interpreted as suggesting that book-oriented socialization, indicated by home library size, equips youth with life-long tastes, skills and knowledge. The context is usually provided as critical assessment of Bourdieu's social reproduction and social practice theories.

However, to date, the scholarly culture argument has not been considered with respect to numeracy of youth as an outcome. In this paper we supplement prior research (Evans, Kelley, & Sikora, 2014; Evans, Kelley, Sikora, & Treiman, 2015; Evans M.D.R, Kelley, Sikora, & Treiman, 2010; Sikora, Evans, & Kelley, 2019) with an analysis of data from TIMSS 2015 survey for Year 4 students. We demonstrate that bookish homes benefit numeracy of pre-adolescents, above and beyond parental class and reading habits of children. The data are for children who were on average 10 years old and hailed from 45 different countries. We argue that growing up around books benefits youth numeracy skills in unique ways, but the benefits may vary between youth from modest and elite social origins.

Mega Philanthropy As Web of Justifications, Critiques and Engagements

Contemporary elite philanthropy is undergoing extensive institutional expansion on the one hand but facing mounting criticism and public distrust on the other. In the process, it emerges as an arena proliferating with disputes and com-

peting criteria of valorization, signaling alternative conceptions and critiques of gift practices as possible vectors of commonality. Building upon developments in the pragmatic sociology of critique and engagement, I shall contribute to a diagnosis of this complex state of affairs by an analysis of the tight web of regimes of justification and engagement that have emerged in the texts of contributors to the Giving Pledge, a campaign encouraging the wealthiest individuals and families to declare their commitment to dedicate a majority of their wealth to giving, and counting now 204 donors since launched by Buffet and Gates in 2010. Theoretically, I hope to show that it is fruitful to combine analysis in terms of public justifications and below-the-public regimes of engagements, thereby enriching our understanding of mega philanthropy as public performance and "deep play." Moreover, I shall argue the need to better harness the cumulative insights of pragmatic sociology for a fuller analysis of contemporary dynamics of inequality and elite formations.

The Participation of Children and Youth in the Process of Implementing a Psychosocial Outpatient Clinic for People Exposed to Violence.

The public policies built for children and adolescents are an object of analysis of the process of implementation of a psychosocial outpatient clinic in a university hospital. Including children and adolescents in the decision making process about how a service will be offered is an important action to ensure the sustainability of an intervention. In this sense, this paper will address the importance of focus groups with children and adolescents who use health units and basic protection services of social assistance, placing them as active subjects in the research and intervention process. Including them as stakeholders is a significant strategy to ensure the success of an intervention (Onocko-Campos, 2011). Facilitating the participation of young people and service users helps to narrow the focus of intervention according to population needs and service demands and to ensure sustainability at the implementation and post-implementation stage (Proctor et al, 2011). In addition, young people are directly targeted by implementation and those using services in local communities. Thus, with focus groups and youth consensus workshops we draw the profile of the therapeutic itinerary, the challenges and potential of the demands and the existing offerings for this community.

ALVES, MARIA LUCIA (Universidade Federal do Rio Grande do Norte, Brazil)

The Pilgrimages of Juazeiro Do Norte and the Feast of the Folk: An Analysis of the Pilgrimage Events Motivated By a Uncanonized Saint in the Inland of Ceará, Brazil.

Thousands of people travel every year to Juazeiro do Norte, inland Ceará, to revitalize their ties with Father Cícero: the Holy of the People. This saint was not canonized by the Catholic Church, yet his holiness is constantly legitimized by his devotees located in the most diverse economic classes, generations and geographical locations. By plane, wagon or bus follow the pilgrims to the pilgrimages. These events go beyond the religious content accepted by catholicism and manifest various playful aspects that make up the great celebration of the people. The popular religiosity present in these pilgrimage events results from their initial motivations with the call of Father Cicero to witness the founding myth of this sacred place. The saint of the people does not enter the church, their devotees do. The blurred margins between what is and is not allowed by the church to take place in pilgrimages in Juazeiro are not completely met by the faithful, which gives these people some autonomy and power to negotiate the guidelines of an event that should be from the folk to the folk. Thus, taking into account the diversity of pilgrimage practices and their mention of the festive time between saint and people, semi-structured interviews, informal conversations and observations in the pilgrimages between 2015 and 2019 were conducted. The aim of the study was to understand how these pilgrims are able to build these great popular festivals, which are pilgrimage events, as well as assimilate their negotiations, consensus

and dissent. Founded on the articulation of festive and religious themes, this analysis makes in a dialogue with the significant classical and contemporary authors of the Social Sciences for an analytical writing through ethnography.

Continuity of Disasters: Reflections on Exploratory Field in Brumadinho-MG

The production of major mining disasters is linked to the model adopted by companies in Brazil. The disaster of the Doce river basin evidenced that the problems regarding the dam conditions in the country pointed to the disasters as elements to be incorporated in the ways of thinking and analyzing mining. Given the notes on the risks associated with the dams and the imminence of other disasters, the rupture of the B1 dam in the Córrego do Feijão mine, Brumadinho-MG, narrates the refusal of warnings and the absence of actions indicated as important to prevent further disasters. Mining disaster contexts have been imperatively enhanced by the latest mining tailings dam disruption, the B1 dam rupture in the Córrego do Feijão mine has dumped 12 million cubic meters of mud, extending data on the disaster in the dead count, contaminated rivers, environmental problems, animal deaths, social suffering, and many other categories that have come into play to address the Samarco disaster. Disasters are observed from markers and consequences of the current mining model, but they are also analyzed from the continuity of disasters, as an element that expands in relations and readings. Facing the perspective of continuity of disasters, it is questioned whether Samarco and Vale disasters can be considered as continuity of the same process, highlighting the different contexts and the implications of acting as a researcher in both disasters. These observations will be pointed from the analysis of the exploratory field carried out in Brumadinho in July 2019 and how the distances and approximations with the disaster in the Doce river basin are possible elements to analyze the entries in the fields and disaster contexts now enlarged.

The Effects of Criminal Embeddedness on School Violence in Brazil

This study examines the influence of criminal embeddedness on the intensity of criminal behavior among primary and secondary school students in a large Brazilian city. A database conceived by the Center for the Study of Crime and Public Security at the Federal University in Minas Gerais is used to analyze the involvement of youths displaying delinquent behavior at home or at school and how school performance and peer relationships are effected. Based on differential association and learning theories, the main hypotheses are (1) the greater the criminal embeddedness, the lower the degree of school satisfaction as well as future expectation of continued higher education, and (2) the greater the criminal embeddedness, the greater the risk of the intensity of deviant and criminal behavior. Applying statistical linear and nonlinear regression models, findings indicate that the criminal embeddedness has a negative and statistically significant association with the student's level of school satisfaction.

Female Body and Body Practices: Sitting Volleyball in the Aparecida Disabled Association of Goiânia.

The present study has as object of investigation the deficient female body of the representatives of the Association of Disabled of Aparecida de Goiânia (ADAP), for presenting a potential indicator of the conflicting social relationship between body and difference. The research will be developed with a qualitative approach and will be based on the ethnographic case study with emphasis on the technique of participant observation as a procedure for obtaining information from the following question: How is the deficient female body built in the sports universe, considering the sensings and meanings attributed to it by the social actresses of Sitting Volleyball that make up ADAP? The objective is to understand the meanings and sensings attributed to the deficient body manifested in Sitting Volleyball practices involving the social actresses of ADAP, considering the processes of female body construction in the sports universe.

The theoretical framework used is from Physical Education, Sociology and Anthropology, especially from the studies by Le Breton (2012) dedicated to the understanding of human corporeality as a social and cultural construction; Maussian

concepts (2017): body techniques and total social fact; Silva (2009): body practices; and Goffman (1981): Stigma. These concepts will support the understanding of the phenomenon in question.

Teamwork in Income Transfer Programs(BOLSA) Família: Profile and Poverty Conceptions of Professionals

This article deals with teamwork in the Bolsa Familia program, and aims to present a characterization of the professionals, as well as the conceptions of poverty that they express when acting in that program. Bolsa Familia professionals generally come from different areas of knowledge, constituting a multiprofessional team (social workers, psychologists, educators, lawyers). The work regime is 40 hours per week and the action takes place in the municipal sphere, especially in the Reference Centers for Social Assistance (CRAS). The main activities are the inclusion of beneficiaries in the general register, besides monitoring those already enrolled in the program observing the conditionalities placed on those subjects. This performance in the Bolsa Família program mobilizes the technical knowledge of professionals and, at the same time expresses his theoretical and political views and conceptions, which translate into the direction given to work. In this sense, the present research focuses on the conceptions of poverty revealed by these professionals, pointing to the presence of different views on the phenomenon of poverty, as well as about the "poor", given that this is the audience with which these professionals interact in this social program. The results indicate that the conceptions of "Poor" and "Poverty" are not homogeneous ranging from mild criticism to the naturalization of poverty, with predominance of the latter. The study identified a tendency to blame the poor for their socioeconomic situation. The conclusions point to the presence of contradictory conceptions, in which common sense is expressed and a moralizing explanation of the "Poverty" phenomenon, which is seen by respondents as a responsibility of the subjects (Poor) and as a constitutive question of social reality. Therefore, there are no scathing criticisms of the phenomenon of poverty, whether economic or political, tending to the naturalization of this phenomenon.

SILVA, JOSE* (Federal University of Campina Grande, Brazil)

National Sanitation Policy and Urban Planning: An Analysis from the Perspective of Disaster Sociology and Environmental Justice

In 2019 completed 12 years of Law no. 11.445 / 2007 that created the National Policy of Basic Sanitation (NPBS) in Brazil. It was a milestone for urban planning in the complex field of basic sanitation, encompassing access to drinking water, urban drainage, treated sewage, urban sanitation and final disposal of waste. The indicators analysis, notably those that present what has already been done and the public budget investment priorities, shows that this policy has failed and it will not be possible to achieve the Millennium Sustainable Development Goals (MDGs). In this context, the literature in the field of public policy and law generally addresses access to water, sanitation and waste management, forgetting a very sensitive area: urban drainage. What we understand from our study was the need to reshape the management format of this policy, directing it in legislation and practice to a set of actions and theories that lead us to the planning and management of social and environmental risks from the NPBS, also rethinking the set of attributions of public entities, since the Brazilian federative model attributed to municipalities the responsibility for basic sanitation and, however, what happens is a systemic inability to universalize this policy, especially in relation to the most vulnerable communities. This analysis could be performed through the lens of disaster sociology and environmental justice, which would help to build an epistemological basis for public management in a context of profound changes in the planet's climate dynamics, improving the implementation of the NPBS in the municipalities, helping in disaster prevention. In the field of public management there is an invisibility of local public administration as a cause or creator of disaster risk, creating a security paradigm that does not stand in a risk society in which the development model posed does not guarantee security.

SILVA, JOSE* (Federal University of Campina Grande, Brazil)

Water Injustice in the Global South: Brazilian Water Policy and the Construction of a Water Citizenship

It is known worldwide the Brazilian water potential, either in terms of surface water or groundwater, we have considerable sources. However, the National Water Resources Policy (NWRP), law 9.433/1997 completed 22 years old in January 2019, and the indicators of its implementation are quite worrying, especially regarding the quality of water governance, considering that we have a very extensive network of national and transnational rivers, as well as a coastal strip also ex-

tensive. Our analysis starts from a theoretical framework based on political water ecology and ecological law based on the epistemology of environmental justice. National water policy is based on principles: access for current and future generations, rational and integrated use, prevention of extreme events and encouragement of reuse. Therefore, our goal is to analyze the complexity of the system and its impacts on water governance nationally and internationally, considering the Brazilian case and its relationship with South American countries. National governance is based on participation from basin committees with representations of government, business, users and civil society. However, this model has shown exhaustion in practice, since it has not reached universalization, notably when we think about transnational water management, cooperation between Brazil and border countries, such as the Paraná River basin and the Amazon Basin, both large volumes of surface and groundwater and exert a major regional and global influence in terms of water balance. Thus, we understand that in the current model there is no systemic-ecological governance that contemplates the ecological dimension as a basis.

SILVA, LUCAS* (Federal University of ABC, Brazil)
LEITE, MARILIA (Federal University of ABC, Brazil)

Applying the PAR Model: A Pedagogical Experience with Residents of the Espírito Santo Slum, Santo André - SP, Brazil

In the Latin American context, the publication *Los desastres no son naturales* by La Red (1993) overcame the paradigm that disasters are caused exclusively by natural threats pointing to the relevance of vulnerability, "conditions determined by physical, social, economic and environmental factors or processes, which increase the susceptibility of an individual, a community, assets or systems to the impacts of hazards" (UNDRR, 2017), in risk and disaster construction. Blaikie et al. (1994) used the PAR (Pressure and Release) Model to analyze the social construction of risk, in other words, the socio-historical process of the progression of vulnerability, seeking to explain the root causes (e.g. resource distribution), dynamics pressures (e.g. rapid urbanization) and unsafe conditions (e.g. dangerous locations) which, interacting with a hazard, culminate in disaster risk. In the education field, Paulo Freire (1974), in *Pedagogy of the Oppressed*, describes that the freedom of the oppressed and the restoration of humanized relations are preceded by the recognition of the oppressive group and the reflection of the present condition by the oppressed. The theoretical framework presented was essential for the elaboration of a workshop that aimed to promote dialogue and reflection of people exposed to the risk of disasters, especially children, from a simplified version of the PAR Model, in which technical/academic terms were replaced by colloquial expressions, for example, 'economic crisis' became 'lost jobs' and 'gentrification' became 'removed'. As a result, the participants created three timelines that symbolized the social construction of risk from different hazards: epidemic, floods, and landslides. Then, it was identified which actions could be avoided by themselves, thus, essentially, leaving the root causes, dynamic pressures, and hazards. Finally, the participants reflected that to transform this scenario presented it is necessary to claim our rights as citizens and to vote for competent politicians.

SILVA, MARCELO* (UFRGS, Brazil)
MAZZILLI PEREIRA, MATHEUS (Universidade Vila Velha, Brazil)
FARIAS DA SILVA, CAMILA (Universidade Federal do Rio Grande do Sul, Brazil)

Transformations in Causes and Repertoires in Rio Grande Do Sul, Brazil (1970-2015)

During the last five decades, regimes and governments have dramatically changed in Brazil. During the 1980's, this country has seen a process of democratization after the military dictatorship initiated in the 1960's. In the federal level, governments of different ideological orientations have been elected, from the neoliberal oriented governments in the 1990's to the left-wing oriented Workers' Party governments in the 2000's.

During this period, local governments have also changed. In the case of the state of *Rio Grande do Sul*, governors of different ideological orientations have alternated in power since the democratization. Its capital, *Porto Alegre*, once seen as the "world capital of participatory democracy" under the Workers' Party administrations in the 1990's, has elected centrist and conservative mayors since de mid 2000's.

Social movement scholars have long discussed how regime and government shifts affect mobilization. The literature has argued that political opportunities affect the salience of activists' causes and their repertoires of collective action. In light of this debate, this work seeks to answer the following question: how did regime and government changes affected activists' causes and repertoires in the state of *Rio Grande do Sul* between 1970 and 2015?

To answer this question, we conducted a protest event analysis. We gathered news on protest events published in the local newspaper *Zero Hora* every five

years between 1970 and 2015. Regarding activists' causes, our preliminary results suggest the continuing importance of labor related causes, the salience of education related grievances during the democratization period, the importance of agrarian conflicts during the neoliberal federal governments and the growth of public security causes during the left-wing federal governments in the 2000's. Regarding repertoires, our data highlights the use of media to express grievances during the military dictatorship, and the consolidation of strikes, street protests, marches, and roadblocks since the democratization.

MARTINS, THAIS* (UFRB, Brazil)

Between Symbolic and Economic Markers: Trajectories and Positions Occupied By Graduates in the Labor Market

For Karl Polanyi, the formal economy by which individuals maximize their economic gains through competitive behavior does not apply to all societies. The socially rooted economy imposes limits on economic and market functions, that is, in capitalist societies not every economic action is rooted out of noneconomic motives. There are other mechanisms used that go beyond the previous logic are those of redistribution and reciprocity. Therefore we will work in the present work questioning the following statement: the existence of rational behavior on the part of students entering the university, with regard to the goal of obtaining the most cost-effective to obtain a degree and to succeed in job market after graduation. However, we work with the proposition that there are symbolic, moral, political dilemmas, and above all, resources (capitals: cultural, social, economic, symbolic capitals of parents, geographical location, performative behaviors, race, gender between others) that direct the trajectories of individuals towards besides a trajectory dictated by homo economicus, that is, rationalized, calculated to achieve academic and professional success and success in their trajectories. In this sense, the objective of this work is to use the methodology of multiple correspondence analysis (ACM) in order to map the social space through which the trajectories of the students of peripheral Brazilian universities, such as the Federal University of Recôncavo da Bahia, are outlined (BA) and the Federal University of Grande Dourados (MS). Therefore, we will work with data regarding the student trajectories of some human and exact courses in the universities mentioned above. In this sense we can outline how the rationalizing (economic) wills and symbolic (non-economic) dictates relate to each other through the mapping of their capitals and other symbolic markers to reach the labor market.

Challenges, Tensions and Limits in the Process of Repairing the Damage Caused By the Collapse of the Samarco Dam in Fundão, Mariana-MG

The following paper is about the repairing process of the damage caused by the failure of Samarco's tailing dam, occurred on November 5th, 2015. Its focus is the relationship among the distinct actors involved, which are characterized by a complex network of asymmetrical relations, in both institutional and symbolic resources. It emphasises the challenges, tensions and limits produced by the relations among corporative and institutional actors, legitimated by the Transaction and Adjustment of Conduct Agreement (TTAC), signed on March 2nd, 2016, by the federal government, the states of Minas Gerais and Espírito Santo, and the mining companies. The analysis focuses on the Renova Foundation, which, as a third sector institution (Corporative Foundation), takes over governmental responsibilities and corporative actions, causing tensions in the management and execution of the programs defined by the TTAC. The results highlight how the institutional repairing model adopted, reassigns mining companies and the state responsibilities towards a hybrid institution, which aims to dodge the attention from the entanglement of conflicts, whose epicentre is based on the natural resources exploitation model of countries located on the south-south axis.

SILVA, PHILLIPE* (Universidade Estadual de Goiás, Brazil)

"We Are Gypsies, Yes, but We Are First Gypsies of Brazilian Origin": A Study on the Boundaries of the Normative Processes of "Gypsy Identity"

In this study, i aim to describe and analyze the process of the bill 248/2015, which proposes the creation of the Statute of the Gypsy, in Brazil. The proposition of this specific legal landmark runs through the discussion about the gypsy identity, because this condition, the *being gypsy*, in the last 15 years, has enabled to trigger public policies, to claim specific rights, as well as to occupy spaces in councils, public agencies, attend meetings etc. As a research problem, it is proposed to reflect: how do the different understandings about *being gypsy* arise and influence the process of bill 248/2015, which proposes the creation of a Statute of the Gypsy? In the course of this legislative process, different forms of borders can be perceived; porous, indefinite margins that try to normalize the *being gypsy*; at the same time as this movement of institutionalization of the *being gypsy*, in the National Congress, also occur in the folds, traverse the formal and informal. It is an ethnographic-inspired research that required participant observation, as well as a *dense description* of the processes investigated.

Shaping Regimes of Governance for Biosimilars in the Global South: The Four Institutional Logics of the Industry of Monoclonal Antibodies in Brazil

Monoclonal Antibodies (MAbs) are biological medicines (biopharmaceuticals) of high therapeutic precision and its being prescribed to the treatment of several autoimmune diseases in urban populations of industrialized countries. Over the last years, the demand for those health technologies also grown in developing countries as Brazil, reflecting changes in the epidemiological profile of the population and as a result of the incorporation of those medicines in the list of products dispensed by the National Public Health System (Sistema Único de Saúde, SUS). To attend this demand, new public policies were implemented by the Brazilian federal government to promote the manufacturing of Biosimilar versions of MAbs by brazilian public and private companies. Biosimilars are biologic medicinal products made from living organisms, that contains the same active substance of the original biological medicine already authorized by regulatory agencies. Its equivalence and therapeutic efficacy must be proven after a rigorous process of quality control the molecule, as well as verification of its biological action in clinical trials with target populations. The aim of this presentation is to examine the four different institutional logics of the emerging regime of governance of the manufacturing policies of Biosimilars of MAbs in Brazil. Supported by the global south perspectives of the *Science and Technology Studies (STS)*, this case study combined semi structured interviews with twenty-four relevant actors (key government leaders, experts, leaders of the public and private pharmaceutical companies, directors of public and private research centers etc.) and documentary research in the official database of the Brazilian Ministry of Health about the initiatives implemented to this sector. We concluded that initiatives for this theme remained

centralized in the governmental sphere, and the political framework was built to meet the National Health Policy agenda and the immediate interests of the public pharmaceutical companies to access technologies of Biosimilar manufacturing.

Collective Bargaining in Times of Gig Economy

The debate over labour market regulation has reached a new level due to the spread of non-standard forms of employment in the so-called 'gig' or 'on-demand' economy. 'Industrial Relations' (IR) is an institutional domain that provides an theoretical-analytical tool to this discussion. On the one hand, owing to the reconfiguration of the productive context, the arrival of new actors and the reconstitution of old actors, established solidarities in IR may be affected by different interests and possibilities. On the other hand, institutions are constituted by endogenous elements that allow their continuity although the changing process. Collective bargaining has a central role in IR and for this very reason it is necessary to understand its structure and practical alternatives inside this mutual influenced environment. It should be kept in mind that this debate lies in a larger one, which discusses the restriction to labour rights of those new types of workers, but it does not take away the possibility to offer a theoretical contribution to the recognition of these rights through the analysis of the relationship between collective bargaining, working relations and 'gig' economy.

HIV Pre-Exposure Prophylaxis (PrEP) and the Risk Society: Arising Conflicts

Social processes are even more intertwined with risks and uncertainties regarding health on contemporary societies. Despite all knowledge on both biological and epidemiological risks, there has remained a lack of grounding social theory to understand such complex relations.

Our aim was to explore how risks and uncertainties are handled at an individual level within the risk society. We have critically discussed the conflicts arising from the HIV Pre-Exposure Prophylaxis (PrEP) use amongst individuals, which consists of a daily antiretroviral regimen that prevents the HIV acquisition.

We analysed PrEP users' experiences in an online group, which holds more than 20000 members. Most of them are gays, bisexuals and other men who have sex with men across North America. We conducted a content analysis with thematic categories to discuss their routines, conflicts, and successes regarding PrEP use.

As a global health intervention, PrEP tackles bodies, risks and uncertainties as a mode to control the HIV epidemic through the individualization process. This constitutes a social landscape in which societal relations have been produced or transformed into conflicting scenarios derived from the use of new health technologies and individual practices. For example, subjectivity and mental health strongly cooperate to individuals' HIV risk perception and their conflicts with medical institutions. The certainty discourse on the drug efficacy is questioned through their own biographical paths. We also identified social and cultural iatrogenesis practices over their experiences, though these are 'silenced' by institutional and scientific medical discourses. Moreover, an escaping behaviour keeps individuals adhering to PrEP when they know its use can increase negative effects to health pre-existing conditions, such as kidney malfunctions and Hepatitis C. Thus, new preventive technologies can produce risks and uncertainties in which should be sociologically confronted as an elementary part of a critical awareness that contemporary risk theory has to deal with.

Data Colonialism or Algorithmic Imperialism? the Formation of Predictive Capitalism

This presentation is based on the rechearch about algorithmic regulation in the public sector supported by Fapesp (São Paulo State Research Support Foundation). It presents the discursive strategy of corporations, in particular, the major technological platforms that aim to storage of population data in their data centers, generally located in a few rich countries. It also seeks to show the concentration on these same platforms frameworks of analytical intelligence in machine learning and deep learning. It will expose the dynamics of capital that have come to be denounced by some researchers of new data colonialism (Couldry and Me-

jias, 2018) and platform imperialism (Jin, 2015). The limitations and possibilities of these notions are pointed out in view of the circulation of international data flows, massive data collection and the expansion of entertainment technologies that have also become surveillance technologies. Controlling these flows strengthens the computational and analytical power of large corporations that seek to anticipate people's behaviors, interests, and desires on a global scale. Such control of the future depends on tracking and modulating subjectivities in ways never seen before.

Artificial Intelligence and Racial Discrimination: The Case of Detecta

This paper aims to investigate the intersections between discrimination, especially racial discrimination, in the use of machine learning technologies. Based on the notion of institutional racism, how may automated technologies contribute, in a racially unequal society, to the reproduction of those inequalities? We take a three-fold approach to tackle this question. Firstly, we briefly present the sociological discussions that have been held around the alleged objectivity of artificial intelligence, and, more generally, of data mining techniques. Further, we intend to demonstrate how human subjectivity and social norms can be reflected and enhanced through the use of machine learning technologies. Subsequently, such theoretical considerations are used as a guideline for an empirical approach, specifically a case study on "Detecta", a predictive policing system used by the Military Police of the state of São Paulo that uses image analytics for identifying suspect persons and situations and guiding police forces thereto. As a qualitative study, besides literature review, exploratory fieldwork and documental analysis were performed. Preliminary findings indicate that it seems to reinforce racial profiling practices and suspect racialization, contributing to the stigmatization of Black persons.

SIMOES GOMES, LETICIA* (University of São Paulo, Brazil)

Predictive Policing, Social Control, and Racial Inequality: The Case of São Paulo

This paper is part of an ongoing PhD research on the intersections between technology use and racial discrimination by Military Police of the state of Sao Paulo. It aims to investigate the relevance of technology use in policing — and whether it configures a predictive policing policy. Based on the notion of institutional racism, how policing may contribute, in a racially unequal society, to the reproduction of those inequalities? As a qualitative study, our sources are document analysis, exploratory fieldwork, and literature review. Preliminary findings point to the fact that predictive tools are used in at least two occasions by the Military Police: a) by contributing to territorialized human resources management, as it georefences police reports and helps to stipulate specific and prioritized areas to operate; and b) in the use of image analytics for suspect situations identification. The Detecta is a system that falls into the latter function; although exterior to the Military Police (as it is under the State Public Security Department administration), it has a interface with it and interacts with the institution. Regarding its implementation, one may call into question the use of its predictive functionalities; its use seem to be restricted to the spreading of a surveillance network, always operationalized by actors subjective perceptions. In these situations, it seems to reinforce racial profiling practices and suspect racialization, contributing to Black people's stigmatization.

SIMONOVA, OLGA* (Higher School of Economics (HSE), Russia)

Alienation and Emotions in Modern Societies: "Toxic" Relationships As a Construct and Emotional Practice

According to various specialists, the emotionalization of social life is viewed as one of the main cultural trends in modern society (Gonzalez 2017). While this is evidence of modern humanist ideology, it also promotes alienation and self-alienation. The process of emotionalization as an element of the process of individualization is termed "new sensitivity," "emotional capitalism," the "new sentimental age," "new emotional culture," and "psychologization" (Simonova 2018). Sociologists often refer to this trend as a "culture of fear" or "culture of anxiety" (Furedi 1997; Glassner 2000) and as a feature of risk societies, marked by widespread uncertainty and the related emotional experiences of fear and anxiety concerning the present and future. We can note in this regard the emergence of a culture of "toxicity" or "toxic relationships," primarily at the level of interpersonal relationships in everyday life. This social construct in fact does not resolve the problems of addiction, violence, manipulation in relationships, but contributes to isolation, exclusion, and alienation (understood as a breaking and weakening of social ties).

This paper aims to describe (on the basis of social phenomenology and cases from social media) what constitutes "toxicity" in social relations, to classify "toxic" types of people and relationships within the context of the "culture of political correctness," and to characterize their critical ambivalence and constructed character. In addition, quite common (emotional) practices of recognition, management, and coping with "toxicity" appear as the consequences of these constructs and as practical everyday "recipes." Analyzing these practices and ideas can help pose new questions within the framework of the sociology of alienation – to understand and conceptualize the role of emotions in the process of alienation, and in general to understand contemporary processes of the weakening and breaking down of social bonds.

WG08-720.2

SIMONOVA, OLGA* (Higher School of Economics (HSE), Russia)

Emotionalization of Labor in Sociology and Society: Practice, Ethics and Self-Identity

The paper examines the current tendency, which can conditionally be described as the process of "emotionalization of labor". This process is observed both in the sphere of labor relations themselves, and in the discourse of social sciences. Emotionalization is manifested in special attention to human emotionality and the emotion management at the workplace, which is considered now an integral part of labor included in the assessment of labor efficiency. The requirements for the managing of emotions become a part of the routine of labor relations: when applying for a job, interacting with clients, coping with emotional alienation, burnout, training the skills, etc. The author poses the questions that reflect the causes, consequences and problems of the process of emotionalization of labor which has an ambivalent nature: on the one hand, it can lead to the hyperregulation of emotions, alienation, manipulation and exploitation of workers, and on the other, to the new forms of cooperation and resistance.

Emotion management becomes ambivalent too: on the one hand, it is considered the part of labor efficiency, and on the other, it can be the means of "humility"or "submissiveness" with what is happening at the workplace, because it is based on a work with undesirable emotions. Some sociologists write about the real danger of the psychologizing and individualizing emotions management in this sense, since it leads away from a cooperative social interaction, joint discussion of problems, creativity and spontaneity, collective resistance, including the resistance to excessive commercialization of emotions (McKenzie et al, 2019). Emotion management in sociology, however, should not be reduced to individual ability and skills, but it should be considered in the context of social relations as a collective practice, not only as an emotional practice of the relations with customers, but also as a practice of relations with colleagues, managers etc.

SINAI, STAVIT* (1985, Germany)

Sociology and Settler-Colonialism

Sociological knowledge is the product of the epistemological conditions under which it is constructed. It bears the potential of reproducing categorical distinctions that reflect structural inequalities, just as it has the power to deconstruct existing hegemonies by means of critical inquiry. The paper investigates the relationships between sociology and settler-colonialism/apartheid, and raises the question of what validity can be attributed to the study of societies in the context of maintaining domination through institutionalized oppression over colonized populations? An examination of S. N. Eisenstadt's multiple modernities thesis shows that despite the attempt to provide a cosmopolitan, inclusive, comparative conceptualization of modernity, the empirical application of the thesis to the case of Israel not only reproduces ethno-essential distinctions which govern the Zionist political culture but also turns to a denial of the very colonial premise on which this culture is based. Analyzing the multiple modernities thesis with regards to the national social imaginaries in which it developed exemplifies the Janus-faced character of historical sociology and furthers a discussion about the urgency of decolonizing the social sciences.

RC16-196.2

SINGER, BRIAN* (Glendon College, York University, Canada)

Populism, Crisis and the Sense of Society

Claude Lefort claimed that democracy, as a symbolic regime, is marked by the dissolution of the markers of certitude. At one level, this dissolution appears a necessary condition for an open and openly dynamic society; but at another level, even a modicum of uncertainty can breed insecurity and a sense of crisis. Populism supposes, feeds off and exploits a sense of crisis—a crisis that can be simultaneously, material, economic, political, epistemological and existential, and at a series of levels. I am interested here in the sense of crisis as a social crisis, and am struck by those who, when supporting populist parties (but also those who oppose such parties when the latter acquire power) claim that they no longer recognize their society... as if the society that they knew had disappeared or

become alien. While the populist appeal to "the people" implies that the latter, to recover through political self-assertion what had been lost of their properly social existence. This sense of loss demands that we reconsider what is (or was) meant by society, and what is (or was) its relation to the political. This requires that one consider society not as an empirical object, but as a key term within the symbolic regime by which we, living in modern liberal democracies, understand and, indeed, institute our sense of a world-in-common. Such a perspective throws an ironic light on certain, recent uses of the term (and its cognate terms) whether to declare its death or celebrate its "civil" extension. Populism itself can then be understood as an attempt to recompose the sense of a social bond in however primitive a manner, one that potentially threatens to prolong, and possibly exacerbate, the sense of crisis it simultaneously seeks to resolve.

Understanding Sex and Geographical

Differences in School Non-Attendance in India: The Need for Greater Focus on Rural Girls

Indian National Education Policy 2019 includes prioritization of vulnerable groups, including girls and rural students, for school retention. Understanding who does not attend school, when, and why can help guide implementation of these policy efforts. Objectives of the paper are to examine school attendance by age, sex, and rural or urban residence for youth 6 to 17 years, and to explore reasons for non-attendance by age, sex, and urban/rural residence. We analyzed data from the 4th wave of National Family Health Survey (NFHS-4), conducted in 2015-16. NFHS-4 gathered data on school attendance and reasons for not attending school. The sample includes all youth aged 6-17 residing in NFHS-4 participating households. By age 8, school attendance is at 96% for rural youth and 98% for urban youth. School attendance begins to decline at ages 10-11. That decline is greater for rural compared with urban youth, and for rural females more than rural males. By age 14, 14% of urban boys and girls, and 18% and 22% of rural boys and girls, respectively, are not attending school. In rural areas the gender gap in school attendance increases substantially in older adolescence. By ages 16 and 17, there is a 10% difference in rural school attendance rates by sex. Only 40% of 17 year old girls in rural India attend schools. Low educational interest was the most commonly reported reason for non-attendance across age groups, for rural and urban boys and girls. Financial concerns were also often reported as a primary reason for non-attendance. Domestic and caregiving responsibilities were identified as a primary reason for school non-attendance for girls more than boys, particularly for girls aged 11-13. Among 14-17 year old females, marriage was reported as the primary reason for not attending school for 10% of rural girls and 9% of urban girls.

Militarism, Masculinity and Gendered Violence in Kashmir: Half-Widows and Their Struggle to Negotiate between the Spaces

Gendered form of vulnerabilities is one of the main aspects of armed conflict. The highly masculinized armed conflict in Kashmir over the past three decades demonstrates the intersection between masculinity and militarism that manifests in multiple ways in everyday life and social relations. The broadening of traditional gender role and shrinking private sphere of women in a highly militarized environment reflects the nature of both military and militant's coercion on the local population in Kashmir. The whole discourse of resistance in Kashmir revolves around the masculinity, traditional roles of women and their passive sufferings. The sufferings of women in Kashmir wreathe beyond the death, destruction, gender-based violence and human rights abuses. Women suffer the structural violence of being related to men that has remained mainly invisible. Half- widow is one such category of women - women whose husband disappeared or missing in the armed conflict in Kashmir. Half -widows are caught in a unique situation in the highly militaristic and masculine environment in Kashmir resulting from the uncertainty around their status. Apart from economic hardships and social

neglect, half-widows are often subject to social censuring, ostracization and stigmatized for being a potential informer by the security forces. In such a social setting, women are left with the no option other than to co-opt with the masculine leadership or get sidelined not complementing the male hegemony in the armed conflict. Based on primary data collected during fieldwork in Kashmir this article argues that the interaction between militarism and masculinity pushed women towards the traditional gender roles on the one hand and left a large section of women (half-widows) in the most vulnerable situation on the other. As they are neither able to comply with the traditional gender role nor in a position the break or challenge them outrightly.

Role of Women in Panchayati Raj Institutions in India (A Study of Sambhal District in Uttar Pradesh)

India has a long inheritance of village panchayats. Panchayats have played an important role in decision making process in rural India. Constitution of India was amended by way of 73rd Amendment Act in 1992, wherein constitution the establishment of Panchayats was made mandatory. A period of about twenty seven years has passed since 73rd Amendment Act. The present study is accomplished with an effort to examine the role of women in Panchayats in India. The study was conducted in Sambhal block of Sambhal district in Moradabad Division. An interview schedule was used as a tool for obtaining primary information from the elected women representatives. We discovered that majority of the women elected as Panchayat Members were educated, married and belonged to joint families. Majority of them stated that economic independence was the main reason behind joining politics. The elected women representatives faced incredible administrative problems, and had insufficient knowledge about the working of panchayats. They could not exercise their right of freedom of expression as their husbands or other male members of the family did not prop up them for this. The study reflects that men play a proxy role through the female representation in PRIs. Influence of family members thus assumes more importance.   This gives an impression that our socio-economic and political structure leaves little space for the women members to be in domineering presence. This shows that real empowerment of women as desired by 73rd Amendment Act through PRIs is still a far cry. Local NGO's and government organizations need to come forward to train elected women representatives for this role.

Bhim Jagran As a Leisure Activity and Its Role in Shaping Assertive Identity Among the Lesser Indians

Leisure time in leisure activity is generally characterised by liberation from constraints associated with job, domestic work and social obligations. Due to LPGD perception of lesser Indian have changed Their life style , mode of consumption and transport spending more money on consumer goods, tourism , leisure and ceremonial activities. Almost every event in our life is marked with some sort of celebration, Bhim Jagran is one such leisure activity which helps in networking, mentalising and socialising lesser Indians with social issues and literature related to them to counter the on slaught of hegemonic forces and reconstruct their own world view about themselves and the society. it works as a social equaliser. Bhim Jagrans are organised on the birthday and special life events of Buddha , Kabir, Ravidas, Phule, Ambedkar, Kanshi Ram etc....

Bhim Jagran has emerged as a new culture and leisure phenomenon transmitting virtues of Bahujan culture from one generation to the another.

They specially focus on how women were enslaved by scripture and got freedom through constitution also about role of Dr. B.R. Ambedkar, Phule in it.

For this study , we have selected 10 Bhim Jagrans which were attended and observed in the last 5 years . After content analysis of songs, speeches delivered , focused interviews with 100 people about their perception , about Bhim Jagran as a leisure activity we can say that they reflect a perfect blend of life, literature and politics setting the ideological tone for socio-cultural and political empowerment and coming of blue revolution.

Social Impact By Solar Energy to Empower Women in Rural Areas of India

Renewable energy can be the key to unlocking a sustainable future and catalyzing the economic mainstreaming of women in villages. Steady access to clean energy at the grass-root level would enable women to run their business operations smoothly and in an environmentally-friendly manner.

There is many kind of renewable energy's available but solar energy is the best alternative for endless energy source, which is not utilized fully till now, that is free for all-time and it will reduce the consumption of coal and wood. The women living in the rural areas mostly depend on these. The availability of energy enables rural women for their empowerment like study, computer work, small scale production etc.

There are many Govt. projects run for achieving this goal for women empowerment like URJA central govt. project and many other NGO based projects.

Impact of women's empowerment has due to these energy options are very impressive and other side it will help the government for improve the life of village women's and reduce the use of natural resources. Hence solar energy is having great future in Indian continent for betterment in the life of village women's empowerment's perspective.

Basic Services and Livelihoods for the Poor in Rapidly Urbanizing (Punjab) India

In the past decade, poverty and inequality were most prominent fields which were discussed a lot, various studies undertaken to ascertain the inequality and poverty levels among different types of societies and its implications for their residents. This paper is a modest attempt to underline the marginalization in urban areas and its impact on health and especially on child health in Punjab (India). It describes the social inequalities and its implications for health within city. It also describes the health problems from which low-income groups in urban areas suffer more than richer groups including those that are not linked to poor sanitary conditions and those that are more linked to relative poverty (and thus the level of inequality)than to absolute poverty. Studies on the health of rich and poor households within cities show the much larger burden of disease, injury and premature death that low-income groups has been faced. Most of this burden can be easily prevent because it is a result of their unequal access to homes which have provision for piped water, sanitation, drainage and garbage collection, and adequate health care. Thus with this we can say that health inequality never been an independent phenomenon. The present paper also explores trends in urbanization, the effect of these trends on the physical and social environment of urban settlements, and the impact of this environment on child health. By using health and social impacts of urban inequality as a focal point of the discussion, the paper intends to provoke thought on some of the fundamental issues of human development trajectories.

The Question of Social Inequality and Human Rights in India: A Sociological Study

Human rights are the inherent and inalienable rights of every individual and for the well-being of every individual, promoting equality is utmost important. But even in the so called modern world poverty and inequality are inevitable characteristics. Due to these hurdles towards having human rights, a bunch of the masses could not exercise their abilities as a human being. In this scenario India is no exception. There are so many bases (provided) for the justification of Inequality between human beings in terms of social, economic, political spheres. We have Caste, class, gender, religion, colour and many more prior conditions to be (become) a human. Social inequality always turns into economic deprivation and economic deprivation leads to poor life chances for the people who belong from lower strata of the society. On the other hand, according to the World Bank (2016-17) 270 million (almost one fifth of the total population) people living below the poverty line in India, they are lacking even food for survival and basic services as human being.

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

The proposed paper is a modest attempt to describe social equality as a pre-requisite for the further fulfillment of human rights. The study is descriptive and analytical in nature. When there is typical hierarchical division of society and that hierarchy defines whole discourse of life, we need to rethink about the state of human rights in concerned society. Assumptions and findings are from Punjab, a prosperous state of the republic of India. The study used primary as well as secondary data sources.

Globalization and Social Media: Explorations from North Indian Rural and Urban Settings

Globalization is a process which embodies a transformation in the spatial organization of social relations and transactions- assessed in terms of their extensity, intensity, velocity and impact - generating transcontinental or inter-regional flows and networks of activity, interaction and exercise of power. Globalization is now happening in real sense than ever in history of mankind. There are different ways to approach this phenomenon. There are different levels of debate and different points of view to understand and explain globalization. Moreover, globalization is intimately connected with media (especially new media) which play an important role in its rapid expansion. In turn, globalization has also has enormous impact on overall media in one way or the other. The present paper is aimed to understand the relationship between globalization and social media on the basis of some 'insight stimulating examples' from the field of north Indian rural and urban settings which is now passing through a communication revolution.

Overcoming Alienation: An Ontic Shift to Feminist Socialism

Overcoming Alienation: An Ontic Shift to Feminist Socialism
The inevitable route to theorizing socialism for most Marxist thinking has been through Marx's early writings, particularly his Economic and Philosophical Manuscript of 1844, where he lays down the ontological structure of human alienation, under the condition of capitalism. Considered essentially natural beings, willfully producing what they need for use, under capitalism individuals produce for profit someone else makes; estranged from their intrinsic nature, their labor is abstracted from them, and they do not recognize the product of their own labor, as it confronts them as a commodity, as a form of capital. Crumpled under the conditions of the division of labor, overcoming alienation is to overturn this condition; in Marcusean parlance, negation of the productivist logic of capitalism.

Some feminists have found this formulation of alienation inadequate for as sexualized bodies women are commodities themselves. Marcuse recognized this and conceptualized feminist socialism bringing about an ontic shift in Marxist theory. Women's movement in his view is a contribution to revolutionary consciousness of negating the fetish of increasing production. Overcoming domination of nature too is a factor in structuring a new economy and morality for him, a new Reality Principle: a principle of feminist socialism.

In this paper I will explore what it may mean for women to realize their full humanity, for it necessarily involves all human beings as does nature. Should one add human qualities such as compassion and empathy to the list of Marcuse's of feminine virtues such as tenderness, love, nurturing, and valuing community life that bind and sustain other values as constituent virtues of feminist socialism, as Marcuse mentions in his "Marxism and Feminism"(1974) article? Should this new socialism not include, in its orbit of life-world, other sensate beings including plants and microbes?

Economic and Health Status of Unorganized Workers: A Sociological Exploration

Demographic is about the characteristic of the population in a specific area and their number but it speaks volumes of sociologically significant categories. One such categories of population those who are engaged in such activities which is broadly conceptualize as unorganized workers. They are called unorganized because they do not have a regular income and they only sell their labor to earn their bread and butter. Importantly as they are unorganized workers doing various kind of unskilled and hazardous jobs which certainly have a significant impact on their health. Hence the 'vicious circle of poverty' is very much significance to unravel the linkage among work, wage and health. The paper is based on sampled unorganized workers of the Sultanpur District of Uttar Pradesh, India.

Information is collected from primary and secondary sources by using descriptive and purposeful research design. The main untold suffering of this worker is non implementation of policies and programs and the failure of safety nets.

In this backdrop the paper argues three fold : (i) How work, wage and health are interrelated with each other. Moreover, how the sociological aspects of work and health plays crucial and vital role, is the main focus of the paper. (ii) On the basis of empirical studies it is highlighted that why such section of the society is not included in the safety net of the government policies and programs. The paper reviewed all policies and program and try to explore where is the lacunae in the policy implementation and or the failure of the schemes. (iii) On the basis of the empirical facts major and workable solution is also drawn to ameliorate their situation and action programs.

Distribution of Ecological Hazards: A Sociological Review through Intersectional Perspective

The social and natural environment constitutes an ecological system within society. In recent years, it has been recognised that the ecological risk is growing sharply due to numerous factors such as global warming, deforestation, soil degradation, drought, poverty, low incomes and their unequal distribution, etc. However, not all social classes are equally exposed to such hazards. There are also several studies which show that the impact is differentiated between different groups of society. Women, too, are vulnerable sections of society as they are dealing with ecological hazards due to their socio-historical disadvantages. The proposed study seeks to understand the inequitable distribution of these ecological hazards by looking sociologically at and analysing various sources of information like reports of national and international organisations, newspaper articles, books, research and review papers etc., on this topic through intersectional perspective. The study focuses on two key objectives that can be described as:

To see the distribution of ecological hazards in different socio-economic groups in the society.

To know the impact of ecological hazards on women and other socio-economic groups and to understand their response towards it.

The proposed study would be a comparative review of the distribution, impact and response of different groups of society to ecological hazards using a mixed method approach. The quantitative representation of hazard would be done in the form of order of risks to different social groups. The in-depth qualitative research will then be performed. A thorough understanding of the topic can help to learn better socio-environmental practices that further contribute to a robust resilience building culture. The differential effect and differential approach to hazards will also lead to the formulation of a community-centered policies and thus to the achievement of an inclusive and sustainable society.

SINGH, VIRENDRA P.* (GLOBAL RESEARCH AND EDUCATIONAL FOUNDATION INDIA (GREFI), India)

Globalization and Social Stratification in India: Emerging Trends

Globalization is a process of transformation which has simultaneously affecting both the developing and developed societies of the world in every aspect of social life. One of the most important characteristics if globalization is that it can simultaneously include and exclude the people, objects, ideas and territories based on their value/devalue for globalization. This characteristic of globalization has implications for stratification system of a given society experiencing globalization. Indian society has now experience of the globalization for about three decades. A society having a traditional social stratification based on caste had encountered the forces of modernization and transformed its peripheral characteristics but successfully maintained its core characteristics. It also emerged as one of the very dominant forces influenced the political processes and leadership in India in post-independence era. The shrinking of time-space dimension at global level has resulted into transnational mobility of the population for the purpose of education, job, business and tourism. In what ways the forces of globalization are transforming the social stratification system in India is the major thrust of the present paper. The paper analyses the impact of new communication technologies and economic and political processes on social stratification and cultural milieu of the Indian Society.

Sustainable Ecology Management and Local Participation

Dr. Ranjana Sinha, Associate Professor, Head, Post-Graduation Department of Sociology, B.R.A Bihar University, Muzaffarpur, Bihar, India, e-mail – *ranjananc56@gmail.com*
We think, create, use, exploit, suffer, lament and rethink. The world is in the second stage of evolution of minds. Discussions on the global platform show genuine concern about the depleting situation of our key natural resources. Who is responsible for its recovery? Is it the common mass, big industries or the government?

A joint effort can ultimately resolve the issue. The lack of coordination has also reduced the motivation at all fronts because the plans have taken a long time to reach the grass root level. The delay/lack of awareness campaigns further worsens the situation.

Every nation has its own problems due to its unique geographic-economic conditions. These problems already however have locally understood solutions. In these cases instead of creating alternate plans, we should understand the perspective of native population towards these problems.

The common population is the force of execution when it comes to big agendas at the global/ planetary level. Ignoring this fact has led to no or partial implementation policies and initiatives taken by the government and the other organised sectors.

We are marching ahead to eradicate poverty, illiteracy, malnutrition but we must also provide a sense of inclusion of socio-psychological understanding of people and their behaviour can be aligned with the idea of ecological conservation through proper motivation since the basic conditioning has already been achieved through religious activities and moral lessons.

The same can be traced decades back in "Chipko Movement" and in the recent initiative like "Mango Girl" at village level for mass to feel to be an important conductor.

The paper examines the condition of Ganges in the northern plains and green conservation through mass initiatives.

SINHORETTO, JACQUELINE* (Federal University of Sao Carlos, Brazil)

Mass Imprisonment and Lethality As Security Policies: The Perspective of Crime Control Agents

The state of Sao Paulo, Brazil, has the first position in imprisonment rates in Latin America, and astonishing civil lethality indicators. Based on a comparative research in 4 states inside the country, our results point out the Sao Paulo government didn't have an explicit security policy program during the last decade, as if the results was not linked to political decisions. In a first moment, the research tried to understand the guidelines of the security policies, detecting actuarial practices, policing models, prison management techniques. In a second phase, date lead us to understand how a silent articulation, at the everyday practice level, among the security and social control institutions (police corps, courts, public ministry, prison system) can reduce the publicization of dissidence. This way, public debate about crime control policies is avoided, with the institutional leaders' discourses enforcing crime control has no alternatives. Interviews with professionals indicate organizational dynamics inside police and courts that pressure dissidents to conformism toward authoritarian practices. That could explain why carceral population and police brutality increased so fast, based on racial and other social bias, and the resistance seems to be quite inexistent inside the state institutions of crime control.

RC29-356.4

SINHORETTO, JACQUELINE* (Federal University of Sao Carlos, Brazil)

Policing, Punishment and Race Issues in Brazil: Technology and Neutrality in Trouble

Racial bias has progressively been considered as an important fact to understand discriminatory treatment in policing, criminal justice and prisons in Brazil, especially in the last decade. Despite several empirical studies demonstrate racial bias in policing and sentencing, the official discourse of police corps denies the use of profiling techniques in policing, and tends to minimize the importance of racial issues as a component to understand institutional responses to violence and crime in Brazil. Police officer's perspective tends to emphasize neutrality in policing technology and the high level of skills and gadgets used by policemen in everyday action. This communication aims to argue the adoption of high technology is not a factor to reduce racial profiling or police brutality in Brazil. Racial profiling is even more important to policing techniques based on cartography and criminal data, due to shifts in crime control strategies in the last decade. The research is based on quantitative analyses of police action in Sao Paulo city, and qualitative analyses of interviews with police officers, human rights activists and media content. It takes part of a comparative research between institutional responses to racial issues in 4 states inside the country.

The 'Rate of Return' of Social Activity on Subjective Well-Being in Middle and Older Age in European Countries

Sociological and gerontological activity theory argues that social activity contributes to higher subjective well-being (SWB) in middle and older age, and the majority of empirical studies support this link (Baker et al., 2005; Litwin, Shiovitz-Ezra, 2006). However, recent studies indicate that the benefits of social activity in terms of SWB vary across countries (Bian, Li, 2017). More precisely, volunteering individuals in countries with low population involvement in volunteering are happier and more satisfied (Plagnol, Huppert, 2010) and subjectively healthier (Sirven, Debrand, 2008) than their counterparts in countries with high population involvement in volunteering. We assume this relationship to be the same for middle-aged and older individuals in European countries. Thus, our research question is the following: whether the influence of social activity on SWB in middle and older age depends on overall population involvement in social activity?

The research is based on the European Social Survey[1], wave 6 (2012). We estimate the influence of voluntary activity (formal social activity) and social contacts (informal) on happiness and life satisfaction of the middle-aged and elderly people (50 years and over) in European countries using random slope multilevel models for both types of social activity.

We reveal significant differences across European countries in the effect of social activity on SWB in the middle and older age. Both types of social activity contribute to higher life satisfaction and happiness of the middle-aged and elderly, but the effect is greater for social contacts. Besides, we find that the 'rate of return' of participating in social activity on SWB is different for countries with different levels of involvement in social activity. This finding supports our hypothesis on the higher 'rate of return' in countries with low involvement in social activity for several European countries.

Matryoshka of Soviet Social Science: Academic Work and Networking at the Time of Cold War.

The metaphor of the matryoshka implies a gap between visibility and content, giantism and emptiness of visibility along with diminutiveness and completeness of content, a sequence of transformations when opening the kernel. Global confrontation between superpowers at the epoch of Cold War had promoted a sort of matryoshka effect on Soviet social science.

Since the Cold War turned to be seen as confrontation between capitalism and socialism, between liberal and communist ideology, academic life was almost completely immersed in external forms, produced by power of Soviet policymakers. But inside those forms academic work and networking were rather dependent on personalities of scholars and on concrete chains of communication. On the other hand, the label of Cold War epoch could spread within the academia the atmosphere of struggling against colleagues within the close network for better position by blaming them to be tied with the West. Therefore, for instance the very name of sociology could be under attack as a sign of bourgeois, and western rival science. So it was common for social scientists to be identified as a "warriors of ideological frontline".

Being a unique attempt of institutionalizing Marxist theory with the purpose of changing society into socialist one, Soviet social science at the epoch of Cold War appeared to be losing the Marxist critical approach while applying to social reality in the USSR. Political nature of this tendency does not mean that academic community fully acts in concord with ideological demands, but one can hardly be socialized as a scholar aside from Marxist education. Nevertheless, academic life of Soviet sociologists was rather complicated as it is seen at a glance.

SIOUTI, IRINI* (Institute for Social Research Frankfurt, Germany)

Political Participation of Migrants in Germany. Biographical Perspectives.

Labour migration to Germany (1955-1973) is characterized by a high degree of politicization. A significant number of the immigrants had been forced to leave their countries of origin (Turkey, Greece, Spain, Portugal) not only for economic but also for political reasons. Some studies in migration research have addressed the question of political participation among the first generation. However, there has been no investigation of the effects of their parents' political activity on the younger generation or of how that generation participated in politics.

In my paper I will discuss first results of an ongoing qualitative-reconstructive research project on "Political Participation in Migration Society". The research project focuses on the biographical experiences of the younger generation of working migrants in Germany. Using a broad concept of participation that looks at biographical construction processes, the project will examine how political participation processes come into being in a field of societal tension between experiences of recognition and discrimination.

I will present a case study and discuss the motives, resources, opportunities and barriers for political participation in (post)migration society. Furthermore I will reflect on the theoretical as well as methodological advantages of using biographical perspectives in the field of transnational political participation.

Constructing Social Citizenship through Social Cash Transfers?: The Case of Child Poverty in Middle-Income Countries

With the aim to promote more inclusive patterns of social development, varying forms of social cash transfers programs have been implemented across middle-income countries (Barrientos, 2013; Hanlon, Barrientos, & Hulme, 2010). Some comentators have suggested that these instruments might serve as elements of new forms of social citizenship (Leisering, 2019). In light of this development, this article explores to what extent the public cash transfer systems in middle-income countries contributes to protecting people from falling into povrty, i.e providing the financially vulnerable with effective social citizenship. As households with children constitute the most common target group for social cash transfer programs, this study analyzes the size and distribution of social cash transfers recived by families with children on the one hand, and related impacts on the economic-well-being of children on the other, using harmonised household surveys from 17 middle-income countries. The data is explored using descriptive analyses as well as random effects regressions, exploiting cross-sectional variation across countries as well as changes over time.

The aim of the study is to explore the role of characteristics of cash transfer schemes in these countries, in terms of the distributive profile, coverage, and benefit rates. Preliminary results indicate that countries where the cash transfer systems distribute more, in relative terms, to people with lower incomes, exhibit lower poverty rates, and that these results may, at least in part, reflect a stronger weight of social assistance in national social protection systems.

SIRÉN, SEBASTIAN* (Stockholm University, Sweden)

The Struggle over Universalization: Actors and Institutions in the Process Towards Social Protection Reform in Bolivia

What are the necessary conditions in order for inclusive social policies to materialize in middle-income countries? This study adresses this topic by investigating the uneven progress of social policy reforms in Bolivia, where, despite the strength of political actors advocating more inclusionary policies as well as improved public finances due to increased revenues from the extraction of natural resources, the progress towards universal coverage in different parts of the Bolivian social protection system has developed in a highly uneven fashion. While a conditional cash transfer program and a reformed basic pension was introduced to cater for the economic security of some population categories, attempts to reform the healthcare system has been fraught with obstacles. This uneven development offers the oppurtunity to study the unfolding of policy changes by means of a comparison across policy fields within the Bolivian case.

This study takes a historical institutionalist perspective on these issues in order to address the causes and impediments of policy change. Empirically, it draws on both primary and secondary textual sources, as well as interviews with relevant stakeholders. The study seeks to shed light on how political actions and counter-actions are stimulated by endogenous factors related to the process of social and political change, as well as how these unfold in the context of inherited institutions and preassures from structural change and international influences. Theoretically the study seeks to contribute to our understanding of how a theory

of gradual institutional change can be used to analyse processes of social policy expansion in middle-income countries, and the lack thereof, given that this literature mainly has focused on creeping neoliberal reforms in advanced welfare states. Additionally, the paper aim to contribute to our general understanding of the causal mechanisms responsible for promoting or hindering the processes of institutional change.

SISLI, ZEYNEP* (İzmir University of Economics, Turkey)
LIMONCELLI, STEPHANIE (Loyola Marymount University, USA)

Protection of "Right to Life" at Work As a Human Right

"Occupational health and safety (OSH)" is a part of domestic labour laws in countries as a reflection of international conventions that are mostly International Labour Organization (ILO) documents or originated from them. OSH is necessary for realization of the "right to life" of workers even if many times it is seen as a technical field related with medical and engineering sciences. Workers die or become disabled because of occupational accidents and illnesses all over the world, especially in countries with developing economies. Death and impaired bodily integrity are both irreparable consequences of violation of "right to life" for the worker who is the subject of them, and they should be prevented by states according to the legal obligations derived from international conventions approved by them. There remains a divergence, however, between the law and practice. In this study, we argue that OSH is closely related with the human right of workers "to live" and we emphasize the legal responsibilities of the States to prevent deaths and bodily harms at work according to international law. We also explore reasons why international conventions have not been applied by using the methods of review of written sources and content analysis.

Birth of Children As a Factor of Regressing of Socio-Economic Status of the Family

The economy of a family depends primarily on the quantitative and structural parameters of the composition of family. Proportion of the economically active members of family and the dependents makes it necessary to search for the economic strategy of reducing the risks of the socio-economic regression of the family. The increase of the dependant component in the structure of the family, that is the birth of children, is a significant factor of regress comparing with the previous socio-economic status of the family. In this regard, the birth of a child objectively reduces the level of consumption inherent the "childless" stage and transforms structure of consumption in modern society called a "consumer society".

This research was based on two approaches. First, we attempted to assess the nature and the level of regression of the socio-economic situation of families with children in modern Russia. Second, parameters of financial costs, when the child was born, were estimated. In particular they included the contribution of the state to the family budget.

According to UNICEF, maintenance of a child is approximately 900 USD per year or approximately 16,500 USD from birth to 17 years in developing countries. At the same time, the "price" of one child can be up to 30% of family income per year in developed countries. This figures increased almost twice in 2012 comparing to 2002.

The consequences of this are the decline in fertility rates, the danger of depopulation, and formation of two polar reproductive strategies: child-centrism and child-free. So, if the politicians of modern states do not fully realize the risks of economic regression of families at the birth of a child, humanity will begin to decline rapidly in this century.

Marriage Migration of Russian-Speaking Women: Scales, Directions, Consequences

Marriage migration is the movement of a person to another country for the purpose of marriage. It is a poorly understood form of migration. However, this phenomenon has acquired the fairly large scale. For example, more than 350 thousand people left Russia from 1991 to 2018 and married foreigners. Besides it, in different countries up to 10% of marriages are between citizens and non-citizens of these countries. At the same time, the main contingent (up to 98%) of migrants traveling through this migration channel is women and girls.

Marriage migration can be viewed from two points of view: on the one hand, there is a group of migrants whose main purpose of moving to another country is marriage; on the other hand, the practice of "transition" of other forms of migration to marriage is common.

The geography of marriage emigration from Russia and the former republics of the Soviet Union is extremely wide. Russian-speaking women can be found in most countries of the world. At the same time, Slavs are very popular in the marriage markets of other countries. The special brand – "Russian wife" – was formed. It has a cultural rather than ethnic basis.

There are four priority directions of marriage migration from Russia: North American, European, Middle Eastern and Asian. There are the countries that are most attractive to move in each of them.

This study is devoted to identifying of the countries that are most popular with Russian-speaking women as destinations for marriage migration. The reasons for the popularity of these countries will be substantiated, as well as the factors of high "demand" for "Russian" women and foreign men will be identified. The impact of marriage migration on migrants themselves, as well as on countries of origin and countries of destination, will be assessed.

SKLAIR, JESSICA* (University of Cambridge, United Kingdom)

The Preservation of Privilege As Social Responsibility: Perceptions of Inequality Among Elite Brazilian Business Families

This paper will explore how the financial mantra of 'preserve and grow' becomes entwined with ideas about social responsibility within Brazilian business families, and how associated practices of philanthropy and corporate social responsibility (CSR) thus become the basis for legitimising discourse on the preservation of elite family capital. In Brazilian business families, the goal of ensuring the prosperity of the family firm - and the preservation of family capital for the benefit of future generations – is broadly defined as a family responsibility, and a way of honouring elite family 'legacies' built around narratives of the labour and sacrifice of older generations. In parallel, however, philanthropic and CSR activities also serve to reframe the success of family businesses as a *social responsibility* towards employees, local communities and diffuse visions of national development. In these parallel processes, the ideals of social responsibility, successful business and the preservation and growth of business family wealth are thus framed as common and mutually reinforcing goals. Family business philanthropy and CSR – practices ostensibly designed to challenge poverty – become tools to help preserve and grow business family capital, thus contributing to the maintenance of structural inequalities within the national context. While these trends continue to characterise most elite philanthropy in Brazil, however, a handful of interesting exceptions have recently begun to emerge. Against the highly polarised backdrop brought about by recent political events, some individual philanthropists have begun to separate their activities from family business frameworks, directing funds towards issues such as human rights and climate change – areas widely considered too 'political' for corporate philanthropy. I will conclude this paper by briefly exploring the potential of these new initiatives to open debate among Brazilian philanthropists, on the ways in which inequality is reproduced and legitimised through diverse forms of elite practice and discourse.

SKOVAJSA, MAREK* (Institute of Sociology, Czech Academy of Sciences, Czech Republic)

Comparing the Canonizations of Marx and Weber in Czech Sociology

This paper is a comparative study of the reception and canonization of Karl Marx and Max Weber as ‚classical sociologists' in one national sociology. It makes two main arguments: 1) peripheral sociologies show diminishing variance from and resistance to the internationally dominant sociological canons as the 20th century progresses, especially due to the advance of professionalization. 2) The canonizations of certain sociologists are not independent of each other, but rather they are subjected to a mutually reinforcing or excluding (the case here) dynamic. The paper documents the complicated historical trajectories of both canonizations. There was an intense reception of Marx in the Czech socialist thought since the late 19th century, but not in sociology which had an anti-Marxist bent (see Th.G. Masaryk's *The Social Question: Philosophical and Sociological Foundations of Marxism*, 1896). Marx was beginning to enter the canon of Czech sociology after 1945 when the country fell under the Soviet influence and sociology was replaced by Marxism-Leninism. Paradoxically, the proper entry of Marx into the canon took place in the 1960s as a new Czech sociology was taking shape – as a project of combining Marxist social theory with Western sociology. After 1989 Marx was de-canonized, but he re-entered the canon around 2009. Czech sociology received some important impulses from Max Weber's work early on (in 1920s and 1930s) owing to its close ties to the German intellectual world. A more sustained reception was prevented by the surge of nationalist antagonisms. After 1945 Weber's status was the inverse of Marx's. Czech Marxist sociology recognized Weber as a major author in the 1960s because of his extraordinary standing

in Western sociology, but his work remained controversial and little known. He rose to a certain prominence in the 1990s to be overshadowed by Marx again in the most recent years.

Development for Whom? – Human Rights Perspective: Psycho-Traumatic Analysis of River Development in North-Western Himalayas

Since the inception of human civilization, man has been striving for better life style and making his life more comfortable and made a considerable intrusion in nature in the name of development and consciously or unconsciously such developmental initiatives resulting into the major problems of modern time which is the result of ignoring human dimensions. Hydroelectric power development is one of such developmental initiatives which is sine-quo-none of any development and necessary to achieve desired goals. But such developments at what cost? This question has been analyzed in present paper.

 The present paper is based on micro study, exploratory in nature, conducted in 22 villages by dividing in 5 research clusters and interviewing 200 respondents in NHPC owned Chamera-I power project. It is an analytical analysis of deprivations received because of its construction and putting the people in psychological trauma and ignoring their human rights. The impact can be divided in two broad categories; one, project affects people (PAP), who got displaced and got compensation, jobs in NHPC and resettled somewhere in the part of the district or state. The second category; who have not affected as per the revenue/policy document of NHPC and can be called as Not Project Affected People (Not-PAP). But in real sense, they are the people who are facing ill effects of this developmental activity and at present, they are dying every moment, every hour and every day and moreover, their concerns have never listened and never answered by state govt. as well as by the executors.

Ecological Concerns in Hydroelectric Power Development- Needs Attention to be Addressed for Better Future

Dams have had serious impacts on the lives, livelihoods, culture and spiritual existence of indigenous and illiterate people, as well as on the physical environmental conditions and biodiversity. River based developmental activities in Himachal Himalayas had got momentum during 5th five year plan and at present there are more than 400 power projects in five perennial river basins. Every basin is being excessively exploited which has a considerable impact on environment and threatening the lives and livelihood of the mountain inhabitants by creating ecological imbalance. The present paper is based on the primary research carried out in Ravi basin. There are more than 50 rivulets in the Ravi catchment which have been earmarked for the planned development. At present, more than 80 power projects are either proposed or generating electricity. Speaking specifically, series of power projects i.e. Shahpur Kandi (125 MW), Thein Dam (600MW), Baira-Suil (198), Chamera-I (540MW) and Chamera-II (300 MW) on Ravi basin have unintentionally produced weather and climate changes on a larger scale and threatening the existing biodiversity and sources of livelihood by interfering with the ecosystem. More than 100 km reservoirs and 25 km dried patches are responsible for tremendous increase in the temperature, untimely and unusual rain in the basin after the installation of power projects. In the present paper the responsibility of hydroelectric power projects for threatening the livelihood will be analyzed, which is based on original micro field research carried out in the lower Himalayan Region by using exploratory and descriptive method. To analyse the impacts on climatic conditions and its consequences on ecosystem services and livelihood, meteorological data of Ravi basin will be used and paper will also report the viewpoint of the respondents belonging to different age groups.

Air Pollution and Social Media Activism. Repertoires of Knowledge (re)Production in Anti-Smog Movement in Poland

The main aim of the paper is to present repertoires of knowledge production and reproduction of Polish anti-smog movement (Della Porta, Pavan 2017) in the social media activism (Bennett, Segerberg 2013). The Polish Smog Alert is the network of local and urban-based social movement organizations (Clemens, Minkoff 2004; Diani 2015) dedicated to fight against causes and impacts of systemic air pollution. Polish cities have the most polluted air in European Union – 33 of the 50

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

dirtiest EU cities are located in Poland (Nabrdalik, Santora 2018). National economy is based in 91% on coal, and the authorities treat the interests of coal industry as a condition of Polish energetic and geopolitical security (Popkiewicz 2015)

The Polish Smog Alert is trying to make the problem of smog and air pollution visible by shaping and spreading the knowledge, mostly through scientific-like visualizations based on various types of records (Latour 1986) to stimulate public awareness and empower local inhabitants. In this sense, anti-smog activists are engaged in citizen science practices (Bonney et al. 2009; Strasser et al. 2018) including the mapping the most polluted areas in Poland, measuring dust levels in urban and suburban sites and monitoring current air-quality policies. Anti-smog activists are "re-politizing data" collection and visualizations (Shelton 2017) by widespreading the use of smartphone air-quality/air-visual apps to mobilize citizens for change in their city and municipality (Earl et al. 2015). However, the producing, sharing and spreading of air-pollution data is associated with norm entrepreneur strategy (Domaradzka, Wijkstrom 2016; Finnemore, Sikkink 1998), which aim is to introduce the new air-quality norm into public discourse.

We will discuss the results of a discourse analysis based on social media posts created by the Polish Smog Alert network. This method allows to gain an insight into framing practices and tactics/strategies (Corrigall-Brown, Ho 2015).

Maintaining Organisational Reputation through Quality Improvement: The Role of a Central Fetal Monitoring System

In maternity care, reducing the incidence of stillbirth has been a focus for quality improvement efforts. Reporting low, or falling, rates of stillbirth enables maternity services to make reputation building claims about the quality and safety of care provision. Central fetal monitoring systems have been promoted as a means to reduce stillbirth rates despite a lack of empirical evidence to support this position. Such systems have been increasingly adopted in maternity services in high-income countries. Our presentation aims to explore the textual role of a central fetal monitoring system in relation to the quality improvement agenda of one such service.

An Institutional Ethnography was conducted at an Australian maternity service. Interviews were conducted with midwives and obstetricians with experience with the central fetal monitoring system and observations were undertaken in clinical settings and meetings. Relevant texts were collected. Data analysis focused on mapping the social and textual organisation of clinicians' work.

The central fetal monitoring system was introduced in response to concerns regarding the safety of care provision. Clinicians' work with the system was coordinated by policy instruments and audits. Quality improvement processes were structured by National Safety and Quality Health Service Standards. Once identified, clinical incidents were investigated by drawing on data from the central monitoring system, and recommendations to improve care were generated. While these recommendations were later audited, audits focused on whether recommendations were enacted, rather whether the underlying issue had been addressed. The central monitoring system and the quality improvement processes were used as proof that the hospital was providing safe care.

We argue that quality improvement processes appeared geared towards maintaining the service's reputation through accreditation, rather than towards improving the quality and safety of care provision.

Sense of Belonging and Transnational Bifocality: Conceptualizing the Family Life of Zimbabwean Male Migrants in South Africa

In an era of transnational migration, the notion of 'belonging' has received increased attention. This paper revisits the possible 'strengths' of using 'sense of belonging' as a theoretical and analytical lens in shedding light on the lived realities of migrants with family ties across borders. It also explores the usefulness of concepts such as 'transnational bifocality' and 'simultaneous social-spatial embeddedness'. The discussion is based on qualitative data collected among Zimbabwean men involved in long-term skilled labor migration in Johannesburg, South Africa. The focus fell on how these men 'do' and 'display' transnational family life, as well as how they structure their everyday lives in terms of 'here' (the country of destination) and 'back home' (the country of origin). This bifocality contributes not only to a sense of being anchored in two different geographical spaces but also embracing two different world views. On the one hand, the male migrants emphasize maintaining a sense of self and familial belonging within the broader kinship network. On the other hand, transnational migration has created an environment - markedly in the host society - where these male migrants exercise autonomy.

Civic Food 'Utopias' in Australia: Scaling up from Initiative to Social Movement

This paper explores the 'obstacles, possibilities and dilemmas of transformation' of CFNs in Australia as they seek to scale-up from local food justice initiatives, to regional coalitions, to national social movement. *What visons of food system transformation are embodied by CFNs at different scales in Australia? What opportunities and challenges exist for praxis-oriented research to strengthen civic network building in this context?*

Findings are drawn from ongoing case study research with food justice initiatives and coalitions across Australia. I focus here on the analysis of qualitative data around personal and collective worldviews and visions for future food systems of key actors in 4 local initiatives, 3 regional coalitions, and 2 national social movement organisations. This is informed by the theory and practice of *food utopias*. This approach looks to current 'experiments' in re-envisaging alternatives, in order to consider the ways that utopian ideals may inspire people to think beyond what is and what is known and motivate them to take action. I also draw on my experiences as a researcher-activist engaged in regional coalition building to further consider tensions and opportunities around scaling up CFNs.

Findings highlight that while local initiatives focus on different problems (food waste, hunger, supply chains) they share some proposals for transformative solutions. These include circular economy, poverty reduction, regenerative agriculture, short food chains, and intersectional food justice (race, class, gender). These solutions have been mobilised by regional coalitions over the past 5-10 years in advocacy around food citizenship and community education, and in policy-making experiments around regional food plans. At the national level, there is a strong discursive agenda aligning with global food sovereignty and agroecology movements. The paper concludes by considering obstacles to, and opportunities for, stronger cooperation between scales as they seek to strengthen the practice of alternative food futures.

Finance's Social License? Sugar, Health, Farmland and the Reef

This paper examines the health implications of an increasingly financialised food system, through a case study of foreign ownership and accountability in the Australian sugar industry. As finance actors engage in speculative farmland investment, commodity futures trading and the conversion of farmland into a financial asset class, power within agro-industrial food supply chains becomes increasingly concentrated. This has been associated with increased food prices, more processed food and less diversity (in foods, and agricultural ecologies), in turn contributing to obesogenic diets and/or hunger, and ultimately, to poorer health outcomes for many. In North Queensland, sugar is publicly debated as both friend – a valuable global commodity, new energy source, local employer and environmental innovator – and foe – polluter of the Great Barrier Reef, historical exploiter of labour, and a key contributor to poor nutrition and the obesity epidemic. The potential for negative social and environmental impacts has also prompted awareness of the need for financial actors to demonstrate sustainability, responsibility and accountability in their farmland investments.

In this paper we seek to build a deeper understanding of finance's 'social license to operate'. This concept goes beyond voluntary approaches to corporate social responsibility (CSR), corporate accountability (CSA) or environment, social and governance (ESG) criteria. Drawing on research into recent foreign acquisitions in North Queensland, we argue that the link between the commodification of 'unhealthy' food inputs (such as sugar) and financialisation remains outside of financiers' purview. The 'distancing' between responsibility and health outcomes highlights the limits to principles of responsible financial investment, and to the legitimacy of finance to claim a social license to operate - the ongoing approval and acceptance by society to conduct its activities.

Occupational Stratification in Suriname: A Comparison of an International and Country-Specific Sei-Scale

Tamira E. Sno, Department of Sociology, Anton de Kom University of Suriname
E-mail: *Tamirasno@hotmail.com*
Harry B.G. Ganzeboom, Department of Sociology, VU University Amsterdam
E-mail: *Harry.Ganzeboom@vu.nl*
SUMMARY

denotes a presenting author. Abstracts are organized by first presenting author's last name.

In his 1977 book "Occupational Prestige in Comparative Perspective", Donald J . Treiman concluded that occupational status hierarchies "are basically similar" across time and space. Using occupational prestige hierarchies from over 85 studies, Treiman found strong correlations over an impressive array of countries and centuries. Treiman (1976, 1977) concluded that the hierarchical order of occupations is strongly similar across all contexts and can be reliably predicted from his Standard Index of Occupation Prestige Scale [SIOPS]. Hout & Diprete (2004) baptized this basic similarity as "the Treiman constant".

In this article we test the Treiman constant by examining the occupational stratification of Suriname, a peripheral developing economy, which has both similarities and differences with its Caribbean and Latin-American neighbors. The question to be answered is whether international occupational stratification indicators are also applicable in the Surinamese situation, or that unique features prevail. In particular we develop a country-specific Surinamese Socio-Economic Index of occupational status and compare it to the International Socio-Economic Index.

The data were collected from 2011-2013, amongst 3929 respondents, within the survey on Status Attainment and Social Mobility in Suriname.

The most important findings are:

Surinamese occupations can be adequately and reliably classified by ISCO-88, but this classification does not take into account the contract form in which the work takes place.

The Surinamese occupational hierarchy is indeed basically similar to the worldwide hierarchy but with important exceptions. The exceptions are: gold-miners, street-vendors and subsistence farmers.

We find that measurement quality improves by about 10% by using the SEI scale.

Keywords: occupational classification, occupational stratification, social distance, socioeconomic status

Translating the Work of Art into a Critique of Modern Society: Watching "Metropolis" with Benjamin and Baudrillard

For the purpose of this essay I will put three bodies of thought into conversation. Inspired by the way Zoe Thompson gathers Benjamin, Baudrillard & Derrida in the conclusion to her PhD on "Urban Constellations" (Thompson 2010), I will do likewise with the first two, and Fritz Lang's 1927 classic movie "Metropolis". Similar to Benjamin, Baudrillard was active as translator in the realm between French and German literatures (vice-versa for each of them). Only from then on they went into what they are most known of today – translations of their perception of reality into meaningful, radical critique. The main thread in creating my analysis will be the question: how would they look at, and make sense of certain scenes? How can one film, in turn, become the grounds for social theory?

My curiosity about this question stems from the fact that I see a tremendous importance of artistic work in general – here represented through film – for sociology's theoretical foundations. In Benjamin and Baudrillard we have two thinkers who came to the social sciences through a prior occupation with literature/linguistics respectively. Even more important, however, is that they not only explicitly acknowledge that fact, but actually embrace these influences. My question thus is as follows: how did their earlier work translate into their social theory later on? Even if not always strictly sociological, they certainly did criticize their contemporary society and the theoretical foundations it stood upon. There are not few texts arguing that combining the thoughts of Walter Benjamin's on the city with Jean Baudrillard's understanding of seduction renders a well-combining approach with the potential for fruitful sociological insights (see Gilloch 1997; Thompson 2010; Smith 2016). It is in this sense that I will try and shed light on less discussed aspects of this 'Metropolitan conversation'.

Critical Theory and the Diagnosis of Our Time: Tensions between Analysis of Given Realities and Formulation of Utopias

For Critical Theory, the emancipation of situations of alienation, injustice and oppression has been a goal of social theory making. The engaged critical attitude of the theorist and an accurate diagnosis of the present, guided by a well-grounded theoretical reflection, have been the distinctive markers of this school since the publication of Horkheimer's Traditional and Critical Theory. The normative character of emancipation, which guides Critical Theory, was described by Axel Honneth as a twofold possibility: that an increasing number of people and social groups can design and realize their own life project, and that more and more areas of life become affordable at free choice. While self-determination has been emphasized in the past, recent authors have emphasized forms of life or a successful life as the concrete utopia to be pursued. The present text intends to analyze two recent propositions of this tradition that translate its normativity: social freedom as concretization of recognition, defended by Honneth, and resonance

as a way of relationship with the world and condition for a good life, as proposed by Hartmut Rosa. These propositions of concrete utopias will be contrasted with critical diagnoses, such as that of Wendy Brown, which emphasize more clearly the normativity of neoliberal logic and the constraints it imposes on everyday life. Behind this discussion is the question of the relationship between the relative weight of the elucidation of the present time, on the one hand, and the inspiration that comes from the future that is sought, on the other one, in the elaboration of epochal diagnoses in Critical Theory.

Solidarity in Movement: Trajectories and New Learnings

In the research on social movements there are many approaches that discuss conditions for the emergence and stabilization of movements as a whole, but few pay attention to the trajectories of participants as participants. Based on the theory of recognition and interactionism, this text aims to reconstruct the learning processes and eventual changes in the life projects of participants of social movements, focusing on their insertion in solidarity economy projects. The text is based on long-term interviews with participants from the Landless Rural Workers Movement (MST) and the National Movement of the Collectors of Recyclable Materials (MNCR), both in Brazil, and reconstructs the outlines of their biography prior to joining the movement, the expectations that lead to the adherence to the movement, the new learnings and the changes in the individual life project that resulted from this participation, as well as their evaluation of the values and goals of the respective movement. This approach aims to help bridge the gap between personal concrete experiences in everyday life of social movements and social theory.

SOKOLNICKA, JULIA* (Nederlandse Filmacademie, Netherlands)

Digital Nomads -Film Archive and Artistic Research through Film Method.

Digital Nomads is an archive of documentary film material focusing on portraits of cultural activists. It illustrates models of community bonding in the digitally globalized era. It's a film with a non-fixed structure that can be shown in a performative screening, lecture, as a website or video installation.

The initial research questions of Digital Nomads project, were about the possibility of a counterculture existing within late Capitalism. The initial counterculture search took the project through the underground nightlife and performative practices in deeply gentrified cities such as New York and Amsterdam - balancing with material shot in Berlin.

The source material of portraits and orientation scenes is shown edited live and narrated through the flaneur subjectivity of the maker / researcher - Julia Sokolnicka. The trajectory of the research changes while the archive grows, allowing Sokolnicka to create new connections between problems, places and the activists she is portraying. The open structure of the project also allows for the use of poetic tools to reflect on nomadism, technology and culture. The possible narratives open the material through different research questions and critical perspectives. As a film the subjective archive manipulation allows to communicate the research through artistic manipulations, such as using voice over and portrait as intuitive vehicle of information, or concentrating on visual information in the multiscreen collages. Digital Nomads constantly balances between documentary, essay and presentation creating a completely new genre.

Cooperation in a Social Dilemma through Investments in Repeated Interactions or Contractual Agreements

Theory and empirical research have demonstrated that repeated interactions and contractual agreements can foster cooperation in social dilemmas. Then, rational and self-regarding actors have incentives to invest in establishing long-term relations with repeated interactions or contractual agreements if they anticipate their benefits. In this study, we simultaneously analyze the effects of repeated

interactions and contractual agreements as well as their endogenous formation through costly investments. We develop game-theoretic models that capture both the endogenous formation (see, for example, Raub et al. 2019) and the effects of repeated interactions and contractual agreements on cooperation. We design and conduct a laboratory experiment that allows for testing predictions based on these models. Results provide support for hypotheses on investments in and effects of repeated interactions and contractual agreements that follow from standard game-theoretic assumptions on equilibrium behavior as well as self-regarding preferences. Our results show positive effects of repeated interactions and contractual agreements on cooperation and allow for comparing these effects as well.

The Social Organization of 'Intercultural Education' from the Experience of Mapuche Educators

In this presentation, I will show part of the results of a doctoral study looking into the social organization of intercultural education in the Chilean context. Through an exploration of everyday life accounts of Indigenous educators from the Mapuche nation who work in the primary school system teaching the Mapudungun language subject, the study set out to unveil ruling relations mediating Mapuche educators' lived experience in the context of their jobs. The educators whose accounts comprised the starting point of this institutional ethnography work at so-called 'intercultural schools', which were formally established in the late 90's and early 2000's upon Indigenous demands stemming from the time of the civil military dictatorship headed by Pinochet. Extensive, critical analyses of institutional policies, legal regulations and practices that organize Mapuche educators' work, which also considered the historical and socio-political circumstances in which these policies and regulations have been produced, revealed some of the institutional relations and ideological discourses that enable the production of precarious material conditions that put Mapuche educators at a disadvantage compared to other educators of the Chilean school system. Part of what this study reveals relates to the way in which the current institutional order that socially organizes intercultural education sustains—and is sustained by—structures stemming from Spanish colonization that have been reinforced throughout a history of over five centuries. By filling a gap in the scholarly work on intercultural education in the Chilean context, the study presented here contributes to expand our understanding of the ways in which intercultural education is socially organized.

SOLIS, PATRICIO* (El Colegio de México, Mexico)
GUEMEZ, BRAULIO (El Colegio de México, Mexico)

Racism from below: Schemas of Ethno-Racial Classification in Mexico

Research on race and ethnicity in Mexico usually emphasizes the role of the state in the construction of ethno-racial categories, such as "mestizo", "indígena", and more recently "afromexicanos" or "afrodescendientes". However, beyond the indigenous/non-indigenous divide, the use of "race" and racial labels as practical categories of classification is weak. Therefore, the analysis of racism and ethnic/racial discrimination in Mexico must focus not only on the imposition of ethnic or racial categories from the state, but also on the ways in which individuals and social groups use in their everyday lives ethnic and racial classification schemas to identify and categorize. In this paper we advance a constructivist approach that underscores these classification schemas and the way they are actively used both as a way of (self-)identification and to impose social hierarchies on others. Using both survey and qualitative data collected from interviews and focus groups in Monterrey, Oaxaca, Mexico City, Merida and three municipalities of Yucatan, we first discuss the weakness of "race" as a practical classification category, and then explore how, regardless of this weakness, classification schemas systematically combine racial, ethnic, socioeconomic and regional origin elements, often used interchangeably. We argue that these multidimensional classification schemas are instrumental in the racialization of indigenous peoples and also to establish ethno-racial distinctions not only between indigenous and non-indigenous groups, but also between dark and light skinned groups within the non-indigenous majority of Mexican society.

PEZZOLI, SILVIA* (University of Florence, Italy)

Hubs of Information. Social Media Use in Public Sector Organizations

Social media relations between citizens and Public Administrations are redefining the communication attitudes in Public Sector. According to the scholars, it seems possible to speak of a «mature» e-government model when social media provide forms of interaction with citizens; on the contrary, the merely informative use of them is assimilated to «immature» e-gov models.

In the present contribution, born from a monitoring action on Italian municipalities, we investigate if success and benefits of innovation deserve to be read in the broader process of social interaction. This more sociological than communicative approach hypothesis aims at verifying whether the recognition of the value of information does not depend only on the intensity of the dialogue with the user, but rather on the ability to slowly strengthen trust and legitimacy between administrations and citizens. In an era of skepticism, distrust and misinformation, public sector organizations could play a pivotal role in managing relationships and fostering civic engagement, exploiting their institutional presence in the digital environment.

However, listening and diffused information also lead us to imagine local administrations as "hubs of information" for citizens, emphasising their key role in the systematization, integration and reconnection of information contents whether self-produced or produced by others, i.e., by other institutional subjects (third-sector associations and authorities, companies, cultural institutions, etc.). In this perspective, the "maturity" use of social media is not necessarily linked with the interactive degree in the social media pages it selves, but with the local administrations' attitude and ability in organising the huge amount of information in circulation, which has grown exponentially thanks to digital communication, attributing it authoritativeness and facilitating citizen navigation and activation processes.

SOLOMON, PREETHI* (TATA INSTITUTE OF SOCIAL SCIENCES, India)

Avenues for and Challenges of Decentralised Governance: An Evidence Based Enquiry in Fishing Communities in India

Decentralization and democratic participation are offered as indispensable political conditions to achieve economic development and social justice in India. The 73rd and 74th amendments to the Constitution of India strengthened the local governments, both rural and urban. The fisheries sector in India caters the nutritional requirements of the country as well as the major contributor in Indian economy. But the community still remains as outliers in the story of decentralization. Exclusion of these outlier communities is evident albeit existence of many efforts of inclusion such as constitutional amendments, micro as well as macro policies and targeted programmes. The present study is positioned around the question of inclusion and decentralised governance in traditional fishing community in Kerala with special emphasis on the local self government institutions and its interface with other institutions and structures. The study mainly covers the reflections of traditional fishing community on the role of local self government in the fishing communities through analyzing the existing institutional structures and processes in addressing their development and welfare concerns. The study conducted in fishing villages of Kerala predominantly used a qualitative paradigm to understand the processes of decentralised governance and inter-institutional linkages. Analysis of the collected data broadly informs that much of these institutions in the community are functioning as independent entities with poor coordination and liaising. This has resulted in the failure of transparent and reliable delivery of services to the poor and needy in the community. The participatory planning is also not effectively functioning due to the lack of negotiation power of traditional fishing community, civil society and church. Politicization of civil society groups, and community structures and elite capture of the local government found to be working against the spirit of decentralisation and have significantly reduced the negotiation power once the community enjoyed.

SOMMER, BRANDON* (International Institute of Social Studies, Netherlands)

Systematic Historical Analysis – Examining Industrial Development in Guangdong

Historical methods have been long forgotten by traditional economists in favor of abstract mathematical models or advanced statistics. Yet, statistical approaches typically ignore phenomena that take place *over-time.* Furthermore, *in-time* dy-

namics that are fundamental to social scientific research are downplayed as the complexity of social life is difficult to capture within parsimonious economic models. This is not to say that quantitative methods are to be ignored but rather put in their place along with a variety of qualitative data. However, this also does not mean that there can be a haphazard treatment of qualitative data either. Rather I argue that qualitative data needs to be treated with the same rigor and precision as quantitative data and more importantly structure and agency needs to be embodied within any realistic model of analysis. This paper will present a case study of one of the leading growth regions in China, Guangdong province which has been a remarkable 'success' in terms of generating economic growth in the last forty plus years. In fact, the model has been so successful, it has been modeled for replication in other regions of China and countries around the world, yet the growth model itself is often misjudged and misrepresented. This case aims to demonstrate the key factors of growth in the region using a new digital tool for historical analysis. Although historical analysis is not new, what is new is the approach I take to analyze the data, which will be digitized to ensure that rigor and transparency are built into the method. This tool enables researching a complex case study and systematically examining both qualitative as well as quantitative data synchronically and diachronically using time as a theoretical variable to underscore the way in which structure and agency can be imbued theoretically and methodologically within a case.

NUSSBAUM BITRAN, ILANA* (University of Duisburg-Essen, Germany)

Theorizing with Bourdieu: The Transnational Recruitment of Healthcare Professionals in an Unequal World

Healthcare systems can no longer be only understood in a national framework. Millions of healthcare professionals are on the move, practicing their profession in different countries than the ones where they were once educated. Their movements are often facilitated by recruitment agencies that mediate between employers searching for personnel and employees who want to migrate from countries with usually more understaffed health care systems than the receiving destinations. An apparent global race for talents has become a common sense metaphor. Simultaneously, the WHO has released a Code of Practice on the International Recruitment of Health Personnel to enhance an ethic and cooperative behavior of its members. Recruitment practices are embedded within a structure of relational global inequalities at different socio-geographical levels. While social practices emerge from these global inequalities, they also tend to reproduce the very same unequal structure. In an unequal field of struggles, recruitment agencies are institutional actors operating as transnational companies located in between states, markets and professions. By promoting the movement of health professionals between countries their business directly contributes to the transnationalization of the healthcare market and to more freedom of mobility. On the other hand, they have to be theorized in terms of the social inequalities and institutional injustices in global healthcare that their business is built on. The paper applies Bourdieu's theory and methodology to a controversial object that he did not study himself. Using his relational approach, we present our reflections of what he could have said today, how he would have applied his notions of field, habitus, capital and symbolic violence to the object that we are going to study empirically: the organized transnational recruitment practices of healthcare professionals in a world of inequalities.

SOMMER, ILKA* (University of Duisburg-Essen, Germany)

Towards a Global Gold Standard in Medicine? An International Experiment with Different Physicians Treating the Same Patient

Is medical professional knowledge and practice universalizing? If it is rather not, how can observable differences between the knowledge-based practices of physicians be theoretically understood? The paper presents first results of an experimental approach to answer these questions. As part of the *interdisciplinary research project "Travelling knowledge: the glocalization of medical professional knowledge and practice"*, we conduct role plays with physicians at four university hospitals in four different countries: China, Germany, Turkey and the Netherlands. All participating physicians treat a standardized (simulated) patient who follows a script detailing the symptoms of a particular cardiovascular disease. Of course, the participants are aware of the experimental setting and have signed an informed consent. Based on a comparative qualitative analysis of more than 50 videotaped treatment sessions the paper discusses observed differences in relation to relevant theoretical arguments such as for instance made by Timmermans and Berg on "local universality" (1997, 2003), by Levitt and Merry on "vernacularization on the ground" (2009) as well as by Robertson on "glocalization" (1992, 1995). Preliminary insights demonstrate surprising parallels between the observed medical practices and the applied sociological research practices in re-

gard to relations between the universal and the particular as well as the core question of understanding (non-)compliance of knowledge workers to a designated standard.

SOMMER, MATTHIAS* (TU Chemnitz, Germany)

(Self-)Advertisement: A Powerful Cultural Factor for Individual Satisfaction?

In his *Philosophy of Money* (1900) Georg Simmel highlights the meaning of advertisement in a society in which persons have increasingly individualized and differentiated needs. For Simmel advertisement is an answer to this modern individualism of distinction and differentiation. He takes the advertisement for a marriage partner as a starting point to show how advertisement rationalizes the problem of the individualization of needs. Whereby advertisements enhance the circles of possibilities for the individual to achieve satisfaction, Simmel describes the problem to show complex qualities of personality through (self-)advertisement. Characteristics like outer appearance, character, or the level of lovableness cannot be shown like the financial status of a given person.

Since Simmel's days self-advertisement has undergone a complex transformation. The individual shows itself e.g. within the new architecture of romantic choice (Eva Illouz) to match on the dating market, and tries to gain publicity by creating advertisement for himself to get access to different forms of social relationships. The paper outlines the problem of the mediatization of emotional qualities of the self and shows how Simmel's concept of advertisement, social circles and competition relate to his concept of emotion. Based on current empirical data the paper discusses how Simmel leads to a better understanding of the relationship between (emotional) self-advertisement and modern individualism.

The Correlation between Family Policy Regimes and Parental Mental Health in Europe

Children bring joy, but also stress, especially among employed parents who struggle to combine work with childcare. In our study, we intend to examine how different types of family policies correlate with the distressing elements of parenthood in Europe. Previous studies suggest the relative importance of the impact of child care policies on parental stress, moreover, the gendered nature of this impact. With our study, we build upon and extend this knowledge with carrying out a European comparison on the association between mental well-being and welfare state types, household formations and gender disparities.

In order to create a comprehensive typology of family policy regimes, we combine information from Ciccia and Verloo's (2012) and Ciccia and Blejenbergh's (2014) typologies of parental leave and childcare services policies. The typologies were then developed using fuzzy set ideal type analysis (FSITA). We differentiate between male breadwinner; supported universal breadwinner; limited universal caregiver; caregiver parity; one-and-a-half earner, and some hybrid version of some of these. Our main interest is in the change of mental health depending on the country-, household-, and individual-level characteristics. Therefore we apply the multilevel modeling framework on wave 2013 of the European Union Statistics on Income and Living (N=72.865).

The analysis found that in general, the worst well-being is found in the male-breadwinner and the hybrid limited universal caregiver/male-breadwinner clusters. These results suggest that the impact of living in a male-breadwinner oriented country is detrimental on mental well-being for mothers and fathers as well, regardless of how parents share care-work and employment.

RC20-JS-83.3

SON, JOONMO* (National University of Singapore, Singapore)

Trust As a Precondition of Social Capital

The role of trust in conceptualizing social capital brought serious contestation in the literature. Robert Putnam argues that trust is a component of social capital along with norms of reciprocity and social networks. Francis Fukuyama maintains that trust, the representative indicator of shared norms and values that promote social cooperation, is social capital by itself. Nan Lin does not consider trust in the definition of network-based social capital as social resources embedded in interpersonal networks. This study proposes that trust is a precondition of social capital. Specifically, it follows a two-step approach: (1) trust facilitates the growth and expansion of interpersonal network; and (2) an expanded network then encompasses greater and more diverse social resources in it. The first step hypothesizes

that trust is a precondition that helps expand the structural basis (i.e., network) of social capital. The second step supposes that the expanded network incorporates greater social capital.

To examine the two hypotheses, this study uses the 2017 International Social Survey Program data with respect to the module on social networks and social resources. The survey administered in thirty countries employed both position and resource generators to measure network-based social capital. Both country-level fixed effects model and multilevel mixed-effects model confirm that generalized trust is significantly associated with extensive interpersonal network and that a more extensive network subsumes greater social capital in terms of positional resources (position generator) and three types of functional resources such as instrumental assistance, emotional help, and provision of information (resource generator).

The study contributes to the literature of social capital by providing a theoretical and empirical solution regarding how to establish the relationship between trust and social capital.

RC15-189.3

SONEGHET, LUCAS* (Universidade Federal do Rio de Janeiro, Brazil)

A Sociology of Care, Death and Dying: What Can We Say about Living at the End of Life?

Based on my ongoing doctoral research, I set out to discuss the place of Sociology in the care of dying people. The lives of individuals considered "terminally ill" are the epicenter where sociological, psychological, medical, spiritual and religious practices meet. This is because the work of caring for the dying person is hard, and is made even more difficult by social inequalities and power dynamics that can delegitimize the pain of some individuals (Bendelow, 1993), regulate bodies in different and unequal ways (Foucault, 1984; Turner, 2014), and inflict terrible burdens to healthcare professionals. In my fieldwork, I follow a public home care service based on a federal hospital in Rio de Janeiro. This service provides "palliative care" for terminally ill people, and is formed by a multidisciplinary team. Since the palliative care approach privileges discussion and colaboration between different fields of knowledge in Health, my presence was welcomed. However, the role of Sociology in the study of care, death and dying remains unclear to most healthcare professionals, and also to patients and their families. What can Sociology say about the existential suffering of terminally ill people? What can it say about the burdens of care that befall family members? And what about complicated and complex family dynamics, in which gender and generational roles are put into motion? I argue that Sociology's place is to look at the body as the *locus* where the lines between health and sickness, normal and critical (Das, 2007, 2015), dependence and self-reliance, subjects and objects, become blurred. By doing so, Sociology can capture dimensions of care, death and dying that escape, but can be added to knowledge in the field of Health, so that together both can work to improve living (and dying) conditions for people facing today's national and global challenges.

RC15-188.1

SONEGHET, LUCAS* (Universidade Federal do Rio de Janeiro, Brazil)

Suffering at the End of Life: Vulnerability, Affect and Narrative

Based on my ongoing doctoral research, I discuss the ways in which the experience of suffering appears in the trajectories of dying people, including the work carried out by families and healthcare professionals in caring for them. Following a multidisciplinary team of healthcare professionals working in a home care service that provides "palliative care" for patients in a public federal hospital in Rio de Janeiro, I set out to describe how the lines between caring and suffering become blurred in the relationships between these patients, their families and the aforementioned team of professionals. Through that description, I place the dying person's body as a relational nexus around which a whole arrangement of care is organized. The body is understood through its ontological openness to the world (Merleau-Ponty, 1964), an intrinsic condition that is translated as a *vulnerability* of the subject to others and his environment. This vulnerability, though intrinsic to being human, is not equally distributed, regulated and organized in society (Butler, 2006; Turner, 2014). Even so, it is still the way through which we affect the world and are affected by it, act on it and are "acted" upon. As the trajectories of dying people show, being a competent social agent who acts, feels and thinks in society is not an easy task. Because of the fragility of their bodies and the structural constraints that shape their lives, the process of dying for patients in the public health system is beset by experiences of suffering. The question then becomes: how is suffering talked about, felt and thought about in these situations? I propose that a social theory of embodied subjectivity can pave the way to understand suffering as both an existential component of humanity, a biopsychological dimension of our embodied life, and as a socially mediated experience.

Climate Change Risks and Global Warming Dangers: Mapping the Political Dimensions of US News and Policy Discourse

Efforts to understand and address the super wicked problems of climate change (CC) and global warming (GW) are complicated by the different labels and frames used to communicate these problems in the English language. Communication studies have shown that political identities in the US are associated with different understandings of CC and GW, but these political and linguistic differences have not been linked to the framing of climatic risk and danger in news media and policy-making institutions. The present study examines how CC and GW are linked to risk discourses on the websites of 115 US news organizations and think tanks. Using an explanatory sequential mixed methods design, the semantic field of climate risk is mapped through correspondence analysis of keyword patterns and contrasting climate storylines are identified for websites with different keyword emphases. Preliminary results show a primary contrast between mainstream media and think tanks that link CC to risk, safety, and security and conservative media that link GW to protection, security, and danger, corresponding to Luhmann's distinction between risk and danger. A secondary contrast highlights the opposition of mainstream news sites linking CC and GW to saving and radical left and right sites linking CC and GW to exposing and defying, corresponding to status quo versus challenger politics. Ongoing research will expand the mapping of the field of climate risk and deepen the interpretation of climate storylines. This study contributes to the understanding of climate risk by identifying how CC and GW are linked to contrasting frames and politics in online news media, and by elaborating the links between theories of risk discourse in the Anthropocene and contemporary political polarization in the US.

SOOD, BHAVNA* (Mehr Chand Mahajan DAV College for Women, Chandigarh, India, India)

"Upscaling Pedagogy to Online Teaching: A Challenge for Teachers"

Education is a powerful instrument for reshaping and modernising the society. It facilitates knowledge and acquiring norms, values, traditions, as well as, skills. Education can take place in both informal and formal settings. The experience that has a formative effect on the way one thinks, feels or acts may be considered educational. The method of teaching is called pedagogy. There is a movement to reform education, with global initiatives aimed at achieving the **Sustainability Development Goal -4** (Quality Education- Increase the supply of qualified teachers in developing countries), which promotes quality education for all. Teaching is a complex activity. In ancient India, the most common form of education was Gurukul based on the guru-shishya tradition (teacher-disciple tradition) but today it is a profession. With Covid-19 the pedagogy has suddenly given primacy to online teaching. **Objective**: This paper will give an insight on the challenges the teachers of higher education in India are facing in the present pandemic, what support is being provided by the institutions in facilitating this transition to the new normal. Methodology: An empirical study will be conducted through survey method and a questionnaire will be designed to delve into the methods used by the teachers during lockdown and post lockdown.

Vision Pathways: How Value Frames and Collective Identity Co-Shape Imaginations of the Future

Visions imagined by social movement organizations can expand by enrolling more and more actors and becoming enacted and accepted in everyday life. Such a pathway shows the vision of the Swiss solidarity movement which imagined more justice in international trade. Its expanding development was unclear from the outset, but we can now interrogate it retrospectively to better understand what shapes the dynamics and development of a social movement vision.

We mobilize institutional and organizational theory for developing a conceptual framework which enables us to study the historical pathway of an idea that envisages a particular future. The framework puts an emphasis on the link between field- and organization-level dynamics and guides our attention towards the relationship between a field's 'value' frame and collective identity in the context of a specific vision.

Drawing on an extensive analysis of archival data supplemented by interviews, we study the beginnings and growth of fair trade in Switzerland covering the period from 1970 until today. We observe a reciprocal, co-evolutionary process between changes in the field frame and shifts in the identity of fair trade organizations during the expansion and burgeoning enactment of the vision. This co-evolutionary process progressed through four stages during which the field frame and collective identity both clash and evolve together.

denotes a presenting author. Abstracts are organized by first presenting author's last name.

Based on our findings, we suggest that field members' identity and the frame of a field represent an interdependent 'bundle' which carries visions through time while shaping their pathways. During times of expansion, values can clash. Efforts at expanding a vision can erode the existing consensus between collective identity and field frame and result in discrepancy, triggering efforts at renegotiating and realigning organizational values in response to these issues.

Social Inequalities in Access to Maternity and Paternity Leave in Brazil

This paper aims to examine the relationship between leave policies and social inequalities. Thus, its first objective is to analyze the historical course of legislation governing maternity and paternity leave, in order to identify the most significant political and legal milestones over the years, as well as the conceptions that underpinned them. The second objective of this paper is to show that access to leave policies is impacted by social stratification, revealing different inequalities. Since the take up of leaves are conditional upon social security contribution, and, to a large extent, formal worker status, the leaves laws always excluded a large part of the employed population. To investigate access to leave policies, this study uses data from the Annual National Continuous Household Sampling Survey of 2017 [Pesquisa Nacional por Amostra de Domicílios Contínua Anual de 2017], conducted by IBGE/Brazil. The results point out the existence of inequalities in the conceptions of leave policies in Brazil, and lead to quantitative confirmation that access to leave is stratified and permeated by inequalities of gender, class, race and age.

Transformation of the Career and Profession of University Teachers in Russia: Historical Dynamics and Current Trends

In the light of contemporary changes in science, education, politics of educational management we are becoming the witnesses to transformation within Russian universities caused by the realization of the program of raising international academic competitiveness. Under these circumstances, the intellectual potential of "homo universitatis" becomes leading capital, and universities as places for its reproduction – key factors of high competitiveness.

Historical transformations led to serious changes in structure of duties carried out by Russian university lecturers and competencies that are required of them. The very content of the profession has undergone drastic transformation – predominantly in the direction of adding up professional competencies that a lecturer should have in order to be materially and morally satisfied by his profession. New times generated need in a new type of lecturer that can rapidly adapt to changing conditions and having managerial, legal, economic and psychological skills.

The main mechanisms for building a university career in the Soviet period, period of the 1990s-2000s and modern changes that are taking place in the career development of university teachers at present. The study is based on the involvement of a wide range of historical sources on the history of the development of higher education in the Soviet and post-Soviet periods, sources of private origin and in-depth interviews with teachers of leading universities in Russia which take part in the implementation of the program to increase the international competitiveness of Russian universities.

In particular, the results of sociological study of the transformation of the profession and professional identity of university teachers at Tomsk and Tyumen State Universities would be presented.

The results were obtained in the framework of the Russian Science Foundation grant, project No 19-18-00485 "The human dimension of the transformation processes of Russian universities: historical experience, trends and responses to the contemporary challenges".

The Expectations of Economic Migrants in Brazil: Formal and Non-Formal Aspects of Citizenship and Integration

Brazil is one of the main countries chosen to immigrate. Between the different reasons that lead people to select this destiny is the economic power of the country and its big dimensions, which create the sensation that is a country pulverized with work opportunities. Of the economic immigrants the country receives, there's a parcel that comes to stay, and other that comes through, seeing Brazil as a path to reach other objectives. This article is focused on the portion of immigrants that live and that are trying to pursue their rights while residents in the country. Underneath the theme of citizenship, it also rebound the perceptions of the immigrants themselves in relation to their wills, adversities and experiences throughout the process. The intention of this research is to comprehend the perspective of those immigrants regarding the pursuit of citizenship. The principal theoretical framework used is Marshall's (1967) theory, of rights and duties of citizens. The methodological approach will be of a qualitative character, with analysis of semi-structured interviews of immigrants living in the city of Porto Alegre (RS). As a result it was identified that, on one hand, although feeling contemplated as citizens, especially on what is related to reception and social support received for the most part of brazilians, on the other hand, there still are some civil, politics and social rights remaining absents, creating a distance regarding to the formal citizenry, despite the individual feeling of being a full member of the brazilian society, from the socially welcome. As Marshall refers, if the social reception of the immigrant exists, and the person feels as a member of the society, then should also be legally consider as a full member of the society, however, in the brazilian case, there are legal restrictions remaining that cause tensionings in this question.

SOSNOWSKA, ANNA* (University of Warsaw, Poland)

Explaining Serfdom. Post-1945 Historical Sociologists on Eastern Europe

The paper presents the main conclusiosn of my book "Explaining economic backwardness. Post-1945 Polish historians on Eastern Europe", Budapest/New York City: Central European University Press, 2019 (*http://ceupress.com/book/explaining-economic-backwardness*). In the presentation, I focus on the debate on the origins of serfdom and folwark (a gentry-owned land estate dedicated to commercial agriculture) as well as serfdom's influence on economic performance and political system of the country in the 16th through 19th century.

Sociological theories of development and historical studies on the origins of capitalism and the global domination of the West had never flourished as intensively as in the post Second World War period, with its peak in the 1960s and 1970s. Dramatic changes in the world, such as decolonization and global competition between capitalist and socialist version of modernity, accelerated interest in and added ideological dimension to the academic debates. My paper discusses historical sociology's debate on the origins of serfdom in East Central Europe since the times of 'the rise of the West' in the 16th century. Comparisons with Western Hemisphere slavery, haciendas and plantations will be explored.

It further presents in detail four models of Eastern and Central European development derived from the Polish post-war economic historiography: Marian Małowist's model quasi-colonial development; Witold Kula's model of hybrid development; Andrzej Wyczański's model of catching up with the West; Jerzy Topolski's model of unhappy coincidence.

I argue that Kula's model provides most convincing explanation. The explanation accounts both for demographic circumstances, social and political power relations in the local environment and international division of labor and terms of trade.

SOUSA, KARINA* (UFT/UFSCar, Brazil)

Leisure and African Diaspora: Spaces and Practices

Colonization and enslavement are historical processes that resulted in many forms of both domination and resistance expressed in social and cultural practices (JONES, 2005). Using photography and field notes from the participant's observation in black social clubs and balls (Samba Rock). The paper seeks to understand the meanings of leisure in black communities using the Brazilian case study. The Sociology of Leisure is interdisciplinary field (PARKER), so it is possible to link it with studies of African diaspora to understand about the meanings of leisure to

black communities, who leisure was historically denied. In southeastern Brazil, free Black Brazilians built Black Social Clubs like the "Grêmio Recreativo e Familiar Flor de Maio" to help Black communities by providing beneficial, recreation, and cultural activities since the beginning of the 1900s. One of the main activities of these Black Social Clubs, such as "Flor de Maio", was to hold sumptuous (luxurious, and majestic) balls for the Black population. Currently, these events have changed, but have not lost their relevance, being transformed in events called Samba Rock Balls. Samba Rock is a dance and music influenced by rhythms from Americas, and Caribbean. This genre has been one of the primary forms of dance and music performed in Black Balls. My hypothesis considers that leisure experiences such as dance, and music should not be considered separately from the experiences of oppression, resistance, and overcoming the effects of adverse conditions in black communities. However, this reflection builds a dialogue between forms of sociability in which leisure practice- Samba Rock- and leisure spaces- Black Social Clubs and Balls- play central roles as social organization, community living, learning and sharing of ways of life, resistance and political practices.

Democratic Support and Authoritarian Values. the Cases of Brazil and Mexico 2005-2014

This work shows changes in the political attitudes of Brazilians and Mexicans in about a decade: in both countries the appreciation of democracy decreased and support for an authoritarian regime increased. It is argued that while there is a positive relationship between socioeconomic status and democracy (and negative regarding authoritarianism) there are other variables in political culture such as interpersonal trust and obedience that complement the explanations on why some citizens support democracy and others increasingly prefer an authoritarian regime. Statistical methods such as factor analysis and multiple linear regression were used to analyze data from the World Values Survey (2005-2014).

SOUTO, LUISA* (Pontifical Catholic University of Rio de Janeiro, Brazil)

Solidarity and Struggle in Contemporary World: Agenda and Daily Life of the Homeless Workers Movements

This research proposes a study about the social movements in XXI century and the individual's place as social actor. The problem of habitation in Brazil (and other big cities) and the way the homeless workers movements mobilize themselves are directed conected the forms of subjectivity that emerge from their experiences. A few questions may be asked: How they organize the resistance? Is there any real perspective of change? Who are the main actors of this fight? Do they propose alternative ways of life?

Observing these movements from the outside we can see the collective action, but when you take a look to the inside – to the militant's routine -, subjectivity and solidarity are two important keys to comprehend their performance. The homeless workers movements are usually formed by families, wich configures a heterogenous base. There are significant diferences between their beliefs, their behavior, their needs and the way they act. As pointed by some authors, what seens to be disconected experiences, are actually what show the intensity, the fight for visibility and the tensions between diferente social logics of power. Each individual, around their subjectivity, their experiences and emotions build themselves as social actor in the struggle for another way of life and new forms of sociability.

A large number of women are in leadership positions in those movements and they are also responsable for inner actions that have as goal make sure that the militants have minimum conditions to live and dedicate to the cause. But why and how women build these solidarity networks and sustains themselves in leadership positions in a society historically marked by the gender opression? This is the root that is going to lead us to observe wich forms of soldarity and struggles are built inside the homeless workers social movements.

Child´s Pastoral As the Largest Brazilian Catholic Organization and the Issues of Its Institutional Adaptations

Among the social pastorals linked to the National Conference of Brazilian Bishops (CNBB) one stands out because of its international scope: the Child´s Pastoral. Gathering around 160,000 volunteers - present in the 27 Federal Units of the national territory and also in ten other countries in Africa, Asia, Latin America and the Caribbean - it has significant recognition, beyond the Catholic milieu. It emerged in 1983 from the proposal of São Paulo cardinal dom Paulo Evaristo Arns to his sister, the pediatrician Zilda Arns Neuman to implement a nutritional orientation and health care work for pregnant women and mothers of young children, which caused a considerable reduction in child mortality in the inserted locations.

The support of the church and some government agencies extended to private institutions, providing diversification of its activities, always focusing on child health. Deceased in a missionary activity during the Haiti earthquake in 2012, the leader was replaced by her son, also doctor Nelson Arns Neuman, who made some adaptations and sought to insert certain characteristics into the Catholic organization. Among other things, such measures refer to the professionalization and improvement of norms in terms of voluntary activities. This investigative work, supported by the São Paulo Research Foundation (FAPESP), discusses the intricacies of the Child´s Pastoral institutional trajectory, covering the challenges faced and its choices in terms of internal structuring.

SOUZA, GLEICIANE* (Universidade Federal da Bahia, Brazil)

Depression, Violence and Medicalization: Experiences of Suffering Among Middle and Lower Class Women in Northeastern Brazil

Gender, socioeconomic and cultural conditions are crucial for women's mental health. Factors such as lower wages, concentration in less valued professions, double and triple work hours and domestic, physical, sexual and emotional violence corroborate the significant increase in hospitalizations and use of psychiatric drugs among women for mental disorders in Brazil. Specifically, violence against women is among the leading causes of female illness, according to the Pan American Health Organization, and constitutes a common experience among women in situations of socioeconomic vulnerability. Assuming that depression is a polysemic phenomenon that has multiple meanings and causes (biological, psychological and social), this paper proposes to look at the experience of depression among women as a result of a pathologizing process of female suffering, which has as its main purpose the medicalization of their lives and emotions. Medicalization consists of a control mechanism that enables a nonmedical problem or condition to be understood and treated through medical intervention (Conrad 2004). Thus, when it is reduced to the medical sphere, female suffering is detached in practice from the socioeconomic and cultural dimensions that trigger and structure it. Based on the comparison of nine biographical narratives of middle and lower class women in a large municipality in northeastern Brazil, I will present some empirical findings of women's subjective perspectives on their depressions, seeking to point out the relationships between gender and socioeconomic conditions in the constitution of their experiences of suffering. In particular, this study shows that, in addition to socio-cultural conditions, the socioeconomic status of women is a determining factor in the structuring of the suffering they face, being more prevalent among poorer women experiences of domestic, physical, sexual and emotional violence, both in childhood and adulthood.

Human Rights "Medium": An Analysis of Articles in Two Major Brazilian Newspapers

Human rights are one of the universal discourses of contemporary society, becoming a self-evident expression. Nonetheless, some studies have been starting to reflect on the empirical expression of human rights in the contemporary world, that is, how they are effectively presented/manifested in social reality. This presentation is based on ongoing masters research and proposes a reflection on the empirical expression of human rights through newspapers. The goal is to analyze how human rights discourses were mobilized in O Estado de S. Paulo and Folha de S. Paulo, two major Brazilians media newspapers, during the period of 2017-2018. Qualitative analysis of newspaper articles allows for the observation of updates of meanings attributed to human rights and what is the "idea" built by the media about what human rights are.

SOZZO, MAXIMO* (Universidad Nacional del Litoral, Argentina)

The Punitive Turn in South America. Comparative and Southern Perspectives

In recent years there has been an important punitive turn in South America that has materialized in important increases in the incarceration rate. For example, in Brazil in 1992 there were 74 prisoners per 100000 inhabitants and in 2017 that rate reached 317 prisoners per 100000 inhabitants, a growth of 328% in two and a half decades, which makes it the country with the highest level of incarceration in the region. In other national contexts the growth during this period has been a little less marked, but equally dramatic. One way to explain this punitive turn in South America has been to resort to the "neoliberal penalty thesis" (Lacey, 2013; O'Malley, 2015) as it has been developed by some authors with respect to certain jurisdictions of the Global North, especially the United States (Wacquant, 2009; 2013). It is a narrative of an epochal change that identifies a "profound cause" in "neoliberalism" as a political project that limits state intervention in the social field and changes its logic (from welfare to workfare) and expands -in a "causal

and functional" connection - state intervention in the penal field and changes its logic (from rehabilitation to retribution and incapacitation) that is uniform across time and space, within the framework of a globalization that is intepreted as a process of convergence. In this paper I intend to discuss this type of explanation departing from the comparative exploration of national cases of the region that experienced during the last 25 years important processes of political change as a result of the rise of post-neoliberal governmental alliances (Argentina, Venezuela, Brazil and Ecuador) (Sozzo, 2016; 2017; 2018a).

Media and Multiple Sclerosis. Role of Mainstream Media and Social Media for Awareness, Storytelling and Care

The paper presents the results of a comparative research between Italy and Pakistan on the role that social media and the mainstream media have in people with Multiple Sclerosis highlighting the cultural differences and homogeneities and socio-economic context related to the disease. In particular, the following issues will be investigated: 1) what MS storytelling is told by the mainstream media (Peruzzi, Volterrani 2016) and what improves in the awareness of people with MS in relation to disease and collective participation to address the problems, 2) the impact of open and closed communities built ad hoc and participated in social media on people with MS (Volterrani, 2018) for the improvement of care and specialized medical or healthcare professional /patient relationships, 3) analysis of the role of the media and social media in the prevention of some of the most common problems among people with Multiple Sclerosis (Volterrani, 2017), 4) the online and offline role of national associations for multiple sclerosis in both countries to promote active participation of people affected with MS.

The methodology of the research is based on in-depth qualitative interviews with Italian and Pakistan people with Multiple Sclerosis placed respectively in the Punjab region and in the Sicily region and an online participant observation analysis in the open and closed communities on the MS in Italy and Pakistan.

Pä Chuyma: When Domestic Violence Produces Transnational Dilemmas

How do forms of violence and social injustce are turned into biographical paradoxes? How does the transnationalization of social life generate moral and practical dilemmas for women? The present communication is based on a multi-sited ethnography, in its modality of "following people and their biographies", performed with Bolivian immigrants and their families in São Paulo, Barcelona and in six Bolivian cities (Sucre, Cochabamba, La Paz, El Alto, Santa Cruz). In the field work it was identified that domestic violence served as a central mechanism for the transnationalization of families. The narrative interviews with migrants make it clear that gender-based violence not only drives the migration of Bolivian women to São Paulo and Barcelona, but shapes the entire migration process and have manifold sociological implications. One of the expressions of this process is what we called "the pä chuyma paradox". Silvia Rivera Cusicanqui defines the Aymara word "Pä chuyma" as the situation of having the soul divided by two mandates impossible to fulfill. This is an expression that synthesizes the paradox that migrant women live in relation to social protection: to protect themselves from domestic violence and to provide for their families in origin they had to migrate but doing so they are not able to provide care appropriated to the moral commandments in origin and destination. These women live differently in each of the places studied the impossibility of, simultaneously, provide personal care and to protect themselves from domestic violence. This presentation describes the different forms and nuances of Pä chuyma and discusses its main implications for thinking about how transnational social protection is crossed by gendered responsibilization.

Talking about Homelessness: Shifting Discourses, Outsourcing Compassion

Programs to combat homelessness are shaped by how homelessness is conceived. Such conceptions are inevitably political, but they are not just political. They arise as much out of the semi-conscious discourses present in a given social setting as they do out of various people's economic and social interests. This paper traces the discourses surrounding a large homeless program in San Antonio, Texas, paying attention to the shifting ways in which homelessness was locally conceived and the roles that religious groups have been asked to play in its solutions. It shows how these conceptions have limited the city's ability to solve the structural problems that generate homelessness and have even limited its view of public responsibility. In the end, the city has outsourced compassion to 'faith-based' and other private sector organizations, who are supposed to help improve individual people's lives. Efforts to provide systemic, public solutions are left on the cutting-room floor.

Nuevas Identidades En El Trabajo Femenino: Re-Significación Profesional De Trabajadoras Del Polo Naval De Río Grande, Río Grande Del Sur, a Partir De Sus Trayectorias y Disposiciones

La propuesta de este trabajo es analizar la trayectoria y la construcción de la identidad profesional de trabajadoras del Polo Naval de Río grande, en el período de su funcionamiento, 2014 a 2017, antes de su desactivación debido a la crisis del sector. La investigación forma parte del proyecto "Masculinidades y diferencias", en la discusión de las identidades construídas por las mujeres en un espacio masculino, del Núcleo de Estudios del Polo naval, que entrevistó trabajadores y trabajadoras contratados por las empresas del Polo Naval de Río Grande y San José del Norte en el período de su funcionamiento. Fueron entrevistadas nueve mujeres en el total de entrevistados, estudiando la trayectoria de trabajo antes y después del Polo naval, así como la construcción de la identidad profesional dentro del sector naval. Utilizando los conceptos de Lahire, sobre las disposiciones agenciadas por los individuos y la construcción de las identidades, a partir de las diferenciaciones, de Avath Brah, la investigación mostró que esas mujeres re-significaron la idea de trabajo femenino, incorporando la perspectiva del trabajo especializado en el sector naval. En este sentido, mismo con el fin del Polo Naval, ellas continúan percibiéndose como especialistas de ese sector, a pesar de aceptar trabajos vinculados a la cuestión de género "trabajo de mujer". Otra cuestión abordada es la formación de grupo de mujeres "Muralla Rosa", creado a partir del fin del Polo Naval, que trabaja en pós de la inserción laboral de las mismas.

Indigenous Controlled Research in the World of Big Data - Novel Approaches from Aotearoa New Zealand

The application of 'big data' research to investigate social and wellbeing issues has the potential to further disempower and disenfranchise indigenous peoples. Such data resources are usually created by the state, and consequently their content and application reflect the needs of the state rather than those of indigenous peoples. The impacts of this lack of representation and inclusivity are compounded by the advanced statistical methods applied to such data, which generate results that appear scientifically rigorous, but fail to account for the limitations of the data and the perspectives applied to it.

Aotearoa New Zealand has world-leading administrative data resources that are increasingly used to inform state decision making, but the indigenous Māori people have challenged a single standard approach of applying big data research. This presentation provides an overview of the innovative approaches to transform big data research to respond to indigenous needs, rather than those of the state or the academy. Existing data is now used by tribal nations to generate research-based information about their own people and regions in order to empower their own transformation activities as well as challenge the activities of the state. The adequacy of the existing official data has been challenged, with recent improvements in indigenous identifiers and the inclusion of culturally-informed variables in official statistics. Māori researchers are working with local communities to create data sources and data systems that support research to address local needs, rather than those of the state. These actions are assertions of indig-

enous sovereignty over indigenous data and the research processes using it. The relevance of indigenous data sovereignty has rapidly gained acceptance in the academy, beyond the activities of indigenous researchers and into institutional processes of research development and even state research funding. Indigenous researchers have moved beyond participating in research to controlling the research process.

Machine Learning and Blockchain Technologies: How Development Organizations Imagine Technological Utopias

Entering the "fourth industrial age," key development actors, including the United Nations, GIZ, and USAID, are abuzz with using predictive algorithms to speed disaster relief and blockchain technologies to secure voting systems, among other uses. In this new moment, technologists become incidental policymakers. These technologies envision digital utopias where bias is reduced through the application of "objective" algorithms and third-party intermediaries are no longer able to take advantage of the poor. This presentation reviews how the development sector—premised on ushering in global equality—has begun managing such technologies. Scholarship has documented the ways biases are heightened by corporate-owned, "black box" predictive algorithms. Blockchain technologies are said to be transparent and inclusive, yet "blockchain bros" dominate, even holding annual meetings at strip clubs. Throughout tech, women are relatively less likely to participate in meaningful ways. Given women's lower employment in tech firms and reduced access to smartphones in resource-poor contexts, I consider how these new technologies are leveraged rhetorically to reduce gender biases and map how they reconfigure gender relations from tech design in the workplace to implementation in development projects. The presentation will be based on initial mapping of development projects utilizing these two technologies, public documents from newly minted "innovation labs," and initial interviews with technologists.

SPRINGER, EMILY* (University of Minnesota, USA)

One Metric to Rule Them All: The Great Gender Injustice of Quantified Evaluation Systems in Development Projects

In an era of tenacious interest in 'evidence-based decision making,' international development organizations utilize data from evaluation systems to publicize success, demonstrate project efficacy, and claim impact to donors. Transnational evaluation systems measure the 'success' of development projects through a process of downward-moving policies from funders and upward-moving data from the project site, aggregated to demonstrate a return-on-investment. This bureaucratic system is only made possible through the joint effort of diverse development workers — from data collectors in rural areas abroad to evaluation directors in donor countries. How do evaluation systems, and the bureaucratic processes of which they are a part, demarcate the possibilities for the inclusion of gender in development projects? In what ways do evaluation systems undermine the very goals of the development projects they purport to measure?

I use the case of a large bilateral agricultural initiative operating in approximately 20 countries around the world, with the majority in Africa. In this presentation, based upon interviews with 59 development professionals, including 20 gender advisors, I demonstrate how evaluation systems undermine the gender-related aspects of development projects (if present). Further, I argue that evaluation systems--as collections of indicators meant to measure project progress--end gender justice before it began: quantified indicators are defined and

codified by development donors in the Global North. As pressure in the global development community has trended towards more measurement, complex, locally-embedded social processes like women's empowerment have come under measurement. Yet, how could these projects produce women's empowerment, if the very notion of women's empowerment is codified in the metric, created by people far away, interested in data aggregation. In a global context premised on "demonstrated results" understanding how measurement undermines the ability of women to self-define their empowerment is essential to maintaining space for such work.

Culinary Commons for Creating an Inclusive Food System and Sustaining Alternative Food Network: A Case from Nawalgarh, India

Academic literature is replete with evidence of the dominant food regime reducing the multidimensionality of food. This highlights the need for a paradigm shift towards a more sustainable and inclusive food system. Thus, building on commons theory this paper analyses an Alternative Food Network (AFN) in Nawalgarh, India as a sustainable and inclusive food system. This alternative network confronts industrialised food production method by growing interest of farmers in rebuilding the local food system engaging them in co-operative movement. The re-localization of food in this case takes place through Self Help Groups (SHGs) engaging the marginalized sections from the region in organic farming and re-valorizing the local food based on pearl millet and barley which are traditionally and culturally significant. Focusing on the local foods, this AFN shifts from producing dominant food crops like rice, wheat and maize. Further, the activities of this AFN are not restricted to the rural regions of Nawalgarh but extends to the urban regions connecting the producers with the consumers through collectively managed shops 'Down to Earth'. The collective also organizes a local food festival called the Shekhawati Food Festival to reclaim the culinary commons of Nawalgarh region through sharing of recipes, cooking techniques and produce of that region. The study highlights the importance of reclaiming and preserving local culinary commons for creating an inclusive food system and for sustaining the AFN. Through this case we contribute to the studies on AFN through commons theory further adding to the literature on commons and AFN.

STAROSTA, PAWEL* ((University of Lodz, Poland)

Civic Participation ,Trust and Social Capital in Eastern European Post-Industrial Cities

The objective of proposed paper is to make an attempt at answering three main problem questions:

What is the general level of civic participation, trust and social capital   in the end of the first and beginning of second decade of the 21st century and what is the scale of differentiation of the participation in different European countries?

2/ What patterns of civic participation, trust and social capital dominate in Cities under research?

3/ Which of the below listed models explaining the differentiation of civic participation, trust and social capital (Socio Economic Status Model; or Attachment Model) is best fitted to explain the changeability of population Post-Industrial Eastern European Cities ?

Three hypotheses have been formulated respectively to the problem questions

H1/In the first hypothesis it has been assumed that the level of civic participation, trust and social capital in Eastern European Cities   will be close to the median position on the designed scale.

It is expected that the highest levels of participation will be noted in the cities from countries of the longest democratic traditions while the lowest levels will be noted in cities from the countries of the shortest democratic tradition.

H2/ In accordance with the results from previous studies (Verba, Scholzman, Brady 1995; Pattie, Sayed, Whiteley 2003), we think that the dominating patterns of participation will be voting and campaign participation, bonding social capital and horizontal trust.

H3/ We think that from among the three models taken under consideration (the SES, SC and AT Models), the SES model is best fitted to explain the changeability of civic participation of the studied inhabitants of Europe from the statistical point of view.

Verification of hypotheses has been based on a database containing information from the 5th Eastern European Post- Industrial Cities(Lodz-Poland; Ivanovo-Russia; Miscolc-Hungary; Oradea-Romania, Poneveżys-Lithuania,   conducted in 2014 year

Social Entrepreneurship As a New Direction in the Welfare in Russia

Social entrepreneurship is a new direction in Russian business practice and in the field of social services. The legislative and organizational field of this type of activity is only being formed. In our study, based on an analysis of the Russian practice of social entrepreneurship, we distinguish two types of social enterprises: social institutions with elements of commercial activity and a classic social enterprise. These enterprises combine two, sometimes contradictory, missions: improving the socio-economic situation of their target group and achieving good commercial results. These enterprises usually reinvest the income from their activities in the business or development of the local community. A special place in the structure of social enterprises is occupied by social enterprises of labor integration. In our report, we present the results of a sociological study conducted by the case study method of two types of social enterprises in one of the largest Russian regions (Sverdlovsk Region). The results of the study allowed us to draw a number of conclusions characterizing the social context in which modern Russian social enterprises operate. In our opinion, social enterprises in Russia are created in those areas where the state social service system cannot work at the proper level for one reason or another. Moreover, as practice shows, civic initiatives of social entrepreneurs going "from below" rather than descending "from above" can solve social problems of regions and social groups more effectively than state structures. We were able to analyze a number of serious problems and limitations in this area, which may hinder the successful development of social business in Russian conditions.

Social Work in Healthcare Institutions in Russia: The Main Tendencies and Discrepancies

The research describes essential models of social work with sick people. The models under analysis are the result of studies conducted in special healthcare institutions, i.e. a psychiatric hospital for adults and a children's hospital for restorative treatment of children with congenital and acquired pathologies. The purpose of the research is to study the formation of social work models in different types of medical institutions. Of much importance is the fact that these medical institutions operate in changing socio-economic and organizational conditions. There is much evidence that modern social policy requires a relatively new integrative approach to people with diseases that lead to disability. The pivotal moment of the research is the analysis of problems that hamper the social functioning and support of such patients in the emerging forms of social work in these institutions. The major methods of the research are quantitative, i.e. a questionnaire survey of parents whose children are the patients of rehabilitation treatment centers; qualitative, i.e. interviews with patients, their relatives, and specialists in the psychiatric hospital; a case-study method, i.e. the analysis of the formation and development of the social service in a children's hospital, as well as, the study of a psychiatric hospital patient's life story.The major finding of the research is the idea that the model of social work in psychiatric institutions is incomplete in terms of organization and content. In the children's rehabilitation hospital social work is more integrated into the main activities of this institution. We analyzed the main factors and difficulties and discrepancies of the models' development in the context of reforming healthcare system in Russia.

Does Inequality Hurt? Individual and Contextual Determinants of Inferiority Feelings

Since long, social philosophers and sociologists have regarded inferiority feelings as an impairment of a good and satisfying life. Recently, the *Spirit Level Theory* (Wilkinson & Pickett 2010) has taken up this strand of thinking, suggesting a corrosive effect of (income) inequality on individuals' status anxiety – of which inferiority feelings are a key part. Status anxiety is assumed to elicit behavior that is harmful to individuals themselves and to others in society, such as obesity or drug abuse. Thereby, (income) inequality and the resulting anxiety impair not only individuals' subjective wellbeing but also the societal quality of life.

Using individual-level data for more than 30 European countries from the European Quality of Life Survey (EQLS), we investigate how widespread inferiority feelings are at the micro- and macro-level and which individual-level and societal-level determinants evoke them. We operationalize inferiority feelings as the feeling of being looked down on and not being valued by others.

Regarding the social gradient of inferiority feelings, we explore a wide range of vertical (e.g. class, education) and horizontal parameters (e.g. gender, migration background). We find strong evidence for the paramount importance of labor market inclusion and consumption for individuals' wellbeing.

As to societal-level determinants, we do find that income inequality heightens individual inferiority feelings. Contrary to one of the cornerstones of the *Spirit Level Theory*, however, we also find a dampening effect of national wealth. Looking beyond structural economic conditions our research further reveals that inferiority feelings are more widespread in societies characterized by strong cultural class divisions, and inegalitarian value climates (e.g. individual blame for poverty).

Thus, in order to improve individual quality of life, wellbeing research should have an eye on various forms of inequality, including cultural inequality.

Coordinating the Transfer Experience of Undergraduate Women in STEM from 2-Year to 4-Year Institutions

The current social and academic systems of science, technology, engineering, and mathematics (STEM) in higher education foster a persistent gender gap and an environment which is often difficult for women students to succeed in (Kreutzer & Bourdreaux, 2012; Lee, 2008). Current recommendations focus on recruitment of women into STEM fields; however, research suggests these recommendations are insufficient because they fail to address the institutional factors that lead to an unwelcoming environment for women in STEM (Linley & George-Jackson, 2013). While social and academic interventions are necessary to improve the experiences of women in STEM, they may not be successful as long as the root of the "chilly climate" is a gendered institutional culture. Additionally, the transitional experiences of women transferring to a STEM program at a 4-year institution are under documented, and the transfer process can create additional barriers for women's persistence in STEM (Jackson & Laanan, 2011).

This study uses institutional ethnography through the framework of feminist standpoint theory to uncover and describe the institutional practices of STEM education at a Southern Research University (pseudonym SU) from the perspectives of undergraduate women transferring to SU and majoring in STEM. Data collection and analysis will focus on how the interface between undergraduate women and STEM education is organized by exploring the work associated with applying to and transferring to SU and if the coordination of their everyday work creates challenges for women students (Smith, 2005; 2006). Participants will include 15-20 undergraduate women who are currently at a 2-year institution and are beginning the process of transferring or are planning to transfer to a 4-year institution and majoring in a STEM field. Multiple interviews with the participants throughout the transfer process will be used to understand how institutional policies, procedures, and discourses coordinate the work of transferring to a 4-year institution.

Is Energy Democracy Sustainable?

This earnest take on energy democracy core conceptualisations and diverse practices aims to discern both materiality and relationality of generated social inventions so far and the likely prospects in the future. It starts from the analyzed struggles of several least developed rural communities in Serbia to reclaim control over their local natural commons endangered by enterprising centralized renewable energy actors' undertakings in constructing the small-scale hydropower plants. Thereby one more argument that the negotiated transfer of sovereignty over all natural resources from states to their citizens, from national systems to their communities is better to be enacted as soon as possible for everyone everywhere. Community-led and teens-aid actions for regaining stewardship over the Earth are determined. Both smartest planners and daring well-wishers for the right governance ideoscapes to be set in place are learning hard that decision-taking practitioners habitually conduct themselves as the masons of centralized energy production violating no harm convention. The very direction of their discursive moves of overstated urgency and needed extraordinary measures for dealing with climate emergency are sickening how they serve the elites and deride every one the elites left behind. Inequalities are set the humankind on fire. But as our societal age is of our elites making our one global world is everyone's world. Consequently, satisfactory tracking and dealing with composite problems could

be only done in compound manner by inventive energy democracy energized by fiery becoming of different democracy of global humankind. And sovereign debts, U.S. dollar, VAT, plastic bags and the streak of misanthropy yet vying for social inventions.

Culture and the Economy: From Horkheimer to Bourdieu and Beyond

The critical theory of Adorno and Horkheimer, but also of Benjamin, faced the question of the relationship between economy and culture to point out a "cultural industries" that downgrade culture, as opposed to high culture and the unique oeuvre that requires effort, that preserves aura. Later on, Bourdieu accommodated the relationship between culture and economy according to the nature of the capital involved, and relegating the relationship of the "economic" economy to mass culture, while Zelizer proposes to multiply the "trade circuits" channeling economic and cultural transactions.

Beyond this reminder of the canonical forms with which social sciences take into account the relationship between culture and economy, my presentation seeks to enrich our understanding of popular culture in its close association with the economy. Accordingly, I rely on the Polanyian tripartition of the economy (market, reciprocity and redistribution) in order to avoid believing that the economy is reduced to the market alone. On the other hand, I use an ongoing inquiry of popular street festivals in the south of France to show the complexity of the mutual relations between these economies and popular culture.

Contesting Accommodations: Far-Right and Conservative Protests Against Asylum Seekers in Germany

The so-called long summer of migration in 2015 has politicized society in Germany. Many supported refugees, while others demonstrated against a growing number of asylum seekers – most prominently by protesting against refugees' accommodations. In an increasingly xenophobic environment, where right-wing movements like Pegida or the Identitarian Movement have gained momentum, it is not surprising that in general, protests against refugees and their accommodations are associated with far-right actors. However, such focus means that conservative's protests and protest participation of the so-called center of society (in a democratic, societal as well as socio-economic sense) are oftentimes ignored. To address this gap, this paper analyzes protests against asylum seekers by closely examining coalitions between far-right activists and more conservative actors.

Empirically, the paper investigates in-depth case studies of such protests that took place in both eastern and western parts of Germany. Specifically, I analyze discursive patterns in protest material, newspaper articles and interviews in order to identify potential similarities of employed tropes. I am particularly interested in the conditions for the emergence of the aforementioned coalitions in protests as well as how these coalitions process during the course of the protest. The aim of this paper is to shed light on two pressing matters of our time – that is, migration and the far-right – by examining protests against asylum seekers in a country that accepted more refugees in the wake of the so-called refugee crisis than any other in Europe, but also one that has a rich history of racism and far-right activism.

Global Unions 1989-2019: Overcoming the Weight of History?

What has kept global union organizations -some of the largest and oldest societal organizations- from spearheading an effective transnational union strategy against neoliberalism and, before that, other forces that divided unions? Is there any evidence that they are currently overcoming historical obstacles as they confront global neoliberalism? The historical record demonstrates that the weaknesses of global union organizations are due to both external factors as well as factors internal to the world of unions. Externally their member unions have long been constituted within national industrial relations and political alliances while the current rules of global capitalism facilitate the transnationalization of capital but not that of unions or other regulatory forces. Internally unions have not been able to negotiate and transcend these dynamics and remain weak confederal societal organizations that reflect the priorities of their main affiliates. Thus, there is no evidence supporting the functionalist argument that global capitalism will inexorably engender global unionism. In fact, it may engender the opposite. The emergence of global as well as transnational unionism, therefore, should be the subject of empirical investigation and this is the subject of this paper. During the last several decades global unions have undertaken a number of initiatives aiming to counteract and temper the power of capital and their members' particularistic tendencies. Two such initiatives are Global Framework Agreements and the pro-

motion of Just Transition in global climate negotiations. This paper will explore whether these two initiatives are evidence of an emergent global union politics or remain projections of national union politics through global unions.

Generational Bridges – Politics, Religion and Meritocracy in Chile's Post-Dictatorship Middle Classes

Recent scholarship on culture and stratification explores established fields of inquiry such as education (Khan 2011; Calarco 2018; Reay et al. 2011), housing (Savage et al. 2004; Savage et al. 2015; Boterman 2012), employment (Rivera 2015; Laurison and Friedman 2016), and cultural consumption (Savage et al. 2015; Lizardo and Skiles 2016); as well as new arenas of symbolic conflict such as food (Cairns et al. 2013; Best 2017; Schrank and Running 2018) and environmentally-conscious consumption (Carfagna et al. 2014; Holt 2014). This work underscores the continuing importance of economic, social and cultural capital as key assets securing privileges for dominant groups and how the affluent use seemingly "alternative" or "oppositional" discourses and practices to seek distinction.

However, individual works focus on well-established middle classes operating within a single field. In contrast, this study, based on 77 interviews with middle class couples and photographs of 31 of their living rooms in Santiago, Chile, analyzes patterns of inequality across the fields of employment, housing, education, home decoration, and cultural consumption. I argue that the privatization of education and land markets as well as trade liberalization have led to a restructuring of middle classes leading to changing symbolic conflicts and reproduction strategies. Individuals experience malaise as old stratification patterns evolve.

Upper middle-class interviewees raised in the 1960s express this malaise by contrasting their values of political commitment and religious faith with market-based values of wealth and materialism. In contrast, lower middle class individuals express faith in the meritocratic discourse promoted by Chile's dictatorship and right wing. These contrasting values reflect how economic action is shaped by political and ideological motivations. Additionally, the contrast between these middle class fractions offers insight into Chile's current political polarization.

Religion and Sports: Experiences of Iranian Professional Female Athletes

This study investigated the experiences and feelings of Iranian professional female athletes in regard to being women in a field mainly dominated by men. Iran is an Islamic country, where religion is intertwined with all areas of society. For women athletes, this means having the gender and religion categories directly influencing their professional trajectories and careers. In this research, interviews were carried out with eleven athletes from seven different disciplines in order to get to know their perceptions and the negotiations that the athletes needed to go through in order to fulfill their dreams, while still observing the Islamic regulations and following the country's state laws. This research carried out an analysis of the relation between Islam and women's sports, highlighting the requirements related to hijab and sex segregation, as well as bringing up the difficulties the professional athletes had to face in their careers due to living under the Islamic Republic. The study found that Iranian professional athletes have different perspectives with regard to the Islamic religion, with some of them reporting that they did not wish to wear the hijab and preferred a separation between the state and religion. All athletes mentioned adversities regarding precarious facilities, the lack of media exposure, and the lack of investments by the government and sponsors. The study also showed that, while contested by some, the hijab and sex segregation opened up new opportunities for women to achieve a professional career in the Iranian sports arena.

Hiperverticalização: Tracing the High and Low of Informal Rental Housing in São Paulo, Brazil

The degradation of informal housing is becoming acute amid rising demands for rental housing in slums (Gunter and Massey, 2017). In São Paulo, Brazil, almost fifty percent of informal housing stock has been converted for rental. Informal rental is not new, yet is generating emergent concerns about where and how people live in cities (Wegmann, 2014; Naik, 2015). Compounding these challenges is the fact that informal rental is almost entirely overlooked by policy, and its spatial variation (building shape and size, construction technology, and density), tenant perceptions, and community management are poorly understood (Durst, 2014; Stiphany, 2019). Drawing on a comparative study of informal rental housing

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

typologies across two São Paulo case studies, this paper aims to expand understanding about how rental markets are reshaping social and spatial inequalities in informal settlements. Spurred by São Paulo's prolific use of rental vouchers over the past fifteen years, incremental housing's rental conversions create productive intersections between densification and local economies, yet also worsen housing vulnerability for low-income families.

Offshore Oil, Energy Transitions, and Social Futures: Building Social-Ecological Wellbeing in Coastal Communities in the North Atlantic

This paper shares key lessons from our research on offshore oil development and social-ecological wellbeing in coastal communities across the North Atlantic region. We draw on multi-sited research carried out in Denmark, Iceland, Newfoundland and Labrador, Norway, and Scotland. This project combines several modes of data collection, including: interviews, field observation; web-based textual analysis, corpus analysis of news media articles, and document analysis of policy documents and other sources. Data are drawn from the oil industry, tourism industry, government, and environmental organizations from across our five cases. We argue that Norway and Denmark serve as best practices models for oil sector host communities. In these cases, we see evidence of maximizing the social-economic benefits of oil for host communities, but we also see more evidence of ecological reflexivity regarding tensions between oil development and the need to navigate an increasingly carbon-constrained world. In these cases, strong state involvement in the energy sector helps ensure social benefits, but is also leveraged to push forward renewable energy transitions and decarbonisation. By contrast, the Scottish case highlights the need to attend to issues of decommissioning oil infrastructure in post-peak fields. This emphasizes the need to take a long view of oil development and to plan for how oil host communities can successfully transition away from oil sector dependency. The Icelandic case shows that new oil exploration can move in and out of public and political visibility in response to global oil prices that make Arctic oil exploration more or less desirable. Finally, as episodes of conflict around renewable energy development highlight, there are no innocent energy systems. Rather, the social dimensions of renewable transitions are important to consider as we think about fossil fuels, energy transitions, and climate change more broadly.

New Approaches to the Study of „Middle-Classes" in Africa. the Significance of Sociocultural Milieus and/or Employment Biographies

Florian Stoll (Leipzig University)
The debate on "middle-classes in Africa used, by and large, daily income or expenditure as its defining criterion. In spite of this focus on the economic dimension, there were many reports which made claims about "the African middle-class" (African Development Bank 2011) or about expected future influence without offering data to justify such ascriptions. Moreover, many of these reports described "middle-classes" in Africa as homogeneous units.

Such economic definitions make it more appropriate to speak of middle-income strata. By disentangling the financial position from sociocultural ways of life, it is possible to break down "middle-classes" into subgroups (milieus) with specific characteristics and orientations in the same income bracket. Empirical research in urban Kenya (Neubert/Stoll 2015; Stoll 2018) showed that the milieu approach allows to develop a nuanced and more realistic understanding in an African setting than the "middle-class" concept.

This paper adds employment biographies to milieu for a more complete analysis of "middle-classes" in Africa. Jobs and work conditions are crucial for professional and private advancement. So why do people stay in certain jobs and why do they leave? Which ideas of successful careers are significant? What are the economic strategies and which sociocultural characteristics (multiple jobs, farming, state jobs as solid foundation etc.) do we encounter? The theoretical question asks which pillars of employment biographies are a) separated by milieus, b) independent from milieus or c) milieu-overarching. Examples from Ghana and Kenya are going to show some tendencies.

STONE, KEVIN* (Plymouth University, United Kingdom)

An Emotional Rollercoaster: The Involvement of Families during Compulsory Hospital Admissions in England.

The Mental Health Act 1983 is the primary legislation used in England and Wales, when a person needs to be detained in a psychiatric hospital for assessment and/or treatment. The Act allows for a 'nearest relative' to be involved in key aspects of the person's care and treatment, including decisions around detention in hospital. The role is intended as a counter-balance to professional powers in the Mental Health Act process.

Theories of family burden have been used within sociology to understand 'objective' burdens of caring. However, the subjective experiences of carers often remain under-explored. This presentation draws on data from twenty interviews with nearest relatives across one region in England.   Nearest relatives provided their experiences of acting as such and the accompanying emotions they experienced.   Participants identified several negative emotions such as fear, betrayal and powerlessness. However, several positive emotions were highlighted such as a sense of duty and gratitude for being identified as the Nearest Relative with its resultant legal powers. Whilst the Nearest Relative role was experienced as stressful, the findings challenge presumptions that caring is predominantly experienced as a burden.

STORME, EVELIEN* (University of Leuven, Belgium)
DE LANNOY, ARIANE* (University of Cape Town, South Africa)

Into the World of Work: Multidimensional Employability and Lived Realities of Youth in South Africa

Employability depends on and shapes a wide range of circumstances in a young person's lifeworld. We take a mixed method approach to build a multidimensional understanding of employability and look into individual attributes as well as vulnerabilities in a young person's home environment and neighbourhood which, in Post-apartheid South Africa, continue to heavily impact labour outcomes.

In the quantitative tier we draw on a multidimensional employability index following the Alkire and Foster method to identify, measure, and map youth and the intensity of multiple vulnerabilities they experience towards employability, using Census 2011 data (Statistics South Africa 2012). We also draw on extensive qualitative fieldwork in two deprived Cape Town communities – Hangberg and Manenberg - to capture the world of work available to youth and how they navigate opportunities and challenges therein.

Our findings indicate that employability largely depends on various forms of networks and to a lesser extent on individual attributes such as education and health. Young people in employment are less likely to be multidimensional deprived in employability compared to those who are unemployed, discouraged or economically inactive. However, an important finding is that for those who are multidimensionally deprived, the composition and intensity of the deprivations are nearly identical irrespective of their employment status. Young people's experiences of – mostly precarious - work, similarly point to realities where employment and search statuses are fluid, temporary, and where "a job" is mostly unable to provide material and immaterial security in youth's livelihoods. This reality contrasts stark with their high aspirations of "a proper job one day". We argue that the most vulnerable youth in the labour market would be better served by moving away from discourses on youth employability centred around binary categories such as employed/unemployed, and formal/informal, in support of a transversal focus on their lived realities.

The Eclipse of Reason in Critical Theory? Contemporary Irrationality and Habermas' Recent Reconceptualization of Modernity

In Critical Theory rationality has traditionally served as the standard for assessing social pathologies. At the same time, the critique of reason has occupied a central role in Frankfurt School social theory. While early approaches have taken issue with a 'wrong' type of reason that has shaped societal development,

　　　　　　　　　　*** denotes a presenting author.*** Abstracts are organized by first presenting author's last name.

Habermas' reconceptualization of the tradition has instead advanced the idea of distorted or one-sided rationalization accounting for social malaises. The three-dimensional concept of reason he has explicated grounds an elaborate theory of societal rationalization. His more recent work culminating in the monumental "This Too A History Of Philosopohy" appears to partly retract this theory and seems to confirm many of the reactions to his considerations on the role of religion in modern society which has repeatedly found his attention over the last two decades. This paper thus revisits the notion of rationalization in critical social theorizing and argues that Habermas' recent explorations on the topic are indeed best understood as a reaction to contemporary society, however, without substantively altering the theory of rationalization and the description of social pathologies as pathologies of reason.

STRECKER, DAVID* (Goethe University of Frankfurt, Germany)

The Other Side of Global Capitalism: Shifting the Misguided Debate on Interconnected Labour Relations and Contemporary Slavery

Unfree labour has recently generated intense academic research. While two decades ago publications focused on raising awareness, the fact that unfree labour persists has today become generally acknowledged. The debate focuses on the relationship of unfree labour and its conditions. The one position argues that local factors are decisive for the occurrence of unfree labour. Most do not deny that it feeds into global commodity chains. Yet they locate its main cause in an insufficient institutionalization of capitalist production due to legal and political shortcomings on the national level. The other position identifies capitalism as the root of the problem. They claim capitalism to be compatible with unfree labour or, in some versions of the argument, to require unfree labour. The political consequences are clearly manifested in the ILO's policies which. Operating on the dichotomy of free vs. unfree labour, it is faced with scorching criticism. This paper argues that the current debate is misguided and tends to either immunize today's major counter-slavery programs against valid criticism or instead to fruitlessly opt for vague and unrealistic alternatives. After sketching the debate and then arguing that capitalism is indeed compatible with unfree labour, the bulk consists in substantiating the claim that the question of whether capitalism requires unfree labour is practically irrelevant because, firstly, conditions under which opportunities for preventing the taking advantage of unfree labour by means of legal and political control do not present a realistic alternative (in addition to not being compatible with liberal principles); and, secondly, legal and pollitical initiatives have been partially successful. The first is illlustrated by looking at bonded labour in India, especially newly developed forms; the second by looking at Brazil. The paper thus argues for a pragmatic approach that takes a principled caveat seriously and confronts the promoted strategies with their shortcomings.

STRELTSOVA, EKATERINA* (National Research University Higher School of Economics, Russia)
DOLGOVA, EVGENIYA (Russian State University for Humanities, Russia)

"Welcome to the Club": The Position of Females in Science of the Early Soviet Period

Formally, the 1917 Revolution solved the gender issue in Russian science and opened the doors to the profession for females. Before, in the Russian Empire, women had the right to higher education, but were not given diplomas to prove the status. This deprived them of the opportunity to apply for research and teaching positions. The restrictions were eliminated by a law passed in 1911, and the Revolution continued this track. Thus, the 1920s was the period when females were officially admitted to 'the club', but in academic literature a critical question still stays unanswered: Have the institutional changes of the early soviet period helped the immediate inclusion of women in science, or just transformed 'the stone walls' into 'the grass celling'?

The paper is an attempt to answer the question with a use of socio-demographic analysis of the female academic community of the two largest Soviet cities – Moscow and Leningrad. Empirically, the study relies on unique archived data and uses several sources of information, including the census of 'research workers' in the late 1920s, the documentary materials on the social and demographic characteristics of females employed in universities and research institutes, information on their position in science and higher education, publication activity.

As a result of a statistical analysis of this data, the paper discusses the structure of the soviet female scientific (sub)community at the early stages of its formation, and reflects on whether women were actually awaited for and welcomed in soviet science, and – what is even more important – what were the aspirations of these newcomers of 'the academic club'.

Controversies about Female Focus and Conditionalities of the Bolsa Família Program in Brazil: Domestic Gender Relations, Motherhood and Violence

The Bolsa Família Program (PBF) is a Brazilian public policy of conditional cash transfer to families in poverty and extreme poverty. In its operation, the people who benefit from the Program are mostly women, and they also have to comply with the conditionalities involving the health and education of children and young people dependent on them. Therefore, arguments argue that the PBF contributes to produce a type of ratification of maternal and female social functions, reaffirming traditional gender roles. In this work, the product of a doctoral thesis in development, we analyzed the meanings these criteria represent for women in their domestic relations. This is a qualitative research developed in different socioeconomic and ethnic-racial contexts of the Brazilian scenario: Porto Alegre, in the state of Rio Grande do Sul, and Juazeiro, in the state of Bahia. The research was conducted through in-depth interviews with women who were in the program and who were passing or had a history of domestic violence. The results evidence the controversies surrounding the female focus and the conditionalities of the Bolsa Família Program in Brazil, considering gender relations, the exercise of motherhood and situations of domestic violence.

Unconditional Public Prosecution Under the Maria Da Penha Law in Brazil: From Legal Determination to Practices in a Women's Police Station

The Brazilian law 11.340/2006, popularly known as the Maria da Penha Law, represents an advance in the development of broad and integral policies in confronting cases of gender-based domestic and family violence against women in Brazil. However, evidence points to the failure of actions beyond the judicial scope, where punitive mechanisms are continually reinforced. In this context, the definition of cases of physical violence as Unconditional Public Prosecution reaffirmed in 2012 by the Federal Court of Justice (Supremo Tribunal Federal), is one of the mechanisms that reinforce the punishment of the Maria da Penha Law and has implications for the possibilities of women's autonomy in the criminal process. In such cases, the Public Prosecutor's Office (Ministério Público) is the complainant. As a rule, it is not up to women to decide on criminal representation. This paper is a product of empirical research that investigated the manifestations of renunciation of criminal representation by women who reported cases of conjugal violence in a specialized police station for women in Brazil. It presents the inconsistencies of this application in practice, as well as the women's perceptions and strategies in these situations. The results reveal how the relationship between state responsibility and women's autonomy develops in this space permeated by power.

The Social Organisation of Silvopastoral Projects in Columbian Amazon: Is This a Way to Protect the Forest?

This presentation is based on a research project in the Colombian Amazon where we are using Institutional Ethnography to explore how silvopastoral (or agro-ecological) projects, offered to small scale farmers, are organised locally, nationally and internationally with important participation from global markets. This is a contentious geographic area, rich in mining resources and with potential for cattle ranching and agriculture.

However, how does the offer of these projects fit with the conservation of the Amazon, and what is the message they are sending in the name of 'sustainable development'?

This presentation seeks to prompt reflection on how to protect the forest and suggests that major networks of solidarity and coordination across scales (local, national, regional and international activist groups) are needed if we aim to protect what is left of the Amazon.

Pathways of Public Sociology in Nepal

The emergence of sociology as a science offering universal knowledge about social structure, social relationship, and social change regardless of the specific historical context became a fertile ground for scholars attached to particularism, which appealed to those who sought to challenge the hegemony of Western Sociology roughly after the 1950s. From the 1970s, after the introduction of the noble concept 'Third World' in social sciences, World System analysts took the initiative to minimize the dichotomy between universalism and particularism urging the dissolution of sociology into a broad social science. The dissolving of sociology into a broad social science would be suicidal for some sociologists as the dissolution takes away the disciplinary heritage of sociology; hence, they advocated for advancing sociology as global sociology the backbone of which could be the public sociology. Such an endeavor was supposed to offer two advantages; the bridging of gap between universalism and particularism, and the defending of discipline from other subjects including the market fundamentalist character of economics and the state authoritarian ideas of political science.

The possible threat of encroachment of sociology from other subjects was quickly realized by Nepali Sociologists in 2015 at a time Tribhuvan University (TU) was prepared for dissolving different subjects into a broader Social Science Department. They established the Central Department of Sociology as an independent department within the TU after splitting with its three decades-long collaborator Anthropology. At this juncture, this paper identifies the key issues that the public sociology is expected to cover and crosschecks whether such issues are inserted within the curriculum of sociology at the TU. Opinions of teaching faculties, members of the Sociology Subject Committee, and curriculum developers are reviewed to confirm the direction sociology is taking. The paper concludes that the incorporation of public issues can only help the subject stay alive.

Knowledge and Social Learning in Management of Environmental Problems in Cities. a Research Perspective for a Better Understanding of Environmental Policy Probelms.

Today's environmental challenges require changes in local management systems, complex approaches involving different stakeholders, tools, social processes and policies. Participation is one of the tools that becomes the basis for decision making and create adaptive management capacity in the area of environmental management. Participatory environmental governance or adaptive govrnance describes an approach in which the use of different instruments creates opportunities to involve stakeholders, share knowledge and make decisions together. In this model, social and environmental system solutions become a multi-stage social process in which the stakeholders involved must learn to improve existing solutions and procedures or take action to change their strategy through participation in decision making policies [Hurlbert 2017]. Therefore, researchers combine participatory approaches with social learning processes [Koontz 2014]. Most often they focus on the process of social change affecting individuals and social groups. However, change related to environmental management depends not only on individual practices, but also on larger changes in institutions and infrastructures or technologies. Speaking of social learning as a policy instrument, there is a particular understanding that it is seen as something that can be physically captured as a tool for building or executing policy [Ison et al., 2011, Woodhill 2002]. In this presentation I will propose a methodological approach to the study of social learning, relationships and knowledge management in participatory environmental management. Social learning will be a field for synergy of perspectives in the co-production and use of knowledge by different stakeholders and its translation into institutions and infrastructures. The presented methodological concept, which I will apply in my PhD thesis, will complement the current gaps of empirical research on the relationship between the social learning process of individuals or groups and the expression of this process in environmental management and the use of this mechanism for real adaptive change.

Support for Social Policies Among Communities: A Computer Simulation Approach to Divided Opinions

This presentation aims to explore the formation process of social opinions in divided communities. Political polarization can be found on various levels, and previous studies have clarified the formation processes of political polarization mainly among individuals by focusing on the effects of interpersonal influence and social network patterns. However, political polarization can also be found at the regional level. Therefore, we need to determine the formation and change processes of the polarized opinions at the community level and explain the relationships among the patterns in these changes at the individual and community levels.

To do so, this presentation analyzes support for social policies by using *The National Survey of Social Stratification and Social Mobility in 2015*. Through this analysis, the community effects of social changes and the support for social policies are specified. Next, this presentation implements a computer simulation to visualize the changes in support for social policies by using software R. Through this simulation, the effects of aggregating support for social policies are demonstrated.

The results clarified the following facts: 1) As globalization and population aging simultaneously proceed in society, variances in support for social policies between individuals have widened gradually. 2) Similarly, the variances in support for social policies between communities have widened. 3) Nevertheless, there is a clear discrepancy in the patterns of the changes in support for social policies between the community and individual levels. Extreme polarization patterns appear at the community level, whereas extreme polarization does not appear at the individual level. Rather, the diversity of social opinions at the individual level tends to remain stable.

Based on these facts, social changes might generate extreme polarization at the regional level. Moreover, such polarization might often be unrecognized by individuals in society because they observe diversified opinions at the individual level.

The Digital Divide in Europe - a Comparative Analysis of Socially Patterned Inequities in Digital Skills

Digital skills are critical for individuals to fully participate in economic, political, and social life and for firms to draw on high-quality human resources, yet they are unequally distributed to the detriment of individuals and countries. Our research aims to identify who is digitally included/ excluded in Europe and explain why. We investigate the factors underlying the digital gap (referred to in the academic literature as the digital divide). For this purpose, we test and extends the Dutch sequential model of Internet access proposed by Van Deursen & Van Dijk (2015) to relate Europeans' internet attitude, material access, digital skills, to the internet uses. The data were provided by the EU on the information society in 2016. To estimate the model, we employed a partial least squares structural equation model (PLS-SEM), and for identifying the social distribution of the digital divide, we have partitioned the sample into four models using the algorithm called pathmox, all implemented in the R language. We have found evidence that favors the sequential model of internet use, but also that the Europeans can be divided into four groups according to the strength of the causal links that explains their use of the internet. Three social indicators were identified as the ones that best account for differences in the global sequential model. First, Education separated Europeans according to their level of education, second, highly educated Europeans were divided according to their age (being 64 the age that separates them), third, medium-low educated Europeans were divided according to the digital development of their country, digital leaders and followers versus the rest of European countries. Our findings provide European information society planners with the evidence necessary to guide decision making regarding new policies designed to bridge the digital gap, reduce digital inequalities, increase digital skill levels.

Obstacles to Emancipation or Agents of Change? Muslim Religious Leaders Response to Adopting a Reconciliation at All Cost Approach in Dealing with the Issue of Domestic Violence Experienced By Muslim Married Women

Muslim Religious leaders have over the years, come under serious scrutiny with how they deal with the issue of domestic violence experienced by married women in the community. As part of my doctoral research that looks at Muslim Religious leaders views on Domestic Violence Experienced by Muslim Married Women, religious leaders was one of the core issues that was with discussed religious leaders who took part in the study. Using a qualitative research methodology, thirteen religious leaders were interviewed using snowball and purposive sampling. One of the pertinent themes was the issue of reconciliation at all cost. Some completely disagreed with this view. Others indicated that reconciliation is a first response but not all costs. Due process needs to be followed to determine

the seriousness of the case and the validity of accusations put forward by women claiming to abused. They also need to consider economic resources available to women should they leave the marriage. Sometimes victims regret asking for a divorce. While they consider these issues, they put a time limit to the process after which they will provide advice to women on whether to stay or leave file for divorce.

Cultural Capital, Mental Health and Life Stress Among Canadians: A Bourdieuan Perspective

Medical sociologists have divergent opinion on the relationship between class, health and lifestyle and the influence of knowledge related to health on the subsequent behavior. The present study examined the association between educational attainment and mental health care seeking behavior among Canadians. The self-perceived life stress (SPLS) was examined as secondary outcome and assessed as a potential mediator. We employed Bourdieu's concept of *cultural capital* and *habitus* to examine if educational attainment is associated with consultation to mental health professionals and to what extent this association is mediated by the SPLS.

We extracted data from the Canadian Community Health Survey 2015-16: Annual Components. The survey followed a multi-stage stratified sampling and collected information from 130,000 respondent aged 12 years to 80 and above years old using computer-assisted personal interviewing. Multiple logistic regression and binary mediation technique were employed for statistical analysis of 106,563 final analytic sample.

Of 106,563 respondents, 14.2 percent of them consulted with mental health professionals in the last 12 months about their mental and emotional health. The likelihood of consulting about emotional and mental health with health professionals was higher among individuals with post-secondary or university certificate compared to individuals with less than secondary school graduation (AOR 1.20 95% CI: 1.07 to 1.34, p= 0.001) after adjusting for potential covariates. This association was mediated by SPLS and 37% of the total effect was mediated by SPLS.

Evidence suggests that *cultural capital*-educational attainment as a structural component determines respondent's consultation about their mental and emotional health issues with the mental health professionals. Moreover, SPLS as an agency indirectly and directly influences the effect of *cultural capital* on individual's consultation behavior.

Indonesian Labour Policy and Regulation for the Protection of Migrant Workers: Intersections of Its Nature As a Sending Country and Its Obligation As a Member of the Free Trade Community

Indonesia is a country in South East Asia, which is part of a global community. It is also a member of the Association of Southeast Asian Nations and the World Trade Organization. Subsequently, Indonesia must open its labour market, notwithstanding internally its unemployment rate was 5.01 percent in the first quarter of 2019 (more than 8.5 million people did not have occupation). For decreasing its unemployment problem, Indonesia must enlarge its job opportunity, and one alternative solution is by sending Indonesian migrant workers to foreign countries. In ASEAN regions they mostly work in Malaysia and Singapore. Indonesia is both, sending and receiving country, even though the number of Indonesian workers work in foreign countries is much higher than the number of foreign workers who work in Indonesia.

Indonesia has ratified the International Convention on the Protection of the Rights of All Migrant Workers and Members of Their Families. Thus, Indonesia must apply the standard of protection arisen by this convention for foreign workers in Indonesia. Unfortunately, based on *lex loci laboris* principle, the law of Indonesia will not be applicable to protect Indonesian migrant workers who work in foreign countries. Malaysia and Singapore do not ratify this convention, while some provisions in Indonesian law provide better protection than in the two countries. As an example, the maximum working hours per week in Malaysian law is 48 hours, in Singaporean law is 44 hours, while in Indonesian law is 40 hours. This paper will scrutinize the minimum standard of protection that has been provided by the Migrant Workers Convention, to compare it with Malaysian and Singaporean Law. A conclusion about what should be done by Indonesian government to protect its nationals, wherever they are working in, with equal protection as it is enjoyed by foreign workers in Indonesia.

Gender, Urban Social Movements and Struggle for Housing from an Interpretative and Biographical Perspective

Housing deficit in Brazilian major cities reaches significant portions of impoverished population. Considering the intersection between different constraints suffered in the formal and everyday spheres, it is not surprising that data reveal the special impact of adequate housing deprivation on the lives of poor urban women. Given the specific context of women living in squatted sites in Brazil, this study sought to understand how they experience and interpret their struggle for adequate housing and right to the city. For this purpose, participant observation and biographical interviews were conducted with women living in squatted buildings and engaged in housing social movements in the city centre of Porto Alegre, Rio Grande do Sul. The applied methodology is supported by Alfred Schütz's phenomenologically grounded sociology, and by Gabriele Rosenthal's biographical approach. Among the main findings, an intersectional framing to the problem between housing and gender is presented, offering an interpretative perspective as solution for methodological limitations within these studies. Secondly, the empirical investigation points to space as a specifically and essential element composing narratives and trajectories, being part of how interpretations are built and transformed throughout the analyzed biographies and along with spatial and urban changes. Biographical and everyday negotiation processes between traditional values and new political emergent, as well as the housing struggle as a "means" and the struggle as an "end", are the final resulting elements from this investigation. Analytical highlights from participant observation and biographical case reconstructions are presented.

Struggle over Legitimacy: Decentralizing the Language of Recognition

As the recent dialogue between Jacques Rancière and Axel Honneth illustrates well, the language of recognition is questioned seriously in contemporary critical theory (Genel and Deranty eds. 2016). The language of recognition has provided the dominant framework for critical theoretical take on contemporary social movements of marginalized peoples. They have generally been described and analyzed as struggles that aim to get recognition (of political existence, rights, social importance etc.) from mainstream societies, hopefully resulting in transformation of status quo. However, as Rancière has provoked in using the concept of dissent, some relevant voices cannot be heard in the democratic sphere of recognition, calling into question the legitimacy of the sphere itself.

Focusing on Indigenous counter actions taking place in Canada, this paper contends that an important aspect of social movements of marginalized peoples cannot be perceived in the framework of recognition, and it provides an alternative theoretical language by which we can better capture the aspect: the language of legitimacy. While oftentimes the legitimacy of settler colonial governance is taken for granted, it is dubious for Indigenous peoples who have lived on the land where settlers stand from well before their settlement. Therefore, in many cases, contemporary Indigenous actions not only seek for recognition by settler polity, but also questions its legitimacy itself and claim Indigenous authority over land. In the face of such contention, the framework of recognition, which presupposes the fundamental legitimacy of current polity, only goes halfway toward explaining the issue. Regarding this lack in critical theoretical toolkit for analyzing social movements, the paper aims not at complete denial of recognition framework but to decentralize it with the language of legitimacy.

Working Conditions, Employment Status, Labour Market Regulation and Health: A Cross-Country Multi-Level Study

Various forms of temporary employment has been on the rise in OECD countries since the late 1980's. It's been argued that temporary work set individuals

in economic insecurity and poor working conditions. Therefore, temporary work is thought to be negative for health. However, findings are inconclusive. Whereas some studies do report worse health among temporary than non-temporary workers others report the opposite. Differences in findings might be explained by the fact that some studies considers socioeconomic position and job characteristics whereas others don't. It's also been argued that a key explanation for inconsistent findings might be differences in welfare policy across countries. The aim of this study is to investigate the association between temporary work, working conditions, welfare policy and self-rated health and well-being. This is done in a cross-sectional multi-level analysis of the 5th wave of European Working Conditions Survey including 22 European countries with control for proportion of GDP spent on active (ALMP) and passive (PLMP) labour market policy respectively.

The results show no significant association between type of employment, ALMP, PLMP and self-rated health. Working conditions and socioeconomic position are significantly associated with self-rated health. There is a significant negative association between type of employment and well-being such that those in temporary employment report lower well-being than non-temporary employees. A positive interaction between PLMP and temporary employment means that PLMP is positively associated with well-being for those who have a temporary contract. The strength of the association between temporary work and well-being decreases after adjustment for working conditions and socioeconomic position. ALMP is not significantly associated with well-being.

Conclusion: Temporary work is negatively associated with well-being, but not with health. PLMP buffer the possible negative impact from temporary employment whereas ALMP do not seem to have the same importance. However, the cross-sectional design calls for further studies

Structure, Institutions and Organizations: Intricacies of Climate Change Policy Network in India

The present study, from the perspective of the sociology of the environment, examines the extent to which Treadmill Coalition discourse explains the pattern of coalition transpiring in the field of Indian climate change policy network. The data for the study was collected from a survey of 78 organization engaged in Indian climate change policy network. Responses were obtained from a list of potential organizations active in climate change policy, with whom respondents had a long-term mutual alliance. Social network analysis was employed to analyze the network of collaboration among organizations. The findings of the study illustrate that the Treadmill Coalition discourse is found to be appropriate in the context of Indian climate change policy network. A high degree centrality and density of network between the business group, labor union and governmental organisation manifest the dominance of theses tripartite system in the field of climate change policy in India. Moreover, the finding is also underpinned by the clustering coefficient, which was found to be higher than the overall density. Most importantly, the study also finds that there a few governmental organizations, which have a significant stake in climate change policy but remained isolated from the network. This pinpoints a lacuna in Indian climate change policy network and to a greater extent a possible reason responsible for the under-performance of India vis-à-vis other countries concerning climate policy formulation. With national and international negotiations underway on climate change policy, the present study appears to be significant in exploring the nature of domestic climate change coalitions network in the Indian context. Moreover, the findings of the study will guide policymakers to lay down a more comprehensive and inclusive framework that would widen the ambit of participation.

New Value Imaginaries for Young People and the Future of Work

How do young people imaging their lives in the future? What is their view of work and how is this shaped by the place they occupy in hierarchies of domination perpetuated by race, class, gender and geography? What role do we need to play as sociologists in understanding, explaining, and innovating when it comes to discussions about young people, their passage to adulthood, possibilities of social alienation, and the future of work in a technological age? If we leave it to traditional pundits we are likely perpetuate a singular focus on skills development and entrepreneurship and miss out provoking and stimulating (1) new work imaginaries for how young people find their place in technologically driven spaces of innovation; (2) new education imaginaries that disrupts past failed practices; and (3) new value imaginaries that bring into focus the unsustainable relationship between profit, growth and dystopian futures.

SWIREK, KRZYSZTOF* (University of Warsaw, Poland)

Alienation Outside Oppression – Rethinking Alienation in Neoliberalism

The core mechanism described by alienation theory in its canonical form (as found in works of Adorno, Horkheimer and Fromm) was oppression inflicted upon individuals by vast hierarchical social institutions. Authoritarian institutions demanded authoritarian subjects. Neoliberalism is different – it promotes not hierarchy, but flexible 'networks', and makes the vision of worker as a cog in the machine obsolete. The model neoliberal workers must be active, self-controllable and 'passionate' about their assignments, even if their work is as repetitive as the old conveyor-belt-type tasks. This neoliberal model doesn't make alienation theory out of date, but it demands a shift in focus from oppression of social institutions towards the dialectics of self-alienation of the individual – a move towards understanding how alienation is rooted in subjective structures and inflicted by subjects upon themselves. In my presentation I would like to sketch an outline of the contemporary forms of alienation structured by three main theses: 1) that contemporary alienation operates not by way of coercive rules but by way of creating incentives towards action – coercion takes form of 'objective necessity'; 2) that contemporary experience of alienation on the subjective level takes form of anxiety and panic, and not of frustration or boredom; 2) that neoliberalism in fact still fosters 'authoritarianism' - but not as the desired type of personality, but as a dialectical by-product and reaction towards an all-encompassing insecurity.

SWIREK, KRZYSZTOF* (University of Warsaw, Poland)

Social Media and the Dynamics of Imaginary Register: Is It Possible to Move Beyond Mimetic Crises?

In recent years a new type of social bond is on the rise. It's technically mediated and establishing image as the privileged medium of presenting oneself to others. Both technical mediation and the image are crucial especially for the dynamics of 'following' - special type of relationship between social media celebrities and their public, relationship that constantly slides between fascination and/or hatred. These media-related social bonds can be described very fruitfully by psychoanalytic theory of the Imaginary as a certain register of subjectivity. According to Lacan, our identifications are enabled by certain images that serve an important role in our subjective structures: they provide us with a model for action and draw affective engagements. Those images, important as they are, always include 'misrecognition' and are affectively volatile: they engage subjects in forever-unresolved play between fascination and hate, where the imagined beloved object can instantly transform into abject refuse. These imaginary identifications that stimulate love and hatred are devoid of distance that is crucial for stable social bonds and therefore produce recurrent 'mimetic crises'. Answer to this situation is to be found in the distinction between the imaginary and symbolic registers in Lacan's theory: meaningful relations between individuals are possible only if one is able to transcend the affective logic of the imaginary and move towards structures of symbolic identification.

Automated Interpretation of Political and Economic Policy Documents: Machine Learning Using Semantic and Syntactic Information

We develop a general understanding of how state agencies' policy announcements are interpreted by taking streams of policy announcements and interpretations, annotating the interpretations by hand, then using machine learning (ML) and natural language processing (NLP) techniques to develop a model which generates annotations from announcements. We use streams of two different types of policy announcements, each for two countries (three in total), one on foreign policy related issues and the other on central bank monetary policy; we also use streams of one particular type of interpretation, namely journalistic accounts in ideologically different newspapers; and we annotate the journalistic accounts in terms of attributed motives, conditional predictions, and other ways in which interpreters typically gloss policy announcements. We then use ML techniques to develop and train deep learning models of textual entailment and inference which use syntactic and semantic (both in general and for specific domains) information in the announcement texts to map from announcements to annotations. The models distinguish between issue-specific and country-specific features of interpretation of policy announcements and more general, cross-domain features, such that the latter can be applied to other issue domains. The paper brings

together expert knowledge on sociology, political science and economics (particularly domain-specific knowledge about foreign policy and monetary policy) with methodological skills and expertise in computational linguistics; it involves disparate tasks ranging from collecting archival materials through to the development and application of textual annotation schema and the development of computational models of textual entailment.

Providing Mental Health Services on the Fringes of the System: The Challenges for Community Mental Health Care in the Favelas of São Paulo

Introduction: Over the previous 30 years, Brazil has built a major health system (SUS) aiming to provide universal healthcare for all its citizens. The process of building the system is mostly completed and the SUS provides healthcare in most of the peripheries were many poor people live. Together with this achievement, a new issue has emerged. This is associated with how to ensure that adequate caring arrangements are offered, without which treatment for many health conditions can't work. Ensuring arrangements of care is particularly challenging in contexts of precariousness where health and social problems are intrinsically connected.
Aims: To identify how interweaving health and social problems surrounding care provision are conducted in primary care settings and with which dilemmas healthcare workers are confronted with when tinkering responses to mental health disorders in the favelas of São Paulo.
Methods: Participant observations in two family healthcare teams of two basic health units in the district of Sapopemba were performed. Over the period of 3 months researchers participated in home visits, case discussions and technical supervision meetings of both teams. Twenty in-depth interviews with community health agents, health practitioners and service managers were performed.
Discussion: The development of the SUS is based on the conception that solutions to health problems could be achieved by providing biomedical services and by ensuring treatment. Yet, in the context of the favelas, marked by structural deficits and precariousness, sustaining care is still a major challenge with which professionals have few tools to cope with. Primary care often faces shortage of resources and professionals lack structural competencies to deal with health and social problems that interact in a complex way. In these situations, community health workers feel confronted with unsurmountable circumstances. In such occasions strategies for dealing with these social/health problems often recur to stigmatization and authoritative decision-making.

Disparities in Medical Research Participation: A Case of Cannabidiol Therapy Trial

Racial/ethnic minority and low-income patients are less likely to enroll in clinical trials and access novel therapies through that route. Further studies are needed to identify gaps in enrollment by disease type, in order to tailor interventions. To illustrate the problem, we examine the social characteristics of patients with treatment-resistant epilepsy (n=167) enrolled between 2015 and 2018 in an open-access cannabidiol (CBD) trial. Minority status was defined as black or Hinospanic/Latino. Socioeconomic constraints were assessed with income <$40,000/year, money strain, and problems with affording food and medications. Analyses included cross-tabulations with Chi-square tests (alpha=0.05). Approximately 16% of the study participants were black/Hinospanic, 33% had incomes <$40,000/year, 25% reported money strain, and 16% and 10%, respectively, reported problems with affording food and epilepsy medications. The minority enrollment progressively increased from 8% in year 1 to 32% in year 4 of the study (p=0.028). The

proportion of low-income and financially-strained patients also increased (e.g., 25% to 32% of low-income patients and 8% to 14% of patients experiencing money strain enrolled in the study between years 1 and 4), but the changes were non-linear, resulting in non-significant p-values. The study showed that few minority patients enrolled in the initial phase of the study, suggesting better/more rapid access to clinical studies and novel therapies for white and other privileged racial/ethnic groups. However, over time the access appeared to ease, with enrollment being more inclusive and resembling the racial/ethnic makeup of the study location. Stronger outreach to racial/ethnic minority patients in early phases of research is needed to offer more equitable access to trials and novel therapies. Further studies using larger samples are warranted to clarify the role of individual and family level economic resources in clinical research participation and potential intersections between minority and socioeconomic status.

Social Determinants of Epilepsy Care Among US Adults: The Role of SES and Health Care Access

There are significant social barriers to optimal care and health outcomes for people living with epilepsy (PWE). Disparities in medical/surgical treatment and disability have also been documented, but contributions of factors such as socioeconomic status (SES) or access to care are not well understood. Guided by the Social Determinants of Health framework, this study examined the role of SES, race/ethnicity, and health care access in receiving epilepsy care and using antiseizure drugs (ASD). We hypothesized that, among adult PWE, low SES, minority status, and no insurance would be associated with reduced likelihood of visiting a neurologist in the past year and taking ASD. We also hypothesized that PWE living in low-service areas would be less likely to visit a neurologist, due to regional variations in availability of epilepsy services. A sample of adult PWE was derived from the National Health Interview Surveys (2013, 2015, and 2017, in which epilepsy information was available). Nested logistic regression was used to estimate associations between social factors and two outcomes: neurology visit and ASD use, controlling for seizure frequency, age, and gender. Among PWE, 30% lived in poverty, 20% had no high school diploma, 24% had no insurance, and 25% were black or Hinospanic/Latino. Thirty-seven percent had seizures, 40% saw a neurologist, and 52% were taking ASD. In a multivariable regression analysis, poverty (OR=.66 [.10]) and low-service regions (ORs=.44 [.08]-.57 [.10]) were associated (p<.05) with *lower* while college education (OR=1.59 [.34]) and private insurance (OR=1.37 [.19]) were associated with *higher* likelihood of neurology care, equal of other factors. ASD nonuse was associated with poverty (OR=.64 [.09]) while public insurance was associated with use (OR=1.46 [.21]). Race/ethnicity indicators had no associations with either outcome. The findings highlight SES/access-based disparities in epilepsy care/treatment and call for stronger social and health policies/programs to enhance health/healthcare equity.

A Climate Change Module for Introduction to Sociology Classes

Introduction to Sociology courses are meant to show students the **relevance** and the **power** of Sociological thought, and to help them better understand the important issues of our time.
Today (in spite of the current, obviously pressing importance of the covid19 pandemic), climate change looms, in the long run, as the greatest threat to the well-being of human societies. However, a content analysis of today's bestselling Introduction to Sociology textbooks finds that climate change is largely missing from them.
In this presentation, I display and explain a teaching module that I created for professors and instructors who would like to add climate change content to their Introduction to Sociology courses.
The teaching module is live, online at: *https://teachingclimate.sites.ucsc.edu/*

Biography and Leadership. A Biographical and Discourse Analysis of Indigenous Women in Paraguay

Indigenous women in Paraguay have a long history of reclaiming their rights and condemning the different forms of violence they suffer, namely land privation, lack of access to basic services (such as health and education), and criminalization of protests. Such difficulties gain a particular meaning against a historical background where their claims saw almost no political response, an indifference which was backed up by discourses minimizing their existence, denying any discrimination whatsoever and delegitimizing their claims and ways of living. Nevertheless, indigenous women are challenging that historical indifference by gaining more and more visibility within and outside their communities and even beyond national borders through leading political action and organization. My research question is therefore based on the biographies of women from indigenous communities in Paraguay who are leading political processes to claim their rights: I ask how they deal with discourses that refer to their positionality in different fields. To answer this question, I have carried out biographical narrative interviews and used discourse analysis.

In this paper I present the first results of my ongoing research project, in the form of a biographical case reconstruction which illustrates how women from indigenous communities in Paraguay narrate their biographies, and how they articulate action to overcome conditions of vulnerability and intersectional discrimination. In order to give an accurate account of the research participants' own perspectives and conditions of becoming, I will also place a focus on historical processes that enable the reconstruction of context and cultural frameworks (Rosenthal 2012).

Against Pragmatism, "Paradigm Wars" and Mixed Method As "Third Way": Overturn the Look

The contribution intends to overturn the vision from which the reflection on Mixed Methods starts. To confer the same dignity to qualitative and quantitative approach, in fact, we should stop to question the validity or the theoretical-practical position of MM, and adopt instead the two fundamental paradigms that have always guided social research from an unitary perspective.

MM are considered on the one hand a simple empirical practice, on the other a possible ontological and epistemological revolution for the future of social research (Green,2015). In any case, they are usually defined as the "third way": but are we certain that it is not the only one?

The contribution reports practical examples which highlight how both the approaches usually considered quantitative (e.g. experiment; Amaturo,2012) and those usually qualitative (e.g. ethnography; Mauceri,2019) have been combined with different methods and techniques, not only recently, but even since the dawn of empirical social research. This demonstrates how the distinction between the two paradigms, in the concrete practice of research, has never been so clear (Cipolla,De Lillo,1996; Campelli,1996; Agodi,1996; Tashakkori,Teddlie,1998; Onwuegbuzie,Leech,2005; Bryman,2006; Dezin,2010; Hesse-Biber,2010).

Quantitative and qualitative methodologies have been functional to the development of specific lines of social research and of the methods and techniques that characterize them, but with the increase in complexity, the rapidity of the ongoing changes, the software improvements, the size and nature of the data available today, this distinction is less and less functional (e.g. studies by Hesse-Biber,Griffin,2013; Alexander,Eppler,Bresciani,2016; Cordaz,2011).

Taking up the *continuum* traced by Johnson, Onwuegbuzie and Turner (2007), it is highlighted that adopting an MM vision from a philosophical point of view does not necessarily mean combining qualitative-quantitative techniques, but choosing those most suitable for the case, even exclusively qualitative or quantitative, without ever losing the awareness of making a strategic choice.

Changes and Stabilities in Brazilian Higher Education: Expansion and Institutional Profiles

The Brazilian higher education system has experienced important changes in the last two decades. A fast expansion in enrolments, adoption of affirmative action, the rise of funding for the federal universities as well the increase of the indirect funding for the private sector are some of the main changes. As the educational expansion and changes in the structure of educational opportunities are interrelated phenomena, the empirical analysis of the patterns of this expansion are central to understanding how the educational opportunities have been allocated. This is specially important in highly complex and heterogeneous higher education systems, like the Brazilian one. Sociological scholarship calls for attention to how different institutional profiles drive the widening of the system. This research aims at contributing to the methodological analysis of the expansion of the Brazilian higher education and to answer in which dimensions the recent expansion has led the institutional differentiation in the country. The study uses the Brazilian Higher Education Census from 2002 to 2016, which is the most comprehensive research instrument on Brazilian public and private higher education institutions. The work argues for the need for new measures of the enrolments expansion.

Conservation of Satoyama and Redesigning the Commons: Actors and Activities in Firewood Production

Underuse and spoilage of resources is developing into a serious problem in Japan. During its earlierperiod of high economic growth, there was significant overuse of resources. The current decreasing birthrate,aging population, urban migration, and declining economic incentives in the countryside are now causing underuse.Vacant houses and abandoned fields are typical effects of the resulting underpopulation. This study examines means of addressing these problems by focusing on the conservation of *satoyama*, a typically underused natural resource in Japan.

Satoyama refers to secondary woodlands of oak coppices and pinewoods with grasslands. It is a typical example of the commons category of resources, and it is an important base for biodiversity, managed for long-term sustainable use. However, in recent years, management of *satoyama* by local residents in underpopulated areas has deteriorated. This paper investigates *satoyama* as a problem of the anticommons, wherein, with too many owners, who have the rights to exclude others, a resource is underused.

How can the underuse of *satoyama* be addressed? Studies of resource commons have focused on the role of local residents in overuse prevention. New work is required to indicate how urban citizens could redesign a commons to prevent underuse and conserve *satoyama*. Ultimately, they must build partnership with local residents and acquire from thempermission to use their *satoyama*.

This case study investigates the gathering, cooperation, and permission using *satoyama*. It examines how firewood is produced in rural area. Urban citizens in a neighboring city who own wood-burning stoves are joining a non-profit organization (NPO) to produce firewood for their own fuel. This NPO would seek to conserve *satoyama*through targeted cutting of older secondary wood to prevent epidemic disease.

Journalism and Societal Reflexivity: A Consideration on Morality in Self-Observation of Society

What is the societal role of journalism in this Internet age? Görke (2003) considers that the public sphere and journalism are responding to the necessity of synchronization in the functionally differentiated society. Synchronization fulfills the function of exposing the boundaries of functional systems to societal observation and reflection. In this sense, synchronization encourages self-observation (reflexibility) in society. For example, when a scandal in the political or economic world is reported, the report usually attracts public attention to how people are behaving in those societal domains. It gives people an opportunity to observe how their society is working in good or bad manners. Such synchronization becomes possible based on social norms (morality, law) that do not belong to a particular social domain.

However, synchronization does not mean that it forms a consensus in society. Luhmann (2012, 2013) argues that the mass media neither establish social norms nor make society more moralistic, rather it only reproduces the binary codes of

denotes a presenting author. Abstracts are organized by first presenting author's last name.

morality (respect/disrespect, good/ bad) in public communications. We can find cases where pros and cons are separated over reported opinions and policies. In such cases, journalism often stimulates debates and disputes between the pros and cons in society. Today, though it may be in smaller-scale, the function of synchronization could be undertaken by communicators who are not professional journalists. So, we should reconsider the societal role of journalism in a big picture of the contemporary society. We will discuss the societal role of journalism from this point of view and also some implications on systems theoretical frameworks of journalism theory.

Toward a Global Historical Sociology of Social Movements

The rise of the anti-globalization movement at the end of the 20th century has prompt social movement scholars to pay greater attention to activism taking place on a global scale. Since then, we have witnessed various development in the theoretical tools and empirical analysis used to capture the dynamics of the newly emerged global social movements. However, despite these progresses, there is a tendency to dismiss the obvious fact that the global social movements are not necessarily a recent phenomenon. Especially with the so-called "global sixties" movement that was salient in its size and scale in transnational activism. Nevertheless, from a sociological vantage point, its global aspect has yet to be fully explored. Within this context, the paper would then explores the methods and approaches to analyze the global social movements from a historical lens through the case of the Japanese sixties movements. In part, it introduces an emerging paradigm of "global historical sociology" and examines its relevance for analyzing the global sixties movements. The paper particularly focuses on the structural and cultural opportunity and hindrance for transnational network building among activists. As Japan being an archipelago in the "Far East" with policy restrictions on international travel and remaining geopolitical tensions within East Asia, opportunities for transnational movements were largely restricted during the 1960s. In other words – network capital for transnational activism was low, especially compared with the sixties movements in North America or Western Europe. The paper argues that the combination and balance between open and closed opportunities for transnational network building is crucial while grasping the characteristics of transnational social movements in different countries, particularly by looking at historical cases where transnational mobility was comparatively restricted.

A Place of Belonging or One of Domination?: Negotiating the Making of a "Home" for Migrant Women with Intermarriage Status in Japan

This presentation will discuss how migrant women with intermarriage status in Japan negotiate the making of a "home" and its meanings for them.

The increase in cross-border marriages in Asia since the 1990s has been attracting academic interest for the last two decades (Constable 2005; Yang and Lu 2010). Many of these marriages occurred between a native Japanese man and a migrant woman from a relatively economically disadvantaged country. While such migrants are eligible for residential status through their marriage, they often make a home with socio-cultural "others" in unaccustomed circumstances. Generally speaking, home is expected to be a particular place that gives a person a sense of belonging through the creation of intimate relationships. Usually, marriage migrants also hold such an expectation at first. However, in practice, there are obstacles to making their home a place where they feel a sense of belonging. Along with the socio-economic disparities between the native-born husbands and the migrant wives, the requirement for the husbands to renew the legal status of their wives as "spouses of the Japanese" or to acquire their permanent residency facilitates situations wherein the husbands dominate their partners. In reality, marriage migrants have experienced high rates of domestic violence.

Nevertheless, these migrants attempt to make a home for their belongings in their country of residence. Some try to build up trust with their husbands over the time while others flee from their Japanese family and attempt to create an alternative secure space. Based on the interviews of around 50 Filipino marriage migrants in Japan and the fieldwork of an NGO, this research explores how marriage migrant women negotiate and experience the making of a home.

TAKENOSHITA, HIROHISA* (Keio University, Japan)
TORNGREN, SAYAKA (Malmo University, Sweden)

Cross-Border Marriage and Integration into the Host Society

This paper aims to argue the ways in which cross-border marriage migration shapes immigrants' integration into the host society in Japan. There is a growth in the number of immigrants from other countries due primarily to the demograph-

ic transition in Japan. Declining population has generated the growing gap between labor demand and its supply. Currently, Japanese economy does not work well without introducing immigrant workers from other countries. Not only labor immigrants but also marriage-related migrants increased over time in Japan. The cross-border marriage and its contribution to Japanese demographic structures have received an increasing attention among academics and practitioners. Many previous literatures focus thus on who is likely to marry immigrants and what shapes intermarriage. Meanwhile, less is known about the consequences of intermarriage. Given this situation, we explore the relationship between marriage types and integration. We use a sense of inclusion into the host society. Many previous literatures have employed education and labor market as measurements of immigrants' integration, whereas few studies looked at the subjective evaluation of immigrants who have a native spouse. There are two opposing scenarios about integration among immigrants with Japanese spouse: optimistic and pessimistic. Highly optimistic scenario is that through immigrant's marriage with Japanese spouse, these immigrants are more likely to gain social support from Japanese and foreigners. A pessimistic story is that immigrants with a native spouse are more likely to have some marital conflict across couples, because those couples may have different languages and cultures. This study tests the two opposing hypotheses by using a nationally representative sample of immigrants in Japan.

TAKENOSHITA, HIROHISA* (Keio University, Japan)

Place of Education and Immigrant's Wage in Japan

In the session of educational investment after immigration, it is assumed that immigrants would be less likely to invest in human capital after immigration. However, it seems that the investment in the host-country-specific human capital depends on the context of reception in the country of destination. In particular, we need to take into account the role of immigration control policies in selecting immigrants in terms of human capitals. Some researchers focus on Canada and Australia because both countries have adopted the point system in which skills are considered for selecting immigrants. Meanwhile, several countries of immigration are eager to accept university students from other countries, because they can pay an expensive tuition fee for a university and because those students can become highly-skilled workers in this place after graduation. Japan is one of the countries in Asia that has been keen to accepting a large number of students from abroad. This immigration control policy that is relatively open to student migration from other countries plays a critical role in selecting immigrants who are positive toward investing skills specific to the host society. Conversely, other immigrants who are admitted to Japan through different immigration channels are reluctant to invest in schooling in Japan. By looking at the case of immigration in Japan, we can highlight the remarkable difference between immigrants who invest in host-country-specific human capitals and those who do not. Given those discussion, we will address the two questions. First, what generates educational investment in the host society by comparing between immigrants who obtained education in Japan and those who did not. Second, does the acquisition of educational attainment in the host society lead to the parity with people in the host society? We use the quantitative survey data to explore these two questions.

TAKEUCHI, YOSUKE* (Nagoya University, Japan)

Reality-Oriented, Self-Fulfillment, or Social Contribution: A Case Study of Young People Moving into Declining Regions in Japan.

This presentation discusses youth work, focusing on youth moving to the countryside. Recently, it is becoming increasingly difficult to find "Stable" and "regular" employment. Especially in rural areas of Japan, regular employment that provides enough wages is limited, which has caused long-term outflows of population from rural areas to urban areas. However, in recent years, there are young people who are interested in working and living in rural areas and some are moving. Why are they going back hometown or moving to the region? This presentation will examine who undertakes instability, taking the case of young Japanese people through moving to rural areas. I will show three reasons. First, there are young people who believe that "local employment is not unstable". These young people come back to their place of birth. This is because, unlike urban areas, there are many family businesses and relationships that make their lives stabilized. They have moved to rural areas to stabilize their lives and to relax. Second, "both urban and rural are unstable". However, the region where the population is declining and the number of players is short has become a place where young people can be challenged. They focus on self-fulfillment, not choosing occupational stability. Third, "The young people resist local crisis". Some of young people whose family is relatively rich, tend to begin working on activities to revitalize declining regions to restore the stability of the society where they grew up. But such social work is not established as a business model, so the work of these young people is fluid and unstable. This shows that young people survive in modern societies, which instability is normalizing, through moving to rural areas in several different strategies.

The Participation in Local Politics and Community: Focusing on Young People Living in the Rural Area of Japan

As in many developed countries, the decline and personalization of youth publicness has been pointed out in Japan. Many Japanese youth studies have argued that young people are confined and satisfied with intimate relationships against a backdrop of a rich consumer environment. In addition, since the 1990s, Japanese youth have been increasingly stopped voting. However, this presentation deals with voting behavior and community activities of youth in rural areas. The rural areas of Japan have several problems associated with population decline and need youth participation for sustainability. The local communities have the customary power to mobilize people to participate, but such power is thought to have been weakened by modernization. On the other hand, young people in recent years are also interested in voluntary activities that help society. In addition, some young people are interested in migrating from cities to rural areas, and some appear to be social entrepreneurship. In other words, the rural areas of Japan is a space where the customary power of traditional communities intersects with the way of life of individualized people in the late modern era. Therefore, this presentation clarifies from a case study focusing on voting behavior and community activities who and how of the young people in the local space of modern times appear in public places. The above study also reveals that the publicness of young people in the late modern era has several variations such as passivity and spontaneity.

Adoption of Mobile Phones for Data Collection for the Fourth General Population and Housing Census of Cameroon: Motivations, Opportunities and Challenges

Data collection during first three General Population and Housing Censuses of Cameroon was carried out using the traditional paper assisted personal interviews method usually known as PAPI. The rapid growth in the availability and use of mobile phones for data collection even in some of the poorest countries of Africa caused the Central Bureau for Censuses and Population Studies, the organ in charged with the execution of censuses in Cameroon, to explore how this device might be used for the first time for census data collection. While there were some reasons hindering the adoption of mobile phones for data collections in the course of Cameroon's 4th General Population and Housing Census, there were equally strong motivations for its adoption. These motivations included their successful use in some African censuses, support from donor organizations and the search for ways to come out of the many problems associated with the paper assisted personal interviews (PAPI) used in previous censuses.Experiences with using mobile phones for many data collection operations have shown that their use provides many advantages over the traditional PAPI methods. These advantages include improvement in the quality of data collected, time and money saving in data collection, the ability to rapidly identify problems and provide real-time solutions, etc.

In shifting to data collection using mobile phones in Cameroon, excessive emphasis was placed on the advantages and little emphasis was laid on some of the inconveniences, most of these problems were unseen. Some of these challenges were only identified when the use of the mobile phone for data collection was already in process. These challenges include energy and internet availability, financial constraints, concerns about data security and technology challenges.

Resisting New Public Management: Tracing Affect to Bring Acts of Resistance into View.

In relation to work at the frontline, the focus of IE research has generally been on uncovering and laying out the connections to restrictive practices associated with the accountability regimes inherent in new public management. Such research frequently culminates in discovering that some workers have found ways to resist governing from afar to enable enhancement of their personal potential and/or enhancement of service delivery. Mapping the social relations that supported such resistance however, is frequently left to a following phase of research, should that even be possible.

This paper explores one way that institutional ethnography might employ analytical methods from the outset that are likely to make visible the social relations that support acts of resistance. Building from informants' experiences, gathered from separate research projects concerned with teacher learning and extending into new work on student learning, the utility of affect is demonstrated. Affect circulates in the work place/learning space and is implicated in the actions that

are enabled or constrained. Here, considerations of affect, as a material influence on action, draw particularly on the work of Karen Barad and Jessica Smart Gullion. Affective circuits are proposed as an analytical device to map how affect is implicated in the social relations that support such acts of resistance in what gets done at the frontline.

TAMAKI, EMI* (Gakushuin University, Japan)

Marriage and Health Among Japanese Women and Japanese American Women: A Comparative Study

A growing body of research has shown that married individuals are healthier than their single counterparts. The debate, however, still remains as to the gender difference in the health benefit of marriage. While some argue that marriage is more important for men's health than women's, others find no gender difference in the positive effect of marriage. Using the surveys of Japanese women residing in Japan in 2009 (N=1243), and Japanese American women residing in the United States in 2018 (N=662), this study examined the association between marriage and self-rated health among Japanese women and Japanese American women aged 21 to 65 years. The results indicate that for both women, marriage is related to better self-rated health even after controlling for socioeconomic factors. Detailed analyses also show that for married Japanese women with a child under age 19, working part-time is associated with better health than working full-time or being a full-time housewife. No similar trend was found among Japanese American women residing in the United States.

Victims' Politics of Memory As a Transitional Justice Mechanism: Addressing the Role of Local Communities in the Configuration of Their Memory Regimes after the War

Transitional justice discourses are underpinned by an assumption that truth commissions, tribunals and trials will assist societies to 'come to terms' with, and move on from, complex legacies of violence. However, local practices of memorialization and commemoration developed by victims' groups can disrupt these assumptions. Local communities are endeavouring to turn the page of violence and conflict in ways that may contrast distinctly from the official approaches of the state, or the priorities of sponsored transitional justice institutions. As a result, these local practices of memory are indicating that survivors of armed conflicts are resisting, challenging and transforming official narratives of memory. In this context, the construction of victims' politics of memory in post-conflict societies is central to understanding the turbulent past, its social repercussions, and support transitional justice mechanisms. This paper argues the importance of comprehending victims' politics of memory as a tool to help divided societies to appropriate its political past, in an on-going attempt to mould its future. Addressing the case of post-conflict Colombia, this paper's significance rests in the idea that the establishment of victims' politics of memory initiatives encourages collective remembrance and socio-political actions from non-official perspectives; supporting the demand of truth, and the construction of contested narratives in processes of transitional justice. It establishes that the tension between different narratives of political memory is a part of transitional justice scenarios in which the clash of diverse sets of values defines positions of power and recognition inside contexts of transition.

PORTILHO, FÁTIMA (UFRRJ - Federal Rural University of Rio de Janeiro - Brazil, Brazil)

Brazilian Agrarian Movements and New Politic Arenas: MST and MPA's Urban Food Markets

Despite the countless experiences of networks which seek a (re)connection between production and consumption by constructing alternative food networks and short food supply chains, theoretical efforts to analyze these two fields in an integrated manner are still limited. In the Brazilian context, several movements of urban consumers have been supporting the "cause" of agrarian reform and family farming, as part of the processes of politicizing consumption and "eticizing" food. In parallel, as a strategy to resist agribusiness, the development of commercialization spaces in the large urban centers has come to occupy a central part of the political agenda of traditional agrarian movements . *Movimento dos Trabalhadores Sem Terra – MST* (Brazil's Landless Workers Movement), for instance, since 2015 has been working on a chain of stores called "*Armazém do Campo*", which are already presented in 5 Brazilian capitals, and has been organizing national fairs which has gathered more than 250.000 people to market products identified as

being from "agrarian reform". Meanwhile, in Rio de Janeiro city, *Movimento dos Pequenos Agricultores – MPA* (Brazil's Small Farmers Movement) inaugurated a space called "*Raízes do Brasil*" that organizes, among other activities, with "peasant food" box schemes which has more than 800 registered consumer families. Mindful of this scenario, the paper aim to analyze how such traditional agrarian movements have been constructed new agrifood markets in the last years. It also explores how, despite their criticism towards capitalism and financialization of food markets, MST and MPA have developed actions and discourses that describe the market as a resistance and a political arena, whereas they have been promoting as well the politicization of food production, marketing and consumption. This paper is expected to bring contributions from economic sociology and consumption studies to rural sociology, expanding interdisciplinary dialogue.

TANFERRI MACHADO, MYLÈNE* (University of Lausanne, Switzerland)

How to Study Digitization? Micro-Approaches for Big Questions

Based on ethnographic fieldwork realized within two digitization projects in Heritage institutions in Brazil, this presentation will discuss perspectives and approaches available to study digitization societal innovations and co-construction phenomena. It will lay a specific way to study digitization: by doing a microscopic approach of interactions with machines based on situational analysis, ethnomethodology and cognition in interaction (Alac, 2017, 2011; Garfinkel, 2002; Goodwin, 2018, 2016, 1997; Suchman 2007, 2011). At this level of analysis, away from quick generalizations, (mis)understandings and blurred definitions of what digitization may be, we gain traction to understand changes and transformations that happens when digitization occurs and we discover the ongoing and progressive shaping of roles and attributes of both humans and machines. The situations observed helped us understand how agreement about what is seen and about the digital copies' quality is a located and situated achievement (Lynch, 1997) made in coordination and/or exclusion of other participants, machines, softwares and the digitized materials.

Far from being restricted to the limited time and space of our observations, these cases complement broader discussions about digitization-lead societal changes by offering a detailed perspective on digitization in the making and its practical definitions as they appear in the process and through the participants' concrete and practical work. This approach considers that phenomena, such as digitization, are the ongoing and progressively stabilized production of specific situated actors and that generalizations of concepts and practices alike are always situated achievements (Latour, 2005). We can then suggest that if digitization may be ethically assessed this cannot be once and for all as it is always situated in particular individual settings. Following this, if digitization needs to be ethically assessed it is to be done from place to place, including its actors, technicians and materials alike, and considering the whole situation at hand.

RC54-JS-79.4

TANFERRI MACHADO, MYLÈNE* (University of Lausanne, Switzerland)

Socializing Digitization Machines - Bodies and Materials As Interactional Supports

This proposition is based on ethnographic fieldwork realized within two digitization projects in heritage institutions, Brazil. Digitization as a process in the making allows us to observe the progressive achievement of situated agreements about what is seen and how to see it from human and technological perspectives alike. Developed with an ethnomethodological sensibility (Alac, 2011, 2017; Suchman, 2007) and broadly constructed from an STS perspective, our analysis lead us to realize that sometime digitizing machines were configured as participants, however disabled, thanks to their specific bodily configurations. For our presentation, we will focus on relationships between human and machines, by extending the attention paid to the human vision and agreement in participation framework, situational and interaction analysis (Goffman, 1987; Kendon 1990; Goodwin, 2000) to technological actors. This approach grows our understanding of the body and the senses as supports and base for interaction by reflecting back on technological limits to interaction.

Focusing our analysis on bodily positions and gestures as indicators of positions and roles in the interactions; on the production of local agreements about quality; and on automation of gestures for temporal adjustments, we were able to follow what, in these situations, was meaning to be human and to produce and evaluate copies of archival documents as a local, collaborative and careful accomplishment including digitization machines. These observations helped us mitigate current perspectives about the disappearance and/or replacement of human work within digitization projects. As it has been regularly demonstrated (Latour 1991; Knorr-Cetina 1997; Suchman 2007; Vinck 2012), following the details of actual encounters between humans and technologies helps deflating grand discourses about technological changes. In this study we were able observe

how human capabilities were central to the task at hand, in particular in enabling otherwise socially disabled machines to interact with them and share a common perspective.

Weakening the Boundaries and Framing: Pedagogic Practice to Embed Mental Health Promotion in Schools

Suicide is the second leading cause of death in 15-29 years old and enhancing young people's coping and life skills has been recommended by World Health Organisation as an effective suicide prevention strategy for youth. While research suggests the usefulness of school-based programme to teach young people about mental wellbeing, there is a lack of research that focus on understanding what pedagogic practices can help promote mental health in schools. In this paper, we will draw upon Bernstein's sociological theory of pedagogic discourse to explain what pedagogic practices facilitate or hinder learning of mental wellbeing for children in Hong Kong.

In this study, data is drawn from the evaluation programme of DoReMiFa, a school-based mental health promotion program that aims at developing students' positive attitudes and values. The programme was delivered by school teachers through traditional classroom learning and digital game-based learning sessions. 17 student focus group (132 students in total) and 17 teacher focus group (61 teachers in total) were conducted in participating primary schools. The concepts of boundaries and framing were used for coding and analysing the data.

Findings show that weakening the boundaries between teacher and student, as well as between students can cultivate a positive and inclusive environment to learn about positive values and attitudes. Weakening framing between teachers and students, eroding the boundaries between classroom, school and home, between academic and wider learning, as well as between school leader and teachers are also factors that help embed mental health promotion in school. Thus weakening the boundaries and framing are indicators for designing innovative pedagogic practices to promote wellbeing of children in Hong Kong.

TANIGUTI, GUSTAVO* (Instituto Federal de Minas Gerais, Brazil)

The Unesco's Studies on Immigration and the Brazilian Sociology, 1940-1960

The development of professional sociology in Latin American countries was strongly stimulated by UNESCO initiatives after the end of World War II. Examples include the creation of regional research centers and academic associations, as well as the development of joint research projects focusing on subjects such as assimilation, cultural integration, development and workforce. In Brazil, the recent literature has already shown that studies on race sponsored by UNESCO were central to driving the development of local sociology by connecting research institutions and intellectuals internationally. Brazilian scholars and Brazilianists then began to cooperate and circulate within an international academic field. However, scholars still have been neglecting that other significant research subjects were also addressed by UNESCO in Brazil. I demonstrate that one of the first projects conducted by its Department of Social Sciences – the 'Tensions' Project – contributed to the development of Brazilian sociological field in a political context of democratic restoration by inquiring the possibilities of immigrant establishment in a supposedly land of harmonious racial relations. Research data were collected from UNESCO archives in Paris, France.

Transitions to Lone Motherhood and Practices of Resistance: Early Findings from a Study in Four European Countries

The Study on TRansition and Exclusion in Society of Single-Mums (STRESS-Mums) adopts the sociological approach of Institutional Ethnography (IE) and it collects data in Belgium, Italy, Spain, and in the UK through discursive interviews to lone mothers, judicial professionals and gender issues activists, participant observations, and photo-voice sessions involving mothers and professionals.

The interest of the research study is about the lone mothers' everyday strategies and social practices to claim inclusion and to negotiate or not negotiate, on the one hand, the dominant definition of family and parenthood proposed by institutions and professionals, and, on the other hand, the less legitimated and multiple situated definitions proposed by lone parents and embodied by their families. The analysis takes into consideration the transition from double parenthood to lone motherhood, in particular paying attention to the period of judicial evaluation for child custody and judicial decisions for allowances and other obligations.

This paper presents the early findings of this research study; in particular, it considers the interviews involving single mothers as participants. Beginning from the mothers' standpoint, the paper analyses the mothers' specific modes of knowledge to coordinate their actions during that period of transition and evaluation. It discusses the text-mediated discursive practices that define family and parenthood as embodied know-how and perception, the ruling relations that shape the local experiences of mothers' everyday lives and their forms and practices of resistance to the normatively organized conception of family.

This research project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Sklodowska-Curie grant agreement no 843976.

TARTYGASHEVA, GALINA* (Russian state University for the Humanities, Russia)

Social Media and Paraculture

Social media has significantly transformed society. Nowadays the real existence of a person, event, phenomenon, process or organization must be fixed in the space of continuous communications. If information about you exists in social networks - you exist, if not - you do not exist. In addition to the ontological function, social media create a special virtual culture, are a tool of cultural education, researching of the world, socialization of the younger generation. Social media also plays an important role in religious and occult renaissance. The worldwide surge of interest in occultism explains the growth of uncertainty and unpredictability, alienation from nature, disappointment in rational, scientific picture of the world, etc. It must be emphasized that the "occult renaissance" also occurs intentionally due to the manipulative effects on the consciousness of people through media culture. The spread of faith in magic, witchcraft is carried out through television, fiction and nonfiction and social media in the commercial and power interests of the establishment. Social networks in the Internet are specific forms of realization of social tasks by means of information technology. Virtual communities - the core of social networks, provide social interaction, information exchange and social identity. Believers unite in the network on the basis of a common esoteric worldview, values and morality, differentiation between "friends" and "strangers". Esoteric consciousness, based on the belief in the supernatural, is a fundamentally distorted reflection of being. Researchers talk about the revival of the occult, but it is a new esoteric consciousness, modified by social networks. On the one hand social media allows you to get deeper and more diverse knowledge of esotericism, on the other hand, the availability and diversity of information misleads neophytes. In addition, with the help of all these "products of religious pluralism", you can competently manipulate the population.

Japanese Super-Diversity in Immigrants?

Super-diversity could characterise British society where immigrants with diverse background entered and settled. But does it emerge in other countries, too? Although Japan is recognised as a typical ethnic country, she has received various types of immigrants within. Before the World War II, so called Oldcomers from Korean Peninsula, Taiwan and mainland China mainly entered and settled in Japan. After the mid-1980s, the number of so-called Newcomers from every corner of the world immigrated to Japan. Nowadays, Newcomers are expanded from skilled workers to Japanese descendants from Latin America, company trainees and technical interns, care workers and so on. This diversity will be accelerated by newly established policy. Against the policy principle of no acceptance of unskilled labour from abroad, Japan started to introduce de facto unskilled workers formally in April 2019. Cumulative diversity poses a question of integration. As urgent issues, hate speech demonstrations often occurred to marginalise Korean residents, and there are full of hate writings against them on the net. Surely, diversity in Japan is somehow limited, because there are fewer immigrant residents for a highly industrialised country, countries of immigrant origins are mainly East Asian and South East Asian countries, partly European and North American countries, not many from other areas such as African and Middle-East, and there are fewer Muslim immigrants compared to Western European countries. However, Japan has reached a point that if she failed to implement effective integration policies, Japanese society would suffer instability with the number of ill-adapted, diverse types of immigrants. Therefore, it can be argued that Japan has already started to experience a type of super-diversity in immigrants. In conclusion, if super-diversity were understood with being related to integration of diverse immigrants, it could occur in every corner of the globe.

Gender Based Violence and Asylum Seeking Women in the Eastern Mediterranean

Drawing upon "key informant" interviews with policy makers and service providers in Greece which are contextualized in International and European Human Rights instruments, jurisprudence, international NGO reports and feminist perspectives, this paper focuses on the socio-legal factors generating or aggravating gender based violence (GBV) in the refugee journey of women seeking asylum in the Eastern Mediterranean. GBV is understood as intersecting with violence based on social memberships and identities other than gender. It is conceptualized in systemic / institutional but also interpersonal terms. The absence, misinterpretation or inadequate enforcement of law on the one hand, but also state and social / community practices at various levels (local, national, international) on the other contribute to (i) creating barriers to protection, while increasing the precarity of particular groups, before, during and after the refugee journey; (ii) aggravating culture specific gender and intersectional vulnerabilities; and (iii) translating as GBV at the interpersonal level. The particular manifestations of GBV are population and stage specific, as the displacement process is conceptualized as a journey, with temporal, spatial and legal status specific dimensions.

Research, Development, Impact Evaluation and Utilization of Beppu Model Disability-Inclusive Disaster Risk Reduction: Towards Seamless Linkages between Normal and Disaster Time Responses

Persons with disabilities (PWD) have been known to suffer more serious damages in disasters. After the Great East Japan Earthquake, Tatsuki (2013) pointed out that the root cause was attributed for the siloed approaches taken by everyday social services and crisis time disaster management organizations and for the lack of coordination between normal and disaster time responses. One solution is to involve social workers who manage PWD everyday functional needs with formal services and to invite them to simultaneously prepare disaster time care plans that mobilize informal neighborhood-based supports for evacuation and sheltering. This paper shares the inclusive disaster risk reduction (DRR) projects that interlink normal time social services and disaster time commnunity-based responses to PWD. A three-year project was launched in Beppu City, Oita Prefecture in 2016 that led to the standard operation procedure (SOP) for assessment, informal/community-based human resources matching, and inclusive disaster response simulation during disaster drills. At the end of the third year, a quasi-experimental, inverse propensity score weighted impact evaluation demonstrated a significant increase of the key performance indicator (DRR Literacy scores) only among the experimental group PWD. Based on the pilot project results in 2018, Hyogo prefecture launched the Beppu-modeled grant program to all 41 municipalities. As a result, 37 Hyogo local governments participated in the inclusive-DRR program in 2019. This paper presents the impact evaluation results from the 37 project municipalities. It discusses that a part of the success of Beppu Model utilizations depends on the role of boundary nospanner (Aldrich & Herker, 1977) that interlinks local government's social services as well as disaster management departments, disabled people organizations and local resident associations. This paper concludes with future research/practice directions such as integrating pre-disaster care planning to post-disaster case management practices.

Gender Segregation of Work-Family Balance in Japan: Agenda of Support Program for Researchers to Achieve Gender Equality

This study considers the achievement and agenda of Japanese support program for researchers' work-family balance to achieve gender equality. Researchers are the professional having a great influence on public opinion. Thus, the gender equality in researchers is quite important. However, the female ratio in Japanese researchers is 16.2% in 2018, it is almost half of European countries. Therefore, the advancement of women is an important agenda for Japanese government. The Ministry of Education, Culture, Sports, Science and Technology started a support program for female researchers' work-family balance in 2006. 100 universities have started this program from 2006 to 2019. This study examines the sufficiency of materials involved in this support program and the data about the researchers in universities. This support program helps female researchers by providing assistants for their research, among others. In fact, female researchers can continue to work and research during pregnancy and parenting. However, the lifestyles of both female and male researchers need change for gender equality, because male researchers comprise about 85% of Japanese researchers and the half of partners of female researchers are male researchers. In contemporary Japan, child-caring fathers "*Ikumen*" are recommended. However, it regards fathers' child-caring as exceptional cases to call fathers *Ikumen*, and it leads to consider mothers' one as natural, yet. This gender segregation of child-caring influences on parents' work-family balance, and researchers are no exception. For example, about the primary caregiver of preschool children during daytime, 80% of male researchers respond "spouse" and 80% of female researchers respond "day-care center." In the other words, most of male researchers can leave child-caring to their wives, on the other hand, most of female researchers must coordinate about caregivers. Therefore, the support program for researchers needs advance both "female and male" researchers for eliminating the gender segregation, and it leads to achieve gender equality.

TATSUMI, MARIKO* (Osaka Prefecture University, Japan)

Is Masculinity Necessary for Child-Caring? the Work-Family Balance and Caring Masculinity of Japanese Child-Caring Fathers "Ikumen"

This paper describes a new perspective about the gender norm of father's childcare. It is a masculinity of child-caring men "*Ikumen*" in Japanese policies. In contemporary Japan, *Ikumen*, who are child-caring fathers, are recommended in media and policies. The Health, Labor and Welfare Ministry started *Ikumen* project to promote fathers' child-caring from 2010. It aimed to increase the number of fathers taking parental leave. However, the ratio of fathers taking parental leave is only 6% in 2017. Why most Japanese fathers do not take parental leave? Because there have been Salaryman masculinity in Japan after World War Ⅱ. The Salaryman masculinity is a hegemonic masculinity and it has believed that father's breadwinner role is quite important for their families and fathers themselves. This study examines *Ikumen* figures shown in the leaflets and posters used by *Ikumen* project from 2010 to 2019. *Ikumen* not only take child-caring but also have Salaryman masculinity. For example, the 2018 leaflet of *Ikumen* project starts a sentence stating "Fathers do not have enough time for child-caring because they have to work for long time." Afterward, it recommends for fathers to take parental leave. Thus, we can say that *Ikumen* is a Japanese caring masculinity including hegemonic masculinity. The caring masculinity of *Ikumen* influences to real fathers' child-caring. For example, Japanese fathers taking parental leave for fewer than 5 days are 36.3%, on the other hand, most mothers take it for around 1 year. And then, Japanese fathers take child-caring for 49 munite on the average in 2016, it is about 4 times shorter than mothers'. Thus, it regards fathers' child-caring as exceptional cases to call fathers *Ikumen*, and it leads to consider mothers' one as natural. Child-caring itself has no gender. It needs for gender equality not caring masculinity but caring with no gender.

Towards an Alienation Theory: Marx and the Grammar of Fetishism's Social Ontology

In my communication I intend to develop some themes that are important to subject-matter of alienation in Marx's thought. The old quarrel about a supposed withdrawal of the use of alienation's concept in Marx's writings after 1844 are well known. Indeed, one couldn't expect anything different from the young Marx's premature anti-hegelianism. However, in his late work, the fetishism category is used to express the phenomena in which social reality seems to be constituted by the basic categories of political economy: value, money, commodity, etc. As if social reality were not fully shown in the appearance of political economy grammar. Hiding, thus, through a "secret" that, in its essence, it was also constituted by labour, surplus-value and exploitation. It follows from this that fetishism is the name of the capitalism social ontology. Name used to express the alienation of reality from itself. It should not be forgotten, however, that before the elaboration of Capital, Marx again flirted with some hegelian texts. It seems that the fetishism category could contain a restatement of the hegelian concept of alienation. In order to study this old quarrel, I want to answer a problem. It is this: would Marx's grammar utilized in the fetishism social ontology explanation tributary of a theory of alienation? My suggestion to begin solving the problem is to postulate the following thesis: alienation and fetishism are ontological rather than psychological phenomena.

Beyond Skilling: An Alternative Praxis of Livelihood for Urban Poor Youth

Globally, the youth population or the population between the ages of 15-24 stands at about 18% of the total world population. In India, the population of the same age group is about 28% of the total population of the nation. (Census, 2011). Moreover, India being one of the youngest nations worldwide, about 65% of the total nation's population is below the age of 35 years and is projected to have the youngest average age of population at 29 years by 2020. At the same time, despite that more than half of the population falls within this category, this age group also faces immense problems of job insecurity, health issues, lack of educational and training opportunities and a high lack of representation.

This paper opens with an understanding of the current situation of education and employment opportunities for urban poor youth and the inequalities they face in accessing them- mainly poor quality services, mismatch between skills learned through education and 'employability' skills, and finally the lack of adequate and decent job creation for youth. The next section presents a critique of the current youth development policy mainly skilling and the emphasis India and other Asian countries lay on 'skills' and youth development.

Against this backdrop, we illustrate the youth development approach of Youth for Unity and Voluntary Action's (YUVA) work as an alternative praxis. YUVA's work with the most marginalized communities through the Integrated Community Development (ICD) model and through the processes of youth-led development have been able to foster democratic values and a sense of responsible citizenship among the youth. Localized, contextual and integrated skill building, youth participation as citizens as also creating more decent jobs for youth are ways in which we can truly engage with youth as 'partners in development' and co-creators of an inclusive and just society.

Work Contexts and Pharmaceuticalization: Theoretical and Empirical Challenges

Based on empirical information obtained through an ongoing research project funded by the Portuguese national funding agency for science, research and technology and in the (scarce) sociological literature on the subject, this communication proposes revisiting the dissemination of pharmaceuticalization. This will be achieved through a reflection on the theoretical and empirical challenges that arise from analysis and research on the relationship between organizational and professional transformations that have been verified in work contexts with implications on changes in the nature of work and the use of medicines, food supplements or others natural products by professionals to enhance their physical, intellectual and social performance (here designated as performance consumptions), within their work place.

This approach focuses on the analysis of the performance consumptions on the transformations of the professional work contexts, in different dimensions, such as the organization of work, technologization of the work process, standardization of professional tasks, unpredictability of occurrences and work situations, new practices and routines, polyvalence and multifunction/multicompetence, extension and irregularity of schedules, increase of workload together with the reduction of deadlines for completing tasks, new forms of relationship with the public. We propose to analyze how these changes, concerning the various as-

pects of the nature of work and the contextual conditions in which it is developed, marked by increasing pressure on work performance with consequent heightened demands on physical and/or cognitive/mental performance, lead to changes in strategies to manage performance. In particular, in the social practices and dispositions of adherence or resistance to the different types of natural and pharmaceutical resources, mobilized for the work performance expressed, for example, in memory enhancement, sleep management, weight loss, bodybuilding, combat physical and mental fatigue, anxiety control and ability to concentrate. The empirical support for this approach concerns three professional groups associated with contexts of high pressure for performance.

Educational Paths in Brazil: Stratification, Inequality and Challenges in the 21st Century

The performance of Brazilian educational systems is one of the main obstacles to national development. This is associated with social factors. There is a lot of research on school reproduction and social inequalities, but there is little work on successful educational pathways and successful schools in vulnerable contexts in Brazil. This work in progress shares findings related to the identification of successful trajectories, especially in unfavorable contexts, between groups (youths, families) and institutions, in order to understand which factors are related to them. On the other hand, it also analyzes factors that limit and / or work against these results. Understanding education as a social production, we investigated what contributes to overcome the traditional cycle of reproduction of inequalities by analyzing longitudinal data from public schools in Brazil in a comparative perspective. Retention is still a major problem, besides strong evidence of its inefficiency (CRAHAY: 2013; HATTIE: 2009). The Brazilian case is unique, according to a study by Crahay and Baye (2013) in 22 of the 42 educational systems analyzed by PISA: Brazil is the top country where retention is more widespread. Bacchetto (2016) estimated that the annual costs arising from retention in Brazil are almost 10% of the total amount of Federal Fund for basic education. On the other hand, poor families find ways to steer different paths for their children: identifying the best public schools and insisting on enrolling there, avoiding retention, showing high expectations to their future, keeping the day shift (rather than night), not allowing them to work, transfer to private schools the most dedicated child, and others. Educational is less result of public policies and increasingly product of different strategies of some families to avoid circle of reproduction and strategies to lead better social paths mixing private and public opportunities.

TAVARES, SELENA* (UFRGS, Brazil)

Feminism and Jane Austen

The interdisciplinary between sociology and literature has been recognized more and more by academics. It is possible to relate the books of the British writer Jane Austen (1774 - 1817), particularly Pride and prejudice, Sense and sensibility, Persuasion, Mansfield Park, Emma and Northanger Abbey, with feminist concepts. The methodology used in this study is a literature review, internal analysis of the novel and subsequent sociological interpretation.

Austen's novels depict a tradicional love story in which women need to change to obtain their ultimate dream: marriage. That was a façade, however, as they covertly denounced the women's condition of vulnerability in a patriarchal society and criticized the institution of marriage. Jane Austen approached feminist topics constantly by discussing women's financial dependence, the need to marry a well-off partner and the limitations of women on deciding their future. Through a sarcastic humor and weak male protagonists, the author warns her readers of the evils of the society they live in. The protagonist's happy endings are conducted by a deus ex-machina incorporated by the author, demonstrating that women might not be so lucky in the real world.

It is impossible to mensure Austen's impact in the Ocident's culture. No one has fought so hard against the institution of marriage and, at the same time, has consagrated it as the ultimate ending for all strong and smart female protagonists. Behind this paradoxal legace, however, lies an intelligent writer ahead of her time, looking to spread a culture of solidarity and sorority amongst women.

Collaborative Collective Action and Institutional Violence in Mexico

Institutional violence is a common feature of public institutions in Mexico. The Mexican state often violates the constitutional rights of people in several ways among which malpractice, refusal of service and/or revictimization, are most common. Studies have shown that in order to resist institutional violence and have their rights respected, people fight institutions mostly through individual action. Obtaining the required service and having their rights met often requires people to act in ways that reproduce institutional violence rather than challenge it. In this paper we: 1) explore if and to what extent do petition platforms have provided citizens an opportunity to collectively respond to institutional violence and 2) ask if such a collaborative way of fighting institutional violence has a transformative rather than a reproductive effect. We look, in particular for petitions related to institutional violence in the Mexican health and justice public sectors posted on change.org, one of the world´s favorite online petition platform.

Crisis Times, or Times of an Interregnum? Misrecognising Migration As a 'Crisis' Instead of Evidence of Transition to New Possibilities.

Liberal and neoliberal political orders have fostered contemporary authoritarian and populist nationalist politics in many parts of the world. This paper explores these histories, excavating the biopolitical, racialised systems and values used to justify the silencing annihilation of populations deemed exploitable. Today, the legacies of these times remain deeply embedded in symbolic and rhetorical systems that reproduce inequalities. Racism, Xenophobia and political populism, expressed in the exclusion of migrants, refugees and people of colour, exhume these histories. The paper draws on Zygmunt Bauman's articulation of the 'times of interregnum', building on the writing of Antonio Gramsci, as a time when an old order is in decay with morbid symptoms appearing, yet when a new order is not yet ready to be born. The paper develops a critical evaluation of these concepts alongside examples drawn from the lived experience of 'irregular migrants' and refugees in the 'liberal West', and the political responses to them. Responses to migrants and refugees tend toward a 'crisis politics', misrecognising the root causes of human mobility. Whether consciously or unconsciously, the pattern of responses among Western states – of exclusion through invoking 'crisis' – have the outcomes of harm to vulnerable populations.

Race, Migration and Visual Culture: Considering the Intersections through the Persistence of Colonial Imaginary

This paper explores the persistence of the colonial imaginary, expressed in racism as a systematised devaluation of some humans. Racialisation takes many forms, perhaps most commonly in state implemented policies, laws and administrative measures of dividing and categorising populations. While the political context is important in understanding the felt experience of racialisation, this paper explores the boundary work of race through art and visual culture. The experiences of minorities, migrants and Indigenous populations are highlighted in exploring archives as artefacts linking the present to the past. I draw on both the Western idea of the archive as repository of the deeds and misdeeds of the state, as well as the living archive that encapsulates other, often less visible traditions through oral and through visual culture. The paper draws on several case studies of the artistic interventions of refugees and Indigenous people that generate a 'counter politics' through visual culture. Through case studies I drawattention to the relationship between memory-making and calls for social justice.

The Role of Women in Agrifood Markets: Contributions from the Marcha Das Margaridas

The sexual division of labor makes it difficult for the contribution of women's work in the agrifood markets to be seen. Women's work is usually related to reproductive labor, while men are responsible for productive labor, which includes the production and marketing of agricultural products. However, women have an important role in the commercialization of production by different ways, such as marketing products in street markets, by institutional markets and CSAs. This paper will focus in the analysis of the women's role in the process of building agrifood markets. How do women family farmers contribute in the building of agrifood markets? Are women innovative in terms of marketing agrifood products? To answer these questions, this paper will analyze the contribution of the Marcha das Margaridas to this process focusing on two dimensions. Firstly, what are the Margaridas' proposals and practices to the marketing of agrifood products?

Secondly, how are women mobilized in the Marcha taking part of the agrifood markets? This contribution will be discussed in the focus of a combination between theoretical perspectives on sociology of agriculture and social movement theories. The methodology employed includes the analysis of documents; interviews with activists; participant observation in both the 2015 and 2019 edition of the Marcha das Margaridas; survey conducted in the 2019 edition of the Marcha; and, finally, an analysis of the academic literature. The Marcha das Margaridas is a mobilization driven by women from the Brazilian union movement of rural workers, in partnership with other movements and organizations, including women's movements, trade unions and rural social movements. The Marcha started in the year 2000 and has had six editions since them. The last one was in 2019. With a broad political coalition, the Marcha includes in its agenda proposals for fair and sustainable agrifood markets.

Agenda De Adaptación Climática De La Ciudad De Curitiba/PR, Brasil

Las ciudades hacer ejercicio papel crucial en la lucha contra el cambio climático, al combinar el liderazgo en la investigación científica y la participación en redes transnacionales de cambio climático. En este sentido, comprender lo que los gobiernos locales han estado para incorporar las cuestiones de clima, especialmente de la adaptación climática, en sus agendas ambientales y urbanas es un paso importante en la construcción y formación de agendas gubernamentales que se preocupan por las ciudades menos vulnerables y más sostenible. Siendo así, el objetivo de este trabajo es analizar el proceso de incorporación de la agenda de adaptación climática en la política ambiental y urbana de la ciudad de Curitiba. Para esto, siguiendo las orientaciones teóricas del enfoque de flujo múltiple de Kingdon, este estudio realiza una investigación documental a partir de instrumentos y acciones de la política ambiental y urbana de Curitiba; así como investigación de campo con entrevistas aplicadas a gerentes y técnicos municipales entre 2017 y 2018. La técnica de tratamiento de los datos recopilados es el análisis de contenido. A partir del análisis de los documentos y las entrevistas, se puede afirmar que la incorporación de la agenda de adaptación climática en la ciudad de Curitiba tuvo lugar de manera más clara y efectiva a partir del Decreto n° 1.186/2009 que establece un plan de acción que, a su vez, propone el Plan Municipal de Mitigación y Adaptación al Cambio Climático. En resumen, se concluye que, aunque Curitiba tiene una vasta historia de incorporación de problemas ambientales en su planificación urbana, el proceso de formación e incorporación de la agenda de adaptación climática comenzó más recientemente en la ciudad, hace aproximadamente 10 años, con adhesión a las redes internacionales de cambio climático, por ejemplo.

Carbon Neutrality Politics in Brazil: Tracing Scientific Knowledge about Pasture Restoration

According to the Food and Agriculture Organization (FAO), by 2050 the meat production across the globe will double, encouraged by the growing population and the increasing demand for animal products, especially meat. In this context, Brazil, with the second large herd in the world, is the largest beef exporter. However, livestock production has a large responsability for its's greenhouse gas (GHG) emissions, especially considering methane from enteric fermentation of ruminants and carbon from degraded pastures. Thus, the country's emissions are peculiar, because most of them are not derived from fossil fuel combustion, but from land use changes and farming. Some authors have pointed out that livestock farming, if we consider direct and indirect emissions, is responsible for half of Brazil's current GHG emissions. Although livestock is a nationally relevant economic activity, it's also one of the largest contributors to climate change, and that's why Brazil's internacional commitments to the United Nations Framework Convention on Climate Change (UNFCCC) include, among other practices and technologies, the restoration of 15 million hectares of degraded pastures. This technology is related to the carbon neutrality politics adopted nationally to achive the commitments by increasing soil capacity to sequester carbon on these restored pastures. In others words, to reduce the GHG emissions, Brazil is especially encouraging practices to compensate emissions. Our aim was to investigate how scientific knowledge about soil sequester potencial is produced, understanding this techonological practice as a socio-technical controversy. Therefore, this paper can contribute to the understanding of why this mitigation practice was chosen by the brazilian government as the main strategy regarding livestock farming emissions. We focused on exploring the role of "verified science" as a component of the social order, and how scientific actors argue for carbon neutrality as the best strategy to achive internationally signed agreements.

TEJERINA, BENJAMIN* (University of the Basque Country, Spain)

The Mobilizations of Knowledge: From the Rejection of Science to Collaborative Collective Action in Scientific Production

It is now 40 years since Paul Feyerabend published *Science in a free society* (1978) where he denounced the surprising prestige of science in the West and its incompatibility with a democratic society. Since then, changes that have to do with the mobilizations around science in the center of attention and public debate have taken place. After a first rejection of the use of science and research for private purposes, there has been a growing collaboration with science to put it at the service of public and common goals. Numerous experiences based on the participation in various forms of citizens have continued to increase around the world (Haklay 2012; Irwin 1995; Irwin and Michael 2003; Lewenstein 2004). This communication has three objectives: 1) to identify the different forms of participation between citizens and scientists (Lafuente 2013; EU 2014); 2) to try to respond to the characteristics, means, purposes, social impacts and resistances of this form of collaborative collective action between citizens and professional scientists; and 3) to present the current debates on the role of participation of citizens in scientific projects in the scientific field.

The communication presents data from a survey conducted on the opinions of alterglobal activists, information from mobilizations on the subject tracked on the internet, as well as interviews with scientists and discussion groups among collaborators on scientific projects.

TEMPLER RODRIGUES, ABBY* (Missouri State University, USA)

Rethinking the Creative Economy: A Post-Capitalist Response to Creativity-Based Development

Over the past 20 years, creativity-based development has become a dominant model of urban redevelopment in post-industrial cities worldwide. Rooted in a capitalist logic, creativity-based development strategies tend to focus on amenity building in order to attract a loosely defined, economically privileged, "creative class." While these strategies utilize a discourse celebrating diversity, they are linked to gentrification and to social exclusion based on race, ethnicity, class, and gender, while ironically generating homogeneity in how creativity is defined and practiced. Drawing on data from a participatory action research project conducted with artists and artisans in rural Massachusetts, United States, this paper contributes to the literature positing local-based, post-capitalist, development alternatives. Framed around a case study of the organization Artisans of Western Massachusetts, this paper provides an example of regional artists working together to support each other as producers while resignifying the act of consumption for their consumers. Modeling their practice on the region's buy local food movement, the Artisans of Western Massachusetts worked to create a buy local art movement, encouraging consumers to see the act of consumption as a way to directly support artists and the region's economy. The organization thrived for eight years before eventually closing. The successes and challenges faced while enacting their vision informs practice-based and academic conversations about enacting sustainable, inclusive, post-capitalist livelihoods in the midst of capitalist redevelopment projects.

RC11-137.5

TENDULKAR - PATIL, ANAGHA* (Sophia College for Women, India)

Non-Residential Geriatric Care System in Urban India

In India demographic greying is an axiomatic phenomenon. Indian society is witnessing an unprecedented rise in the number of elderly population. However, the level of preparedness for this inevitable catastrophe appears to be abysmal. Care is a prerequisite of a welfare society. Marginalized groups thrive on care provided to them. Due to the heterogeneity and complexity of Indian society; laced with innate hegemonic configurations multiple

less-privileged groups constitute, the marginalized section in Indian society. However, the discrimination and oppression faced by the elderly in India is not even clearly recognized in academic discourse. This neglect can be attributed to the existence of a strong joint family system.

The unschooled assumption that the senior citizens are automatically looked after by the forever tolerant family system, has hampered a clear comprehension of the gravity of the problems faced by the elderly. The problem is further complicated due to the unforeseen alterations in the structure as well as the functions of the institution of family. The forces of change like liberalization, privatization and globalization have impacted the cushioning capacity of the family system. The elderly are pushed out or are compelled to join the periphery of the community. In such a scenario the non-residential care system plays as pivotal role.

This paper operationally defines the non-residential care system as a network of Senior Citizens Associations and Day Care Centers for elderly. It reviews the nature, functions, efficacy and limitations of these clusters and comments on the perception of elderly about it. The conclusions are based on the extensive survey of the associations and centers. Unstructured interviews conducted during the process of data collection; have unearthed several nuances of experiences of the elderly population thereby providing enriching insights into the extent and quality of the non-residential care for the senior citizens in India.

TENENBAUM EWIG, GABRIEL* (Universidad de la República, Uruguay)

Avances y Retrocesos En El Sistema De Responsabilidad Penal Adolescente Uruguayo Durante La Gestión Del Frente Amplio (marzo 2005-febrero 2020)

Desde la aprobación del Código de la Niñez y la Adolescencia (CNA) en septiembre de 2004 -norma que derogó el Código del Niño de abril de 1934-, las tendencias estadísticas del sistema de responsabilidad penal adolescente (asuntos que ingresan a la justicia, procesos judiciales, sentencias) aumentaron constantemente hasta los años 2013 y 2014. A priori, los datos llamaron la atención. Se esperaba que el CNA, instrumentado hasta el momento en los gobiernos de izquierdas del Frente Amplio, sea un avance normativo, aunque tardío, hacia el enfoque de derechos humanos. Pero claro, con la reforma se crearon nuevas políticas e instituciones que aumentaron la capacidad de trabajo del sistema punitivo. Entre los años 2010 y 2014, aproximadamente, proliferaban las discusiones masivas y efervescentes sobre "los adolescentes en conflicto con la ley". Para algunos sectores sociales y políticos, estos jóvenes eran el gran problema público de la criminalidad del país. En ese período, se aprobaron legislaciones regresivas en materia del interés superior del niño. Además, se realizó un plebiscito constitucional -el mismo día de las elecciones presidenciales de octubre de 2014- para bajar la edad de imputabilidad penal de 18 a 16 años. Aunque un importante contingente electoral (46,8%) votó a favor de la reforma constitucional, el resultado no fue suficiente. Después del 2014 y, especialmente en el 2017 y 2018, los adolescentes sentenciados por la justicia disminuyeron drásticamente. En el presente, Uruguay se encuentra en el contexto histórico más favorable que ha tenido el sistema desde la aprobación del CNA. Sin embargo, la privación de libertad de adolescentes sigue siendo la regla y no la excepción. En este marco, la ponencia desarrollará el proceso histórico referido resaltando los avances y retrocesos del país en materia de derechos humanos de acuerdo con las normas aprobadas, las políticas y las estadísticas del sistema.

Tráfico De Drogas y Lavado De Dinero En Uruguay

La división del trabajo es una condición necesaria para el funcionamiento y la reproducción del mercado internacional de las drogas ilegales. Para ello, la globalización económica resulta fundamental ya que acerca a las jurisdicciones y flexibiliza las comunicaciones (digitales, económicas, financieras, etc.). El crimen organizado circula evaluando los beneficios-costos-riesgos relacionales de cada jurisdicción (capacidad corruptiva de los funcionarios públicos, capacidad estatal para reprimir y controlar el delito, flexibilidad y lagunas normativas, etc.) con las distintas fases implicadas en la actividad ilícita (importación de materias primas, producción, distribución, exportación, comercialización, lavado de dinero, repatriación de los activos, sicariato, etc.). En este esquema, la hipótesis de trabajo es que Uruguay se posiciona como una jurisdicción protectora de la renta criminal desde el segundo lustro de 1970, durante la dictadura militar, y los subsiguientes gobiernos democráticos "hasta" la "nueva" política estadounidense contra el terrorismo y el lavado de activos. La creación y el fortalecimiento de la arquitectura normativa financiera del país, como política de seducción y atracción de capitales internacionales, especialmente del Mercosur, facilitó el lavado de dinero, la defraudación tributaria y otros delitos de cuellos blanco. Los protectores del capital nacional (escribanos, contadores, abogados, etc.), algunos de ellos vinculados con la política, fueron los principales diseñadores y beneficiados de la configuración de la plaza financiera local. En este marco, la ponencia se propone demostrar el lugar de Uruguay en el esquema internacional del crimen organizado, particularmente para los grupos delictivos mexicanos dedicados al tráfico de sustancias psicoactivas ilegales. Para ello, se expondrá la evolución de la arquitectura normativa financiera y sus recientes "frenos". También se abordarán las operaciones criminales más "importantes" de los últimos años con la finalidad de demostrar que en el Uruguay, arrinconado en el sur del continente, también circula el crimen organizado internacional.

Global Framework of Climate Change in Local Context: A Case of Local Adaptation Initiatives from the Planned City of Chandigarh, India

Cities seem to be very vulnerable to climate related risks occurring more frequently in recent past. The potential risks are putting pressure on city governments for devising knowledge based innovative tools to cope with the emerging challenges. Chandigarh, the only planned city in Northwestern India has initiated very remarkable and participatory initiatives for improving environmental conditions in poor neighborhoods and institutionalize climate adaptation practices. The major climate friendly initiatives of the city are introduction of Garbage Bin Free Scheme, Sahej Safai Kendras (Easy Sanitation Centres), Scientific Landfill of Waste, Setting up of Waste to Energy Plant, revitalization of green belts, parks and round abouts, opting for energy saving street lights, augmentation of secondary and tertiary treatment of liquid waste, SCADA for water management, construction of dedicated bicycle lanes, switchover to CNG/ LPG based automobiles, modernization of fire services and a very important initiative of making solar energy systems compulsory in the larger housing units, institutions and offices and last but not least provision of housing of the poor slum dwellers. The results of all the initiatives in Chandigarh have been remarkable. Chandigarh has topped in a survey on cleanliness conducted by a AC Nileson ORG Marg. Chandigarh topped with 144 points in all the four parameters of survey relating to sanitation/ cleanliness i.e. Cleanliness of roads, Efficiency of garbage disposal, dustbins in public places and Cleanliness of Public Toilets. The construction of cycle/rickshaw paths in Chandigarh has decreased the burden of slow moving vehicles on the main roads. The city has been adopted as a model city for the solar energy and it has been moving very fast in making city a 'solar city'. The paper based on some recent studies by the author is an effort to describe the initiatives of Chandigarh towards institutionalization of climate adaptation practices.

Understanding Participatory Planning and Governance at Local Level in India: Some Evidence from Kerala and Punjab States

India is a huge and highly diverse country in the context of planning and governance at local level which vary from state to state. While Kerala is popular due to its participatory planning and governance, Punjab is marred with poor participation and quality of local governance. The state of Kerala started a People's Plan Campaign to strengthen the planning process at local level. At present most of the local government institutions follow the participatory planning mechanism which starts at neighborhood level. The quality of governance Kerala is much better today due to participatory planning and governance at local level. The ward sabhas in rural setting and ward committees in the urban setting are very active and play crucial role in local governance, poverty alleviation and augmentation of infrastructure and services. The Kudumbashree Model of poverty alleviation is one of the most successful model which was even adopted by the national government in implementing National Livelihood Missions in entire country. The experience of Kerala state in addressing concerns related to inequality, marginalization and exclusion of the poor seems to be more effective than Punjab which has been going very slow despite the high state domestic product. Punjab on the other hand is going slow in participatory planning and the quality of governance at local level continues to be poor. In the present study an efforts has been made to understand why Kerala has been more successful in implementing participatory planning and governance and why Punjab continues to lag behind. What are the social, cultural, educational and political factors that have been playing crucial role in promoting participatory planning and governance in Kerala and what factors are hindering the same in Punjab. What Punjab state can learn from Kerala to improve quality of governance and participatory planning at local level and how.

Leisure Practices in the State of Uttar Pradesh: The Shift

The leisure sector has observed a great expansion since the year *2017* onwards. The aim of this analysis is to study the decisions and goals of the Uttar Pradesh government policy during the period *2017* to *2019*. The empirical analysis covers government propositions and governmental investigations. The fields covered are sports, culture, exercise, tourism and recreation. The article concludes that during the last two years, the companies, led by the private sector , economic associations and foundations had expanded and stretched it's base in the leisure sector. Whereas the State used to control all parts of the leisure value chain, it is now possible to distinguish between those who produce, arrange and finance leisure services.

An Imprint of a Quiet Decision: India's Non-Alignment on Cold War

This paper aims to examine the historiography of Indian foreign policy priorities and its ideological determinants of the development of social sciences during the Cold War period. Further, it lies emphasizes on the fact that the Cold War affected Indian society, as it did for much of the world. In the previous studies, historians describe India's position in the world during the Cold War era, with the term "nonalignment", giving importance to the role of Prime Minister Jawaharlal Nehru in designing Indian foreign policy. This paper argues that this period defined India's status as a non-aligned country which represents autonomy of independence, presenting India as a country committed to peace. However, the umbrella concept of nonalignment lacks critical analysis in questions of national interest, security and Indian politics. Therefore, this paper helps in understanding that while the nonalignment movement of India may have prevented power accretion, India was more concerned about the costs of alignments than its benefits and so it becomes crucial to evaluate the passive standing of India during the Cold War. This paper questions the nonalignment's flexibility associated with the historical period of the Cold War. The results of this paper pave the path towards the development of Indian social sciences which further the understanding of the future political decisions arising from a historical event. This article guides the policymakers to study the patterns of the decision-making process of Indian leaders during the Cold War era, which proves helpful in developing India's future choices on the world stage.

Dance and Body Culture: Changing Habits of the Moving Bodies

The purpose of this paper is to explore the incorporation of the body in dance practices, and its role in cultural (re)production, social relations, and lived experiences. Moreover, the paper aims to identify and explore certain habits which resonate with the dancing bodies through an investigation of dance and everyday aesthetic movement practices as they are situated in a particular place and time.

The research was conducted using a qualitative case study, and data were collected through semi-structured in-depth interviews of Russian and Indian women learning Indian classical Kathak dance, conducted in the city of Saint Petersburg, Russia and later analyzed by using deductive content analysis.

It was found that the respondents perceive their dance as a motive to express themselves through bodily movements, as a chance of experiencing a new culture, personal development through changed habits, and as an opportunity to better their physical state. Both, Indian and Russian participants' personal preferences for learning Kathak dance in Saint Petersburg, Russia was investigated to be the willingness to understand that dance shapes the language of the body which helps in proper interpretation of socio-cultural meanings, community feeling, and the habits developed during the process of social integration through cultural diversity spread through dancing bodies. It is revealed that the body experience in dance is productive as it celebrates relations in movements which construct similar habits adopted by moving bodies through shared dance practices.

This paper expands the fields of body studies by placing the personal bodily experience of city space in dialogue with a study of dance movement practices to theorize how habits constructed is productively intertwined with processes of space, time, and formation of social relations in a globalized era.

The Contextual Determinant of Sport As an Instrument of Leisure Tourism: Assessing Development in Kashmir

The intention of this paper is to analyze the role of sport as an instrument of leisure to enable development networks expand through tourism, specifically in the underdeveloped regions of Indian State of Kashmir to gain conceptual understanding of the development processes. Based upon the notion of initializing Athletics in this State, the study synthesizes the plan to introduce this particular sport with the model of developing and creating legitimate avenues of tourism. It identifies the processes through which a series of viable network of informal interdependent relationships are created and this sort of tourism aids the State in exploring more feasible opportunities for revenue generation and overall development. In an attempt to make sense of the mechanisms through which these processes will be measured, this analysis will deploy a qualitative methodology by interviewing the Officials of the Athletics Federation of India, assessment of secondary data through the Economy Survey of India, and interviews of nine Officials of the Sports Federation from the State.

THEOBALD, HILDEGARD* (University of Vechta, Germany)

Migrant Care Work, Precarisation and Patterns of Stratifications in the Home Care Sector in Germany: An Intersectional Approach

With the introduction of Long-term Care Insurance (LTCI), Germany made universal long-term care support available. Embedded in a neoliberal agenda the policy scheme combines universalism coverage at a medium level of generosity, a market-oriented expansion and restructuring of the publicly funded care infrastructure and publicly supported family care provision. Within this framework a complex mixture of different types of paid care work in distinct home care settings emerged; i.e professional home care organized within the framework of LTCI as well as household-oriented services and 24-hours live-in care arrangements within private households embedded in a different set of regulations. The commodification of care work resulted in different forms of precarisation of care work, an increasing employment of migrant carers followed by the development of new patterns of stratifications within and between the distinct home care settings. Against this background, the paper focuses on the analysis of different forms of precarisation in distinct home care settings. The analysis includes:
- a mapping of the different forms of precarisation – characteristics and distribution
- an explanation of their emergence within the interaction of long-term care, employment- and professionalization and migration policies
- a description and explanation of emerging patterns of stratification among different groups of care workers embedded in an intersectional approach based on gender, skill levels as an indicator of socio-economic class and migration status

Theoretically, the paper combines concepts developed within international comparative welfare research for the analysis of the institutional frameworks of policy designs, the different forms of precarisation embedded in an intersectional approach for the inequality-related outcomes. Empirically, it is based on representative statistics, findings of representative inquiries as well as qualitative research for an integrated analysis of the developments within and between the distinct care settings.

THEOBALD, HILDEGARD* (University of Vechta, Germany)

The changing involvement of voluntary work in elder care: a comparison between Germany, Sweden and Japan

Against the background of demographic changes with its increase of the number of frail elderly people in the society, in several western countries voluntary work has increasingly been regarded as a resource in long-term care provision. Despite this common trend, the significance of voluntary work as a resource in long-term care provision as well as the definition of the role and shape of voluntary work differ considerably between western countries. The country-specific patterns are developing embedded in an interplay of the (changing) long-term care- and civic society regimes in place. The rising involvement of voluntary work is followed by changing patterns of inequalities in care work in society. Against this background the paper compares the changing involvement of voluntary work in elder care in Germany, Sweden and Japan. The three countries differ considerably with regard to their long-term care- and civic society regimes, patterns of changing involvement of voluntary work and their embeddedness in both regimes.

Conceptually, the paper combines approaches of long-term care regimes and civic society regimes to create a joint, innovative conceptual framework for the cross-country comparison. Empirically, it draws on statistics and research findings to compare the development of voluntary work in the three countries, their embeddedness in the changing long-term care- and civic society regimes and the potential inequality related outcomes. The innovative conceptual framework enables a deeper understanding – description and explanation – of the changing, country-specific involvement of voluntary work in elder care, the contradictories and the inequality-related effects in a cross-country comparison.

Cross the Fields of Environmental Justice and Postcolonialism: Heuristics and Applications on the Field of Investigation in Reunion Island

We aims to cross two theoretical fields, the one of Environmental Justice (EJ) and the one of postcolonial studies to understand environmental inequalities in Reunion Island. The case of this island territory is interesting because it shares a community of destiny with the other islands of the Indian Ocean and more broadly with the island systems of the South. However, as a French territory, it is an emanation of the North. Thus, Reunion Island plays a singular role in the Conference of the Parties and intends to lead the innovative proposals to address the environmental challenges.

But, this former French colony is still today seized through the prism of modernity and tradition, the western practices as modern ones and the indigenous practices as traditional ones. Thus, the decolonial period have aimed the economic catch-up as a movement towards more social justice (to eradicate insalubrious habitats), health (to eradicate malaria) and economic (by setting up social minima). This was yesterday to "educate" the inhabitants to "good practices" of modernity, but this educational perspective is no longer enough to make believe in the participation of local people.

We will first see how the politics of environment protection have been put in place in this territory, facing great social disparities. We will highlight how classical French sociologies are struggling to grasp the issues of social justice in Creole postmodernities. Crossing-reference the fields of EJ with Postcolonial studies allows us to take a singular look at the mechanisms of (re)production of environmental inequalities.

In a second step, we will set the limits of this theoretical framework to look further at how the silent forms of empowerment of local people, still named as "subalterns", challenge the models of environmental justice that overvalue the place of recognition in social mobilization and renew the critical power of sociology.

Ghana's 2021 Population Census and the Politics of Innovation

For the first time in the history of census taking in Ghana, the 2021 Population and Housing Census will be entirely digital. This paper explores innovations in Ghana's 2021 population census from the point of view of the country's ongoing "data revolution" and the developmental promise of interoperable population registers in particular. It explores 1) the legal dimension of the recent expansion of the national Statistical Service's coordinating functions, 2) technological innovations in digital census taking and the inter-agency infrastructural arrangements that inform the new mode of census taking in Ghana, and finally, the political communication situating the census in the national development agenda. In doing so,

the paper seeks to carve out the policy assemblages in which the current data innovations have emerged, including the impact of transnational factors such as the spread of the SARS-CoV-2 pathogen.

THIERBACH, CORNELIA* (Technische Universität Berlin, Germany)
BRAUNISCH, LILLI* (Technische Universität Berlin, Germany)

Exploring the Limits of the Digitization of Housework. the Case of the Automated Kitchen.

Predominantly, technology developers (rather than consumers) push the digitization of homes (e.g. Wilson et al. 2015). They expect great benefits of so-called smart homes in the areas of lifestyle support (assisted living, eHealth), safety, energy management, and provision of better living standards (e.g. more leisure time). However, the digitization of homes will also affect unpaid reproductive work (i.e. homemaking), care work in households and household services. As a form of unpaid work, homemaking is usually not a topic of the sociology of work (Geissler 2010). However, as paid and unpaid work are linked, unpaid work should be integrated into sociology of work.

Using kitchens and cooking as examples, the interdisciplinary research project "UbiAct" aims at two goals: (1) Developing a multimodal interaction system for networked environments in digitalized homes. With the use of AR glasses and a ring for gesture control, context information will be visualized in space and control options will be more intuitive in execution. (2) Exploring the needs, benefits, and barriers of (potential) smart home users.

Therefore, we have to ask: What are negative consequences and what are the limits of digitizing kitchens resp. homes? What do potential users think of these digitizing trends in their home? What are obstacles, fears, and limits (e.g. ethical, legal, and social issues, costs)?

For this presentation, we will present first findings on this topic and we want to embed them in a critical discourse on digitization. The data basis will be focus groups conducted in 2019/2020. Sampling criteria will be gender, age, affinity for technology, and health status. For data analysis, we will apply a content analysis.

THOMPSON, MICHAEL* (William Paterson University, USA)

Alienation and Democratic Consciousness

Every since Rousseau, a core aspect of democracy has been the idea that each citizen must be able to have in view the common interest or the common good: those parameters needed for distinguishing between one's genuine self interest as a social-relational being. I want to argue that alienation is a crucial component to obfuscating this capacity in civic consciousness. My basic thesis will be that alienation consists of an incapacity to have a proper social ontology in view for determining one's self and common interest. I will argue that alienation is a serious deficit in modern democratic societies and the kind of consciousness requisite to stave off authoritarian populist appeals and preserve democratic attitudes and norms.

THOMSEN, SARAH* (Helmut Schmidt University Hamburg - University of the Armed Forces, Hamburg, Germany)

Processes of Biographical Transformations of the Habitus in the Context of New Social Movements in Germany

'*Bildung*' in the *Bildungs*-oriented biographical research in Germany is defined as a transformation of self-world-relations. Drawing on Bourdieu's concept of habitus in my recently published PhD thesis on biographical processes of 'Bildung' in the context of social protest movements (cf. Thomsen, 2019) I understood this basic change in self-world-relations as a transformation of the fundamental structures of perception, conception and action that form the habitus.

In my research I empirically analyzed narrative interviews of actors engaged in the new social movements of Germany. Interpreting these biographical accounts by means of the Documentary Method (Bohnsack et al. 2010) helped me grasp not only the overt experiences the interviewees have undergone whilst participating in the movements mentioned but also the covert, more implicit "orientation frames" (Bohnsack et al. 2010) – a concept very close to the habitus – underlying these processes. The documentary interpretation is based on a comparative analysis of several interviews and leads not only to the identification of typical orientation frames but can also be used to identify typical courses of the respective processes (cf. Nohl, 2017), which was my focus.

As a result of my study I can not only show how deep an impact the engagement in social protest movements has on individuals and their biographically established habitus. Furthermore, I reconstructed that in the process of these transformations protestors often (implicitly) reconnect to former biographical experiences that had not necessarily been 'political' in the first place. They can

rather be called 'protopolitical' as they are being politicized in the process. I can thus show how the transformation of the habitus also bears traits of biographical continuity.

Missing in Action: A Longitudinal Study of the Dynamics of TEAM NON-Emergence

Ad hoc and temporary groups have been an enduring focus of organizational theory since its inception in the 1950's and the importance of this form of organizing has only been growing. As Einola and Alvesson (2019) cogently argue in their recent review of theorizing and research on teams, instead of empirical investigations of the processes through which a collection of individuals may or may not come to act like a "team", research has historically presumed that a team exists and instead has investigated how they move through pre-defined stages or how well they perform to generate desired outcomes. As Einola and Alvesson note, teams are treated as a static entity obscuring how and, as we illustrate, whether teams *become* and the dynamics of *teaming* .

The vast majority of research on teams has used either quantitative methods or qualitative methods that focus on gaining insight into how individuals understand and describe their involvement with a team. There has been very little research that investigates how the actions of individuals promote or impede the becoming of a team and how "teaming" fluctuates over time. In this study we ask: how do the actions of a collection of individuals assembled for the purposes of executing a particular task contribute to and/or detract from the *becoming* of a team? While Einola and Alvesson's (2019) recent ground-breaking research investigates this with a focus on cognition, i.e. using interviews/diaries to gain insight into the degree to which individuals see themselves as a team over time; in this two year study of the activities (i.e., recordings of all in person meetings as well as archival material of all whatsapp and email communication) of a group of researchers assembled at a university in Argentina, we illustrate how the individuals sometimes do and mostly do not "team".

Between Obstacles and Support. Lgbtiq Refugees in German Accommodations*

Entering the German state refugees and immigrants are confronted with a complex bureaucratic system, stratifying the rights of immigrants against the background of 'humanitarian reasons'. So called 'save third state regulations' are differentiating between good and bad, political or economic reasons for flight. Individuals and families are differentiated taken gender into account and re-producing discursive pictures of male Muslim villains and female victims of flight (Tietje/Tuider 2019).

While sexuality often enough seems to be an invisible category, the separation by gender offers opportunities of bettering the living conditions for some immigrants. At the same time those segregating practices function as disciplining affirmations of public discourses (Foucault 2006) on the othering gender imaginations (Dietze 2016). Nevertheless, beyond a heteronormative perspective the segregated accommodation for immigrants offers opportunities. For example, the especially for the needs of LGBTIQ* refugees implemented accommodations and LGBTIQ* support structures are opening opportunities to live their sexuality more freely.

In my lecture I will focus on the ambivalent differentiation and segregation of the accommodation of LGBTIQ* refugees in Germany. For this purpose, I reconstruct from an intersectional perspective *first* the general circumstances of the arrival of LGBTIQ* refugees in Germany. *Second* focus on the opportunities and obstacles of a good living for refugees and *third* conclude while focussing on the field of tension between enabling freedom and precarising experiences. My conclusions are based on the outcomes of the qualitative research project 'Welcome Culture and Democracy in Germany'.

Governmental Independence? Decent Life and Bettering Situations through Fair Trade Standardized Coffee Production in Southern Mexico

The neoliberal organisation of the Mexican government combined with the repressive state structure is related to interrelations between local politics, the military and police forces and international organized cartels controlling parts of trade and social infrastructure on the national and regional level. The well-known maquiladora industry in northern Mexico finds its counterpart in the more agricultural shaped Southern Mexico and therefore exists a strong unequal distribution of welfare and livelihood over the country. Meanwhile especially the southern federal state Chiapas is getting more and more famous for its ecological production of agricultural products (e.g. Villalpando 2004; World Bank/CIAT/CATIE 2014).

The global standardization of ecological production combined with the opportunities of certified fair trade production within the production chains of coffee enable small farmers to substitute the failing of Mexican social state policies and escape living in poverty. In consequence small farmers find opportunities in focussing on international standards to reach independence of the Mexican government labour policies. Within those international processes Alternative Food Networks were established especially for the coffee production certifying e.g. Zapatist or Mayan coffee.

So the means of standardization and certification offer a tool of non-governmental governing of the agricultural market through its access regulating function. As part of alternative food networks on the other hand those certifications guarantee a decent income to otherwise very poor small farmers.

Having the intersectional relation of different categories of difference in mind, we reconstruct the relevance of communal organising in the coffee production, exemplary for the federal states Oaxaca and Chiapas, and point out how those little ruptures within the neoliberal everyday refer to a shifting of the everyday. Our talk will base on qualitative interviews with small farmers, manufacturers and vendors of coffee in Chiapas and Oaxaca, mostly organized in cooperatives who are producing for the European coffee market.

The Young Anthropocene: Silence and Fire

I have previously argued that the nursery rhyme *Ladybird ("Ladybird, ladybird fly away home, Your house is on fire, your children are gone")* written during the great Fire of London in 1666 might assist the field of youth studies to recognize our relative silence about the Anthropocene and the work that young people are doing to contend with this age where digital technology and extractive capitalism coalesce in their lives. Life on this planet has been changed so profoundly by human activity that it marks this new geological epoch "the age of the human". Recently, millions of young people from around the globe have joined Greta Thunberg and other youth activists in global/local responses to impending ecological catastrophe, letting us know that "our house is on fire" and immediate action is required. These forms of youth resistance demarcate one critical "golden spike" to be hammered into the social sciences of the Anthropocene. I will illustrate the ways in which youth attempt to be neither victims nor perpetrators of anthropogenic crimes against humanity and planet. Rather, they connect geopolitical dots and negotiate new structures and agencies of the Anthropocene in global, intercultural and intergenerational ways that call for immediate responses from those who study and support young lives. Our silence in the fire is no longer an option so I offer some provocations for discussion.

TINSLEY, MEGHAN* (The University of Manchester, USA)

Overcoming Positivism, Understanding Power: Towards a Critical Realist Postcolonial Theory

Recent years have witnessed a significant wave of theoretical contributions to postcolonial theory within sociology (Bhambra 2007, Go 2016), alongside anthropology, geography, urban studies, and development studies. Yet despite these important innovations in the social sciences, many critiques of postcolonial theory continue to locate the field within the humanities in general, and literary criticism in particular. These have included claims that postcolonial theory places undue emphasis on discourse, that its abstraction from a particular time and space neglects the material realities of colonialism, and that, conversely, its emphasis on twentieth-century European overseas empires makes it complicit with twenty-first-century neo-colonialism. In response to claims that postcolonial theory is limited in scope, social theorists have called instead for decoloniality (Mignolo and Escobar 2013, Savransky 2017) and deimperialisation (Chen 2010). Bifurcating postcolonial theory and critical realism serves to entrench the epistemologi-

cal divide between relativist approaches that embrace multiple perspectives and positivist approaches that search for truth. I intervene by placing postcolonial theory in conversation with critical realism. I argue, further, that a critical realist postcolonial theory provides a model for overcoming positivism in social science methodology: it foregrounds marginalised voices and unsettles hegemonic ways of knowing without negating the reality of colonial and neo-colonial violence. I begin by tracing the interdisciplinary, transnational origins and axes of postcolonial theory. I then delve into three crucial, yet highly contested, topics within postcolonial theory: discourse, materiality, and liberation. In each case, I review the criticism of postcolonial theory and explore how an explicit engagement with critical realism suggests a way forward. I conclude by considering the implications of a critical realist postcolonial theory for the project of decolonising sociology.

Work Intensification and Digitalisation of Work

Although digitisation will unlikely bring an end to work, some tasks and professions are already changing drastically. An increasing number of studies indicates that digitalisation is related to an increased work intensity – with negative consequences for the well-being of employees. Yet, it remains largely unclear why the use of new technologies is associated with an increased pace and pressure at work. One possible pathway discussed is that the use of new technologies is often accompanied by an increased work pressure, as the technological and the organizational implementation have to be handled by the employees in addition to the day-to-day business. This paper aims to empirically explore this hypothesis that employees first need to familiarise with new technologies and that this process in turn leads to an intensification of work.

The analyses are based on the German BIBB/BAuA Employment Survey. This cross-sectional survey is a representative for the German working population and includes comprehensive information on the working conditions and health of employees aged 15 and over working at least 10 hours per week. We perform linear probability models with robust standard errors clustered at the occupational level controlling for age, gender, industries, occupations and the educational level. The findings suggest a positive relationship between the introduction of new technologies (new computer programs as well as new manufacturing technologies) - and work intensity. With respect to the introduction of new computer programs, interaction models indicate that the confrontation with new tasks seems to reinforce time and performance pressure.

Globalization, Gender and Transformation of Professional Identity

Anthony Giddens explores the social world of the late 20th century under the label of `high modernity`, and in particular, he links the changing nature of self-identity of the individual with key trends in society at this period. Giddens identifies some key features of contemporary life which in his view distinguish it from what has gone before. These are: *time-space distanciation, disembedding of social relation from local context of interaction, increased trust in abstract systems* and *chronic reflexive ordering and reordering of social relations in light of new knowledge*. He emphasizes that these features are not an abrupt change from the modern period but rather the identification of the more of thoughts and behaviour and the extension of the related institution of the Modern Age. He uses the term 'high-modernity 'to characterize this view, in contrast to the idea of Post –Modernism which emphasizes discontinuity. In his view, globalization is a stage of high modernity transforming all the institutions of modernity including the professions. The present paper is aimed to explore the utility of this conceptual framework for understanding profound changes in the identity of women professionals and their role performance in select professional groups of globalizing India.

WG01-694.1

TIWARI, PREETI* (University of Allahabad, India)

The Local, the Global and the Transformation of Everyday Life

The globalizing tendencies of modernity are inherent in the dynamic influences of its three major characteristics-'separation or reorganizing of time and space', 'disembedding mechanism' and 'reflexivity of modernity'. All these presume universalizing properties that explain the expansionist, coruscating nature of modern social life in its encounters with traditionally established practices. The globalization of social activity which modernity has served to bring about is in some ways a process of development of genuinely worldwide ties-such as those involved in the global nation-state system or the international division of labour. The global spread of modernity can be understood in terms of an ongoing relation between distanciation and the chronic mutability of local circumstances and local engagements. Thus, globalization has to be understood as a dialectical phenomenon, in which events at one pole of a distanciated relation often produce divergent or even contrary occurrences at another. The dialectic of the global and the local is an important area of sociological investigation. Based on these presumptions of the late or high modernity, or globalization in the view of Giddens, the present paper is aimed to understand the dynamicity of globalization in everyday life at the local and the global level.

TOBEÑA, VERÓNICA* (FLACSO Argentina, Argentina)
NOBILE, MARIANA (FLACSO Argentina, Argentina)

Hacia Una Fenomenología Del Cambio Con Foco En El Proceso De Transformación Del Cuerpo Docente. El Caso De La Escuela Secundaria Rionegrina (Argentina)

Esta ponencia se propone analizar la iniciativa de transformación del nivel secundario que desde el año 2017 está implementándose en la provincia de Río Negro, Argentina, haciendo foco, por un lado, en las expectativas que penden sobre los docentes como agentes de la política y, por otro, dando cuenta de la forma en que los agentes de la enseñanza tramitan la interpelación que reciben por parte de la reforma. Asimismo, la ponencia se propone sopesar qué recursos moviliza la reforma para sostener el tránsito de los docentes hacia el modelo educativo que intenta instalar y cómo se conjugan con los diferentes perfiles docentes disponibles para ello.

¿Qué recursos pone en juego dicha política en pos del cambio con foco en los docentes? ¿Son suficientes las estrategias diseñadas para muñir a los docentes del perfil profesional que traza la reforma? ¿Varía su resultado según las condiciones que reúne cada profesor en términos de trayectoria, formación, antigüedad, etc.)? ¿Contempla una diferenciación en los dispositivos de intervención que ofrece atento a la heterogeneidad que condensa el cuerpo docente provincial? En suma, la ponencia se propone contribuir a reconstruir la fenomenología del cambio en lo que respecta a un agente crucial como son los docentes, en el contexto de una reforma como la rionegrina, orientada a transformar la dimensión epistemológico-pedagógica de la escuela. Esto significa un intento por romper la forma en que históricamente la escuela se relacionó y organizó el conocimiento y cambiar la matriz disciplinar que determina tanto la formación docente, como su contratación por especialidad y el dictado de asignaturas.

TOBIAS, MELINA* (CONICET- Instituto de Investigaciones Gino Germani, Argentina)
MORENO, LUCILA* (Instituto de Ciencias Antropológicas UBA, Argentina)

La "Urbanización" Como Promesa Incumplida: Infraestructura, Riesgos y Cambio Climático En Barrios Populares Del Gran Buenos Aires.

En las últimas dos décadas en Argentina cobraron importancia diferentes políticas públicas orientadas a "mejorar la calidad de vida" de la población que habita en villas y asentamientos populares. Para ello se elaboraron diversos proyectos estatales de "urbanización", que implicaron la extensión de infraestructura urbana (pavimentación, y provisión de servicios públicos tales como agua potable, cloacas, pluviales, electricidad, gas) y la regularización dominial de las tierras. En este marco, en el partido de San Fernando, ubicado en la zona norte del Gran Buenos Aires, se llevaron adelante Programas de Mejoramientos de Barrios (PROMEBA) financiados por el Banco Interamericano de Desarrollo y el Estado Nacional, y diseñados por el municipio. Tras más de diez años del inicio de las obras, muchos de estos proyectos fueron suspendidos, dejando obras inconclusas y produciendo nuevas incertidumbres, riesgos e (in)seguridades en la población.

Esta situación hizo que diferentes organizaciones sociales que se encontraban llevando adelante proyectos de acceso justo al hábitat en articulación con equipos de investigación y extensión universitaria, comenzaran a problematizar los efectos o riesgos que dichas infraestructuras inconclusas dejaron en el territorio. Así, a partir del 2018 iniciamos un proyecto de investigación colaborativa centrado en analizar las percepciones de riesgos por parte de los habitantes y sus vinculaciones con los efectos locales del cambio climático (principalmente inundaciones y olas de calor) en tres barrios ubicados en el cauce viejo del río Reconquista.

El objetivo de esta ponencia es reflexionar, a partir de un enfoque cualitativo, acerca del proceso de producción colectiva de conocimiento en estos años en dichos barrios y la centralidad que cobraron los riesgos asociados a la infraestructura. Concretamente nos interesa indagar el modo en que dichas infraestructuras profundizaron las desigualdades sociales al crear nuevos escenarios de riesgo e incertidumbre, agravados por los efectos de la variabilidad climática.

Authoritarianism, Populism and Attitude Towards Political Elites in Serbia

Contemporary literature defines populist ideology as a covariance of anti-elitist orientation, 'nativism', and negative attitude towards 'others'. Populism defined in this way is close to the concept of (right wing) authoritarianism. Authoritarianism includes negative attitudes towards various minorities as well, and is often conceptualized as the psychological basis of the support for anti-democratic ideologies. What differentiates the two concepts is the attitude towards authorities. Populism implies a negative attitude towards the elites, who are perceived as corrupt and alienated from "the people". Authoritarianism, however, involves the submissive position vis-à-vis the authorities. Although 'authorities' and 'elites' that populism and authoritarianism refer to differ, the relationship between the two concepts needs to be clarified. They are supposed to explain similar phenomena, and yet, imply different positions towards authorities and political elites. This problem, insufficiently understood in the literature, is the subject of this study. Data for the analyses come from a web-based public opinion survey, conducted after the last presidential elections in Serbia, in 2017. The sample includes more than 2000 respondents, and is balanced according to the basic socio-demographics. The first part of the analysis examines the relationships between authoritarianism and populist ideology. The second part is focused on the associations between the two ideological orientations and party preferences. The results show that authoritarianism and populism overlap in the areas of anti-minority attitudes and nativism. The anti-elite orientation, however, does not belong neither to the domain of authoritarianism, nor populism. In 2017 Serbia, it primarily reflected the attitude towards the governing party.

ÁVILA, THIAGO* (Instituto de Educação Superior de Brasília, Brazil)

Acciones Conjuntas Del Buen Vivir En El Distrito Federal, Brasil: Praxis Para Escapar De La Trampa Del Desarrollo

Con base en revisión de la literatura especializada, sostenemos que los conflictos sociales y ambientales se acentúan a medida que la idea del desarrollo trae consigo la noción de que los lugares subdesarrollados son espacios atrasados que deben adaptarse al tiempo presente. Esta idea de linealidad histórica hace que sea necesario luchar por el propio derecho a existir de manera diferente de lo que se considera moderno, y coloca la idea de los bienes comunes como obstáculo para la expansión de la producción y del consumo. Por lo tanto, el desarrollismo, uno de los dispositivos clave del capitalismo que hace creer que el bienestar es sinónimo de consumo, es un elemento central de la crisis ecológica que amenaza la existencia de miles de especies, incluida la humana. Las Acciones conjuntas del buen vivir ("Mutirões do bem viver"), proyecto que existe desde 2017 en el Distrito Federal, Brasil, se oponen a la lógica del desarrollo. Más allá de objetivos específicos importantes, como la (bio)construcción de viviendas o el fortalecimiento de la agricultura familiar, su objetivo estratégico es compartir experiencias y una nueva praxis creativa que genere confianza entre las personas a la vez que permita la desnaturalización de la cosmovisión dominante y la autoorganización de la comunidad referenciada en la cosmovisión de los pueblos originarios de América Latina. Al combatir el imaginario del desarrollo, esta experiencia concreta se encuentra con autores como Acosta (2016), Gudynas (2011, 2012) y Lang (2011, 2016, 2017) que sostienen que cualquier alternativa que desee ser antisistémica necesita cuestionar el mito del desarrollo, o terminará por reforzar la base de apoyo del sistema capitalista, destruyendo modos de vida alternativos e impidiendo cualquier resolución de la crisis ambiental.

TOLEDO FERREIRA, MARIANA* (Universidade de Sao Paulo, Brazil)

Tensions between the Local and the Global: The Legitimation of a Peripheral Scientific Agenda

This paper seeks to advance the understanding of relations between centers and peripheries in the production of scientific knowledge, considering the construction and legitimation of a peripheral research agenda in the field of human and medical genetics. To look at the construction of scientific agendas in terms of center and periphery is to take into account the assumption that scientific production is unevenly divided between different regions around the world (Medina, 2013; Keim, 2010; Alatas, 2003; Hountondji, 1990). Empirically, the work is based on quantitative data on the career and trajectory patterns of 416 Brazilian researchers in the field of human and medical genetics, as well as bibliometric analysis of their work in international co-authorship. In addition, 50 in-depth interviews were conducted in three Brazilian regions (North, South and Southeast). This paper analyses the tensions between the local and the global in the constitution of a research agenda presenting convergences and tensions regarding patterns and parameters of what has consensually been named "international science". In terms of legitimating the type of research conducted in the local context, we discuss i) different conceptions of research "impact"; ii) tensions regarding publication versus care for people with genetic diseases and public health policy formulation; iii) basic research versus application to the local context; and, finally, iv) advocacy for dealing with local problems (and local samples) versus an international agenda that emphasizes the most up to date techniques and methodologies.

Migrants and the Making of the City: A Biographical Study of Selected Community Leaders in the Neighborhood of Accra

Since its declaration as the capital city by the British colonial authorities, migrants have played a prominent role in the transformation of Accra not only from a small coastal fishing village into the nation's main commercial and economic center but also a hub for social, educational, sports, entertainment and cultural activities in the country. Unlike elsewhere in West Africa, the autochthonous Ga population of Accra have always welcomed migrants into their fold and successfully integrated them into their society. The influence of migrants from West Africa and abroad has been prominent in the transformation of the city. Accra has benefited so much from the continued arrival and active participation of migrants in the areas of trade, transport, sports and entertainment, manufacturing as well as education, and public administration. Today, Accra has several neighborhoods with a modern, cosmopolitan and vibrant multi-cultural and multi-ethnic populations.

This paper seeks to elaborate on and contribute to an understanding of the historical development and current trends in the city by examining the experiences and observations of selected leaders of the different migrant communities in Accra. Using largely a biographical approach, it will document the perspectives and contributions of different individuals and migrant groups such as the Hausa, Fulani, Lebanese and the Akan to the growth and changing developments in Accra since the beginning of the 20th century. The life stories and life histories of these individuals should give us useful insights about their activities, interactions between and among neighbors as well as how the city of Accra has been influenced and transformed by these migrants.

Brazilian Transnational Family Practices: The Ageing Process and the Death of a Loved One.

This paper explores how Brazilian migrant women in the UK 'do family' with their elderly parents in Brazil, and how they face their own ageing process in migratory context. This investigation was carried out during my doctoral research. It has focused on how Brazilian migrant women, who moved to the UK in the 1980 and 1990, have (re) created a sense of familyhood, even while living at a distance for an extended period of time. The research dialogues with transnational family studies that consider the significance and continuity of family relationships in the process of migration. The study was framed by a qualitative methodological framework which includes a multi-sited ethnography, biographical interviews and diaries. Fieldwork was carried out in the UK and in Brazil. Among several family practices done by the participants of my study, to this paper I shed light on the creation and recreation of family during the life-course event of death. Facing the death of a love-one from a distance involves practising a set of activities heavily encoded with symbolic and affective meanings (e.g. taking part in the funeral) as well as some social constraints, which can influence the capacity and opportunity to practise them. Moreover, going through the death process of a loved-one led the Brazilian migrant women interviewed reflect on their own ageing process (where to grow old, who will take care of them, die in a foreign land). These were dilemmas listed by them. The study, then, showed that for the Brazilian migrant women studied taking part in the death process of their elderly parents even from a distance was a family practice especially important for them in order to (re) constitute their sense of familyhood. In addition, experiencing such practice was crucial to make them thinking about their own ageing process in the UK.

Engaging Citizens in Science with and for Society: Contributions from Social Theory

In spite of the contributions from social theory, many are the citizens who do not see the need to participate in scientific research. But these same social actors can potentially be engaged through actions which connect the scientific advancement they appreciate and interact about with the research that led to them. In this vein, the ALLINTERACT proposal was born to shed new light on how citizens access, act and react around scientific research with social impact. The project's contribution from social theory is twofold. On the one hand, it draws on the social theories which have greatly contributed to the improvement of societies and have had a key role in the promotion of the social impact of all sciences. For example, the contributions from the communicative theory of action (Habermas) have demonstrated the potential of the inclusion of all voices through dialogue and critical rationality; or the contribution from Public Sociology (Burawoy) and real utopias (Erik Olin Wright) to the social impact of SSH. On the other hand, ALLINTERACT promotes methodologies of research deeply rooted in the advancements from social theory, such as the communicative methodology of research, and puts forward a novel use of a new methodology, the Social Impact in Social Media methodology (Pulido, Redondo-Sama, Sordé-Martí, & Flecha, 2018), which relies on social media users' interactions in social media to assess the social impact of a research.

ALLINTERACT contributes to building the knowledge base of SWAFS (Science with and for Society) drawing on the theoretical and methodological advancements led from social theory, which in turn lead to the improvement of the cooperation between science and society.

TORRAS GÓMEZ, ELISABETH* (University of Barcelona, Spain)

The Pleasure in Falling in Love

The coercive dominant discourse (CDD) conveyed through TV shows, popular songs and social media, among others, is socializing some women, from a young age, into attraction towards violent attitudes and behaviours (Puigvert, Gelsthorpe, Soler-Gallart, & Flecha, 2019). Alongside, we find a parallel discourse which portrays romantic love as an imposition that limits girls' sexual freedom.

Drawing on this evidence, our aim was to explore the relationship between the CDD and the pleasure women associate to their sexual-affective relationships. Our hypothesis was that the socialization to such discourse might be driving young women to sexual-affective relationships in which there is neither freedom nor desire, but the pressure to meet social expectations leads them to internalize those relationships as exciting. To that end, we conducted a pilot study with women between 20 and 29 years-old, who were interviewed following the communicative methodology of research. Results unveiled a lack of pleasure in coerced relationships, while those in romantic egalitarian relationships reported them as being passionate. Moreover, girls who had fallen into the pressures of the coercive discourse, but had decided to break with such pressures, denounced the lack of freedom and pleasure in the former, and strongly advocated for romantic egalitarian relationships that united passion and love. Unveiling the lack of pleasure in coerced relationships in contrast to the pleasure reported in romantic egalitarian relationships free of the coercive discourse, brings new evidence that both contributes to breaking with the CDD and vindicates our right to the pleasure of falling in love.

Why Are Gender Equality Issues Under Attack. a Reflection from a European Perspective

Over the last decade, gender issues have been hotly debated. The financial, economic and migration crisis, which has accentuated the precariousness in the living conditions of the populations and raised fears and feelings of insecurity, has created the grounds for the emergence of authoritarian, dictatorial leaderships that use sexism, homophobia, and xenophobia, attacking **directly gender equality issues,** when not overtly defending the use of violence.

While there have been reactions against these politics - huge demonstrations on the streets or in the social media, where activists have had a very relevant role – the fact is that they have been unable to stop these movements from growing. And despite being supported by powerful economic and military interests,

authoritarian leaders continue to find additional supporters among the disempowered and the poor, who unfortunately believe that they are the solution for their problems.

But why is gender equality under attack? Why do these new authoritarian leaders use sexism and homophobia as weapons in their nationalist discourses? Why is it that in countries where these policies are not so strong, we are nevertheless still witnessing a sort of *backlash,***or what some consider** *an anti-genderism trend***? Importantly too, how are these trends affecting academic life and women's, gender and feminist studies? And what strategies have been developed to address attempts to erase, marginalise and/or silence the field?**

These and other topics will be addressed reflecting in this presentation.

MORROW, RAYMOND* (University of Alberta, Canada)

Deliberative Democracy and Pedagogy of the Oppressed: A Critical Reading of Paulo Freire's Contributions.

In this paper, we continue our collaborative work in social theory focusing on the question of deliberative democracy and dialogical democracy emerging from the social construct of *Pedagogy of the Oppressed*, the famous book by Brazilian philosopher Paulo Freire. Without attempting a full reconstruction of his work, that will be done in another place (Morrow, 2019a) in this paper we will discuss his analysis of deliberative democracy in light of critical cosmopolitanism. We emphasize Paulo Freire's agonic attempt to propose a hermeneutical strategy in defense of a democratic model that could be helped by a new educational model. Yet, simultaneously, in each of the historical periods of his oeuvre, he developed an understanding of postcolonial traditions looking at the risks but also the benefits of deliberative democracy.

To develop our argument, it is important to situate the location of this important book in the history of social sciences and pedagogy—though we shall move beyond this book in our analysis--, and to briefly outlined Freire's historical and analytical stages while constructing his oeuvre. In our conclusion, we will discuss *alternatives* and *resources* in Freire's theoretical insights while hinting that one of the key references not fully understood in his work is his analysis of *alienation* drawing very closely with traditional sources of Critical Theory a la Frankfurt School but departing from it in several ways.[1]

[1] Given the now widespread use of the term "critical theory" to refer to textual criticism and rather speculative theories of society in the humanities, the term "critical social theory" will be used to describe approaches linked with a sociological theory of society and related historical and empirical research. Capitalized as the "Critical Theory", the term will be used to refer to the Frankfurt School tradition, usually specified by generation, as forms of critical social theory.

TORRES, MIGUEL* (CEPAL, Chile)

Estructuralismo, Dependencia y Neoestructuralismo En El Siglo XXI

La Comisión Económica para América Latina y el Caribe (CEPAL) ha desarrollado un rico pensamiento teórico sobre el desarrollo económico, social y ambiental de esta región. Desde su fundación en 1948, este pensamiento se ha caracterizado no solo por elaborar diagnósticos sobre la materia sino también por estar orientado hacia las políticas de desarrollo. Se puede afirmar de manera fehaciente entonces, que el pensamiento de la CEPAL es un cimiento de la "socioeconomía" latinoamericana y caribeña por más de 70 años.

A partir de la noción centro-periferia de Prebisch y de la incorporación del método histórico estructural, la CEPAL ha contribuido al análisis de los problemas del desarrollo en la región, mediante tres enfoques bien acotados en términos de periodos históricos que pueden ser considerados parte de una "sociología latinoamericana", pero que también han influido las escuelas sociológicas de otras regiones. Estos enfoques son: a) el estructuralismo latinoamericano (1948-1990), b) el enfoque o teoría de la dependencia (1965-1980) y c) el neoestructuralismo (desde 1990).

El objetivo de la presente investigación es identificar cuales son los elementos analíticos de cada uno de estos tres enfoques teóricos que hoy pueden ayudar a comprender mejor el proceso de hiperglobalización que enfrentan las regiones periféricas en su proceso de desarrollo económico, social y ambientalmente sostenible.

TORRES, SANDRA* (Uppsala University, Sweden)

Social Exclusion in Health and Social Care Services Offered to Minority Patients: Does Racialization and Racism Play a Role?

The starting point of this presentation is the ongoing debate on social exclusion in old age that is currently taking place in Europe. The debate in question

acknowledges that ageism is an important exclusion mechanism and that the implications of cultural and ethnic identity for how people's experience exclusion in later life have not been sufficiently acknowledged by scholars engaged in old age social exclusion research. It is also acknowledged that the increases in the migration flows that most of the Western world has experienced over the past two decades means that the study of late-life exclusion needs to take into account the post migration stressors that older people with a migrant background experience. This presentation asks therefore whether racism figures in the gerontological imagination on older ethnic and racial minorities and older migrants. Based on a scoping review of peer-reviewed articles on the intersection of old age and ethnicity / race published between 1998-2017 (n=336), this presentation asks if the kind of social exclusion that older ethnic minorities (and migrants) experience as a result of racism is taken into account in this literature. Focusing primarily on the articles that tap into health inequalities (n=117) and health and social care (n=55), this presentation will show if, and how, racialization and racism inform this research. In answering these questions, the presenter will argue that the debate on old age social exclusion needs to expand its agenda so that the specific social exclusion mechanisms that affect older ethnic and racial minorities can be studied in a systematic fashion.

RC43-534.1

TORRES ANGARITA, ANDREINA* (City University of New York, The Graduate Center, USA)

Housing and Revolution: Women's Access to Housing in Caracas, Venezuela

In this paper I analize how women's access to land and housing has expanded in the context of the Bolivarian Revolution in Venezuela (1999-present). By focusing on a specific social movement that embraces the principles of "urban revolution" and sees itself as part of a larger process of social transformation, I focus on how women have become pivotal actors in activists' efforts to fashion themselves as "legitimate actors" within a range of actors involved in housing policies and activism. I propose that while poor women's work has become essential for the organizational structure of the movement, the materialization of its core values, and the maintenance of land occupations and self-building of housing overtime, this participation also traps them in particular gendered and racialized subject-positions and a sexual division of labor, which ultimately undermine their rights. Thus, using Nancy Fraser's distinction between "recognition" and "redistribution," I ask what kind of redistributive effects are made possible through the recognition of the barrio resident as a key actor in the Bolivarian Revolution? How are these effects gendered and why? I recognize an "uncanny" effect in activists' efforts to upset established property relations and create a collective property regime, which are presented as new and yet carry with them historically established patron-client relations between urban dwellers and community activists, and between the urban poor and the state. Along with opening oportunities for the creation of self-governed communties with strong female leadership, these forms of access to housing also perpetuate barrio women's "precarious possession" of their homes.

AINZ, ALEXANDRA (Universidad de Almeria, Spain)
RODRÍGUEZ-PUERTAS, RUBÉN (Universidad de Almería, Spain)

"La Generación Invisible". El Edadismo De Género En El Mercado Laboral.

La edad en su dimensión social, como relación de poder y concepto construido social y culturalmente, actúa como una potente barrera de acceso al mercado laboral y es además un motivo de expulsión del mismo. Este criterio de discriminación afecta indistintamente a hombres y a mujeres; pero son ellas las que lo sufren en mayor medida. Las consecuencias sociales son muy graves: pobreza, precariedad laboral, economía sumergida y exclusión social.

Esta preocupante realidad se desprende tanto del análisis de los datos publicados por el Instituto Nacional de Estadística, los Servicios Públicos de Empleo y Servicios Sociales, así como de las entrevistas realizadas a personas desempleadas de larga duración mayores de cincuenta años e informantes claves pertenecientes al ámbito de la intermediación laboral. No por predecibles los datos dejan de resultar alarmantes. Cada vez más personas desempleadas se encuentran en la difícil tesitura de ser consideradas demasiado jóvenes para jubilarse y demasiado mayores para trabajar.

Es necesario identificar los mecanismos de discriminación para poder combatirlos eficazmente. La presente investigación, se realiza bajo el paradigma feminista y desde una perspectiva interseccional; al analizar la importancia del edadismo y sexismo como discriminaciones laborales que intervienen significativamente en el desempleo de larga duración y que a su vez interactúan con otras variables discriminatorias como la etnia, el origen o la nacionalidad.

TORRES-FALCON, MARTA* (Universidad Autonoma Metropolitana (Autonomous Metropolitan University), Mexico)

El Derecho Humano a Una Vida Libre De Violencia: El Caso De La Alerta De Género En México

En 2007, la *Ley general de acceso de las mujeres a una vida libre de violencia* estableció algunas directrices para la coordinación de los órdenes de gobierno (federal, estatal y municipal) a fin de prevenir, sancionar y erradicar la violencia de género. Crea también un mecanismo novedoso para atender la violencia que por su magnitud o severidad requiera acciones extraordinarias e inmediatas: la alerta de género. Para su activación, se requiere la solicitud expresa de una organización de la sociedad civil.

A doce años de distancia, en más de veinte estados del país -de un total de 32- se han producido solicitudes y en 17 entidades, se ha decretado la alerta. El caso de la Ciudad de México es particularmente interesante por varios motivos: la solicitud documenta tanto la violencia extrema perpetrada contra las mujeres (feminicidios) como la falla en la investigación penal; hubo cambios de gobierno tanto a nivel federal como local, que retrasaron notoriamente la emisión de un dictamen; la instancia de la Secretaría de Gobernación (CONAVIM) se negó a declarar la alerta de género, a pesar del bajo cumplimiento del gobierno de la entidad; finalmente, el uso de las organizaciones peticionarias de los recursos legales existentes para obtener la declaratoria por la vía judicial (amparo).

La ponencia que se propone busca ofrecer un panorama general de la aplicación de la alerta de género en México, a través de un análisis comparativo de las solicitudes presentadas, así como analizar el caso de la capital del país, donde claramente interactúan motivaciones políticas y jurídicas.

La alerta de género puede ser un mecanismo de gran utilidad en otros países de la región. Por ello resulta útil una evaluación de su funcionamiento de diversos contextos.

TOSCHENKO, ZHAN* (Russian Academy of Sciences, Russian Federation)

"Old" and "New" Professions in the World of New Reality

The professional structure of society has always been a vivid indicator of maturity, development and success in the use and application of human capital. It has been and remains a characteristic of its compliance with the needs of scientific and technological progress. Speaking about the "old" professions, the lion's share is occupied by engineering personnel and workers in the mass professions, since for a long time not only the functioning of what was achieved depended on them, but also the further improvement of equipment, technologies, functions and management methods. This professional structure is undergoing major changes. Arrival of Fourth industrial revolution involves the use of cyberphysical systems in production and servicing of human needs, including everyday life, work and leisure, as well as the transition from industrial to local and even "home" production of most goods thanks to the 3D printer technology. This revolution is aimed at the widespread use of flexible avant-garde technologies, digitalization of many sectors of the economy. Consequently, professions of a fundamentally different order will be required; the remaining ones will cardinally change the functions and methods of implementing; those that can/will be replaced by employees capable of performing fundamentally new functions will vanish.

However, real processes in the Russian economy show that of the approximately 450 elementary professions that make up 9 enlarged professional groups, two groups lead by a large margin in number: car drivers and sellers (about 7% each). This is followed by specialists with higher education in the fields of production, natural and engineering sciences (5.1% of all employed). Professions associated with the digital economy occupy a modest place (2-3%). Thus, in real life, we are dealing with a solution to a very complex socio-economic problem - the continuing preservation of old professions and the difficult formation of new professions.

Couples' Fertility Differentials By Education: Do Stepchildren Make a Difference?

Increasing divorce and union dissolution rates, and ensuing constitution of single-parent families or stepfamilies represent important societal changes in Europe, taking place over the second half of the 20th century. Stepfamilies often present peculiar combinations in term of partners' human capital, which eventually has consequences on family wellbeing. The diffusion of these family be-

haviors may contribute to an increase in social inequalities because they tend to be more common among the lower strata of society. The way social inequality is linked to these family behaviors substantially depends on fertility behaviors of individuals who have experienced partnership disruption.

Recently, a growing number of studies has explored both partners' educational characteristics as potential determinant of couples' fertility behavior, acknowledging the fact that the decision to have a child is couple-based. Still, those studies have especially focused on children born to the couple, without considering stepchildren in their counts. As a result, in studying couples' birth rates by educational pairing, previous studies do not account for the complexity of family composition, which also affect partners' decision to have a common child.

In this paper, we emphasize family complexity, its association with human capital and possible ways to analyze it in a comparative way. Using Generations and Gender Surveys data of 15 European countries, we analyze the association between educational pairing and couples' fertility based on different definitions of couples' children. Applying standard fertility indicators (mean number of children, proportion childless) and regression techniques, we test whether highly educated homogamous couples have less often stepchildren (born from one partner before the union) and less often remain without shared children. Next, we test whether, among heterogamous couples, the partner with the lower education, male or female, is more likely to bring children within the new union. Country-differences and time trends in Europe are discussed.

Loot Boxes and the Changes in the Gaming Market

The videogame industry is a recent one among in the cultural industries, the arcades (here we are considering coin operated electrical-mechanical games, and disregarding games like pinball) emerged during the 1960 and in the next decade we had the emergency of the console market. Since then, this market has evolved from a niche one to a blockbuster market; during 2018 the videogame market earned revenue of US$137.9 billion, according to Newzoo (2019). Despite the apparent success the videogame industry has faced criticism and doubts about its effect on the players. Since the arcades there is a concern about the effect of violent games and violent behavior, especially on the long term. Khaled Jr. (2018) argues that this concern first turns into moral panic in the 1970s with the launch of Death Race (a arcade game based on a movie and that would give points to each ran over gremlin). This article aims to study the last wave in this kind of concern; recently gaming addiction has been recognized as a disorder by the world health organization. And the concern surrounding loot boxes (loot boxes are virtual items that can be redeemed in a game, so that the player can receive a bundle of random items) and the development of this disorder has become more prominent, and several countries have been discussing and imposing restriction to the loot boxes (UK, Japan, Netherlands). As the restriction are imposed it changes the gaming companies' strategies. So the article aims to use the Theory of Fields to analyze the changes in the market as the loot boxes business models suffers restrictions in different countries. We use the Theory of fields because in order to analyze the market not only from an economic perspective, but also considering the importance of the historical and social perspective.

Are Sociologists Ready for 'Artificial Sociality'? How Russian Sociology Meets the Challenge in Comparative Perspective with Sociologists in Other Brics Countries.

Current sociology does not have a settled view on what to do with a phenomenon that in the literature has been designated as "artifcial intelligence" (AI). Sociological textbooks, handbooks, encyclopedias, and sociology classes' syllabi typically either do not have entries about AI at all or talk about it haphazardly with a stress on AI's social effects and without discerning the underlying logic that moves the prodigy on. This paper is an invitation to a professional conversation about what and how social sciences can/should study "artificial intelligence". The first part presents comparative historical analysis of AI development in BRICS countries and discusses challenges that it poses for both theoretical and empirical research in social sciences. The second part of the presentation is based on a discussion of the preliminary results of an on-going three-year research project on how different actors (scholars from various disciplines and interdisciplinary fields, professionals from AI-related organizations, expert users of AI technolo-

gies) reflect on transformative changes that are brought to human societies by AI-based technologies. We discuss the case of Russia in comparison with other BRICS countries stressing both common issues and specific features. We conclude that social sciences have to look for new theoretical and methodological frameworks to approach AI and 'artificial sociality'.

Implementación Del Marco De Hyogo y Marco De Sendai Para La Reducción De Riesgos Asociados a Eventos Climáticos En Latinoamérica: Una Propuesta De Análisis Comparativo Entre Ciudad De México y Sao Paulo.

Cada vez son más frecuentes e intensos los desastres asociados a eventos resultado del cambio climático y a la vulnerabilidad de comunidades humanas. Especialmente en ciudades densamente pobladas, como las dos mayores de Latinoamérica (Ciudad de México, México y Sao Paulo, Brasil). Como herramientas de reducción de desastres, marcos internacionales promueven acciones para promover que ciudades estén más preparadas y sean más resilientes ante el posible impacto de amenazas. Por ejemplo, Marco Hyogo de 2005 y el Marco Sendai de 2015, ambos publicados por las Naciones Unidas. No obstante, existe la incógnita de ¿cómo estas herramientas han o están fortaleciendo la preparación y resiliencia? Este trabajo tiene como objetivo explorar la influencia que estos marcos han tenido específicamente en la Ciudad de México y Sao Paulo para que estén más preparadas y sean más resilientes ante el impacto de eventos climáticos (inundaciones y deslizamientos). El método es un análisis cuantitativo de artículos científicos que fueron encontrados en la base de datos de Google Académico entre enero del 2005 y septiembre del 2019, mediante el uso de las palabras: hyogo, sendai, disasters, flood, landslides y Mexico City o Sao Paulo. Los resultados, se basan en un total de 91 indicadores, 43 donde se usó Mexico City como palabra clave y 48 para Sao Paulo. De éstos, 30 están relacionados a artículos publicados en revistas científicas, 11 (36.7%) corresponden a Mexico City y 19 (63.3%) a Sao Paulo. Sin embargo, para la Ciudad de México, sólo el 27% son estudios relacionados a esta ciudad, el otro 73% tienen como área de estudio otras regiones. Para Sao Paulo, 31% corresponde a casos de estudio relacionados con de la ciudad y el restante a otras regiones. Finalmente, cómo los marcos han tenido una influencia estudios en las dos ciudades.

TREUKE, STEPHAN* (Ruhr Universität Bochum, Germany)

Assessing the Relationship between Spatial Proximity and Socio-Economic Integration in Four Shanty-Towns of Salvador, Brazil

Grounded on semi-structured interviews, we will examine the impact of neighbourhood effects on the individuals' living conditions in four shanty-towns of Salvador, Brazil, addressing the question under which conditions the proximity to affluent gated communities fosters their socio-economic integration. We demonstrate that the relationship between spatial proximity and socio-economic integration is conditioned by the capacity of public space to promote (non)employment cross-class interactions, the impact of crime, and the gated communities' degree of securitization. Whereas in Calabar, large opportunities of economic participation in its surroundings mitigate the negative impact of neighborhood effects, (non-)employment relationships decline in the less centrally located Vale das Pedrinhas and Bate Facho. The construction of the highly isolated gated community Alphaville 2 has neither fostered cross-class interactions nor benefitted the economic integration of the Vila Verde inhabitants. We urge to reflect on a holistic approach to social inequalities, comprising socially more integrative labour and housing policies.

Does the Spatial Proximity to Affluent Gated Communities Mitigate Neighborhood Effects? a Case Study from Salvador, Brazil

We shall examine the impact of neighborhood effects on the individuals' socio-economic integration on the basis of a qualitative research conducted in two peripheral shanty-towns and in three favelas located in some affluent regions of Salvador, Brazil. In the peripheral São João do Cabrito, the individuals' embeddedness in a homogeneously poor region fosters their social isolation; yet, in Fazenda Grande II/Jaguaripe I, the population's socioeconomic heterogeneity attenuates

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

neighborhood effects. The individuals' functional embracement vis-à-vis their wealthy surroundings declines towards the periphery, their chances of integration being conditioned by the shared use of public space, and the gated communities' degree of spatial isolation. We discuss three mechanisms that might explain neighborhood effects: changes in the support structures, the impact of crime, and territorial stigmatization. We conclude that the individuals' chances of integration mainly depend on the spatial distribution of employments and urban services, rather than on their proximity to affluent neighborhoods.

Religion, Gender and Politics in Brazil: The Case of the Ministry of Women, Family and Human Rights in Bolsonaro´s Government

The centrality of religion in social and political life has been officially removed in Brazil with the establishment of the Republic in 1889, legally breaking apart the Catholic Church from the Brazilian State. Still, churches and religious groups maintain the claim for their role in defining laws and public policies within the Brazilian State. With the end of the military dictatorship in the 1980s, the increasing political participation of different social groups and the demographic expansion of Pentecostal evangelicals, this group began to participate in party politics by electing parliamentarians and mobilizing support for candidacies for the president of Brazil. Such movement brings up the claim of religion's centrality for the regulation of laws and public policies for the behavior control of the Brazilian population. On the other hand, feminist and LGBT movements claim their civil, sexual and reproductive rights in the name of autonomy and igualitarism, raising conflict with religious parliamentarians who seek to adjust them to what they understand as traditional moral behaviors. In this political and religious scenario, in 2018, Jair Bolsonaro was elected president of the Republic of Brazil, with strong support from this religious group, as Mariano and Girardi (2019) demonstrated. The nomination of Damares Alves (evangelical pastor and advisor of the Evangelical Parliamentary Front) as a Minister of Women, Family and Human Rights reveals the compatibility between the new government and the ideas of this group. The project analyzes the statements of Minister Damares Alves in the main official media (Folha de Sao Paulo, Globo, Estadão) and also the reaction of the population in social networks (Facebook and Twitter), as well as the actions planned and executed by the Minister with the lens of the sociology of religion theories.

The Educational Gradient in Singlehood, Educational Assortative Mating and the Role of Country-Level Inequalities in Europe

In the last decades, scholars have observed great changes in partnership formation behaviour and its association with individuals' socio-economic status. Previous studies suggested that the better-educated are more likely to enter into a partnership and they are also more likely to form educationally homogamous unions. It is much less clear-cut to what extent these findings are generalizable across genders, periods, and countries. On the aggregate level, scholars have been increasingly concerned about rising social inequalities across and within countries, and how these are linked to family demographic processes. A strand of research argues that changes in family structure are responsible for changes in income distributions within a country. Recent findings regarding Western countries showed that the increase in single-headed households is an important factor associated with rising inequality, rather than the rise in educational homogamy.

As a result of these changes at both macro and micro levels, scholars have been increasingly interested in solving the puzzle of the link between individual behaviour and country-level inequalities. In particular, the link between the educational gradient in family formation behaviour and inequalities on the aggregate level has been rarely explored, mostly due to a lack of available comparable multilevel data in many countries. Using Generations and Gender Surveys data of 16 countries and by means of a two-stage regression approach, we examine whether the negative educational gradient in singlehood for men and women is steeper in countries where social inequalities are stronger. Preliminary results show that differences by education in both men and women's unemployment rates may explain differences across countries' educational gradient in singlehood. Next, focusing on two periods, we have not found a strong association between country-level inequalities and the positive educational gradient in homogamous relative to heterogamous union formation.

TRINIDAD DA SILVA, ANGELINA* (Universitat Autònoma de Barcelona,)

Gestión De Riesgos En Paraguay. De La Teoría a La Práctica.

Paraguay, de forma recurrente y en periodos variables, está expuesto a fenómeno naturales extremos como: tormentas, inundaciones, tornados, sequías e incendios forestales, afectando principalmente a los sectores menos favorecidos de la sociedad, así como al medio ambiente. Los lineamientos en gestión y reducción de riesgos de desastres son responsabilidad de la Secretaria de Emergencia Nacional, que en coordinación con otros actores: gobiernos regionales y subnacionales, instituciones gubernamentales, de la sociedad civil y cooperación internacional, construyen e implementan estrategias para el manejo integral de los riesgos. Esta investigación pretende comprender tanto la dinámica actual como los desafíos a los que se enfrenta la gestión de riesgos a nivel estatal. Se trata de una investigación cualitativa, que utiliza el método de estudio de caso, y que recopila evidencias procedentes de una variedad de fuentes públicas relativas a la gestión de riesgos. El propósito es identificar las principales acciones registradas en el periodo de 2013-2019 a partir de los pilares establecidos en la Política Nacional de Gestión y reducción de riesgos. Los principales hallazgos han permitido identificar que el cumplimiento del marco normativo establecido está dictaminado por la voluntad política a nivel territorial. Además, a gobernanza local de los riesgos puede considerarse débil, ya que realiza una trasferencia de sus competencias al nivel central y organizaciones de la sociedad civil. La gestión de riesgos se orienta en mayor medida a gestión reactiva frente a la prospectiva y correctiva. Gran parte de la gestión prospectiva es realizada por la sociedad civil financiada de forma significativa con fondos de la cooperación internacional. Constituye un desafío esencial para el Estado movilizar el potencial que tienen los gobiernos regionales y subnacionales para la gestión y reducción de sus riesgos de modo a que logren resultados sostenibles.

Poverty Lines in the Brasil Sem Miséria Plan: A Review and Proposed Alternatives in Poverty Measurement According to the Methodology of Sonia Rocha

This paper criticizes the methodology of poverty measurement used by the Brazilian federal government called Brasil Sem Miséria Plan (PBSM). Using a compilation and analysis of secondary data collected from the National Household Sample Survey (PNAD), we conducted a comparison between the government methodology and that one used by the economist Sonia Rocha. Her methodology establishes poverty lines which are regionalized and indexed to the consumer basket values found in different regions of the country. The results of both methodolo-gies are compared, showing that PBSM lines are incapable of detecting 12.9 million Brazilians living in poverty. In our conclusions, we present suggestions to improve the government's poverty measurement methodology, i.e., the need of a regionalization of poverty lines and that they become indexed to regional consumer basket prices.

TROTSUK, IRINA* (RUDN University; Russian Presidential Academy of National Economy and Public Administration, Russia)

Russia's Food Security: Is There a Chance for Sustainable Agriculture?

Since 2000, the transformation of Russia's food system has led to a concentration of capital and power among relatively few players, which mirrors broader trends in the global food system. With its basic food security ensured, Russia's agricultural sector will face significant challenges in the next decades in the quest for sustainable development. However, a sustainable agricultural system is not likely in Russia anytime soon. The main reason is that its industrial agricultural model has evolved into large-scale, vertically integrated agribusinesses that are linked to international trade and global markets. The industrial agricultural model has brought greater food security to many regions of the world, including Russia, and developed countries have not yet worked out solutions how to feed their large urban populations without industrial agriculture. Other most obvious obstacles to the transition from industrial agriculture is that it is (a) institutionalized in multiple levels of Russia's society and economy, (b) supported by political interests (well-fed population, several million jobs, large tax revenues and export earnings, (c) considered a basis for regional economies (Russia's modern, technologically advanced, vertically integrated megafarms have an immense economic impact in certain regions of the country). Nevertheless, there are some examples of sustainable agriculture in Russia: eco-villages that produce food for self-consumption; in some regions, farmers modify equipment to local conditions and use biological growth stimulants, micro-fertilizer and microelements to replace chemical fertilizers; many rural households still operate subsidiary agriculture, mostly for self-consumption rather than for commercial sales; there are greenhouses near many big cities. Certainly, small steps to sustainability are better than none, but small steps that develop and strengthen local initiatives for sustainable agriculture are insufficient for transforming the national food system towards sustainable agricultural practices.

TRÜBNER, MIRIAM* (Johannes Gutenberg University Mainz, Germany)
NISIC, NATASCHA* (Paderborn University, Germany)

Conflicts over the Division of Labor

Over the last decades, a less specialized, gendered division of labor in families has evolved, characterized by women pursuing employment and men taking on tasks in the domestic sphere (Sayer, 2010). Considering this overlap in responsibilities, negotiation about the allocation of tasks seems indispensible for modern couples. Although a wide body of research has investigated determinants for the gendered division of labor (Bianchi et al., 2012), research on conflicts regarding household labor has been scarce.

Economic and exchange approaches conceptualize these conflict as rational choice: Bargaining theory (Lundberg & Pollak, 1993) argues that a woman's individual resources determine her ability to negotiate her way out of her normatively ascribed role as the partner chiefly responsible for housework and child care. Relative resource theory (Blood & Wolfe, 1960) states that it is the intersecting responsibilities of couples with similar resources which are likely to cause conflicts. Exchange theory (Blau, 1964) emphasizes the role of mutual appreciation and concern for the harmonious assignment of responsibilities.

According to the social constructivist approaches, conflicts as a form of interaction help actors form their perceptions regarding gender-appropriate behavior (West & Zimmerman, 1987). Consequently, disagreements on the division of labor may occur as certain life stages necessitate the symbolic 'doing' and enactment of gender. In contrast, Röhler & Huinink (2010) claim that these intracouple negotiations are likely to increasingly be determined by individual preferences for housework in the context of widely accepted egalitarian attitudes.

Based on pairfam (The German Family Panel) data from 2016/17, analyses using actor-partner interdependence models (APIM) (Kenny et al., 2006), which take into account information provided by both partners, show that high expectations for a partner's engagement in domestic work, rather than their actual contributions, lead to conflicts. Conversely, reciprocal appreciation of each partner's contribution and individual enjoyment of housework reduce conflicts.

TRUZZI, OSWALDO* (Universidade Federal de São Carlos, Brazil)

Multigenerational Immigrant Paths in São Paulo (1880-1950)

What did the geographical implantation of the various contingents of European and Japanese immigrants who settled in the state of São Paulo between the 1880s and 1950s depend on? This paper seeks to answer this question by combining biographical research of families in a multigenerational perspective. It starts with the recognition of an expanding agricultural frontier in the territory of São Paulo, which also meant a continuous mobility of immigrant families. Based on a series of documentary and census sources, as well as on several interviews and data gathered from family histories, we elaborate a model to explain the social processes of displacement as they were experienced by immigrant families and individuals in the territory.

Religiosity Among Christian Arabs and Their Descendants in São Paulo

This paper discusses Christian religiosity among Arabs and their descendants in São Paulo, a contingent originally composed almost exclusively by Syrians and Lebanese who have integrated the great migratory waves arrived to the country from the late nineteenth century onwards. After framing their religious identities, the article describes the situation of the different Christian faiths by taking into account their historical development, institutional building and the dilemmas that characterize the maintenance of both followers and their original traditions. Methodologically, it is based on research done by the author and on data gathered in publications both on migration studies and religiousness among Arabs. Then the article points out the factors that weakened religious identity among descendants and, in particular, the challenges to raise followers and to affirm a specific identity amid the dominant Roman Catholicism.

Current and Prospective Well-Being: The Influence of Social Capital in Japan, South Korea and Taiwan

This paper examines the influence of social capital on current and prospective well-being in the East Asian context by comparing Japan, South Korea and Taiwan. By using cross-national online survey data collected during 2015-17 by the project of Social Well-Being Survey in Asia, overseen by Senshu University of Japan, I investigate three perceived life conditions from a life course approach: evaluation of 1) the current life condition compared to five years ago, 2) life condition 5 years from now, and 3) life condition in old age. This measurement design is particularly meaningful for the three rapidly ageing societies The Japanese (n=11,133) shows a sinking curve from now to old age, South Koreans (n=2,000) reported a higher level of life conditions, with a lowest point being at "now", and Taiwanese (n=2,132) predicted their life conditions at old age to be less secure but the change is not as obvious as that of Japan. I then estimate these three life conditions with regression techniques using two sets of social capital factors. The first is three separate trusts (trust in family, neighbors and friends), and the second set is two social interaction frequency with relatives, and friends and acquaintances outside school or work. Basic demographical factors are also considered in analysis. The findings show that social trust generates consistent and strong effects in prospective well-being across three societies. Compared to gender, age, education, and urban-rural residence, these social capital factors fare far better in sustaining a higher level of subjective well-being in the three East Asian societies.

TSAI, PO-FANG* (Taipei Medical University, Taiwan)

Between Translations and Monographs: An Exploratory Analysis of Secondary Literature on Max Weber-Reception in Chinese Context

Max Weber-reception in Chinese context relied on not only the translations of Weber's works, but also the selection of secondary literature translated in Chinese. The latter reflected the collective mentality and intellectual framework of the recipient community. The author examines these secondary materials in terms of genre and period. During the crucial 1980s to 1990s, there were three genres scattered in a common space of secondary literature (monographs, book-chapter, and biographical work), in which we could identify at least two different dynamics: divergent trend in monographs and convergent trend in book-chapters. The two dynamics represented the dual understandings of Weber as centrifugal and centripetal forces did exist around the center where located an incoherent and confirmed image of Weber. In other words, reception of Weber included a two-face image which could barely be explained in terms of external factors, such as social, economic, political changes. No matter how the secondary literature will contribute to Weber study in Chinese context, we at least have to recognize their impacts on the reception of Weber in the past decades. It is highly interesting to note that the importance of secondary literature, the mechanism by which they had formulated the knowing framework of our Chinese scholars on Weber, and then,

580

denotes a presenting author. Abstracts are organized by first presenting author's last name.

of course, the way Chinese reception of Weber will be in the future. Although the former two have been demonstrated in this paper, the latter is an open question waiting for advanced research.

Internalized Social Responsibility in Competency-Based Medical Education? a Sociological Analysis of Canmeds Framework

In the past decade, competency-based or outcome-based education (CBE or OBD), in contrast to content-based or time-based education, has become the mainstream way in medical education around the western world. However, researchers in the sociology of professions have not yet noticed this new yet contested trend. In this paper, I examine a representative case—CanMEDS framework—in terms of its formation and debate, in order to emphasize the ambivalence of internalized social responsibility in competency-based medical education (CBME). CanMEDS not only has its virtue of simplicity, in which the "medical expert" role is surrounded by six additional roles—communicator, collaborator, leader, health advocate, scholar, and professional, but also has been widely-adopted outside Canada. Nevertheless, the conventional two theories—trait approach and power approach—treat the concept of profession too extremely to see the ambivalence of CBME. Even the new theoretical approaches seldom find their one-sidedness in which social responsibility is viewed as either positive or negative residual-concept. Neither the neo-Weberian approach nor the Foucauldian-governmentality approach scrutinizes the contested nature of CBME, which no longer relies on punitive self-governance (e.g., the codes of ethics) or self-disciplined altruism (e.g., Hippocratic oath), but rather emphasizes on the idea of competency. In this paper, I provide a sociological analysis to argue that CBME or CanMEDS reflects not only the desire of medical profession who is eager to restore the golden years of the profession with an ideal medical-doctor image, but also the anxiety of being charged with a lost publicity since the last three decades. Therefore, taking the dual faces of CanMEDS into consideration would release some possibilities of new theoretical synthesis of professional power its social responsibility.

Environmental Governance and the Invasive Water Hyacinth Weed: A Case Study of Lake Chivero in Harare, Zimbabwe.

This paper is a general analysis of the influence of the water hyacinth weed on Lake Chivero, Harare, Zimbabwe through social science lenses. It problematizes the water hyacinth in the context of environmental governance, the latter being a huge discourse which looks at how human beings exercise authority over natural resources and natural systems. In the broader context, environmental sustainability is one of the key objectives of the United Nations Sustainable Development Goals. Situating environmental governance within the framework of invasive, alien species like the water hyacinth helps in understanding the intricacies of managing them. The water hyacinth, a floating water weed said to have been discovered by a German naturalist C. Von Martins in Brazil in 1823, has become a major pest in waterways around the world. The weed, whose natural habitat is South America, has become ubiquitous because of a combination of anthropogenic and environmental/ecological factors. There is polarization among scholars as to whether the plant should be referred to as a weed or flower, the latter from its ornamental value. As a result of this polarization, the plant has been invariably referred to as a "beautiful devil" or a "pest and terror". What is beyond debate are the deleterious effects of this invasive, alien species, which has seen the colonization of rivers, canals, ponds,lakes, dams, irrigation infrastructure and hydroelectrical installations around the world. It has triggered serious socio-economic and environmental problems for millions of people in riparian communities, thereby adding a constraint to development. In Zimbabwe, its impact has been far and wide. Findings of a study carried out by this author showed that over and above influencing the quality and quantity of water, land use and livelihoods, the water hyacinth can also influence race relations-a component of sociological mapping.

TSIRIKIOTIS, ATHANASIOS* (Goethe-Universität Frankfurt am Main, Germany)

Subjectification in Homeless Services - Social Order and the Fragile Subjectivity of Both Homeless Clients and Social Work Professionals

Homelessness is characterized by a lack of resources, both material and immaterial. These can include such things as housing, regular and sufficient income, formal educational qualifications, as well as the ability and opportunities for self-cultivation, self-formation and public participation. Becoming chronic, these conditions of shortage tend to accelerate a gradual process of economic, institutional, cultural and social exclusion which may affect individual agency of per-

sons affected. However, the loss of accommodation is not the first step of the described process. It appears as a temporary escalation of the prolonged critical life situation which might lead to a permanent state of poverty conditioned exclusion.

As part of certain welfare regimes social work is focusing the bio-political treatment of social problems such as homelessness. Homelessness services, designed as reintegration services, address 'the homeless' as subjects who failed the requirements of the present social order. The front line work of homeless services in general appears as a mutual mediation between subjectivity and social order embedded in hierarchical structured relationships between clients and social work professionals. The allocated status as a client of is based a) on the construction of deviation from social order and b) on the alienation/exoticization of 'the homeless'. (Madden) This in turn constitutes the status of normality within the present order. (Foucault) Constructing 'the homeless' as the only vulnerable part of working relationships however ignores the fragility which is passing through the professionals' subjectivity as well. My empirical contribution features the results of the research that forms the basis of my PhD thesis, which I will hand in later in 2021. My research focuses the process of subjectification in homeless services of both homeless clients and social work professionals. This process appears as an entanglement of a 'struggle for recognition' (Honneth) and misrecognition/misunderstanding (méconnaissance) of the conditions of subjectivity. (Lacan)

Advancing Social Care in Greece By Examining the Health Needs of Undocumented Refugee Minors

The underdevelopment of social care services in Greece before the fiscal crisis and the subsequent dramatic decrease in social spending and social benefits, as a result of it, have noticeable implications for Greek society, let alone for its foreign national UASC who cannot rely on family solidarity. The systemic failures to protect UASC in Greece revealed significant gaps within the existing framework of the child protection system. As a result, the two significant changes in legislation entailing Law 4554/18.07.2018 with special provisions for guardianship and the establishment of a new department for the protection of UASC under EKKA, as well as the Law 4538/16.05.2018 with special provisions in foster care are examples towards improvement in the legal child protection framework. It remains to be seen whether law implementation will improve the chaotic and fragmented situation in place.

Research findings suggest that the gaps identified between legal/policy framework and its implementation in the case UASC in Greece provide an explanatory framework of increased levels of post-traumatic stress and depression symptoms, self-harming behaviors and violence, irrespectively of levels of pre-flight trauma exposure, among those who are living in "legal limbo" situation as compared to those who hold a refugee status. Addressing the mental health and psychosocial needs of UASC has once again brought up to the surface the syncopated process in public child and mental health care services, which do apply of course for national minors. The refugee crisis gave impetus to a new care regime for child mental health in Greece in a unique and surprising way. The paper explores for the first time this new situation in Greece. New different measures (e.g. tele-psychiatry, improving sectorization system, creating and securing funding for new posts) were activated as a result of this influx.

Survivor's Guilt Among People Affected By Tsunami of the Great East Japan Earthquake after Four Years

Objective: On March 11th, 2011, the Great East Japan Earthquake hit the Tohoku area, and more than 15,000 people lost lives by the tsunami and earthquake. People who survived natural disasters, terrors, or serious diseases who witnessed many deaths often reported survivor's guilt. The objective of this study is to elaborate survivor's guilt among people affected by the earthquake and tsunami after the Great East Japan Earthquake after four years. Method; Quantitative and qualitative analysis from a questionnaire survey conducted after four years of the earthquake in 2015 to ask their difficulty in their lives. The questionnaires included the open-ended question and asked them to write about their challenges in their lives. Result; we received 552 responses. Among those who responded 39 were affirmative to survivor's guilt and had shown guilt over their inaction and helplessness though many others lost their lives during tsunami and earthquake. From quantitative analysis, survivors guilt were slightly correlated with to be younger (p=0.02) and female (p=0.02), lost their families by tsunami and earthquake (p=0.04). From a quality analysis, we observed psychological distress by survivor's guilt; "Escaping from the tsunami, I ran first, and my husband followed me. When I looked behind, my husband was gone. I will never understand why I

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

survived alone (66 years old, female)", "Every day I remind of people who sought and cried for help to me but were swept away by the tsunami. I regret that I survived by myself and could not help them (82 year's old, male)." Conclusion; Survivors guilt have shown to be a factor on PTSD and many other psychological distress. Individuals who were affected by a large-scale disaster have to live with sorrow for a long time. Providing support, help such as mental care is necessary for long-range.

Professional Work in Austere Healthcare in the UK- Preliminary Findings of a Qualitative Exploration into Physiotherapy in the National Health Service

The growth of managerialism, technological advance and the ageing population are woven into the reality of 20th-21st century healthcare. Following the global financial crisis in 2008, austerity measures and cuts to public spending have added to the challenges professional groups face in the health setting. Austerity poses a particular challenge to professional groups in a universally funded health system; emphases on cost effectiveness, productivity and evidence-based practice are not new or unique to austerity, though increasingly, the continued commissioning of individual health services is based upon such concepts.

Furthermore, austerity has the potential to impact on the technical nature of professional work, tacit knowledge and decision making due to its influence on resources, equipment, staff and the growing complexity of service users as a consequence of the wider societal implications of austerity. This paper will outline and discuss the preliminary findings of a qualitative exploration of professional work in the context of austerity in a publicly funded National Health Service (NHS) in the UK, examining the practices of physiotherapists, a profession allied to medicine.

Physiotherapy is a profession of interest due to its course of professionalisation and relative success in terms of their successful acquisition of autonomy from medicine in 1977, though are more vulnerable to marketisation compared to their nursing colleagues. Much of the investigation into the rise of managerialism and its effects on the professions is associated with the archetypal professions such as medicine. The professions considered subordinate or allied to medicine (such as physiotherapy) are subject to hierarchy and differing processes of professionalisation and thus, their ability to react to challenges to professional work may differ. This paper will examine professional autonomy, decision making and the implications austerity poses for the professionalisation of an allied health profession in times of growing economic uncertainty.

Women on the Run: Human Suffering and Empowerment during Their Travel Towards Italy

In Italy, in recent years, the attention to female in migration has been linked to the increase in the number of women who emigrate alone to look for work like men. Women who become *breadwinners*, provide economic resources for the needs of their families; women who give rise to chain migration, and also family reunions, in which husbands are reunited, to reach them. Women engaged in jobs that have an importance for the functioning of the receiving society, but also women who are present as refugees and asylum seekers, women on the increase in trafficking in human beings and trafficking for sexual exploitation.

Women have always emigrated, but today in the Mediterranean countries they are increasingly more vulnerable.

To simplify a complex picture, we could identify five different types of migrant women, in Italy:

1. women who came on their own with a work project (mainly from Eritrea, Ethiopia, Latin America, Philippines, women from Eastern Europe);
2. women belonging to predominantly male flows, who have come for family reunification (especially Moroccans, Tunisians, Senegalese, Ghanaians, Albanians ...) often willing to work;
3. women who came together with the spouses in a more familiar migration path and who are often included in economic-commercial ethnic activities and / or managed directly by the family (Chinese, Indian, Sinhalese);
4. refugees claiming for protection;
5. women arriving through the sex industry.

The paper will be divided into two parts. The first part will focus on the situation of female in migration in the Italian territory. The second one will focus on the analysis of 25 stories of women who crossed the Mediterranean on the boats to arrive in Italy.

Social Capital As an Intergenerational Asset

Background
Social capital is a valuable resource that previous research has associated with e.g. better school performance, prosocial behavior and subjective well-being. This study combines theories of Robert Putnam and Pierre Bourdieu to explore the origins of pre-adolescents' social capital. In line with Putnam, social capital is understood as a combination of (i) actual social relationships, (ii) overall trust on people and (iii) norms of reciprocity.

Research questions
To what extent is social capital an intergenerational resource?
What is the mechanism that can explain the transmission of social capital
H1: Parents' social capital is directly transmitted to their children
H2: Home socioeconomic background shapes young people's social capital
Data and methods
The study builds on a survey collected in South-Western Finland in spring 2018. The data consists of 169 primary school students (12-13 years old) and their parents, the majority of whom have a middle-class background. The analysis is built with structural equation modelling on Mplus.

Results
The results suggest that social capital is partly an intergenerational asset. Parents' social capital directly relate to youngsters' propensity to reciprocate with others and their trust in other people. No evidence was found on the relationship between parents' social capital and youngsters' social networks. Socioeconomic background only has an indirect effect on youngsters' social capital, fully mediated by parents' social capital. Although, cross-sectional data are not adequate to confirm the causality or the direction of these relationships, the background theories and commonplace logic support this interpretation.

Conclusions
The study elucidates mechanisms interlinking social capital and socioeconomic background, and demonstrates the influence that parents' behavior has on their offspring's social capital. However, middle-class being over-represented in the sample, the results cannot be inferred beyond this group.

As Tuition Rises: Opposition to the Neoliberalization of Higher Education

Over the past two decades, every country in the OECD has tried to raise tuitions at public universities, as part of neoliberalism's broad retrenchment of the welfare state. Not all of these proposals were implemented. Opposition arose in almost all of these countries and blocked half of the tuition hikes. Using a new dataset, this study compares the process and outcome of opposition to tuition increases across all 34 OECD countries as of 2010, along with detailed case studies of three countries, in order to understand the potential for resistance against austerity policies in a neoliberal era. It compares partisan politics explanations developed in comparative study of welfare states with the political mediation model developed in social movement studies, and offers a new model to analyze policy outcomes that focuses on opposition alliances. The findings suggest that neoliberal policies may be vulnerable to opposition alliances between protesters outside of electoral institutions and opposition parties within the system, brokered by intermediary organizations – in the case of tuition increases, coalitions of student movements and opposition political parties, brokered by organized labor. These coalitions, combining contentious politics and institutional politics, require analyses that bridge the fields of political economy and social movement studies.

Higher Education Policy Protests in Turkey and Brazil: Targets and Alliances

The process of democratization and the role of social movements in this process have been widely studied by historians, sociologists, and political scientists. However, there is very little research on how social movements react to democratic backsliding; a government-led weakening of political institutions that supports an existing democracy. In this paper, I analyze the reactions of social movements to changes in higher education policy during democratic backsliding by focusing on Turkey and Brazil. In Turkey, the expansion of the role of Higher Education Council (YÖK) and the intervention to academic freedom by executive decrees that fired many dissidents from universities marked the hyper-centralization of the higher education policy. In Brazil, Bolsonaro's attack took the form

of budget cuts in public universities targeting humanities and social sciences. Despite the differences in the political contexts and higher education structure, the oppositional framing of social movements highlight the claims against not only rising authoritarian populism but also in support of education as a social right. Using newspaper data analysis, interviews, and Twitter data of social movement organizations and labor unions in Brazil and Turkey, this study focuses on cases where social movements emerged under relatively democratic conditions and had to adapt to an increasingly closed political system as illiberal reforms reshape the political terrain.

In Search of Good Fortune: Individualization, Youth and the Spanish Labour Market within a Context of Crisis

In 2007 Spain began to experience the effects of a deep economic crisis, which would generate a situation characterised by instability and uncertainty. This has been an obstacle especially acute for the youth of this country seeking to enter the workforce. Currently, Spain leads Europe with the highest youth unemployment at around 40%. As a result of the impact of COVID-19, the Spanish youth are now suffering the effects of a new crisis that has exacerbated an already precarious labour market. In this presentation we analyse the discourses formulated by Job Today and CornerJob, two companies which have developed mobile applications targeting young adults in search of employment in the service sector. Utilizing a discourse analysis approach, we explore the impact of individualization and how this process may contribute to an increasing reliance on individual solutions to social problems. As such, we seek to highlight the expectations and demands placed upon young workers within an unstable environment marked by chance, an element closely associated with the emergence of individualization. Furthermore, we consider the extent to which youth people incorporate these discourses and the strategies they employ basing our analysis on the VULSOCU (New Forms of Socio-Existential Vulnerability, Supports and Care in Spain) research project, specifically the results of nineteen in-depth interviews and three discussion groups with young adults in this country. Consequently, we seek to elucidate the argumentative threads rooted in the process of individualization and underline the implications of this dynamic for the young worker and his/her labour insertion, while also identifying manifestations of the goddess Fortuna as a representation of fortune or chance in this context. Finally, we approach this panorama of social change in Spain from the perspective of the individuals or young adults who find themselves immersed in this transition from one crisis to another.

Glass Ceiling Against Immigrants and Racial/Ethnic Minority Men

Though the glass ceiling effect predicts minority groups will face barriers in becoming promoted to supervisory positions, it is unclear whether these barriers persist against all minority groups once a high level of education is acquired and all else is held equal. We test this question against hypotheses derived from human capital theory and structural discrimination constructs with data extracted from the 2013, 2015, and 2017 National Survey of College Graduates. With the exception of Asian immigrants and 1.5 generation Black immigrants, we find no evidence for a glass ceiling to becoming supervisor against college-educated immigrants and racial/ethnic minority men when working in a large firm. In small firms, there was more evidence of a glass ceiling for certain groups. Additionally, we find evidence for subsequent wage disadvantage once hired as supervisor.

TØNDEL, GUNHILD* (Norwegian University of Science and Technology, Norway)

Taming the Home: Body, Technology and the State

During the last decade, the combination of "the home", "old age" and "the resources of the old body" has gained increased attention in Western ageing policy. The background is e.g. calculations of future capacity pressures within public health and care services, accompanied with fears of an expanding situation of dignity loss, loneliness and unsafety among the eldest. To simply keep the old bodies at home as long as possible has been a key strategy to solve these problems. To achieve this, governments have put much effort into facilitating the development of technology (welfare technology/gerontechnology), to practically realize and legitimize the home as the main arena for elderly care. These are often interpreted as "small" tools, such as safety alarms and digital monitoring systems. Yet, "bringing them home", and with them, connecting the home to the public infrastructure of care and monitoring, has material and symbolic implications for the everyday life of "the inmate". The arrangement of the home and the ways the old body can be done changes, as well as the norms for how available and transparent the personal home shall be for the State. I argue that this technocare-policy involves a taming of the home and a making of the home into a tool of governance, which is important for Sociology to explore to understand the social institutionalization of old age today. The presentation builds on qualitative empirical studies of how old age, technology and care combines, in Norwegian public health and care service and everyday life settings.

Relational Perspective on Best Practices in Immigrant Integration Policies: The Case of Spanish "Anti-Rumours"

Recently, best practice examples have considerably increased their political significance in immigrant integration policies. As the construction of best practices becomes an integral part of "integration model" discourse as well as a shared-process in various transnational policy networks, it is essential to revise substantialist and unidirectional approach of previous research; best practices have been considered as normative products of determinant "models" of integration. This research takes a relational perspective; it focuses on mutual dynamics between the normative discourse on integration policies and the construction of best practices.

Theoretically combining institutional isomorphism approach and Goffman-inspired dramaturgical sociology of social movements, this research analyses how apparently consistent and transnationally-shared discourse on "intercultural model" to immigrant integration in Spain has been reconstructed in relation to the local implementation of its symbolic best practices, such as anti-discrimination related "Anti-Rumours" ones. The research employs policy document analysis and semistructured interviews to the stakeholders of local integration governance in two Spanish cities (Santa Coloma de Gramenet and Getxo), both active in the aforementioned best practices and transnational policy networks, yet with contrasting local demographic, economic, and historical contexts.

The findings do not support simplistic local divergence nor transnational conversion. Instead, they demonstrate a bifurcated constructive dynamics in relation to the "model" of integration; transnational normative isomorphism in policy packages and discourse which unify formal and visible phase ("frontstage") of best practices, goes along in tension with local divergence in the approaches to prepare concrete actions ("backstage") dependent on local narratives on related topics and path-dependent institutional contexts.

UHLMANN, SARAH* (, Germany)

"the Neighbourhood Is the New Factory". Urban Social Movements and the Recomposition of Class in the Global City

Against the background of financialized capitalism this contribution aims at understanding urban protests against gentrification and displacement by taking into account theories of social reproduction, and in a broader sense, class theory. Through this approach, common features of urban protests in the Global North and South and the character of their collective agency become visible.

Based on research in Buenos Aires and Hamburg, I found that urban social movements (USM) have emerged from different contexts and conditions of protests against the increasing valorization of urban space. Since land is not a real commodity, but a fictitious one, its form of commodification has led to a class conflict between landowners and people depending on that land for reproduction. Access to and organization of urban space, f.e. in relation to housing, are causes and triggers of urban protest. Simultaneously, as I show, urban space is also the medium and the goal of USM.

Since USM have less structural power than workers - because they cannot intervene in the production sphere - they use other methods such as blocking highways, as sometimes USM in Buenos Aires do. What is to be regarded as the weapon of the weak, however, is the strong associational power that arises when the USM make possible the reproduction of everyday life in urban neighbourhoods by (re-)appropriating urban space and building territorial connections. For example, through (housing-)cooperatives, social centres and *comedores* the USM in Buenos Aires and Hamburg generate the necessary movement resources and build basic social relations and networks that protest relies on.

Regardless of their different contexts, when USM successfully create a collective subjectivity based on a shared reality on a local level, they may constitute a global class actor – but within the sphere of reproduction. Considering the growing urbanization this interpretation is of particular importance.

Trajectories of Belonging Among the Sephardic Diaspora: An Analysis of Citizenship Under the Integrative Pluralism of Quebec and Multiculturalism of Ontario

As a multinational state, Canada is very much concerned with both its diversity and the social cohesion of its diverse groups (Taylor 1994, Papillon 2012). In my project, the two discourses of integration characteristic of the multinational state (Blattberg 2003) emerged as a means of demystifying the challenges of diversity.

Indeed, a detailed examination of multicultural and intercultural policies' ramifications on the behavior of generational groups remains a significant gap in prior studies (Bouchard 2015, Laxer 2013). Hence, in this presentation, I aim to contribute to the literature of citizenship by addressing the issue of pluralism through a qualitative comparison of one specific ethnic group, namely Sephardic Jews, in two neighboring but linguistically and culturally different Canadian provinces.

How can we bridge the gap in the extant literature on integration discourses by way of a qualitative comparative study of the Sephardic sense of belonging in Canada? Do the agendas of social integration and cohesion for ethnic groups sustain a sense of belonging on their part? How do specific social networks function as bridging individuals through membership? How do Sephardic Jews negotiate their sense of belonging in two provinces? Drawing on life story interviews with the first and second generation and accounting for the intersecting interests of language, religion, and ethnicity in two pluralist spaces/contexts, in this presentation, I aim to share the empirical results I derived from the field. Throughout the presentation, I argue that a comparison of two distinct approaches to immigrant incorporation may help to illuminate some of the issues and challenges confronting diverse multinational societies.

UMEMURA, MUGIO* (Japan Society for the Promotion of Science, Japan)

The Usage of 'Classics' in Sociology Education: A Case of Sociology Textbooks and Syllabi in Contemporary Japan

In this presentation, we examine the signification of 'classics' in the discipline of sociology and sociology education, focusing on sociology textbooks and syllabi in contemporary Japan. The fact itself that some of 'classics' have continued to be referred to in sociology education may be a problem and it may be polemic whether it should be continued in the future or not. However, for now, we accept the assumption from discussions in German sociology that 'classics' function as 'stock of knowledge', 'paradigm-like conception' and guidline in this discipline (Dietmar Brock et al. (ed.), 2012, *Soziologische Theorien von Auguste Comte bis Talcott Parsons*, 3.ed., p.5; Volker Kruse, 2012, *Geschichte der Soziology*, 2.ed., pp.15-17.)

First of all, sociology as major subject is educated in about 102 universities (73 private universities; 23 state-run universities; 6 universities run by local governments) in Japan (2015/16 academic year). In particular, the universities that have a faculty of sociology are almost private (20 private universities.) In those 102 universities, 91 universities have the course like 'introduction to sociology', 42 universities have the course like 'history of sociology', and 47 universities have the course like 'theories of sociology.' As the syllabi of those courses shows, the most mentioned sociologist is Max Weber (103/350 courses) and the following one is Émile Durkheim (86/350). Following these two major 'classics,' Talcott Parsons (49/350), Karl Marx (45/350), and Georg Simmel (43/350) are more mentioned in those courses. However, greater part of those courses (169/350) have not referred to any particular person in syllabi. In this presentation, we shall examine how the 'classics' have been mentioned in those syllabi and sociology textbooks in Japan in more detail.

Forest Stewardship Council (FSC): Opening the Black Box of Forest Certification and Environmental Expertise in Chile

The Forest Stewardship Council (FSC) is an NGO that has promoted the certification of responsible forest management in Chile since the 1990s. It operates in a forestry sector marked by social, indigenous, territorial and environmental conflicts, inherited both from the Chilean conquest of Mapuche territory and the massive growth of the forest industry since the dictatorship of General Pinochet (Kublock, 2014). Even though FSC aims to reduce deforestation and ecological destruction (Auld, 2014), it has not been very successful in transforming the productive practices of the Chilean forest industry (Mogg, Spicer and Böhm, 2015). The incorporation of FSC standards in local contexts is complicated by the judgments and assessments made by companies, communities and the State, each of which has a distinctive approach to forest certification (Tulaeva 2013), as well as expertise (Eyal, 2013) in the context of environmental management. This article opens "the black box" of forest certification and environmental expertise in Chile, asking how the FSC was configured, how it evolved and how it works in practice. In particular, the paper (i) investigates the formation of FSC certification, addressing the conflicts and agreements that enabled its acceptance in the industry; (ii) analyzes the technologies, concepts and indicators used by FSC experts to certify responsible forest management; (iii) evaluates practices of certification and forest management in Chile; and (iv) studies the networks of environmental expertise that mobilize the forestry industry in search of legitimacy. The article is based on three research methods: a) analysis of documents and archives; b) twenty interviews with members of the FSC training team, forest management experts and state

agents responsible for environmental regulation; and c) ethnographic research with producers of certified forestry, analyzing the impact that the FSC has had on their practices of production.

What Conservation Looks like: Frictions and Resonances of Deep Ecology in Southern Chile

The conservation of species, ecosystems and natures has become central to the global agenda of combatting climate change. One of the most used forms of conservation has been the constitution of land trusts, that is, the private acquisition of land by environmental philanthropists and non-governmental organizations. Despite the universality of this approach to conservation (global purposes and efforts), conservation land trusts are located in specific places, and enter into particular relations with state regulators, economic agents and other interested parties. Seen from a local perspective, the promises of conservation projects are often less obvious; their universal claims enter in conflict with local provisions and interests. Based on ethnographic work, interviews with key actors and media analysis, this article explores the local conflicts provoked by the installation of conservation projects in southern Chile on the part of foreign deep ecologists. In particular, the article reconstructs the history of frictions and resistances (Tsing, 2005) that foreign deep ecologists have encountered in politicians, businessmen and rural inhabitants of southern Chile. Using the conceptual tools of economic sociology and science and technology studies, such as the sociology of justifications (Boltanski & Thevenot, 2006) and valuation practices (Stark, 2009), the article contrasts the distinctive visions of nature, development, and society that animate global conservationists and local actors in this case study. It explores the distinctive environmental imaginaries in play (Purdy, 2017).

The Lived Experience of Exclusion from Social Relations: Gender Perspective.

Social exclusion is a multifaceted social problem with disruptive consequences for individuals and society (Walsh et al. 2017; Ogg, 2005). One aspect of social exclusion is the exclusion from social relations, which is the key focus of this presentation. The subjective experience of being socially excluded may be a key factor in the generation and social construction of exclusion from social relations, and its outcomes in later lives. And while exclusion from social relations in later life might be viewed as an outcome of conditions, events, and transitions over the entire earlier life course (Dewilde, 2003), there is still not enough research effort in capturing how gender might be interlinked with (1) construction and (2) consequences of social exclusion from social relations.

In this presentation we draw on preliminary analysis of qualitative data gathered in the GENPATH project in order to answer the following questions: (1) How is exclusion from social relations constructed, and is this process different for men and women? (2) What are the consequences of exclusion from social relations for men and women?

The analysis shows that normative and non-normative experiences in life course construct life narratives that are clearly influenced by gender, which could lead to a gendered subjective experience of exclusion from social relations and its outcomes.

La Expansión De Las Coberturas En Salud Durante Los Gobiernos De Centro Derecha En Colombia y México: Entre La Inclusión y Las Tensiones Público - Privadas (2010 – 2018)

Durante la primera mitad del siglo XXI América Latina experimentó una importante expansión de políticas sociales con la llegada al poder de gobiernos de centro – izquierda a países como Chile, Uruguay, Brasil, Argentina y Ecuador. Sin embargo, este fenómeno no fue exclusivo de los gobiernos progresistas, en casos como Colombia y México donde se mantuvieron gobiernos de centro derecha también se implementaron estrategias como la *Cobertura Universal en Salud*. En ambos casos, los gobiernos hicieron una apuesta especial por fortalecer el modelo de las asociaciones público-privadas (APP) con el argumento de mejorar el acceso y la disponibilidad de los servicios. Este trabajo busca explorar las ideas y estrategias de dichos gobiernos para alcanzar la cobertura universal, a la vez que pretende identificar los mecanismos de incorporación de las APP a dichas iniciativas. El análisis pretende enfatizar en las particularidades de dos países que tuvieron como referencia modelos de expansión semejantes.

Child Trafficking, Reality or Fiction?

Según datos de Eurostat el 16% de las víctimas de trata con fines de explotación sexual en Europa son niñas y niños, sin embargo, el número de niñas/os víctimas de trata identificados en España es muy bajo. Eso no significa que no existan, sino que en nuestro país no estamos siendo capaces de identificarles de forma adecuada. Lo que sí sabemos es que esos datos están aumentando cada año de forma alarmante. Cada vez hay más niñas/os que son introducidos en nuestro país para ser explotados sexualmente.

Los datos de menores víctimas de trata que aquí vamos a presentar proceden de una investigación realizada a nivel nacional sobre víctimas de trata en España, y proceden de informantes clave de la policía (18 policías), del ámbito jurídico (9 fiscales d extranjería), de ONG que trabajan con víctimas (52 ONG) y de entrevistas a mujeres víctimas de trata (22 mujeres entrevistadas).

Analizaremos por qué las niñas/os son cada vez más interesantes para las redes de trata de personas, así como la potencial demanda por parte de los clientes de prostitución. Es interesante ver de qué manera las mafias utilizan a estos menores para sus fines e intentar ver donde podrían localizarse y ejercer estas actividades las niñas/os víctimas de trata en nuestro país.

También analizaremos la intervención de los poderes públicos para poder identificar a estas niñas/os. Estudiaremos qué tipo de procedimientos empleamos para poder identificar posibles víctimas y como sería posible mejorar estos mecanismos para ser más eficaces en la detección.

Por último, veremos los mecanismos de protección que empleamos en España para la protección y recuperación de estos menores una vez que han sido identificados y analizar si los recursos que se les ofrecen son realmente adecuados para su efectiva protección.

URVASHI, SHREYA* (Tata Institute of Social Sciences, India)

The Politics of Belonging and Security in India

In the urban, the identity of individuals forms a chief characteristic in determining their membership to the community. The state as well as public perception, both, play an important role in getting an issue constructed and recognised as a security threat. This security issue becomes particularly relevant in the wake of increased number of extreme events due to climate change as well as rise in ethnic conflicts. The sufferers and displaced in such cases are the most vulnerable class of people who are already disadvantaged socially and economically. Events like these raise the issues of belonging and security in the host countries and the way policymakers handle them determine the fate of millions of people.

The social construction of migration as a security question results from a powerful political and societal dynamic reifying migration as a force which endangers the good life. Migration has to be understood as both a spatial and a temporal phenomenon. Migrants, irrespective of existence of supporting empirical evidence, are perceived to be as hampering the 'way of life of the citizens who belong'. They are imposed with stricter rules and regulations. Thus, the idea of who is the object of security and whose interests are to be safeguarded comes up.

Although theorization on such lines have been done primarily in America and Europe, the same is very relevant in the Indian context as well. India forms for an interesting study in the wake of various policy formulations and the extreme climatic conditions. India's neighbours, including Bangladesh, Myanmar and Bhutan, also form part of this. This paper, using various secondary sources of information, seeks to comprehend how this politics of belonging and the consequent securitization of migration plays out in the Indian discourse.

How Bureaucratic Clientelism Undermines Redistribution in a Decentralized Democracy

Notwithstanding a substantial increase in realized state expenditures for redistributive programs and robust political participation through elections to demand more equal resource distribution, economic inequality is worsening in post-authoritarian Indonesia. This paper investigates state processes that perpetuate

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

unequal resource distribution by examining linkages between political leaders and bureaucrats from the period of administrative state building under authoritarianism to contemporary democratic Indonesia. The transition to democracy generates more opportunities for local state actors to misuse public funds for their political interests through the mechanism of *bureaucratic clientelism.* A close look at the linkages between these state actors at the local redistributive government agencies shows that the practices of bureaucratic clientelism reduce the efficacy of redistributive policies that aim to address inequality. Using a within case analysis strategy, which traces the independent variable Causal Process Observation constructed from interviews and archival work, this paper argues that the existence of bureaucratic clientelism at the level of local governments is a necessary condition for the perpetuation of economic inequality following the transition to democracy in Indonesia. This study also addresses key debates around democracy and inequality, state autonomy, as well as bureaucracy and policy implementation.

UTAMA, RAHARDHIKA ARISTA* (Northwestern University, USA)

The Politics of Development Beyond the Developmental States in the Global South

The twentieth-century scholarly works on development demonstrate how thriving developmental states are responsible for economic transformations in the Global South. These works, however, overlooked the experience of Southeast Asian countries other than Singapore in establishing industrial economy to catch up with their first developer counterparts. Many scholars have attempted to improve the feasibility of the developmental states as a concept by adding political variables and locating the institution in the context of globalization but narrowly assume state-society relations as merely the coordination between state actors and elites. The scholarship has to not yet investigate the dynamic political and economic relations of the state with non-elite groups of society. It is unknown how those relations affect the feasibility of the developmental state in successfully achieving economic transformation. This study proposes the agrarian relation as a vital explanation for the economic transformation in the Global South. It argues that the developmental state is no longer a feasible explanatory factor for the variation in economic development without taking the agrarian relation into account. By employing comparative-historical methods, the study aims to produce an interpretive framework of agrarian relation to contest, refine, and organize existing theories of economic transformation in late-developing countries in Southeast Asia.

Certification: Process and Benefits

Certification is an important way in which clinical sociologists can demonstrate the professional nature of their work through publicly exposing it to scrutiny by other professionals who make the judgement whether their work is effective, in particular, the extent to which their work is making a contribution positive social change. This paper considers the rigorous process that is followed from applying for certification up to the conclusion of the process. It also looks at the benefits that individual clinical sociologists receive from subjecting themselves to the process and achieving certification. Finally the paper explores the ways in which certification strengthens the field of clinical sociology overall.

The Emergence of Clinical Sociology in South Africa

Clinical sociology is an area of sociological practice that focuses on assessing social problems with the aim of improving people's living conditions through a combination of analysis and intervention. This chapter starts with an overview over the development of sociology as a discipline in South Africa. It then looks at the contribution of various scholar-practitioners in establishing clinical sociology as a field within sociology, whether explicitly or implicitly. This includes scholars such as Harold Wolpe, Fatima Meer, Jaclyn Cock, Frans Bezuidenhout and Edward Webster. It concludes with a discussion of curricula at South African universities that demonstrate the emergence of clinical sociology as a field within South African sociology.

Digital Labour Platforms As Mechanisms of Neoliberal Governmentality. the Case of Domestic Workers in Turkey

Recent studies on digital labour platforms are mostly focusing on the neoliberal elements within platforms or working conditions of workers within platform economy or the regulation debate surrounding platforms. Governmentality perspective is important in the study of platforms to analyse the sociological change that these platforms create around work in the era of informatization. Also, studies are almost exclusively undertaken in developed economies. With platform work is growing around the world, there is apparent need for the study of labour platforms in developing economies and on less known local platforms where the number of workers can be very high. Hence, this research is focusing on the case of Armut platform in Turkey from the point of view of neoliberal governmentality

The purpose of the research is to explore the effects of recently emerged digital labour platforms on workers' experience and meaning attributed to work, as well as on the mechanisms of managerial control of employers. What are the effects of digital labour platforms in promoting entrepreneurial outlook attached to labour, which is a defining characteristic of neoliberal governmentality? Do the technologies deployed in platform economy change the nature of control exerted by the management on the workers? Are these platforms constitute a new phase in the prevalence of entrepreneurial culture and managerial control?

The research is based on a qualitative study of domestic workers case in Turkey, through in-depth interviews with platform workers, owners, managers and service requesters of Armut, the largest domestic work platform in Turkey. The hypothesis is that labour undertaken in Armut platform is encouraging entrepreneurial outlook on labour as described by Foucault in his analysis of neoliberal governmentality. On the other hand, Armut is marked in the increased control over the workers applied by management specifically using the data and technology available in the platform structure.

VALDERRAMA, MATÍAS* (Pontificia Universidad Católica de Chile, Chile)

El Giro Digital De La Sociología: Problematizando El Entretejimiento Entre Lo Social y Lo Digital

Lo digital ha expandido la trazabilidad de lo social, generándose un mar de datos que ha sido catalogado como una verdadera "bendición" o una inminente "crisis" para la sociología contemporánea. Esto ha puesto en tensión varias de las distinciones clásicas de la disciplina y su jurisdicción sobre lo social. La digitalización de lo social aparece como un proceso excepcional que posibilitaría una supuesta redistribución y democratización de los métodos sociales y una reinvención de las ciencias sociales. Ya sea virtualizando metodologías tradicionales o posibilitando nuevos métodos "nativamente digitales" de indagación social, Internet no sólo se posicionaría como un interesante objeto u ámbito de estudio, sino que también como un instrumento o artefacto indicativo de múltiples fenómenos sociales más allá de lo online. Dentro de este debate, se ha llegado a sugerir que con este nuevo régimen de cuantificación digital se podrá acceder a los fenómenos sociales en su ocurrencia natural, inmediata y en tiempo real. En esta ponencia se discutirá críticamente el denominado giro digital o computacional de la sociología, revisando en sus principales discursos, expectativas y dispositivos materiales. Se situará lo digital dentro de un macro-proceso histórico mayor de cuantificación de lo social. Desde este marco, se problematizará las implicancias políticas del actual régimen de cuantificación digital, examinando casos de estudio que complejizan los múltiples "dobles de datos" de fenómenos sociales y la supuesta "naturalidad" o no reactividad de tales datos. Con ello se busca abrir la discusión dentro de la sociología digital sobre formas alternativas de comprender el entretejimiento entre lo social y lo digital.

VALDIVIEZO-SANDOVAL, RENE* (Universidad Iberoamericana Puebla, Mexico)

México 2018: El Movimiento De Regeneración Nacional (MORENA): De La Movilización Al Gobierno

MORENA nació en Octubre 2011 como Movimiento Político y Social, se constituyó como Asociación Civil en Noviembre 2012 y obtuvo su registro como Partido Político en Agosto 2014. Entre 2011 y 2014 se transformó de Movimiento a Partido Político. Sus antecedentes provienen del Partido de la Revolución Democrática y de su líder: Andrés Manuel López Obrador, quien encabezó movilizaciones populares en Tabasco en protesta por el fraude en las elecciones de 1988, 1991 y 1994 y en defensa del petróleo y de los campos agrícolas degradados por el petróleo, realizando dos marchas desde Tabasco hasta la Ciudad de México. En estas movilizaciones, ligadas principal pero no exclusivamente a procesos electorales, se establecían los antecedentes de MORENA, cuyo objetivoinicial como partido fue encauzar el movimiento político hacia las elecciones en México 2012.

El debate entre mantenerse como Movimiento o convertirse en Partido se centró en la discusión sobre las características y coyuntura que México vivía para esos años. Pobreza en aumento, polarización social y económica, deterioro ambiental, dependencia muy fuerte de la economía norteamericana, un orden antidemocrático en el país, partidos poco congruentes frente al gobierno, fraudes electorales, etc., lo que planteaba la necesidad de contender por el poder político y conformarse como partido político. En las elecciones federales de 2015 Morena alcanzó poco más del 8 % de la votación, colocándose como cuarta fuerza política nacional, y para 2018, triunfó en las elecciones federales y varias elecciones locales en el país.

Esta ponencia, presenta el panorama del país al inicio del 2010, ubicando el tránsito de MORENA de movimiento a partido político y analiza los resultados de las elecciones del ejecutivo del 2018 en todos los estados de México para mostrar, comparativamente con las elecciones federales del 2012, los cambios generados en la geografía política nacional.

Synergistic Crises at the Crossroads of Public Management: A Complex Systems Approach to Intertwining the Dynamics of Disasters, Public Finance and Sanitation

In Brazil, the way in which sanitation problems have been systematically relegated to municipal and regional public policies during periods of economic prosperity reflects a certain level of mismatch between the agendas and priorities of power groups operating in the state apparatus and the social demands for collective wellbeing. In recessive economic periods, this disengagement became even more noticeable, in an institutional alienation, aimed at its own maintenance, resulting in the worsening of the quality of life of those citizens who, deprived of this basic infrastructure, also suffered from a precarious public health care as well as due the lack of work and employment under decent conditions. While critical, this progressively discouraging scenario is made worse by the occurrence of disasters. From the administrative act of emergency decree, the government is urged to demonstrate that steps have been taken to repair sanitation problems, public health care and revive the economy. It turns out that the reversal processes of this stage of the crisis encounter several mishaps, which will feed further crises if they are not properly addressed. Taking into account the correlated dynamics between disasters, public finances and basic sanitation in the universe of Brazilian municipalities that declared emergency with worrying regularity (> ten times) over the period 2003-2017, and by applying the CaMI method and the Graph Theory, this socioeconomic study presents a schematic picture, which is used to comparatively modulate the analysis of the cases of municipalities that, during the same period, directly or indirectly related to the collapse of dams. It is concluded that the structural conditions, under which public and private wealth move and are distributed, have a greater weight to confront the acute crisis than it has to affect the local economy, while the causal links between sanitation and public health remain relatively stable.

VALENZUELA, FELIPE* (, Chile)

La Persistencia De La Informalidad Urbana En Nuevos y Antiguos Asentamientos: El Caso De Valparaíso (Chile).

Este trabajo analiza los procesos de urbanización informal en Valparaíso (Chile), que concentra la mayor cantidad de asentamientos informales (campamentos) en el país. Específicamente, se estudia el rol que ha jugado el Estado en la reproducción de la informalidad desde 1990 en adelante, a través de las políticas de vivienda, los programas de regularización y la planificación urbana.

Situaciones como la de Valparaíso, donde los asentamientos informales han crecido, suelen ser interpretadas como una "anomalía" en el contexto de una política habitacional exitosa en términos cuantitativos. Sin embargo, al analizar este caso, los problemas relacionados a la informalidad estarían lejos de ser una anomalía y corresponderían más bien a una característica estructural y persistente del modo de urbanización de la ciudad. Algunos resultados preliminares obtenidos de datos censales y catastros indican que el 2017 cerca de un 13% de los hogares de Valparaíso presentan alguna condición de informalidad, ya sea referida a la autoconstrucción, la tenencia irregular de la vivienda o el acceso irregular a servicios básicos. Si bien se han aplicado programas de regularización en estas zonas, que han significado el "cierre" de muchos campamentos, ello no necesariamente ha resuelto los problemas de precariedad que se manifiestan tanto dentro como fuera de los límites de los campamentos.

Existen antecedentes para suponer que esta persistencia de la informalidad tiene una importante relación con la inadecuación de las políticas urbanas implementadas desde el Estado, debido a factores como: la incapacidad de generar suficientes alternativas habitacionales formales mediante proyectos de vivienda social con buena localización; la descoordinación institucional que deriva en la entrega de títulos de dominio sin la existencia de condiciones de infraestructura para reducir la vulnerabilidad de los asentamientos; y la obsolescencia de instrumentos de planificación territorial que habilitan la urbanización, pero sin vincular proyectos de inversión que la acompañen.

VALENZUELA, MARIANA* (Universidad de Santiago de Chile, Chile)

El Sistema Moderno Colonial De Género. Un Análisis Del Pensamiento Feminista Descolonial Latinoamericano De María Lugones.

La ponencia analiza el pensamiento de la filósofa feminista descolonial argentina, María Lugones. Se focaliza en su comprensión del sistema moderno colonial de género como una imposición heterosexista y patriarcal de carácter eurocéntrico. Con este propósito, primeramente, se aborda la definición del sociólogo peruano Aníbal Quijano sobre el sistema moderno colonial que ha sido abordada y críticamente reformulada por Lugones. Luego se centra en la concepción de la autora del género y la raza como categorías ideológicas de la episteme colonial moderna, a partir de las cuales utiliza la concepción de interseccionalidad como una herramienta teórica que aunada a la noción de colonialidad del poder dan forma a los principales postulados de la corriente feminista descolonial latinoamericana. Finalmente, la ponencia se focaliza en la crítica que hace Lugones hacia lo que ella denomina el pensamiento hegemónico feminista occidental, aduciendo que ha impuesto una máscara feminista basada en una visión de la feminidad que solo contempla a un modelo de mujer: blanca, heterosexual y burguesa, siendo cómplice de la sumisión de las mujeres de color. En este sentido, la autora propone los feminismos de mujeres de color como una estrategia de resistencia que quiebra la representación de ellas como subordinadas. Esta concepción que ha sido desarrollada por feministas descoloniales latinoamericanas como Yuderkys Espinosa Miñoso, Rita Segato y Breny Mendoza, entre otras, ha implicado un giro epistemológico que moviliza la capacidad de agencia desde la posición de la subalternidad para pensar el feminismo descolonial como una corriente de pensamiento crítico relevante en América Latina. Esto plantea un desafío sociológico para comprender la apropiación que hacen los movimientos feministas latinoamericanos de la categoría de lo subalterno como un eje emancipatorio. La ponencia es una exposición oral que no requiere apoyo técnico.

VALENZUELA, MARIANA* (Universidad de Santiago de Chile, Chile)

Heterosexual Couple Relationships in Contemporary Chile. Subjectivities Conflicted in the Neoliberal Model

The military dictatorship in Chile (1973-1990) implied the establishment of a neoliberal economic model that was deepened since the 1990s with the arrival of democracy. According to the research developed by Araujo & Martuccelli in *Desafíos comunes. Retrato de la sociedad chilena* (2012), this neoliberal model implied the emergence of a new type of individuality characterized by the generalization of the principle of competition and individual success in all social dimensions while continuing to establish a series of moral values that placed the family as one of the bases of the social life. A type of politically demobilized citizen was generated, in which the previous demands for political equality translated into an expectation of horizontality in their daily relations, while being strongly responsible for their personal destiny as a result of the mixture between traditional values and pro-market attitudes. This presentation, based on the results of a research on conflict management and decision making in the relations of Chilean heterosexual adult men and women, raises that the type of individuality generated by the neoliberal model is a framework for understanding the discourses on the daily dynamics in the relations of couple and expectations in relation to the significant other. The problems around relationships are formulated from the gender position of men and women, revealing a conflicted subjectivity between a project of personal autonomy, the constant demand for respect for individuality on the part of the other and conservative values associated to the family. All this within a complex context marked by gender inequities in the country that place the members of the couple in an asymmetrical position, having access to differentiated resources to be able to face them.

Another Politics Is Possible: Radical Democracy and Socioenvironmental Struggles in Chile

In the last decade, a growing number of socioenvironmental conflicts have spread across Chile, opening up the debate about the deep inequalities observed both in the access and control of natural commons and in the distribution of the damages triggered by ecological degradation. While extractive industries and corporate projects in the sectors of energy, infrastructure and real estate justify their activity under the name of progress and economic growth, increasing grassroots movements have begun to question this rationale, rejecting a development model based on the exploitation and commodification of nature and their territories. Alternatively, they advocate for an alternative and interdependent relationship between human beings and the environment, where the usufruct of natural commons is not commanded by the logic of capitalist accumulation but by the reproduction of life.

Alongside the critique of the extractive model of development, these grassroots movements refuse state-centred and top-down approaches to social change and seek to prefigure in the present the social world in which they want to live in. Through innovative forms of self-organization, self-determination and self-management, they embrace the ideas of 'autonomy', 'horizontality' and 'territorial sovereignty' as a new path towards emancipation.

What are the main repertoires of action developed by these organisations in their struggle against extractivism? How do they interact with the state? What are the alternatives to capitalist and extractive development envisioned by these grassroots movements? Drawing on an ethnographic approach to inquiry combined with participatory-action research methods, this paper seeks to address these questions, exploring how grassroots movements from six coastal cities of Chile understand and defy environmental injustice in their territories, and what are the alternatives to capitalist development that they are envisioning.

"Our Rivers Are Not for Sale": Struggles over Water in Southern Chile

In the last decade, a growing number of socioenvironmental conflicts have spread across Chile, opening up the debate about the deep inequalities observed both in the access and control of natural commons and in the distribution of the damages triggered by ecological degradation. Far from being an isolated process, the multiplication of socioenvironmental struggles in Chile is part of a broader tendency observed in most Latin American countries, where local communities have systematically resisted the proliferation of extractive industries, investments in the sectors of energy, infrastructure and real estate, and the privatization of their territories, water and land.

The outbreak of environmental conflicts in Latin America has occurred in a context of "reprimarization" of the region's economies, with a focus on extractive and export-oriented activities. From a Marxian angle, the consolidation of this extractive paradigm responds to a renewed phase of capitalist expansion that uses dispossession, enclosure, proletarianization and commodification as core strategies for capital accumulation.

In the case of Chile, given the strategic role of water for extractive companies, and the neoliberal and privatised character of its water management system, a number of environmental conflicts over water have emerged. In this paper, I explore an ongoing conflict taking place in the region of Biobío, Southern Chile, where social movements and indigenous communities are resisting a "water highway" project seeking to transport water from local rivers to mining and intensive agricultural sectors in the centre and north of the country. What are the reasons to resist this project? What are the main repertoires of action developed by these movements in their struggle against water commodification? Do these movements posit an alternative to capitalist and extractive development? I expect that this paper would allow us to open the discussion about these key questions.

ALMADA, PABLO (Universidade Estadual Paulista Julio de Mesquita Filho, Brazil)

1968: The Bibliographical and Memorialist Return in Its 50 Years

The purpose of this paper is, in light of the events of 1968, to analyze the different reports and analytical perspectives that emerged in the 50th-anniversary celebrations of that event in Brazil. As is well known, about 1968 there is a huge body of scholarly references, reports of its former protagonists, and articles linked by the mainstream press, which favor the most diverse interpretations possible, as well as varied practical and political meanings and effects. Thus, in the "commemorations" of its 50 years, there are new interpretations that can be explored: the academic turns that take over 1968 globally; the workers strike (Osasco and Contagem) and their relations with the student movement; and the composition of certain political inheritances in the face of current political conservatism. Therefore, the research that underlies the article aimed at the memorial composition, based on oral history, with reports of scholars and former protagonists, who identify several points of convergence, especially regarding the identification of 1968 with a (still) current project of criticism of disciplinarity and technocracy aimed at building a more egalitarian society.

Camilo Catrillanca's Death: Changes and Continuities in Chilean Discourses on Nationality and Ethnicity

The murder of a young Mapuche student by Chilean police in November of 2018 created a new wave of protests in Chile regarding the conflict between the Chilean State and the Mapuche people. After initial attempts at a cover-up by authorities, investigations revealed serious wrong-doings by the police that lead to several convictions. The present paper focus on how media and political discourses framed the case, focusing on the language and frameworks on nationality and ethnicity. The present research attempts to illuminate the historical changes and continuities in the media and political discourse. What has changed in the last decades? What has been the role of social movements in influencing such discourses?

The analysis provides a comparison with the media discourse regarding the murder of another Mapuche student by the police in 2008, analyzing changes and continuities in the media discourses. The significance of the social movements of the latest decades in Chile (not only the Mapuche social movement, but also the student movement, women's rights movement, and regional movements) is addressed. The research analyzes how such social movements have impacted the public debate and the legitimacy of language and frameworks on nationality and ethnicity. The present research analyzes how hegemonic discourses of *otherization* have persisted; while alternative discourses have emerged challenging them.

VALLE, TRINIDAD* (Fordham University, USA)

Coding and Classifying Media Frames: Problematizing the Researcher's Standpoint

Research on framing, media, and social movements has provided a rich literature helping us better understand the power of frames in contemporary discourses. While the Weberian ideal of value neutrality still permeates the production of knowledge, new epistemological stands have opened a debate regarding the position of the researcher. For example, standpoint feminism brought to the forefront of the discussion the importance of acknowledging our position as researchers, emphasizing the relations of knowledge and power at the center of any epistemological position.

The present research analyzes the difficulties in codifying and classifying media framing of social movements, and the importance of acknowledging our position as researchers. Three case studies are discussed: the study of media frames on reproductive rights, media frames on immigration, and media frames on gun violence in the American debate of the last decade. The paper discusses the difficulties in processes of codification and classification, both at the level of open coding and selective coding, and the significance of identifying the researcher's standpoint in the analysis. Acknowledging the researcher's standpoint is central to our understanding of the selection of research questions, theoretical frameworks, and methodologies.

RC24-296.6

VALLEE, MANUEL* (University of Auckland, New Zealand)

Invasive Species, Biosecurity Concerns and Government Expertise

In 2002-2003 the discovery of an invasive species of moth in Auckland (New Zealand's biggest city) led the country's government to pursue a massive aerial pesticide spraying campaign over the city. Over the nospan of seventeen months the government conducted 45 aerial spraying sorties over densely populated areas of the city, exposing over 193,000 residents in the process. This pesticide campaign was predicated on the public's perception that the government possessed expertise to adequately define a bio-security threat and successfully address it. However, the pesticide campaign led to more than 20,000 health complaints from citizens and led to many about the pesticide campaign's on local ecosystems, prompting important questions about the kind of expertise the government possessed. Through an analysis of this case, I discuss the social construction of perceived expertise, which includes considering who claimed expertise in the crisis, what they did to bolster their claims, the differences in "epistemic frames" (Kleinman and Suryanarayanan, 2012) they deployed, who ultimately prevailed in the struggle, why, and how the deployment of government expertise put citizens in harms way, while helping to protect capital accumulation.

VAN DE VELDE, CÉCILE* (Université de Montréal, Canada)

From the Indignados to Hong-Kong Pro-Democratic Movement : What Slogans of One Decade of Youth Protests Tell Us about Generational Aspirations

Indignados, student protests, pro-democratic movements, and more recently, climate demonstrations... do these various mobilizations mark the rise of a global generational outlook of future in the 2010 decade? To answer this question, the presentation proposes to compare the generational speeches born within 8 social movements that took place from 2011 to 2019: the "Indignados" in Madrid (2011-2012), the student movement in Santiago de Chile (2011-2012), the "Maple Spring" in Montreal (2012), the "Umbrellas movement" in Hong-Kong (2014), "Nuit Debout" movement in Paris (2016), the "Gilets Jaunes" in Paris (2018), the Montreal climate demonstration (2019), and Hong Kong's pro-democracy movement (2019). The comparative device is based on the direct and large-scale collection of slogans and placards within each of the mobilizations. Their textual and comparative analysis will, in this communication, bring out the different "generational grammars" about alternative futures, identify their main points of convergence, and how these generational discourses evolved over the decade.

WG08-722.2

VAN DE VELDE, CÉCILE* (Université de Montréal, Canada)

Neoliberalism and Anger : A Comparative Analysis of Social Emotions Among Young Adults in 5 Countries.

This communication aims to identify the emotional responses to neoliberal policies among young adults in 5 different countries. It is based on a comparative survey of 135 young people aged 18 to 30 from diverse social backgrounds in Montreal, Santiago de Chile, Paris, Madrid and Hong Kong. The interviews focused on life stories, social emotions and the relationship to politics and institutions. Their comparative analysis provides a better understanding of how social policies can shape certain emotions, and how these emotions can in turn structure the relationship to citizenship. In the first place, the communication will show the prominence, among these young adults, of a dominant emotion, that of a social and political anger directed against society or the "system". The analysis of these multiple speeches of anger shows how this social emotion is related to a feeling of political injustice, which allows the understanding the links between neoliberalism and social anger at the global level. Secondly, the presentation will show how these expressions of anger may differ from one social group to another, and from one society to another, which will help to think about how the different Welfare Regims structure different "regims of anger".

VAN HERREWEGHE, LORE* (University of Leuven, Belgium)
VAN LANCKER, WIM (University of Antwerp, Belgium)

The Accumulation of (dis)Advantage: An Empirical Investigation into Parent-Child Financial Transfers across European Countries.

Population ageing has major consequences for the financial sustainability of the welfare system across all European countries. In this context, the link between public and private streams of intergenerational support becomes increasingly important. The present paper examines the flow of financial transfers, from parents to their adult children (downward) and from adult children to their parents (upward), and how such transfers contribute to the accumulation of social and economic (dis)advantages. It is important to realize that people from different social classes or with different socio-economic backgrounds vary in their ability to provide financial support. Subsequently, this variability can lead to the accumulation of both financial advantages and disadvantages through higher or lower probabilities of giving or receiving financial support. What is missing in the current literature on intergenerational financial transfers is an in-depth examination of what the generations exchange, and how this potentially affects inequality between and across generations. Therefore, we will look at financial support measured as relatively large money transactions or gifts between parents and their adult children. First, by looking at parent-child dyads, we will evaluate the impact of the socio-economic characteristics of the parent and the child on the likelihood of receiving a downward financial transfer on the one hand, and an upward financial transfer on the other. Recent research shows that patterns of financial exchange between generations within the family varies substantially across countries and welfare state regimes. Therefore, in our second step, we will analyze whether the set-up of the welfare state influences the linkage between socioeconomic characteristics of the family and the likelihood of giving and/or receiving financial support. Results will lead to greater understanding in the potential mechanisms through which socioeconomic advantages and disadvantages are transmitted across generations, and evaluate the role of the welfare state in within-family exchanges.

Insights for Diversity Education in Health Care: Testing a Conceptual Model on the Psychosocial Mechanisms of Diversity Competent Care within a Belgian Health Care Student Population

Rationale: Although psychosocial mechanisms such as the relationship between attitudes and behavioural intentions have been extensively studied, applications and a deeper understanding of these mechanisms remain scare within the European health care context, particularly regarding the promotion of diversity sensitive care and education.

Objective: The current study assesses how Flemish health care students' diversity sensitive task perception was influenced by their ethnocentric attitudes and their cognitive intercultural capabilities. We also explored how their intentions were influenced by their ethnocentric attitudes, cognitive intercultural capabilities, and diversity sensitive task perception.

Method: The study includes data of 364 health care students that participated in an online survey at Ghent University. Furthermore, we utilized a situational judgement test to assess health care students' intentions to act in diversity sensitive ways in a variety of intercultural situations that can occur in the health care context. The article discusses various multiple linear regression models.

Results: Ethnocentric attitudes negatively affect health care students' moral judgement over the provision of diversity competent care (here referred to as: diversity sensitive task perception) and their overall intentions to act in diversity sensitive ways. Health care students' motivational- and behavioural intercultural capabilities positively impact their diversity sensitive task perception. Health care students' behavioural intercultural capabilities and their diversity sensitive task perception positively influence their intentions to act in diversity sensitive ways during various health-care related critical incidents.

Conclusions: Psychosocial mechanisms influence task perceptions and intents to provide diversity sensitive care. We encourage further exploration in European health care contexts. Education on diversity competent health care should address ethnic bias in the medical context and encourage a diversity sensitive task perception, motivational- and behavioural intercultural capabilities in students.

Psychotherapy and Psycho-Educational Group Work to Unaccompanied Young Adult Refugees in an Institutionalised Communal Living Project: Recommendations Towards Culturally Sensitive Mental Health Services in Belgium

Notwithstanding validated appeals for culturally sensitive approaches to mental health services, there is limited contemporary and practical evidence available on what this exactly entails and how to review such services within their institutional context. In this article, two specific types of mental health services are reviewed: psychotherapy and psycho-educational group work. We investigate whether these services interfere or if they are complementary. Both services are offered within a bureaucratic communal living project where 81 young adult refugees aged 19-25 years old cohabit with matched local 'buddies'. This article draws on qualitative research data that includes focus group discussions with the project psychotherapists and narratives of the young refugees' experiences with these services. Most challenges refer to the fact that although refugees disclosed

stress symptoms, oftentimes these young refugees remained reluctant towards mental health services. Hence, a key challenge was to encourage psychotherapy and psycho-education from a conventional 'preventive' perspective. Many refugees reported feeling uncomfortable to share their psychological sorrow on an interpersonal and group level. The young refugees recommend services that directly advise them on how to cope with certain issues such as grief, distorted sleep, acculturation stress, and tensions related to their insecure future perspective. This article suggests that psychotherapy and psycho-educational group work are complementary and should be customised based upon individual needs and talents.

Informality As a Learning Process: Chinese Medical Students' Orientation to Guanxi

While many studies have explored informality of access in medical contexts, the evidence on how healthcare practitioners develop their positioning to informal practices is scarce and anecdotal. This interview-based study fills the gap by exploring how Chinese medical students understand and signify guanxi (informality of access), and how their orientation to guanxi is acquired through professional socialization. The findings suggest that the lay perspectives students bring in as they begin medical school are challenged by their exposure to ethics classes, day-to-day interaction with doctors, and first-hand experience of hospital interactions. Thus, students pass from taking guanxi for granted to becoming reflexively aware of the practice and developing ambivalence towards it. The tension between the ethical norm of affective neutrality and the local morality is mitigated by the anxieties surrounding the beginning of the medical career. The predominant view among the more advanced medical students is that notwisthstanding its challenges, guanxi is beneficial to patients and doctors alike; patients who have a connection with the practitioners tend to trust them more and enjoy a better healthcare experience, whereas doctors reduce the risk of patient misbehavior or complaint. Chinese medical students' narratives obliterate the wider implications of guanxi use, such as the generation of inequity of access to medical services. The study indicates that the overall positive understanding of informality by Chinese medical students is in part a response to structural problems in the organization of health care. The predatory practices devised in response to underfunding (e.g., ordering unnecessary tests; prescribing expensive medicines at the expense of cheaper ones; and overmedicating) generated distrust in practitioners and led to an increased number of malpractice accusations and episodes of violence against doctors (yinao). Guanxi is seen as a means to protect practitioners from these risks.

VANDEN BROECK, PIETER* (UCLouvain, Belgium)

The Problem of the Present. Simultaneity, Synchronisation and Transnational Education Projects

The current inclination at the European level to fund education in the form of projects expemplifies the modern orientation towards the present as the attempt to bind a yet indeterminate future. This contribution proposes a close re-reading of Niklas Luhmann's oeuvre in order to problematise the place of the present in modern education. It highlights how such transnational projects articulate their specific, educational meaning in order to sketch out the need for a new educational ecology. It is argued that the strict line that school instruction draws between education and society at large in order to uphold its own autonomy, as symbolised by the isolation of the classroom, starts to stir in favour of projects steering themselves towards solutions, which construct the boundary between the two very differently, even fluctuating from project to project (*cf*. Besio, 2009, p. 289). Drawing upon empirical study, the contribution offers a theoretical inquiry of how such transnational "projectification" (Lundin & Söderholm, 1998) changes education's range of the possible, when compared with its more familiar form of the school (Vanden Broeck, 2019).

VANDENBERGHE, FREDERIC* (Federal University of Rio de Janeiro, Brazil)

Ontology of the Present: Neo-Liberalism, Anthropocene, Populism

In dark times, we desperately need pointers to orient ourselves intellectually, ideologically and politically. For those who live in countries (like Brazil) that have gone over the edge, the question of the ontology of the present takes on an existential dimension. In this paper, I will suggest that we need to think at the same time the challenges of the Anthropocene, neo-liberalism and populism. None of these terms are analytical concepts, however. They are polemical folk notions, but as they have stuck, we need to use them as well, even if for us, liberal intellectuals, they function as Rorschach tests on which we can projects our worst fears. The challenges they refer to have different genealogies (capitalism, industrialism, liberal democracy) and cannot be lumped together. But as they have now fused into a syndrome, they have to be thought together. How to do that delineates the contours of new research agenda on the second post-modernity. In an attempt to grasp once again the ontology of the raging present in concepts, it interweaves an analysis of the conjuncture with a more structural approach to social change into a critical diagnosis of the present.

EU Democracy Support in Uganda Revisited: "Eddembe Ery'obuntu" As a New Framework for Policy Making

The 'consolidation of democracy' has been a key objective of the European Union (EU) with the African, Carribean and Pacific countries (ACP) and is likely to continue to be so, whatever the outcome of the post-Cotonou discussions. Even more so, given the global context whereby 'democracy is being challenged and put into question' the EU has reaffirmed its commitment in the 2019 council conclusions on democracy. However, the EU's support to democracy has been firmly criticized for being depoliticized, technocratic and liberal in nature. Consequently, academic literature and civil society have called on the EU to 'repoliticize' and 'rejuvenate' its external democracy support in terms of exploring 'non-liberal' conceptions and 'varieties' of democracy whom are more locally embedded. Yet, as noted elsewhere, such recommendations remain highly vague and superficial and have insufficiently engaged with local ontologies. Also, they remain 'inward-oriented' and depart from an 'inside-out focus', rendering them rather Eurocentric. Therefore, departing from 'agonistic pluralism' as a theoretical guideline, this paper seeks to re-imagine what EU democracy support should look like in the context of Uganda. More specifically, based on qualitative and interpretative fieldwork on the ground, this paper analyses how the local concept '*Eddembe ery'obuntu'* relates with EU democracy support policies. In doing so, this paper ads an important empirical contribution to the current debate on bridging postdevelopment with EU external policy studies. Indeed, it presents at first step into 'the need to go beyond critique and concentrate efforts on articulating the narratives of those struggling to retain or create diverse ways of life against the homogenizing forces of development'.

Unholy Development. Religion As an Emerging Voice in the Global Debate on the Future of the Planet.

The current technoscientific and economistic focus in addressing the socio-environmental crisis conceals a potentially important activator in a sustainability transition: religion. Historically, religion has significantly influenced individual and collective ways of feeling, thinking and acting. Hence religion could contribute to an expanded understanding of sustainability (which includes ecological, social and spiritual well-being) and of its cultural assimilation, as well as political and everyday life orientations to build sustainable societies.

Several studies have analyzed the role of religion and churches in fostering sustainability. Here, we propose a discussion of the current and potential role of religion in the necessary socio-ecological "Great Transformation" of our world, taking the encyclical Letter of Pope Francis, Laudato Si' (2015) as a conceptual cornerstone.

Laudato Si' opens a historic window of opportunity for mainstreaming a critical reflection on the idea of development and its structuring role in the dominant political and economic world-order, as well as its social and ecological consequences. The narrative of "integral ecology" promoted by Pope Francis introduces three central points into religious thought in a novel way: care of the environment (our "common home"), the interrelation between environmental and social justice, and a criticism of economicism and technocentrism. Thus, the Church joins a growing chorus of "transition discourses" (Escobar, 2011) that seek to promote a change in the subjective and objective conditions underpinning unsustainability.

Under which conditions can religion and churches fulfill their potential as transition agents? in which concrete ways could religion and churches contribute to such a transition in cultural, environmental, and socioeconomic terms? Which risks are associated with religious actors becoming more active agents towards a socio-ecological transition? These are the central questions we seek to address in our presentation.

Risk, Uncertainty and the Environment: Spontaneous Uses of Non-Knowledge Categories in Public Discussions on Agricultural Biotechnology in Argentina

Agricultural biotechnology occupies center stage in controversies over recent changes in rural activities in Argentina. Particularly, glyphosate-tolerant soybean, or Roundup Ready (RR) soybean, has been the focus of a series of debates in which different kinds of knowledge —among those, expert, local, as well as co-produced— have played a role. In this presentation, I will analyze how a number of categories taken from novel theoretical frameworks on ignorance and non-knowledge, such as "known unknowns" and "unknown unknowns" (Beck and Wehling, 2012), "negative knowledge", "nescience" and "surprise" (Gross, 2010), as well as "undone science" (Frickel et al., 2010), are spontaneously used by expert social actors and play a part in nuanced argumentations in which issues of status and trust are intertwined with divergent concerns over risk.

Street Sport and Masculine Subjectivity: Skateboarding, Parkour and Workout in Mexico City's Public Space.

Throughout the end of the 20th century and the beginning of the 21st, cities have undergone huge changes in their designs and ways of being inhabited, traveled and occupied. Their public spaces have been redefined by market and State forces that have promoted business and corporate interests rather than equity and respect for social and economic rights. A scarcely studied aspect, nevertheless, are the strong inequalities of gendered projection, occupation and appropriation of the urban public spaces. In the case of Mexico City, along with the urban reconfiguration, new sporting practices have appeared in the street landscape (skateboarding and parkour) and others have intensified (street workout). Far from equalizing access and enjoyment of public spaces between men and women, these new sports are still remarkably masculine and excluding of female practice, performance and social representation. What forms of male design and appropriation of public space are displayed through skateboarding, parkour and street workout? How do manly subjectivities (moral and corporal) unfold in these street spaces and sportive practices in contemporary Mexico City? Manhood virtues such as risk, pain and recklessness are displayed constant and comprehensively in the spaces where mostly young guys practice these informal and street sports. This paper discusses the preliminary findings of an ongoing qualitative research that seeks to answer these questions through exploratory questionnaires, in depth interviews and biographical stories of some of these contemporary sportsmen.

Les Transformations De l'Emploi Salarié Au Brésil: Croissance, Crise Et Impacts Dans Les Trajectoires Et Expériences Du Travail

Ce travail a pour objectif d'analyser les transformations de l'emploi salarié au Brésil, en identifiant les impacts de la dynamique économique tant sur les trajectoires et mobilités occupationnelles que sur les expériences subjectives du travail. L'on focalise dans l'analyse d'une région du Brésil, où se trouvent les villes de Pelotas et de Rio Grande, dans l'Etat de Rio Grande do Sul, région particulièrement touchée, au début des années 2000, par des politiques d'expansion de l'industrie navale brésilienne, ce qui a mené à la formation d'un pôle naval à la ville portuaire de Rio Grande. Initialement, l'on cherche à analyser la dynamique de croissance économique et la crise qui ont lieu dans la période, en identifiant leurs impacts sur l'emploi et la conformation des marchés locaux de travail. Dans ce sens, une croissance significative de l'emploi salarié protégé produit une énorme ampliation des opportunités de travail, déplaçant les inégalités sociales et permettant à nombre de travailleurs à la fois un éloignement par rapport aux formes les plus précaires de travail. L'on estime que ces changements ont provoqué, chez des individus traditionnellement insérés dans des formes instables et informelles d'activité économique, un changement de leurs rapports au travail, celui-ci se constituant dorénavant une référence identitaire plus fort et positif. D'autre part, avec la crise économique observée au Brésil à partir de 2014 et sous un nouveau scénario de chômage et de réduction de l'emploi formel protégé, ce change-

ment du rapport au travail se traduit en des expériences plus douloureuses de chômage. Il faut souligner que cette dynamique est fortement marquée par des clivages de classe, de genre, de génération, de couleur/race, de telle manière que ces catégories analytiques deviennent d'importance fondamentale pour la compréhension des transformations en cours.

A Social Cartography of the Impact of Armed Groups Violence on the Lives of Women in the Baixada Fluminense

The study explores the everyday reflexes of violence by armed groups: traffickers, death squads, police and army in the lives of women in one of the most violent regions of Brazil, located in the metropolitan area of Rio de Janeiro. Violence and its narratives (DAS, 1999), detailed by fifteen women who participated in seven workshop, were analyzed by the social cartography method (BARROS; KASTRUP, 2012). This methodology allows the researcher (implicated and reflective) to situate himself in the territory under study - intersected by gender, race and class -, as well as describing the experience and movement of the actors, their relationships, their resistances. It is argued that the daily expectation and experience of death and terror has been putting the lives of these women on edge and at first devoid of future projects. However, the pain of different experiences of violence and loss is often re-signified in struggle projects that drive changes in the lives of these women and their communities. This research pretends to contribute to the conceptual and methodological expansion of violence study in the social science. It is based on methodology that aims to 'innovate' in its ability to produce social analyzes on the impact of violence on the lives of women living in Baixada and to support differentiated public policies that meet the needs of the population of one of the regions more affected by violence of groups armed in Brazil.

RC19-238.4

VARGAS FAULBAUM, LUIS* (University of Oxford, United Kingdom)

The Political Economy of Universalist Social Policies: A Comparative Research on Pensions Reforms in Chile and Brazil.

Since 1981, the Chilean pension system is based on defined contributions that finance individual capitalisation accounts and has been a central aspect. The Brazilian pension system is a mandatory pay-as-you-go system with defined-benefits, with different regimes for private-sector employees (RGPS) and civil servants (RPPS). Also, it considers a voluntary private capitalisation (*RPC*).

The Chilean 2008 pension reform, aimed to include people who were not able to receive a minimum either assistance pension, to raise the amounts of non-contributory pensions through a new solidarity pillar and to offer a complement to the contributions made during the active life. Moreover, the reform created new instruments to increase the state regulation of the contributory pillar. In 2003 a pension reform, in Brazil, was enacted which aimed to equalise the rules between public and private workers regimes, by introducing parameters modifications to the RPPS. Most of these initiatives were based on the reform conducted between 1995 and 1998.

This paper draws on Martínez-Franzoni and Sánchez-Ancochea (2016) and Pribble (2013) to explain the variation on the achievement of the different dimensions of universalist outputs (access, equity and generosity) of both reforms, considering the role of the components of the policy architecture and its connections with political parties and organised groups, mainly for the policy adoption stage.

The general findings show that Brazil experienced efforts to reduce segmentation and over-generosity to particular groups. Both countries made significant efforts in progressing on the access dimension. The differences between Chile and Brazil on generosity and equity is because advancing in access due to electoral pressures in specific components of the architecture while weakening corporatist unions (concentrated in debates about benefits) is more accessible than confronting a private sector that concentrates efforts on maintaining conditions of the provision.

VASCONCELLOS, CAIO* (Unicamp, Brazil)

The Election in Reverse. an Ethnographic Research on Jair Bolsonaro's Official Youtube Channel

The aim of this proposal is to present the results of ethnographic research on Jair Bolsonaro's official Youtube channel. Although regularly publishing videos since 2010, the early years were largely circumscribed to publicizing his parliamentary activities. Since 2015, however, the publishing patterns on Bolsonaro's official channel have changed considerably, and the composition of discourses and a particular language to digital territories has become a key element of his candidacy and one of the most important aspects of his victory in the last Brazilian presidential election. Rather than an analysis of Bolsonaro's electoral strategies, the immanent critique of the content and form of these productions is a fruitful way to analyze ideological disputes and authority figures that emerge in the latest stage of world capitalism.

In this regard, this proposal underlies a comparative approach. As reactions against 2008 crisis, the erosion of legitimation criteria that underpinned political domination and the rise of populist figures emerge in different national contexts - the Brexit in the United Kingdom, the election of Donald Trump in the United States, and the strengthening of right-wing movements in Europe are paradigmatic. From the ethnography of videos posted by Jair Bolsonaro, this proposal aims to take a look *from* and *over* the peripheral of socioeconomic system, shedding light on systemic features associated with such phenomena and elements that particularize them.

The theoretical framework of this research is based on Theodor Adorno's interpretations of the phenomenon of Nazifascism and modern anti-Semitism, especially from his lecture of the concepts of mass and narcissism, and of the mechanism which transforms libido into the bond between the leader and followers.

Title: Circus Women: Their Symbolic and Material Possibilites of Existence Dear Organizers, I Have Been Part of RC37 Sessions Since 2010, Presenting Papers in Gothenburg, Yokohama and Vienna Meetings, during My Master and PhD Studies at University of São Paulo. This Time I Propose a Reflection Related to a Specific Issue of My Ongoing Post-Doctoral Research at the Arts Institute of Unesp.

Mobilizing discussions of gender studies and the studies of organization of the worlds/fields of arts, my proposal discuss the possibilities and conditions of existence of women in circus arts. Considering both the symbolic and the material existence – following the approach proposed by sociologists as Nathalie Heinich –, my study combines two dimensions of analysis, which I define as the *inside the scene* and the *outside the scene* approaches. In other words, I observe the places/roles that women occupy in narratives and discourses of the circus performances, as well as their conditions of existence in the circuits and labor markets of circus.

I begin with an historical approach and a revision of circus literature to discuss how the imaginary of women and especially of the female body have been built in classical performances, based largely on patriarchal representations of the feminine. Then I try to enlighten some contradiction of this processes: at the same time that women were showing their bodies much more than men in the performances, or playing roles like the assistant, the victim or the naïve girl, circus women were also related to non-conformity, freedom and rupture with the bourgeois representation of the ideal woman. That is, these representations are both as gender-conservative and gender-revolutionary, to use the terminology of queer theorists.

In a second moment I bring information of a qualitative research conducted with women circus artists of São Paulo, Brazil, where I explore some issues related to their conditions of work (discussing the *outside the scene* dimension), analysing themes as recognition processes, authorship and especially work perspectives after motherhood (since most of the circus practices require mastering a technique and controlling the body). I also explore issues related to self-representation of the body and imaginaries of feminine they perform in their acts or spetacles.

Social Innovations in the Context of Management of the Future

We are looking at managing the future through the influence of social innovation. We using the methodological basis of sociosynergetics, the cross-disciplinary and fractal-evolutionary approaches.

The complexity of the social system, its dynamic variability structurally and qualitatively require an interdisciplinary research approach.

However, "interdisciplinary scientific dialogue and relevant research cannot be conducted on the basis of the simple addition of various methodologies, they are were created to solely take away their field of study from other disciplines. But it is possible to use the method of crossdisciplinary analysis and synthesis in research involving various subject areas.

The mechanism of the spread of innovation is similar to the process of spreading the epidemic (self-organization, superfast mass distribution of the "infectious agent", a certain prototype of a social fractal). The aim of the article is to present a research approach related to the identification of development trends caused by the emergence of social innovations and their spread in response to the emerging needs of society.

The introduction of innovations can cause the effect of irreversibility, disrupt the symmetry between the past and the future (according to I. Prigozhin), and can change the course of evolution. We have chosen as a criterion the degree of influence the social innovationon on the social system: the local nature of the impact (Auto-Poesies models); the emergence of a new parameter of order (Synergy-integrating models); the allocation of a new sub-system in the modernized old social system (Openness entrepreneurship models); the birth of a new social system. The choose innovations is a responsible process. The most effective choose are in line with the trends in the development of the social system.

RC51-627.1

VASILENKO, LIUDMILA* (the Russian Presidential Academy of National Economy and Public Administration, Russia)

Sociology of Digital Society

The evolution of the theoretical foundations of the study of society is swift. Industrial society was organized around the production and consumption of things. Post-industrial society has made the transition to the production of services. The information society has put forward time as the most important value. The theoretical foundation of the sociology of informatization became the synergetics (the theory of complex systems) and informational understanding of the world, constructive mechanisms of self-organization. We see the following areas of development of the sociology of a digital society:

– sociological analysis of complex social processes, of the formation of order parameters, the study of the dynamics and specifics of the spontaneous emergence of new information channels, networks, boundaries of governance information processes;

– analysis of the pace and rhythm of interacting network processes, the intersection of networks of ideas, interests, principles, rules, real and virtual actions;

– the research the network activity of virtual communities, the study of their cooperative potential and antagonism, the social potential, the social diffusion and the level of their entropy;

– creation of complex, flexible research methods, including service capabilities of the blog environment and social networks, Internet opinion polls, Web-questionnaires (Anketolog.ru, Tes-tograf.ru, Webanketa.ru, Surveymonkey.com, Survio.com), sociological flash mobs, modeling. The systems "Active Citizen", "People's Initiative", and "Russian Public Initiative" are used in decidings on "how to improve the city and the quality of citizens' living." For example, to July 11, 2016, 1,722 voting were held in the Active Citizen system (1353021 participants, 50769350 opinions), 137 proposals have been implemented.

Social Bots As a Tool for Democratization of Society

Due to resonance processes of social bots` use, especially, in political communication (voting practices, astroturfing, public opinion manipulation etc.), in the focus of authors` attention are 'malicious` bots polluting the information space of social networks. The authors of this study take a broader approach to social bots, considering them as a neutral instrument for information exposure, which could be used by different agents both for manipulative disinformation, and for constructive propaganda of interests of different groups within civil society, creating a `Megafon effect`. The authors of the article propose to consider the use of social bots as a tool for implementing various forms of civic participation. The authors present the results of a pilot study conducted by the author's methodology. The aim of the study was to identify and describe social bots on the Russian social network VKontakte. As a result of the study (February and October 2018), several botnets were identified. Content analysis of these botnets reflects various forms of civil participation: representing the interests of civil society groups (informing about the most important social problems for these groups), call for collaborative action in online and offline space (petitions, rallies, pickets), social control over the activities of officials and ensuring transparency of information from government and business structures (the fight against trolling, etc.). The authors of the study raise the question of the prospects for using social bots in Russian social networks in the formulation and discussion of social problems. The study is part of the RFBR (Russian Foundation for Basic Research) project 18-011-00988 `Structure of Social networks online bot space: network analysis`.

Aproximaciones a Una Caracterización Sociológica Sobre Las Mingas Como Forma De Organización Social, Productiva y Política En Colombia.

Las investigaciones realizadas en el marco de las ciencias sociales han arrojado que las organizaciones son unidades con características individuales y únicas, en las que sus integrantes se comprometen a uno o varios objetivos comunes. Estos son alcanzados por medio de su estructura, que moldea la forma en que interactúan sus actores entre sí, y la manera en la que los mismos interactúan con los actores externos a la organización. Dentro de un sinnúmero de organizaciones, existe una clasificación llamada organizaciones políticas, cuyo fin es la concientización y lucha de las comunidades por la resolución de problemáticas sociales comunes. De esa tipología desciende una taxonomía de organización indígena en Colombia llamada La Minga, la cual es la unidad de análisis de la presente investigación.

La Minga es una forma de organización especial de las comunidades indígenas que se manifiesta en diversos escenarios sociales, productivos y políticos para reivindicar, luchar y tomar decisiones sobre los derechos y deberes de los pueblos indígenas en Colombia. A través de una exploración de artículos académicos de orden teórico y empírico y notas de prensa provenientes de investigadores de diferentes instituciones y organizaciones en Colombia, se presenta el origen de La Minga y se describirán diversas categorías sociológicas que permitan explorar sobre esta forma de organización social, productiva y política. La investigación indaga sobre las siguientes categorías: las razones de existencia de La Minga, las características que configuran su estructura interna, la manera en la que sus actores internos se comunican entre ellos, las particularidades sobre el ejercicio del poder con o hacía actores externos estableciendo relaciones sociales en diferentes vías. Finalmente, se presentan los rasgos distintivos y particulares que permiten reconocer a esta forma de organización como única y diferente a otras taxonomías de organizaciones latinoamericanas y mundiales.

Bridging Social Capital Moderates the Negative Effects of Disability on Healthcare Access and Depression in Contemporary Europe

Current research establishes a strong relationship between objective health measures and mental health. Disability is particularly notable as a stressor, with stigma leading to mental health problems. Further, mobility issues and discrimination make accessing healthcare a greater challenge when compared to other health conditions. In this study, I investigate the potential for bridging social ties across national divides to function as a healthcare resource. Utilizing data from the European Social Survey, I find that social ties with immigrants are associated with lower rates of depression and increased healthcare access among the disabled. This is notably true in European nations that are currently experiencing an increase in nativist hostilities. The implications for research on social-psychological coping mechanisms and social capital are discussed at length.

VAUGHAN, SUZANNE* (Arizona State University, USA)

"Institutional Ethnography As an Alternative to Studying Historical Change: A Conceptual Framework and Analytical Strategies"

Frequently institutional ethnography, as a mode of inquiry, is critiqued as being ahistoric. I argue that the ontological and epistemological basis of institutional ethnography does not preclude exploring the past, as we and others doing institutional ethnography have found. Inspired by critiques of historical sociology by Hamilton(1987), I argue that institutional ethnography is the alternative that addresses the shortcomings he identifies. In this presentation I outline a conceptual framework and analytical strategies my colleague and I used to explore ruling relations through textually mediated discourse in historical research.

I discuss the two stages of data collection we employed in our research on the transformation of the U.S. housing regime during the 20th century. These stages involved generating oral housing histories of older women living alone in the Phoenix metropolitan area in the 1990s and collecting archival materials from US National Archives and Research Administration, the Library of Congress, historical societies and museums in cities in which the women lived as children and parents. Drawing from this research, I discuss two analytical challenges we faced in carrying out our project: 1) locating so called "controlling" text in household and family settings that coordinate people's past activities; and 2) incorporating observations of texts-in-action into our ethnographic practice. Next, guided often by cultural and social historians, I illustrate various analytical strategies we used to locate texts in these women's talk about housing as a way to open up for us the ruling relations organizing and reorganizing the housing regime.

VAZQUEZ, MELINA* (Researcher at CONICET, Adjunct Professor at UBA, Argentina)

Entre Las Militancias Partidarias y Los Paisajes Insurrectos. Causas Colectivas, Repertorios De Acción y Militancias Juveniles En Argentina (2010-2020).

Durante los primeros años del siglo XXI proliferaron acciones contenciosas y se crearon (nuevos) colectivos que tomaron como una de sus principales inscripciones colectivas en el espacio público su condición de "jóvenes". Las primaveras árabes, los movimientos de indignados y el 15 M en España, los reclamos por el pase libre en Brasil, el movimiento #yosoy132, las protestas frente a la desaparición forzada de los 43 liceístas de Ayotzinapa, entre otros, permitieron reconocer la fisionomía de un conjunto de acciones, modos de ocupación y producción de lo público, así como la emergencia de novedosos sujetos y culturas políticas.

En ese mismo contexto, en Argentina encontramos un proceso de revitalización de los compromisos militantes juveniles que tuvo como uno de sus centros principales a los ámbitos político partidarios. El propósito del trabajo es presentar y analizar estas experiencias a la luz del ciclo político (nacional e internacional) más amplio. Se busca explorar las singularidades que adquiere la revitalización de experiencias "más tradicionales" de participación en torno a la política formal e institucional en el marco de estos *paisajes insurrectos* (Reguillo, 2017).

Se espera aportar al estudio de los compromisos militantes desde una perspectiva sociohistórica que permita sortear las lecturas binarias de las militancias (en general y juveniles en particular) en función de la tematización de continuidades o las rupturas, como si se tratara de procesos excluyentes entre sí. Por otro lado, que invite a pensar la condición situada de la producción de los compromisos partidarios, atendiendo a los impactos que posee la presencia de jóvenes y la construcción de narrativas juveniles al interior de los mismos.

El trabajo forma forma parte de la línea de investigación de la autora en el CONICET y en el Grupo de Estudios de Políticas y Juventudes del Instituto de Investigaciones Gino Germani (UBA).

VECCHIOLI, VIRGINA* (Universidade Federal de Santa Maria, Brazil)

Contemporary Human Rights Activism and Unequal Feelings of Compassion Towards Victims

After 36 years of searching (2014), Estela de Carlotto, president of the Grandmothers of the Plaza de Mayo Association, found her own grandson Ignacio. He was stolen from her daughter Laura, killed after giving birth in a clandestine detention camp. The event turned into an emotional drama. Newspaper reports emphasized the collective emotion that led to Ignacio recovery, who immediately became "everyone's grandson" and "a whole symbol" of the struggle of the Grandmothers. The feeling of joy was compared to winning a football world cup, a national passion. The press conference at which Estela announced Ignacio's appearance was transformed into a full-blown civic ceremony.

On the same day and at the same time, Victoria, Recovered Grandchild 53, was taking part in a union protest when she was brutally arrested by national security forces. This act of repression against a recovered granddaughter aroused neither feelings of compassion, nor moral indignation over the infringement of political rights under the rule of law. How can we explain this uneven distribution of emotions towards victims of State terrorism? What processes allow some victims to acquire titles of nobility in Argentinean politics? Both grandchildren were born in clandestine camps, their parents had been disappeared and both had been raised under a fictitious identity by appropriator families. Yet, despite these similarities, they failed to elicit the same feelings of compassion or share the same public legitimacy.

By engaging in a microscopic analysis of these performative acts, I explore diverse assessments of affective dispositions, the critical place attributed to suffering in forging forms of governmentality and the significant role played by the State in the unequal distribution of compassion, making comprehensible the moral economy that organizes current human rights activism. This paper inscribes in current debates on the place of compassion towards victims in modelling contemporary politics.

VECCHIOLI, VIRGINA* (Universidade Federal de Santa Maria, Brazil)

"La Tragedia De Los Setenta" Como Problema Público

En el contexto de la reapertura de los juicios de Lesa Humanidad (2005) y la implementación de políticas de Estado en derechos humanos, un número creciente de actores y grupos se han hecho presentes en la escena pública argentina con el fin de denunciar como moralmente inaceptable algunas de sus consecuencias: a) familiares y camaradas de las Fuerzas Armadas impugnan los "juicios de la venganza," reivindican la libertad a los "presos políticos" y el reconocimiento a las víctimas del "terrorismo"; b) hijos de desaparecidos apropiados por militares y recuperados por sus abuelas se oponen a ser restituidos a sus familias biológicas y denuncian pública y judicialmente la obligación de sustituir el apellido de sus apropiadores. c) Hijos de genocidas rompen el vínculo con sus padres y exigen al Estado poder cambiar su apellido y testimoniar judicialmente en su contra.

Buscando resolver estas situaciones problemáticas, estos actores se nuclean en nuevas y diversas asociaciones civiles y llevan adelante repertorios de movilización desde el cual interpelan a los poderes públicos. La toma de la palabra bajo la forma de dramáticos testimonios hechos públicos en los tribunales, la prensa y la publicación de relatos autobiográficos testimonia la vocación militante presente en esta dinámica colectiva que hace surgir a un mismo tiempo al problema público, su público y la causa que los convoca. Este trabajo se propone identificar este espacio de interacción y de controversias en el marco del cual testimoniar deviene una performance política. Se examinará en base a estos materiales el trabajo crítico realizado por los colectivos en la estructuración de un nuevo problema público que, utilizando las categorías consagradas del activismo en derechos humanos, las redefine al tiempo que busca objetivar los contornos de la "tragedia de los 70."

VEGA, MARÍA* (Universidad Nacional de las Artes, Argentina)

Catholicism and neo-indigenous religiosity among women in the Humahuaca ravine, Argentina

Every Easter, in Tilcara, a town at the Humahuaca Ravine, the largest gathering of ensembles of a kind of native Pan Flutes called *sikus* in Argentina takes place. The *sikuris* or *sikus*' performers go on pilgrimage to a sanctuary placed at Abra de Punta Corral to honour Our Lady of Copacabana, patron saint of Bolivia. In this celebration, the pilgrims ascend to a high shrine located 25 km from the small town of Tilcara to celebrate Holy Week. These Pan Flutes of indigenous origin are traditionally played by men in large groups, being women excluded from performing. Over the past 23 years, some young women started challenging the traditions to create the first female band of *sikus*. The emergence of this band, Our Lady of Fatima, resulted in the creation of new women's groups throughout the region, fostering a feminine presence in one of the largest regional demonstration of Catholic faith. On the other hand, the consolidation of various re-ethnicization processes that are currently taking place in Latin America has reinforced the development of a religiosity that combine local traditions, rituals from other ethnic groups in North America, and New-age beliefs and practices, in which the female participation concurs with the empowerment of women and their engagement in public spaces.

Based on in-depth, open-ended interviews with key informants, participant observation and observation in Catholic pilgrimages and Catholic and non-Catholic rituals, I describe and analyse the transformations of regional beliefs systems, the attribution of new meanings and enhancement of the feminine in the public sphere, and the actions and discursive strategies of women in the appropriation of concepts, notions, and representations of foreign origin for the construction of a religiosity that integrates them and accompanies, in a symbolic realm, their emancipating claims.

EL DIÁLOGO COMO UN PROBLEMA EN EL PROCESO DEL FSM

La Coordinadora de Pueblos y Organizaciones del Oriente del Estado de México en Defensa de la Tierra, el Agua y su Cultura-CPOOEM, se unió a las actividades preparatorias iniciales del comité local mexicano de facilitación y organización del FSM 2021 en México, que se vio obligado a convertirse en virtual debido a la pandemia de Covid-19. En este proceso aprendimos sobre la naturaleza, historia, objetivos y proceso del FSM, y su lema: "Otro mundo es posible". A la luz de esto, nos dimos cuenta de que, sin la participación y la contribución de los Pueblos Originarios Ancestrales, Otro Mundo no era posible. Esta realización nos llevó a organizar un espacio temático de Pueblos Originarios Ancestrales, que desarrolló diversas actividades paralelas y convergentes al funcionamiento del comité organizador mexicano. Desde este punto de vista, tomamos conciencia de las diferentes opiniones sobre, por ejemplo, la Carta de Principios del FSM, que adoptamos, y también de los diversos intentos de interferir en nuestros intentos de organizar el FSM virtual 2021 sobre bases abiertas, democráticas y dialógicas. En un momento dado, parecía que había dos procesos organizativos paralelos, el que habíamos construido en los dos últimos años y otro organizado por un pequeño grupo de intelectuales y reformistas autoproclamados. Desde una perspectiva organizativa, este fue y sigue siendo un rico proceso de aprendizaje. Aprendimos, por ejemplo, que algunas organizaciones y movimientos hermanos apoyaban nuestro objetivo de constituir un espacio temático sobre los pueblos originarios, mientras que otros se oponían y ponían obstáculos a este respecto. Al final, es importante tener todas las cartas sobre la mesa, dado que somos una pluralidad de actores y agentes, que representamos no sólo a diferentes movimientos sociales y organizaciones de la sociedad civil, sino también a diferentes políticas e ideologías que tratan de tomar la delantera.

SISTEMA CAPITALISTA NEOLIBERAL: El responsable del despojo, discriminación, desprecio, violencia, imposición, explotación y daño a la Humanidad y al Planeta

Como en las sociedades de las primeras civilizaciones, de la época feudal y luego la época moderna, los pueblos originarios siempre hemos sido ignorados por existir una pugna entre los grupos de poder político y económico en el mundo. Seguimos enfrentando la discriminación, el desprecio, la violencia, el despojo y la imposición con el uso de la fuerza *(el ejército, la marina, las policías, el narcotráfico, el crimen organizado y de grupos de choque paramilitares)* de megaproyectos de infraestructura *(como el Corredor Interoceánico en el Istmo de Tehuantepec, el Tren Maya en la Península de Yucatán, el Nuevo Aeropuerto Internacional y la Autopista Pirámides-Texcoco en la Cuenca del Valle de México, Hidroeléctricas, Gasoductos, la remodelación y equipamiento tecnológico de puertos marítimos, parques eólicos, granjas de paneles solares, torres de alta tensión, etc.)* para el saqueo de nuestra riqueza natural y la explotación de la mano de obra de nuestros pueblos en México y Latinoamérica, con consecuencias de daño al Medio Ambiente, que difícilmente las futuras generaciones podrán revertir.

Otras afectaciones igualmente graves son la violación de las leyes y de nuestros derechos por parte de los propios gobiernos, quienes también actúan como facilitadores al servicio de los empresarios; la suplantación de autoridades tradicionales; la imposición de falsos íconos de identidad regional; las alteraciones a las lenguas maternas y a la memoria histórica de los pueblos; y el otorgamiento ilegal de tierras y de cargos públicos por corrupción. Existen también factores que han acelerado el sometimiento de los pueblos que no hemos dejado de luchar para liberarnos, tales como la ciencia, la tecnología, los medios de comunicación, la desinformación, el consumismo, la sobre-producción, etc., y el control de la población a través del uso de las armas, las drogas, el alcohol y la prostitución, que generan enfermedades sociales.

Establishing a Register-Based Census in Spain: Challenges and Implications

Until 2001, censuses in Spain were needed to correct the errors accumulated throughout each decade in order to precisely count how many inhabitants were residing in the country as a whole, as well as in each municipality. This had always been an important issue for city mayors because municipal budgets greatly depend on the size of the population. Since 2001, thanks to the technological improvement of IT services operating at the local level, municipalities in charge of registering citizens residing within their administrative boundaries were finally able to register (and de-register) residents in a coordinated fashion. This task has been carried out with unprecedented diligence because state funding is still dependent on population size. Thus municipalities have a strong incentive to include all of their inhabitants in their registration books. At the same time, citizens benefit from registering by becoming entitled to local public services. Similar incentives are in place among the rising population of immigrants, many of whom are residing in Spain with an irregular immigration status but are highly interested in being officially registered with the municipality. Municipal registers have never been used by Spanish authorities to locate illegal immigrants, since they are managed exclusively by a statistical office (INE). Registration not only entitles immigrants to local public services but also allows them to prove their presence in the country once they finally do meet all the prerequisites for applying for a residence permit. Thus, municipal population registers have become the most reliable source of population numbers and the census is no longer needed to make significant corrections. As a result, the Spanish government decided to replace the "old-fashioned" traditional census with a census based on register data. This presentation will discuss the implications of such change.

Aesthetic Dispositions and Cultural Preferences: Latent Class Analysis in Contemporary Chile.

This paper examines the association between aesthetic dispositions and cultural preferences in cross-field domains of artistic production in contemporary Chile. After empirically identifying a cultural consumer typology based on patterns of aesthetic choices, three clusters of "cultural consumers" are estimated via structural equation modeling (latent class analysis): "omnivore consumers," "mass-culture consumers," and "inactive consumers." The findings reveal that the income-education association remains a salient predictor of the individual's chances of omnivore and mass-culture preferences. However, the effect of aesthetic disposition, operationalized as the individual's network ties with the domains of artistic production, significantly increases the chances of omnivore preferences as the years of education increment. Furthermore, additional statistical analysis shows that while the consumption of mass-culture and popular forms (live music concerts, movie shows, etc.) is related to economic prosperity, high-culture consumption (opera, ballet, art galleries, etc.) proves highly related to aesthetic socialization and network ties, even more than income relations. In the context of contemporary Chile, the findings activate the discussion over social models explaining consumption in circumstances of exacerbated cultural inequality. Finally, the paper offers further theoretical discussion on the interpretative potential of latent class analysis in the sociological study of the arts.

VELIKAYA, NATALIYA* (Russian State University for the Humanities, Russia)

Russian Opposition in the Global Context: New Topics Vs Old Strategies.

Regarding legitimating of political opposition as a fundamental component of modern liberal democracy we suppose that the nature of opposition in "one particular case" cannot be considered outside the context of political process and the peculiarities of the specific regime's functioning.

Our paper is based on the All-Russian monitoring (1993-2019) of Russian Academy of Sciences and on All Russian Survey (2019) devoted to the main social and political Threats.

Describing Russian regime as neo-autocratic we analyze evolution of opposition during last 30 years, it's role in political system and estimation of opposition by different groups of Russian people. We show that weakness of party system and immaturity of parliamentary institutions was compensated by the presidentialization of politics, growing authoritarianism, curtailing the realm of public politics and freezing of their political regimes which reduced the opportunities for evolution towards liberal advanced democracies.

We also describe social base of system and not-system opposition which can be estimated as not numerous and not consistent. Artificial character of system opposition on the one hand and not understandable activity of nonsystem on the other push people to regard opposition as useless and needless element of political system.

As for opposition we can point out different strategies of the presentation and activity, and some of these strategies are linked with international agenda. Analyzing Russian public discourse we can conclude that point of view about many actual global problems (migration, terrorism, climate worming) is not determined by ideological base of oppositional parties, they rather are determined by momentary needs and electoral interests. As the result it lead to low level of trust to oppositional parties and to low level of real party-participation of people.

RC26-322.1

VELIKAYA, NATALIYA* (Russian State University for the Humanities, Russia)

Social and Political Threats in Russian Public Opinion and Political Discourse.

Regarding modern society as society of risks we suppose that quantity of social threats have been growing up in the context of globalization. Many of those threats need to be identified and interpreted. The paper is based on the data of multidisciplinary project "Cognitive mechanism of socio-cultural threats» which include All-Russia Survey (n-1600 respondents, 2019), expert interviews (n-36, 2019) and content-analysis of mass media of 2012, 2015, 2019.

We define social threat as potential breaking of normative order in the sphere of social connection, values, public and private relations, which consider by individual or group as danger, which corrupt reproduction of social and cultural way of life. Thinking about methodology of research we proposed not to create the actual list of threats, but clasterization of threats on the base of situate, instrumental and functional character. In this logic we point out three groups of threats which help us to describe wide spectrum of imaginations and anxieties: security threats, wellbeing threats, identity threats.

Using different data gives us opportunities to see mismatch between some point in public opinion and mass media which tend to be more and more propagandistic during last period. F.e. people regard as more actual wellbeing threats which are connected with their everyday life and with worsening economical or political situation. Mass media on opposite create other landscape of threats as migration, losing national identity, losing sovereignty, conflicts with western countries ext.

We also sort out the most actual threats broadcasting in political discourse, represented by official power, system parliamentary oppositional parties and non system political organizations as well.

Cosmopolitan Nationalism, Esperanto, and Consent in State-Socialist Eastern Europe: The Case of Bulgaria

In this study, I show how Eastern European cultural elites made sense of and not only accepted but also participated in building state socialism following World War II. I outline the discursive practices of Bulgarian Esperantists in 1946-1947 and trace their foundation in three discursive fields, communism, Esperanto, and Bulgarian society. The Esperanto movement, as the most institutionalized transnational social movement in the region during state socialism, is representative of the relations between the organized cultural elite and the state. Bulgaria, in turn, was selected because no widespread opposition to state-socialism was registered in the country prior to 1989. I find that Bulgarian Esperantists sided with the state-socialist project through advancing a form of *cosmopolitan nationalism,* a hybrid discourse creatively combining (1) socialist patriotism, (2) sensitivity to global developments—from war and nation-state relations to cultural achievements and progress—and to Bulgarians' position in the world, and (3) locally resonant ethics of fellowship. Consent consisted of creating a symbolic bridge at the intersection of distinct discursive fields resulting in a field-circumscribed multivocality. Bulgarian Esperantists saw the world through a lumping lens: the international and the domestic arenas, politics, culture, and the economy, the public and the private spheres were all connected. Different audiences could read into Esperanto discourse something familiar. Bulgarian Esperantists were able to thrive under the new regime, reconnect with the global Esperanto movement, and recruit new members.

VELITCHKOVA, ANA* (University of Mississippi, USA)

The Logic of Transnational Community: Continuity and Growth of Esperanto

Many contemporary thinkers are pessimistic about the possibility and continuity of community, especially of transnational communities. I trace the case of the century-and-a-half-old transnational community Esperanto to alleviate such concerns. The Esperanto community developed thanks to a transnational social movement that engaged in multi-level organizational building in order to promote the international language Esperanto and, through it, communication equality and global understanding. I outline three mechanisms that ensure the continuity and growth of the Esperanto community alongside with but largely independently of nation-states, professions, and religion. The first mechanism is *rationalization*, the development of a form of the community logic specific to Esperanto, consisting of institutionalized symbols, practices, and organization. The Esperanto community logic unifies Esperanto activities at the local, national, and transnational levels across space and time and creates the possibility of growing the number of instantiations of the community. The second mechanism is the *variation* of elements of the Esperanto community logic. New instantiations of the community logic result from groups adopting alternative symbols, practices, or organization. The third mechanism is the *hybridization* of the Esperanto community logic and its mixing with other institutional logics (professional, state, corporate, religious, family, and other forms of the community logic). The variation and the hybridization of the community logic allow for internal differentiation, community continuity, and growth through the inclusion of diverse voices. With the development of a distinct type of rationality—community rationality—and its instantiation not only in patterned symbols and justifications but also in practices and organizations, the community logic is integral to modernity at the global level. Social movements play a central role in these processes of social change and institutional continuity.

VELLOSO, JOAO* (University of Ottawa, Canada)

Rearranging Penal Policies in Canada: Carcerality, Micro-Penalities, Prevention and Regulations in a Post-Jordan Framework

Canada has the lowest incarceration rate in the Americas: 131 per 100,000 habitants (2017/2018). This rate is relatively stable since the 1960s, oscillating roughly between 100 and 120, with some peaks above 120 in the recent years. However, since the late 1990s there is a sustainable drop of the rates of police reported crimes and of charges, violent crimes included. Canadian criminologists (A. Doob, C. Webster and many others) already explored this relative stability and how the country was less affected by the carceral boom and mass incarceration trend that marked the US carceral landscape and still mark the Brazilian one. I will take a slightly different approach in this paper. I will suggest that a certain punitive turn occurred in Canada, but it operated mostly through a dynamic of shadow-carcerality (Beckett and Murakawa, 2012), which is something that cannot be captured in incarceration rates. I will argue that Canadian incarceration rates remained stable in part due to the overuse of preventive aspects of criminal justice, either in terms of sanctions (pre-trial detention) or by coupling criminal law with regulatory, administrative or civil regimes (crimes against administration of justice). The boom was not carceral via longer imprisonment sentences, but a correctional boom with an acceleration in the turnover of prison population via pre-trial detention, short sentences and reincarceration due to breaches that are not necessarily criminal in nature. I will conclude that the *R. v. Jordan* (2016) decision, which set a presumptive ceiling of 18 months between the charges and the trial as the main delay to be tried within a reasonable time, paradoxically reinforces the preventive trend already in play and it may consolidate even more the plea-bargaining machine and the revolving door phenomenon.

VELOSO, DIANA THERESE* (De La Salle University, Philippines)

Gender-Based Violence and Militarism in Conflict Zones: The Experiences of Internally Displaced People from Marawi City

This paper examines the experiences of armed conflict and displacement among civilians, who evacuated from the Islamic City of Marawi to nearby cities and municipalities in the southern Philippines, to escape the clashes between ISIS-affiliated extremists and security forces. Through in-depth interviews and focus group discussions with community residents and duty-bearers, such as government employees, heads of non-government organizations (NGOs), doctors, and administrators of educational institutions who aided in relief efforts, this research identifies the safety and security issues and vulnerabilities confronting internally displaced people (IDPs) from Marawi City. This study looks into the heightened risk for gender-based violence among women and girls and men and boys in conflict zones and the challenges in the promotion of their safety and well-being. This paper examines the dynamics of gender-based violence and the respondents' experiences of private, community-based, and state-sponsored violence in conflict zones and the risk of further violence upon their return to Marawi City. This research also examines the experiences of militarism among IDPs and their views of and coping strategies under Martial Law, which was declared in Mindanao on the first day of the Marawi Siege and extended until December 2017. This study illuminates the nuances in the experiences of IDPs living in traditional evacuation centers and alternative home-based evacuation arrangements, the service needs they confront, and existing support systems and interventions that seek to abolish the risk of perpetuating dependency among IDPs in evacuation centers. The researcher highlights the links between racial, ethnic, gender, and social class inequality in the Philippines and the vulnerability of IDPs, given their dismal living conditions and the absence of normalization in their lives due to the prolonged siege. This paper highlights the intersections between private and public violence, the human rights issues confronting IDPs from Marawi, and the responses to their situation.

VENTURA ALFARO, MARIA JOSE* (University of Bath, United Kingdom)

Feminist Social Movements in the Decolonial Turn

I examine the new wave of women's movements calling for an end to violence against women that has enveloped the contemporary world, with focus on the ever-growing feminist movement "¡Ni Una Más!" in Mexico City. In their struggle against the rise of feminicide and impunity in Mexico, *Ni Una Más* challenges contemporary oppressions that are reproduced by neoliberal economic policy within a matrix domination intersecting gender, race, sexuality and class. Informed by Latin American decolonial feminism (Lugones 2010, Segato 2016), I examine the historical, political and socioeconomic circumstances that allow the reproduction of feminicide in Mexico. I engage with theorisations (Lagarde, 2006; Fregoso, 2010; Monárrez Fragoso, 2008; Olivera, 2010; Segato, 2016) that enable us to re-evaluate contemporary gender, class, racial and sexual dynamics in Mexican society. My argument is that *Ni Una Más* is challenging the power dynamics that sustain violence against women in Mexico but is also prefiguring alternative social, cultural and economic relations and practices to the present ones. By so doing, the movement is engaging in creating "worlds otherwise" (Escobar, 2004). I explore the movement by deploying a community-based participatory action research approach (PAR) that combines semi-structured interviews, focus groups and storytelling data collection techniques. By recruiting social activists and policymakers as part of the study I will develop a specific form of the co-construction approach to policy: 'prefigurative policy' (Dinerstein 2014). I engage with Dinerstein's (2015) theory of autonomy and her notion of 'translation' to analyse the relationship between *Ni Una Más* and the Mexican State, and study how the movement's prefigurative practices are translated into policy.

*Genealogy of De-Radicalization Strategies: Food for Thought.***

This paper aims at offering a preliminary analysis of the theoretical frameworks and policy responses to the phenomenon of Islamic radicalization in the

Italian penitentiary system. In particular, through a historical reconstruction of the administrative responses to political crimes, ethnographic observation and interview, the submitted proposal will make an attempt to analyze the type of specific interventions connected to the phenomenon of radicalization and their possible effectiveness. How the Italian State define radicalization? What strategies of contrast is proposing? Which are the dimensions of the phenomenon? What is the right statement for those defined as 'radicalized'? What effects the different treatment produces in terms of human rights protection, State conflict and de-radicalization? These are some of the questions the paper will aim to answer to, starting from David Matza and referring to Khosrokhavar approach to prison radicalization.

Mujeres Líderes EN Contexto De Desastre

Los desastres en Chile han marcado la agenda pública durante su historia, y es que siendo un país sísmico, con características geográficas y de distribución demográficas de alto riesgo, surgen una serie de catástrofes a nivel socioambiental y socionatural. En los últimos 10 años, esto se ha intensificado, y Chile se ha caracterizado por la ocurrencia de una serie de desastres: terremotos, tsunamis, incendios forestales, sequías y aluviones. Sólo en 2017, 15 regiones se encontraban en procesos de reconstrucción, afectando a nivel económico, político y psicosocial a un gran porcentaje de la población nacional.

Estas implicancias se experimentan a niveles regionales, comunales, barriales, y familiares, y en quienes suele recaer la responsabilidad de recomponer el tejido social es en las mujeres (Valdes, 2012). Las mujeres en contexto de desastre suelen destacar por su alto nivel de participación, y es que en base a los roles de género comienzan a ocuparse de toda la organización social, incluyendo la comunidad y sus familias (Guzmán et al., 2018).

En este contexto, el rol de las mujeres ha sido esencial en los procesos de liderazgo y negociación, por esto, la presente investigación tiene como objetivo analizar la incidencia de las mujeres en las políticas públicas en contexto de desastre, reconociendo desde la interseccionalidad sus roles de lideresas en tanto mujeres indígenas, de zonas urbanas-rurales, y en situación de discapacidad. La ponencia surge desde las experiencias de trabajo en terreno en procesos de reconstrucción post-desastre, y de entrevistas a mujeres claves en contextos de desastres socioambientales y socionaturales de localidades damnificadas de los últimos 10 años. En este sentido el enfoque interseccional (Creenshaw, 1989) permite determinar cuáles son las barreras para que estas mujeres puedan incidir y en qué parte de la emergencia o reconstrucción logran hacerlo.-

Schools' Responses to Performance-Based Accountability: Evidence from a High-Stakes Accountability System

Currently, both school autonomy and accountability are conceived as central policy principles to develop modern and mature educational systems (Sahlberg, 2016). However, in real educational settings, the balance between these two principles is rather precarious. When accountability pressures are high, school autonomy and teachers' discretion tend to be undermined (Holloway and Brass 2018). This school autonomy-accountability trade-off is particularly evident in countries with high stakes accountability systems, in which significant economic and administrative consequences are attached to schools' performance.

This paper departs from the premise of the autonomy-accountability trade-off in school dynamics, but considers that the specific manifestation of this trade-off is strongly mediated by the contextual and organizational characteristics of schools. The paper reflects on the multifaceted nature of schools' responses to accountability pressures, and on how such responses are often more creative, diverse and deviant than expected. Specifically, we consider that school responses to accountability are mediated by two core variables: first, the position of schools in local education markets and, second, whether the school ethos is more oriented toward academic outcomes or toward students' welfare. On the basis of these factors, we expect to identify different types of responses to performative accountability pressures.

Chile is a privileged context to investigate this phenomenon due to the historical presence of a national large-scale assessment, which is used to, one the one hand, promote school choice and, on the other, govern schools at a distance through the distribution of a incentives and sanctions. Regarding the method, we adopt a mixed method approach. First, we explore the data of a questionnaire administered to a sample of Chilean school leaders (n=250) and, secondly, through the interviews to some of these leaders (n=30), we deepen in the articulation of the most relevant aspects that emerged in the questionnaire phase.

VERMA, CHETNA* (Tata Institute of Social Sciences, India)

An Exploration into Women's Agency during Disaster Response and Recovery: A Comparative Analysis of Three Disasters in Gujarat

The present study, based in the Morbi and Surendranagar districts in western Indian state of Gujarat, is an attempt to explore women's agency during disaster response and recovery. Set in the context of three different disasters - drought (1986), Bhuj earthquake (2001) and floods (2017), this explanatory and exploratory study employs qualitative research methods to compare the actions and agency of women affected by these events. Women are often recognised as only vulnerable and victims in a situation of crisis and their contribution in disaster recovery is limited to the traditional care giver role. This perception of women is so embedded in the patriarchy that women's active participation is overlooked or neglected equally by society, government and other institutions like media. This study through an exploration of women's stories and narratives of disasters shows that affected women do contribute to disaster response and recovery as also long-term Disaster Risk Reduction using their knowledge, skills, networks and groups. An attempt is also made here to analyse how women's participation has changed during the course of these three disasters specially after the 2001 Bhuj earthquake after which India adopted the Disaster Management Act and Policy and more recently, in 2016, published the National Disaster Management Plan based on the global blueprint of Disaster Risk Reduction – the Sendai Framework.

This study explores, examines and stresses the need to recognise women's agency in disaster management policies and programmes at local, district, state and national levels, using the rights-based approach. Extensive research should be conducted in remote and rural regions of India to make women's agency visible and change the old, patriarchal narratives, which remain gender blind or at best neutral, but not gender sensitive.

VERMA, MANISH K.* (Babasaheb Bhimrao Ambedkar University, India)

Displaced People in a Volatile World: The Nuances of Infrastructure and Livelihood

Accomplishment of development necessities is essential for human survival on earth. However, the gigantic urge for development activities in recent past has seen man reaching to such a threshold where their endless craving results in the exclusion and under-development of their fellow brothers. A large number of socially marginalized and economically deprived populace, involuntarily displaced due to development projects, is forced to live in an extreme adverse condition exposed to greater 'impoverishment risks'. The paper articulates the nuances of project induced involuntarily displaced populace of India living in resettlement colonies. Studies confirm that the condition evokes existence problems among them. Involuntary dispossessed struggle to adjust and accommodate in a small patch of land in a resettlement colony which is generally planned to cater urban conditions. The adverse condition of housing and other basic services are not the only problem for these displaced. Living in distant places among aliens and hostile people, after losing their age-old traditional agronomic activities, force them to venture into such strange occupations for which they are never mentally and psychologically prepared. The perennial situation creates a question mark on their sustained source of livelihood, loss of seed money in entrepreneurial activities often results into hand-to-mouth existence. Resettlement colonies are also not far from trouble. Most often it consists of poor infrastructure, sanitation problems, lack of availability of potable water, poor availability of electricity, lack of communication and transportation facilities along with little space to accommodate joint families and cattle. The common property resources like orchard, ponds, wells etc. remain missing in these colonies which mars the possibility of traditional pattern of life for which the displaced are habituated since ages. The existing situation urgently entails reconsideration of development priorities to create a just society which shares the fruits of development equally among all.

WG05-707.2

VERMA, MANISH K.* (Babasaheb Bhimrao Ambedkar University, India)

Neo-Capitalism, Special Economic Zonese and Involuntary Displacement: Resistance Among Rural People in a Volatile World

India being the fastest developing economy of the world has shown a new degree of development preference in contemporary times wherein the governance is vying for 'industrial development' and inclusion of the marginal to the main-

stream society. But behind such admired development achievements lays the grave for the underdevelopment of millions of marginal whose land is utilized for the sake of attaining national goal – creating paradoxical situation of 'neo-capitalism'. By virtue of claim of sustainable and inclusive growth of the marginal farmers and labourers, the development endeavours carried out in recent past, contrarily, proved to be bane as it aggravated the problem of involuntary displacement, loss of land and livelihood, unemployment, food insecurity, human rights violation and negate the chances of creation of an egalitarian society. By introduction of SEZs in 2005, on pretext of rural development, industrialization and employment generation, government opened flood gates for MNCs and big industries, further aggravating the problem of development induced displacement and making situation worse for the farmers. In this background, the paper critically comprehends the predicament of development induced displacement vis-à-vis state of farmers in India especially after the inception of SEZs Act 2005. The paper brings under sharper purview the politics of governance which lacks social accountability by remaining apathetic to the plights of the farmers. The fluid condition of land acquisition and resettlement and rehabilitation acts in India, despite many revisions and amendments, act as catalyst to strengthen hegemonic minority against the feeble majority representing proletariat. The situation has set-up battle ground, wherein fierce struggle, protests and violence is seen on streets of India between the government, MNCs, industrialists and planners on the one side and; farmers, labourers, marginal communities supported by exponents of civil society, human rights activists, NGOs and environmentalists on the other, destroying the tranquil environment.

VERNIK, ESTEBAN* (Universidad de Buenos Aires, Argentina)

Simmelian Contributions to a Relational Sociology of Senses and Emotions. the Case of "Platforms Workers"

In *The View of Life*, the last Simmel criticizes the Kantian approach to ethics, because it considers the individual exclusively from his rational dimension, leaving aside his sensitivity; that is, "temptation and seduction by the senses." At the same time, he warns about the dangers for modern life of the technical expansion of the sensitive world, such as when "a being who has the structure of a giant telescope" or legs, "half-kilometer stilts" is conceived. But throughout Simmel's work, and in particular from *Philosophy of Money*, the connection between the problem of technique and the sensitive and emotional condition of individuals has been a frequent topic.

This paper aims to make a reconstruction of elements of the Simmelian relational sociology referred to this topic, in conditions of being applied to an emerging phenomenon of contemporary capitalism, such as the constitution of precarious working relationships between distributors of the current platform companies of delivery.

VERONESE, MARILIA* (Universidade do Vale do RIo dos Sinos (UNISINOS), Brazil)

Associativism in Traditional Communities: Overcoming Inequalities through Solidarity Economy

The presentation focuses on a qualitative study, theoretically supported in Boaventura Sousa Santos' critical sociology, especially in the sociology of absences and emergencies and the prospect of epistemologies of the South. The epistemologies of the South are understood as a metaphor of human suffering caused by colonial predatory relationships through exclusion, exploitation and hiding. It refers to existential cultures, which produce *habitus*, behaviors and values. In a world of appalling social inequalities people are becoming more aware of the multiple dimensions of injustice, whether social, political, cultural, sexual, ethnic, religious, historical, or ecological. Cognitive injustice is another vital dimension and the object of the research were the knowledge and socioeconomic practices produced by communities of traditional origin, such as *quilombolas* and Indigenous, small fishing and riverine. Such groups, quite diverse in the production of collective identities, refer to peculiar social situations with a strong territorial link. The concept of *buen vivir* or *sumak kawsay* expresses in Latin America a worldview that can be identified with the epistemologies of the South. During the fieldwork, we were staying with community-based groups in the south of Brazil that practice associativism, in the context of different experiences of solidarity economy. They produce various strategies of work, mobility and militancy. The main findings point to the plurality of organizational forms; the importance of association as a central community figure; and how ethnic, gender and generation diversity impact on the construction of their identities and trajectories, marked by the adversity of poverty and sociopolitical suffering. In the proposal to combat inequalities, we think of an ethic being with those who are put in the place of "inferiority"; in an aesthetic that aims the inventive character in valorization of the life; and of a politics that conceives the subject in its historical contexts in search of citizenship.

Mental Health and Solidarity Economy in Brazil: Care in Freedom and Artistic Production for Socioeconomic Inclusion

This presentation approaches the articulation between solidarity economy practices and the production of citizenship and autonomy between subjects in psychosocial suffering, through artistic/cultural production. The confluence between mental healthcare and associated work as an alternative to labor insertion for people in psychic suffering is important, although still challenging in Brazil. The Brazilian Psychiatric Reform has as its basic nucleus the rescue of citizenship, and it is observed that the practice of solidarity economy provides the expansion of workers' capacities, which originates from the creation of access to cultural goods, which may constitute products and services. In this paper I analyze two consolidated experiences, each extending over a period of about two decades: The *Suburban Madness* group in the city of Rio de Janeiro, and *GeraçãoPOA* in Porto Alegre. Some theoretical articulators of the text are George Yúdice with the concept of culture as a resource and Paulo Amarante with the theorizing about psychiatric reform. Participant observations and interviews with the users of mental healthcare services were carried out. We have also used photography to record the sensitive realities of the arts produced and sold by the groups. The questions we asked ourselves were what effects do these experiences have on their life trajectories, previously marked by exclusion and confinement? What are the most potent socioeconomic and cultural forms of insertion at the intersection between the anti-asylum struggle and the solidarity economy? The relevance of this research lies in showing the fruitful intersections between social movements, public health care and arts, especially now that Brazil is entering a period of authoritarianism that places at risk the democratic achievements of both.

VERPRAET, GILLES* (University Paris OUest Nanterre, France)

Configuration As Metaphor and As Hypothesis inside the Diagnosis of Contemporaneity

The category of configuration has been leading so to analyze and to combine the symbolic forms of State inside absolute state (Cassirer, Adorno), the construction of nation State and people identification (Benjamin, Elias). This categorization can be reassessed facing new forms of State between weak State and exceptionalism inside the network society (Beck, Castells). This symbolic categorization can be questioned by the subaltern situation

The concept of configuration, generated inside relational anthropology, sustain the notion of social space and cultural field, under symbolic domination (Bourdieu, 1977). The saturation of the social by symbolic forms underlines some incompleteness. The questions of prefiguration and configuration concern deeply precarious subjects, half positioned subjects (Browne, 2017). The relevance of cultural configuration is questioned by the diversity of refiguration processes such as subjectivation (Foucault), conversion (Mannheim), subjective affirmation instead of emancipation . In this regard, the quality and consistency of a cultural space frames an anthropological support to stabilize between the different subjectivation processes (Adorno, Benjamin, Panofski, Alexander).

This demonstration on subjectivation and cultural supports will be assessed from the litteracy texts of Edouard Glissant, caribbean author regarding the creole condition and its progressive emancipation, within a cultural emancipation. Configuration appears as an important category of cultural creation who complements the division of the subject (Fanon). It contributes to clarify understanding between different processes of subjectivation, as referential of subjectivation, as space of displacement for new subjectivities. This approach differentiate the leading contributions of metaphors inside contemporary social science, such as genealogy and ontology, such as social space and symbolic order, such as morphogenetic and new creative space

VERPRAET, GILLES* (University Paris OUest Nanterre, France)

Transnational Solidarities and Trajectories for Sustainable States

Our analysis envisions transnational solidarities, as communication and intersection between communities, but also as communities of issues and as a politicization of these issues. The development of the Internet sustains a community of problems and stabilizes the connection between local communities. But it is necessary to specify the intersection of solidarity within mediated governance (Hajer 2009). The federation of issues has to consider the resistance of the micro-worlds, how the contingency could fix some points of reluctance and the new combination due to the fractalization of issues (Chateauraynaud 2015).

Transnational solidarity arises from the articulation of these different public spheres. We induced some insights on the social relations bounded between global interdependence and collective expression (Verpraet 2006). The French yellow jackets revolt (gilets jaunes) in December 2018 was first envisioned as a

resistance to carbon tax and sustainable development. In a context of income and energy precarity, a new demand of social justice can be framed, sustaining the continuity of energy transition.

The third methodological question frames a progressive reconstruction of multilevel mobilisations and environmental solidarities by examining the coupling and decoupling between mobilization and conflict, between transnational solidarities and trajectories of sustainable State. This methodology examines the transnational solidarities as communities of issues, as politicization of common issues and common problems as interconnection of issues (Tassin, Beck). The new configuration of environmental solidarities can be linked with reconfiguration of environmental issues.*We will present a comparison between France, Korea, on the different ways of coupling State and civil mobilization, on the different linkages between sustainable policy and development trajectories, on the implementation of coordination mechanisms elaborated in each country.

Lawyering for Social Transformation? a Debate on the Role of Lawyers in Social Mobilization and Protest

The work is inscribed in a research agenda on legal professionals and cause lawyering in their interactions with social movements in processes of collective mobilization. The objective of our presentation is to discuss how groups of professional lawyers operate in social mobilizations and protests and how they articulate the purpose of their professional practice with the objectives of social movements. These actors are fundamental to support the struggles of social movements and to foster their demands and politicize a social issue. In this specific work, we offer in the first hand a theoretical debate drawing on the critical debate on the limits and potentials of cause lawyering. In the second hand we discuss insights from empirical research carried out on the engagement of lawyers both in the Brazilian large-scale demonstrations of June 2013 and the anti-austerity protests in Portugal in 2011-2012. This research opens questions for a research agenda on multiple forms of interaction between collective and legal actors and jurisdiction.

Social Mobilization and Legal Institutions: Complex Relations in Times of Austerity Crisis

The worldwide wave of demonstrations that started in 2011 had a specific resonance in Europe. The protests in Ireland, Spain, Portugal, Greece and more recently France, represented a milestone for the debates on the democratic characteristics of the European Union and the role of economic institutions in shaping political decisions. The critique of austerity measures and curtailment of social rights was and still is at the core of the claims of social movements, this time not only in the Global South, but also in Europe, especially following the impoverishing effects of the "one size fits all" policies proposed by international institutions and the so-called "Troika". The mobilizations, however, are not only summed up in the confrontational moments of the protests; they represent a complex context characterized by interactions between social movements and political and legal institutions. Between 2011 and 2014, during the Portuguese financial crisis, the Portuguese Constitutional Court issued a series of judgments declaring certain austerity measures unconstitutional. Despite the escalating political and economic crisis, the legal system has been responsive to collective mobilizations. The decisions of the Constitutional Court act as an intermediation point between the "politics of the streets" and the institutional options for action within the political system. Considering the example of anti-austerity movements in Portugal, the central contribution of my presentation is the discussion about the potential of transformation and emancipation of struggles of social movements using legal strategies. In order to understand those, they will be analysed from a critical materialist legal approach.

VIANA BRAZ, MATHEUS* (Minas Gerais State University, Brazil, Brazil)

Groupes D'implication Et De Recherche En Sociologie Clinique : Faire Face a La Psychologisation Des Contradictions Sociales Dans Le Contexte Du Travail Bresilien

Dans le scénario de travail brésilien, les modèles hégémoniques d'intervention dans les organisations traitent des conflits et des contradictions au travail strictement sur le plan psychologique: problèmes de communication, manque d'information, conflit d'intérêts entre départements ou interpersonnel, malentendus,

«structure émotionnelle affaiblie ou limitée», «personnalité incompatible avec la fonction»,« comportement non stimulant», «manque de motivation personnelle ou de résilience», etc. Afin de chercher une voie alternative à ces modèles, qui tendent à individualiser les souffrances et les contradictions sociales, l'objectif de ce travail est d'analyser et de valider les possibilités d'utilisation des Groupes d'Implication et de Recherche (GIR) dans des organisations, publiques et privées, au Brésil. Puisque le chercheur a mené des recherches et des interventions au cours des dernières années dans le cadre de la Sociologie Clinique, les données obtenues proviennent de sa pratique quotidienne et ont été analysées selon la méthodologie des *réminiscences du chercheur*. Il a donc été conclu que les GIR constituaient un outil fructueux pour la construction d'espaces d'écoute, d'implication et de changement, qui remettent en question la structure collective et les enjeux de pouvoir dans les organisations. Outre le refus d'un travail régi exclusivement par le réalisme économique, la construction d'alternatives à la souffrance et aux conflits semble faire émerger des liens de solidarité, d'affections et de coopération parmi les travailleurs. En pratique, ce processus n'est pas une tâche facile. La construction d'une l'écoute sensible nécessite l'humilité du professionnelle de reconnaître ses erreurs, sa volonté d'apprendre toujours et l'implication, de façon à ne pas abandonner le travail face aux résistances qui se manifestent dans sa vie quotidienne. Enfin, les effets de ce travail, progressivement perçu à travers les changements et les retours offerts par les travailleurs, sont ce qui nous mobilise pour répandre l'utilisation des GIR sur le scénario du travail brésilienne.

The Least Restrictive Principle within the England & Wales Mental Health System, Keeping Families Together

In England & Wales there has been attempt to see mental disorder transcend a purely medicalised construction and label, but to be balanced by an understanding of the consequences of difficult social circumstances being applied. The use and benefit of such social responses, including engaging with family and friends, increasingly frame and underpins policy in this regard. Conflated with the social approaches or perspectives, this approach is referred to in some jurisdictions as applying the least restrictive alternative. It is, for example, the second of five legal principles highlighted in the final report of the Independent Review into mental health legislation in England and Wales (Department of Health and Social Care 2018 p. 100). Despite this, the Review makes little attempt to explain what is meant by least restriction either in theory or practice, and it is this gap which this paper seeks to address. It will do so in the context of two jurisdictions, the one from which it said to originate, America, and the one which now uses it to underpin its current mental health legislation, England and Wales.

Mobility Struggles in the Platform Economy: The Case of Private Hire Drivers in England

This paper theorises the interrelated fields of everyday contested mobilities and collective action among private hire drivers working via digital platforms. This draws on a qualitative empirical study, which involved drivers working for Uber and a variety of local operators, conducted in partnership with the Nottingham branch of the United Private Hire Drivers union (UPHD) in England during 2018-19. The paper integrates a Marxist analysis of the labour process with a framing of mobility as a contested terrain, to argue that drivers' conditions of work require them to use their relative autonomy largely reactively, to navigate between competing demands of customers, platform operators, and licencing authorities. These demands are conceptualised as embodying different and sometimes contradictory logics of mobility, which shape both the everyday labour process and the demands, alliances and organising strategies that adopted by UPHD. The paper concludes that while digital platforms are implicitly dislocated from physical places, they nevertheless produce employment relations for private hire drivers that are shaped by local factors and centre on struggles over material mobility. Understanding these mobility struggles can help to explain both the forms of collective organisation that emerge, and through this understanding can potentially inform further improvements in organising strategies.

When Rules Are Not Enough – an Investigation of Military Competence-in-Use

The search for military professionalism could today be seen as moving target. What is right in one situation might be wrong in another and every new situation requires a new kind of flexibility from the soldiers and commanders. Accordingly, scholars showed renewed interest in what military competence actually is. The aim of this study is to examine *competence-in-use* in military international operations. The paper investigates 32 critical incidents from Swedish soldiers and commanders between 2010–2014.

Two theoretical tools have been used in the analysis – Critical Incident Technique (Flanagan 1954) and a model for understanding Occupational Competence focusing on competence-in-use i.e. the interaction between the individual and the task (Ellström 1997).

The paper contributes to the current debate on post-modern warfare by highlighting how soldiers and commanders diagnose situations and cooperate (sometimes with unpredictable and unreliable partners) and transform actions to fit the current situation.

VIDAL, VERA* (UOC,)

Platform Cooperatives and « Cooperatives Commonwealth » : Scaling in the 21 St Century for the Sharing Economy

First conceived as an alternative to neoliberal markets - with many expectations regarding potential environmental, economic and social benefits - sharing economy platforms have turned out to have mixed outcomes. They have challenged traditional sectors, public authorities and local communities, putting more pressure on already strained resources and infrastructures, contributing to labor precariousness and being a further driver of inequalities.

As a response, communities and local governments have been exploring alternative models such as platform cooperativism, that aims at creating a fairer practices by combining the democratic ownership and governance approach of cooperatives with the transparency of open technology and knowledge. Nonetheless, platform cooperatives face many difficulties when trying to scale as they are opposed to platforms in quasi-monopolistic position in their sectors they benefitted from network effects. How do platform cooperatives manage to scale?

This contribution proposes to reflect on how platforms are scaling through the development of a three-level governance : locally - communities of member-users self-organizing; nationally - members deciding on the strategy of the cooperatives and internationally - national cooperatives that use the same free software share knowledge and decide on how to further develop the platform.

The analysis is based on a series of case studies operating in Barcelona – where the local government, civil society organization and the social and solidarity economy have been actively supporting such endeavors since 2015 – but sharing their software at a European level with other cooperatives. The study will be carried out using a combination of qualitative research techniques: participant observation and interviews.

VIDIZ, MONICA* (, Brazil)

Proximity and Distance: An Exploration of Brazilian Young Care Leavers' Sense of Belonging in Light of Their Relationships with Godparents in the Befriending Programme in Sao Paulo.

Belonging refers to experiences of being part of the social fabric, encompassing emotional, relational, social and political elements of inclusion and participation. Belonging is a matter of particular relevance for individuals and groups who have a non-normative positioning in society, as is the case of looked-after children. The presented qualitative research aimed to investigate how Brazilian young people who left the care system in Sao Paulo narrate their constructions of a sense of belonging, and how this is worked through their intergenerational relationships with volunteer 'godparents' in the Befriending programme. Moreover, the study aimed to explore how the intersecting social distinctions among them appear to influence this process. The data was generated through two focus groups with young participants, with the use of visual and verbal activity-based discussions, and one individual semi-structured interview with each participant. For the sample, five care leavers and their godparents were recruited through purposive sampling. Data were analysed using thematic analysis with an intersectional approach. The findings reveal boundaries facing young people while constructing a sense of belonging, related to their inferiorised and stigmatised positioning and their sense of inability to 'play the game' as functioning adults. In this context, the close, affective and lasting relationships with godparents emerged as a source of recognition, self-trust, support and expansion of young people's capital. However, paradoxical

effects related to the hierarchically distinct social positionings among befrienders appear to actualise young people's inferiorisation, reproducing adult-child as well as racialised and classed power dynamics. Young people's positioning as 'apprentices' being to some extent 'civilised' by godparents open up attempts for their adaptation to dominant forms of belonging, as well as affirmation of their marginalised identities and forms of belonging.

Social Robot and Humour: New Spices for Active Ageing?

In the HUMR project „The Use of Humanoid Robot in Promoting Active Ageing in Older Men and Women" (2019 - 2021 TA CR TL 02000362) we utilize a humanoid robot as a provider of entertainment and education for older adults, achieving enhancement of their active ageing and community involvement on one hand and bridging the generational digital divide on the other. By such approach we encompass the need of older users to familiarise with the new technologies by providing the opportunity for human-robot interaction and communication based on two-way learning processes. The robot-assisted edutainment is also an innovative approach to active ageing as such, as the robot helps to include the gaming aspect into specific setting of the community centre for the active-agers.

The provisional results of the project show that older adults, and especially women, are active users of ICT devices and greatly enjoy the initial contacts with humanoid robot Pepper. There are however serious hindrances in achieving the first encounter as there is a hesitance to the notion of a robot. The actual human-robot interaction then is a source of enjoyment and humorous situations as the limitations of the state-of-the-art technologies are revealed.

The paper discusses the role of the humanoid robots in achieving some of the ageing societies goals and calls for reflected introduction of humour and play into later life experiences.

VIDU, ANA* (University of Deusto, Spain)

A Reflection on the Legal Relevance of Consent in Relation to Sexual Assault Cases

Gender-based violence is the leading cause of death among women aged 15 to 44 all over the world, ahead of deaths produced from cancer, traffic accidents or wars (according to the latest WHO report). It also occurs at younger ages, since 30% of girls between 15 and 19 have suffered some type of violence in their sexual-affective relationships. Facing this reality, much consideration has started to be raised on approaching sexual violence also from the legal approach. The gang rape case occurred in Spain (known as "La Manada") during a regional famous festival (San Fermín, Pamplona 2016) placed the trial against its five aggressors on an unprecedented media and social scale. The court ruled for sexual abuse and not for rape sparking a prompt social rejection of the decision, and so, also against the Spanish current legislation. To overcome revictimization and give voice to survivors, considering sexual consent from the legal perspective is essential. In view of this paradigm, some legislations in the US and Europe have already included consent as the basis of their sexual violence convictions. The Spanish government also expressed its interest in modifying the Criminal Code in the same line. In our duty to provide scientific knowledge on the matter, this paper frames the debate on the crime against sexual freedom and the context under which consent can neither be asked for nor conceived. As language takes place through interactions, the analysis of verbal and nonverbal communicative acts sheds light on specific situations that can promote or prevent violent experiences. Thus, the current paper deepens on the analysis of communicative acts for ensuring consent, while emphasizing on the current social opportunity needed to raise awareness and transform legislation with the aim of considering consent as an essential element in the assessment of this type of behaviors.

Speaking about Second Order of Sexual Harassment to Prevent Gender Violence

Gender violence and sexual harassment are still huge challenges of our current society. Understanding sexual harassment from a wider perspective involves analyzing Second Order of Sexual Harassment (SOSH) and its social implications. From its first definition (Dziech & Weiner, 1990), SOSH raised awareness on the need to protect not only survivors of gender violence but also those who actively

　　　　　　　　　denotes a presenting author. Abstracts are organized by first presenting author's last name.

dare to support them. While sexual violence' prevention and response actions have been broadly approached during the last decades, the role of SOSH for the overcoming of gender violence is still little explored. This paper pretends to fill this gap from shedding light on the negative consequences for victims' supporters and the limitation for victims' complaining and coming forward, which it implies. While it is widely agreed that *bystander intervention* constitutes one of the most efficient mechanisms for action and prevention, the protection of the *bystanders* has not been addressed enough yet. Indeed, those who take a stand on survivors' side are more likely to suffer from defamations and attacks, among other consequences. Scientific studies reveal that breaking the silence on sexual violence involves revictimization, not only for the victims but also for their supporters. The efforts for combating sexual harassment, protecting direct and second order victims, have to entail contemplating SOSH in the current debates about sexual violence prevention and response mechanisms (involving media, documentaries, awareness campaigns, social networks, etc.); empowering and supporting direct and second order of sexual harassment's victims. Aiming at contributing to overcoming this social scourge, the pioneer contribution described in this paper demonstrates the impact of approaching SOSH from a global and broad framework as a way to empower survivors and to engage people into action, while introducing this perspective in the scientific agenda of sexual harassment analysis; contributing to the struggle of sexual harassment eradication.

VIEIRA, MAGDALENA* (Uppsala University, Sweden)

Materiality of Age-Coded Bodies in Interaction Moments: Exploring Non-Verbal Mundane Interaction in Swedish City-Bus Riding

This paper explores the role of materiality of age-coded bodies in heterogeneous mundane non-verbal interaction in a Swedish city-bus riding context. The analysis presented here is based on a micro-sociological study of what the phenomenon of city-bus riding could contribute to our understanding of mundane social interaction. In the thesis I systematically apply a Goffmanian informed theoretical framework on fieldnotes from structured participant observations. The empirical data consist of detailed descriptions of interaction moments and the gestural patterns (gazing patterns, movements of bodily limbs etc.) carried out within them. This paper focuses on the materiality of spaces (territories and the design of urban places), and bodies (where age is addressed as a phenotypical key category). The findings concern two dimensions of significance in non-verbal interaction: intensity of involvement and territorial orientation. In regards to these dimensions, this paper shows *how* public places such as a bus stop can shape behavior and expectations on the interaction, and thereby also non-verbal interaction between older and younger bodies. The complexity of the dimensions of non-verbal interaction in focus here is moreover illuminated by two empirical examples showing 1) how using a walking aid (a walker) impacts non-verbal interaction between age-coded bodies, and 2) how using a jacket opens up alternatives for connectivity seemingly enhancing the rider's awareness of others around them. The findings highlight the interplay between some of the dimensions of non-verbal interaction (concerned with space and bodies), the material aspects of this kind of mundane interaction, and the role that (old) age plays. In doing so, they offer us insight into the role materiality and the corporeality of age-coded bodies plays for non-verbal mundane social interaction.

Political Resistance and Local Cultural Dynamism: The Alternative Carnival of Santo Além Do Carmo (Salvador, Bahia, Brazil).

Santo Antonio Além de Carmo district is located in the Historic Centre of Salvador; it is today one of the most important colonial sites in Brazil, recognized as a World Heritage Site by UNESCO in 1985. In the 1990s, the region, more specifically Pelourinho zone, experienced a classic gentrification process resulting from a tourism modernisation policy that juxtaposed culture, tourism and the enhancement of the State's cultural identity. On the other hand, the Santo Antonio Além do Carmo district has been relatively untouched by the effects of the gentrification of the 1990s. Recently the district has experienced a spontaneous movement of culturalflourishing that is more the result of the initiatives of artists, its residents, small collectives and cultural entrepreneurs than of local public policies and interventions.

If we take as a premise the notion of models such as creative cities and neighbourhoods (Landry, 1995, Florida, 2002), Santo Antonio meets fullfils some of its requirements, but differs strongly by others. The cultural dynamics of the neighbourhood are not rooted in production practices based on digital technology or technological innovation. The cultural production of the district is rather driven by initiatives of small cultural collectives that are organized on a logic of networks and proximity systems based on values such as informality, autonomy, cooperativism.

Based on the concept of cultural scenes (Straw, 2005, 2014) we take as our starting point the analysis of the Carnival of the district organized by the cultural

collective "Bloco de Hoje a 8", whose organization and values are guided by a policy of resistance to the industrial carnival model in vogue in Salvador. A model of resistance that has developed strongly in recent years and has contributed to the cultural, social and economic dynamism of the territory.

Gender Studies in Cape Verde

This paper aims to present preliminary reflections on the production of knowledge in gender in the social sciences developed in Cape Verde, based on South-South cooperation. To this end, it is supported by an analysis of the production carried out in the Postgraduate Program in Social Sciences of Cape Verde, from the year of 2007 to 2015, from my personal experience as a collaborating teacher of this program. During this period, more than 15 dissertations and theses were concluded in this field of study, in themes such as gender violence, sexuality, family dynamics, masculinity, work and immigration, among others. This production is characterized by a focus on ethnography as a way to access daily agencies and negotiations in the context of gender relations. In this paper, I am interested in looking at this production with the objective of focusing on the ethnographic dimension and its epistemic possibilities for the construction of knowledge from the perspective of the Global South.

The Challenge of Indigenous Youth in the City: Between Identity and Its Erasure in the Urban Scenario, Based on Biographical Analysis of a Young Indigenous in Rio De Janeiro

The issue of indigenous people in Brazilian cities is the subject of research and debate as a result of the struggle and mobilization against their situation of invisibility in the urban space. Both the public administration and Brazilian society, in general, deny the presence of indigenous people in cities, triggering numerous control and/or prejudice mechanisms to combat and deny a process that is still underway and that points to important achievements, such as largest visibility for the fight for rights.

In Brazil, a non-urban population still predominates among indigenous peoples. There are about 315,000 indigenous people in the cities, according to the 2010 census, corresponding to 49% of the native population. However, the situation of urban indigenous peoples involves very different processes. Based on Latour's notion of the hybrid, Alcida Rita Ramos (2008) highlights the colonizer's view of indigenous peoples: they must continue to be considered part of nature; or must be acculturated and lose all traces of their indigenous identity.

Based on biographical research (Rosenthal, 2014 & 2017), we analyze some of the dilemmas faced by the indigenous subjects in the urban landscape, a space which complexity is multilayered. Thus, from the trajectory of an indigenous young woman born in the city of Rio de Janeiro, we approach some challenges of the process of the native identity. It is important to mention that forced displacement has greatly hampered the preservation of indigenous identities despite self-determination, which is not sufficiently respected or even recognized. Thus, we will unfold a better understanding of some ongoing processes, whose challenges range from the legal issues - the 1988's Brazilian constitution unquestionably presented some achievements, but also brought bureaucratization and its dilemmas - to the recognition by society and by the indigenous peoples themselves.

Brazilians Overseas and Their Interactions with the Brazilian Government

The present paper proposes to discuss how Brazilians communities abroad have interacted with each other and the Brazilian government in order to strengthen their bonds and stimulate the birth of ethnic organizations in order to achieve their social and political goals. We focus in the Brazilian community in Japan and analyze the transnational connections with other Brazilian communities abroad. The activism of Brazilians abroad dates to the beginning of the 1990s and it is related to the social, political and economic environment that surrounded these immigrants. It began in Europe, where restrictive policies resulting from the Schengen Agreement led to the deportation, death and even murder of undocumented immigrants. This was a defining factor in stimulating Brazilians to demand the recognition of migrant rights both in Brazil as well as in the host society. In the case of Japan, even though the matter of health security for for-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

eign residents and labor issues which became a concern during the late 1990s, it wasn´t until the 2008 financial crisis that we witnessed a stronger push for organization. High unemployment and insecurity about the future led many Brazilians to organize themselves and demand solutions from the authorities. After understanding the context in which these changes happened, we move on to the analysis of how the Brazilian government has formulated policy tending to the overseas Brazilian community. Our analysis will be based on field work in Japan during the period of 2011 to 2019 and analysis of policy change from the part of the Brazilian government. That includes interviews and surveys as well as the participation in meetings of the Brazilians Citizen's Council of Tokyo. We intend to highlight how mechanisms from the community have contributed to both shaping the community in Japan and changing the policy making process in Brazil.

Between Symbolic and Economic: The Role of Music in the Contemporary Phonographic Industry

With the reconfiguration of the music market, driven mainly by the decentralization of the music industry, the immateriality of music and the emergence of streaming as one of the main means of access to music content, new ways of relating the cultural and economic spheres are emerging. Indicative of this is the alignment of these services with the logic of the financial market and the participation of technology companies in structuring their platforms. From this scenario we question how the circulation of music is regulated and how the hierarchies of availability and access to this content are operated. Our hypothesis is that music starts to function as mediator between the economic, technology and culture spheres, and thus becomes a bond between global flows of symbolic and economic capital.

With a huge database on the music consumption habits of millions of people, streaming services currently hold valuable information about people from around the world, which has already attracted the interest of countless companies in various sectors, as well as represent the main source of revenue for today's recorded music industry. Thus, this research analyzes the effects of the new forms of consumption and availability of music content, understanding that they reflect, at the same time that they affect not only the cultural markets, but also the business model of large corporations.

To do so, we study the operation of music streaming services, the organization of the contemporary phonographic industry and the logic of financialization and investments in the sector, as well as the way artists seek to position themselves in this scenario.

VIGNA, ANA* (Universidad de la República, Uruguay)

Profesionalización De La Fuerza De Trabajo Penitenciaria: Desafíos Observados a Partir Del Proceso De Reforma En Uruguay

Uruguay atraviesa desde 2010 un proceso de reforma penitenciaria que tiene entre sus ejes centrales la profesionalización y despoliciamiento del personal asignado al trabajo en cárceles. Así, se creó un nuevo escalafón civil, un Centro de Formación Penitenciaria con una currícula especialmente diseñada para la nueva concepción de la privación de libertad y se incrementaron los niveles de educación formal requeridos para el ingreso a la fuerza. Sin embargo, y a casi 10 años de iniciados los cambios, las condiciones de vida en las cárceles continúan siendo preocupantes desde el punto de vista del respeto de los derechos humanos más fundamentales (Comisionado Parlamentario, 2018).

Esta ponencia sistematizará la literatura internacional sobre profesionalización de la fuerza penitenciaria (Vickovik y Griffin, 2014; Liebling, 2011; Bensimon, 2005; Robinson et al., 1997; Jurik et al., 1987), vinculándola a cambios que este proceso trae consigo en otros aspectos relativos a los perfiles del personal (por ejemplo, su feminización y mayor presencia de profesionales universitarios). Dichos elementos se discutirán a la luz de los resultados del Primer Censo Nacional de Funcionarios Penitenciarios de Uruguay desarrollado por la Universidad de la República en acuerdo con el Instituto Nacional de Rehabilitación.

Los resultados ponen de manifiesto el carácter contradictorio de la tarea de los custodios, donde se entremezclan mandatos ligados al cuidado y la rehabilitación de la población reclusa, con otros que enfatizan la idea de control y castigo. Si bien los factores sociodemográficos (sexo, edad, nivel educativo) explican en parte las diferencias en las orientaciones del personal hacia la tarea y hacia los internos, los factores derivados del puesto de trabajo y del nivel organizacional (ambigüedad del rol, vínculo con las autoridades y los pares, compromiso organizacional) son los que más peso explicativo tienen para comprender el modo de concebir y llevar adelante la tarea.

Catolicismo y Sociología En Argentina. La Recepción De Durkheim En La Universidad Nacional Del Litoral (1910-1947).

La presente ponencia aborda la recepción, circulación y apropiación argentina de la escuela de sociología francesa fundada por Émile Durkheim en las cátedras de sociología de las Facultades de Ciencias Jurídicas y Sociales y de Ciencias Económicas, Políticas y Comerciales de la Universidad Nacional del Litoral, Provincia de Santa Fé, en el período que va desde la fundación de la primera de ellas en 1910 hasta el alejamiento de su entonces profesor titular, José María Rosa (h) 1947. El objetivo central del trabajo es analizar la forma en que un proyecto laico de sociología fue procesado localmente por los profesores a cargo de las mencionadas cátedras, los cuales pertenecieron, en su mayoría, a vertientes del nacionalismo católico, tal como fueron los casos del ya aludido Rosa, Gustavo Martínez Zuviría, Alberto Baldrich y Jordán Bruno Genta. A su vez, se tiene en cuenta la trayectoria social, la apropiación y los usos del padre de la sociología francesa por parte de José Oliva y Francisco Ayala, quienes también formaron parte del plantel docente de la Universidad.

From Human Rights Advocates to Anti-Corruption Crusaders: Prosecutors' New Professional Identity

Sociologists have been increasingly concerned with how professions emerge, become internationalized, and transform broader fields. However, the processes through which professional identities change remain unclear. This paper draws on institutional theories and organizational sociology to explain how professional identities change over time through a case study of public prosecutors in Brazil, who switched their focus from human rights advocacy to combating corruption. Based on document analysis and 80 in-depth interviews with prosecutors and other law enforcement agents, I show that this professional change was not driven by an increase of corruption in Brazil or by exogenous pressures from other fields (eg changes in Law Schools), and nor was it driven by an attempt to control knowledge and power. Rather, I argue that this new professional identity emerged from changes in the division of labor within the Public Prosecutor's Office. In the 1980s, a new Constitution was passed during the transition to democracy, which granted prosecutors autonomy and investigative powers. However, prosecutors faced multiple challenges using this new authority: they had little experience conducting their own investigations and their traditional division between criminal and civil prosecutors did not work for corruption cases because they often contain both criminal and civil violations. In order to deal with these organizational hurdles, prosecutors created Anti-Corruption Centers, departments exclusively dedicated to corruption work. But these centers also changed the way prosecutors are socialized as newly-recruited members were slotted into these centers, often against their will. As they began working on Anti-Corruption Centers, prosecutors started to get the taste for corruption investigations, embracing this new professional identity. Anti-corruption prosecutors consolidated this professional transition by reframing corruption in terms of a tool to fight for human rights as well as by developing new outreach strategies to publicize their work, which gave them both internal and external legitimacy.

Subterranean and Public Activism: Anti-Corruption Reform in Brazil

What explains administrative reform? Current explanations tend to assume that reform is originated outside bureaucracies and can be explained by two factors: the executive will of political elites and pressure from social mobilization. This paper proposes an alternative framework for state reform based on an analysis of anti-corruption reform in Brazil. Until recently, corruption had largely gone unpunished in Brazil. But this changed with Car Wash, the largest anti-corruption operation in Brazilian history, which has convicted over 200 high-profile politicians and businessmen since 2014. This paper compares Car Wash with three previous unsuccessful attempts to promote reform and draws on 80 in-depth interviews with prosecutors, FBI detectives, judges, and other public officials. I argue that reform was the result of an iterative process of subterranean activism by regulatory and law enforcement bureaucracies and public activism from politicians and sectors of civil society. Bureaucrats learned from every defeat by actively 1) clustering officials into Anti-Corruption Centers and task-forces, cultivating a professional identity focused on combating corruption, 2) building capacities to create inter-institutional and international networks, and 3) developing new ways to engage with the press and with society in order to secure public opinion support. This subterranean work of law enforcement bureaucracies was boosted

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

by public activism in specific moments, such as when the government helped restructure the Polícia Federal (Brazilian FBI) and when mobilization against corruption escalated. By examining the interactions between subterranean and public activism, this paper highlights the role of bureaucratic organizations in promoting state reform, which is often obscured by elite- and movement-driven explanations. Additionally, the paper shows that factors traditionally understood as exogenous - such as social mobilization - can sometimes be triggered by endogenous sources: the public outreach strategies of bureaucrats.

VILADRICH, ANAHI* (Queens College & The Graduate Center, City University of New York, USA)

"Puertas Afuera" Versus "Puertas Adentro": Latino Immigrants' Religious (In)Visibility in the Trump Era

Based on a long-term study of "botánicas" (religious-healing dispensaries) this presentation will focus on the open and subtle ways in which Latino immigrants in New York City engage in Afro-Caribbean religious-healing practices. These religions have become increasingly popular among Latin American immigrants who find in botánicas a safe place where they can advertise their creeds, shop for religious items and share their experiences with peers.

Religious healers and immigrants who work, and shop, at botánicas tend to display complex in/visibility tactics, as they both exhibit and camouflage their religious beliefs. On the one hand, botánicas have become "hypervisible," implying a demand for recognition in the public space. This is reflected in their colorful window displays and services openly promoted on billboards, newspapers and social media. On the other hand, they conceal certain religious and spiritual practices in order to shield themselves and other immigrants from punitive state surveillance—which has dramatically increased during the Trump Administration.

Puertas afuera (outdoors) and *puertas adentro* (indoors) epitomize botánicas' innermost predicament as they navigate border-crossing religious discourses and practices. While *puertas afuera* these dispensaries advertise the use of healing herbs and plants for minor ailments (e.g., rue for fertility problems or valerian root for *nervios* or nervs); *puertas adentro* they display a complex spiritual world that is mainly shared with religious followers and trusted patients. In this way, botánica providers are able to merge and conciliate different religious-healing explanatory models while protecting themselves, and other immigrants, from unnecessary public attention. The latter is crucial given the increasing harassment experienced by vulnerable immigrants (i.e., mostly the undocumented) and those who ascribe to non-mainstream religious-healing systems (such as Santeria). In the conclusions, this paper reflects on the theoretical implications of these tactics of religious (in)visibility embraced by diverse immigrant groups in the global city.

Jóvenes Cineastas y Circulación De Contenidos Audiovisuales En Plataformas Digitales: ¿Surgimiento De Nuevas Estrategias?

Este artículo busca comprender las estrategias de circulación de productos audiovisuales brasileños en plataformas digitales propuestas por cineastas que comenzaron sus carreras en la década de 2000, especialmente aquellas cuyas producciones fueron financiadas por políticas y programas cuyos objetivos discursivos se centraron en expandirse acceso a la cultura y diversidad cultural. Analizamos las trayectorias de estos cineastas y cómo su producción se articula y circula a través de plataformas digitales. En la relación ambigua del desarrollo de la industria audiovisual brasileña, las políticas específicas para el sector y los grupos y colectivos que producen sus contenidos, nos gustaría entender cómo surge el surgimiento de nuevos grupos, colectivos y movimientos socioculturales que se autodenominan periféricos, subalternos, decoloniales o cuestiones contrahegemónicas y cómo se articulan en redes de apoyo transnacionales desde reuniones en festivales o ideas para establecer estrategias para la difusión de sus productos. Además, el tema de la circulación, difusión y distribución de contenidos audiovisuales merece mayor discusión. Aunque la producción de contenido audiovisual necesita técnicas, artefactos y tecnologías a las que no todos tienen acceso y, por lo tanto, necesita promoción, el número de películas producidas en Brasil ha aumentado. El aumento en el número de películas se puede ver en el aumento de productores, grupos y colectivos que pueden participar en las políticas de acceso a la producción. Sin embargo, existe una mayor limitación en la participación de mercado como distribuidor de películas, por ejemplo. ¿Qué prácticas de circulación en plataformas digitales proponen estos cineastas? ¿Cómo se articulan con los mercados y cómo los mercados se apropian de estas prácticas?

VILLA LEVER, LORENZA* (Universidad Nacional Autónoma de México, Mexico)

Los Jóvenes Universitarios De Grupos Vulnerables: Anticipación y Desarrollos De Futuro En Contextos De Desigualdad

La educación superior es considerada un importante insumo para imaginar el futuro. Pero en contextos de desigualdad vale la pena preguntarse cómo es vivida la incorporación a ella por parte de grupos vulnerables: pobres, indígenas o mujeres, por citar algunos. Es común que los jóvenes universitarios y sus familias asocien a la educación superior con la posibilidad de alcanzar "una vida mejor". Asimismo, se puede decir que hay entre ellos un cierto grado de concenso sobre el hecho de que las decisiones que tomen en este periodo de la vida tendrán repercusiones importantes para configurar su futuro. Por eso, interesa indagar la manera en que los jóvenes universitarios anticipan los potenciales desarrollos de futuro con base en las decisiones que toman, para transformar los posibles peligros en riesgos manejables. Para ello es necesario preguntarse: ¿Cuándo ingresan a la educación superior, a qué aspiran las y los jóvenes pertenecientes a grupos vulnerables? ¿Cuáles son sus anhelos y cómo son modelados en su paso por la institución en la que estudian? El hecho de estudiar la licenciatura o la maestría ¿orienta de manera diferente sus aspiraciones de futuro? Lo anterior se tratará de responder con base en una encuesta ya aplicada a estudiantes de tres programas universitarios diferentes, en seis distintas instituciones de educación superior, en Ciudad de México y Guadalajara.

VILLACIS, BYRON* (UC Berkeley, USA)

Population Censuses in Crisis: The Cases of US, Brazil and Ecuador

Population Censuses are sociotechnical objects product of practices within and between political contingencies. These procedures –publicized as open and democratic while in practice are closed and technocratic– start long before the production of population indicators. They follow complex and tangled bureaucratic courses of action involving public servants, consultants, politicians, activists and journalists. This implies that their outcomes are influenced by power inequalities and conflicts for economic, symbolic and political capital. Consequently, the objectivation of censuses and their indicators requires the objectivation of its diversities, contradictions and controversies, as well as points of encounter.

The 2020 census round exposed an opportunity to study these struggles. Three countries faced exceptional political interventions, allowing an investigation of regularities and asymmetries. Since 2018, Trump's administration attempted to include a citizenship question in the census, putting in danger its coverage and quality. The intervention opened a battle in the legal field where pro-immigrant organizations played a crucial role. Since 2019, Brazilian President Bolsonaro intervened the Brazilian Institute of Statistics nominating a Director who ordered a dramatic cut of the questionnaire in the name of austerity. Worker's unions and activists defended the institution, facing the resistance of a section of bureaucrats inside the institute. Since 2018, Ecuadorian's President Moreno dismantled the public system of statistics, provoking that the census depends on international organizations.

This paper shows the results of a systematic comparison between these countries through in-depth interviews, methodological documents, archival methods and media reports. It shows the mechanisms behind interventions and how local forces reacted. It reveals the role of institutions at the time of defending public assets and exposes the consistent participation of international experts when justifying homologations, frequently misjudging local demands. More broadly, it helps to understand the sensitivity of these sociotechnical devices, which, at the time, change the configuration of social imaginaries.

VILLACIS, BYRON* (UC Berkeley, USA)

The Role of NGOs in the Construction of Anticorruption As a Dimension of Development

Corruption, as a dimension of concern of development, emerged in the 1990s due to the popularization of country rankings based on perceptions. These measures were accompanied by ideological prescriptions designed to normalize governments in the Global South, historically affected by weak institutions and fragile models of development. Non-Governmental Organizations promoting the use of these rankings belonged to fields with institutional motivations, constantly accumulating political and symbolic capital. In the same way, countries where anti-corruption policies were applied recurrently shaped this knowledge through cultural and institutional channels.

Through in–depth interviews, prosopographical analysis and in-situ archival research in Germany, Brazil and Ecuador I investigate the emergence of corruption as development concern in Brazil and Ecuador through the arrival and constitution of European anti corruption NGOs. Preliminary results show that corruption and its materialization as development concern produced: (1) the expansion of

transnational political fields, (2) the emergence of an international network of elite experts, and (3) dissimilar understandings of corruption, which are locally instrumentalized under political interests. Consequently, in some cases corruption concerns provoked social mobilizations; in other cases, they were passively acquiescent with the political establishment.

The interviews also reveal how the network of anti-corruption experts (1) pay more attention and interest to the expansion of professional networks influenced by political and corporative interests, and (2) tend to underestimate or ignore unethical practices of agents related to the members of the network. Finally, a detailed analysis of the network of experts in anti-corruption exposes their convergence in terms of type of education, connection with key international organizations and their understanding of corruption as a homologous and measurable concept, capable of being inserted in formulas of development. The paper brings into light how experts construct components of development and how contingent is the notion of corruption in the Global South.

The Entity-Ness of Decisions: Taking Agency Seriously in Organizational Decision-Making Studies

Historically there has been a discussion about the differentiation between action and decision (i.e. Mintzberg & Waters 1990, Chia 1994). In organizational literature, and particularly in decision-making studies, these terms have been sequenced, i.e., first the actor (e.g. individual, group, organization) decides and then acts (e.g. Simon 1960, Mintzberg, Raisinghani & Théorêt 1976), or else, first acts and then retrospectively rationalizes the process as a decision (e.g. Weick, Sutcliffe & Obsfeldt 2005). This controversy led the field to a fruitless debate, without noticing that the very understanding of action and decision had problems in their assumptions (Chia 1994, Tsoukas 2010). In this theoretical paper, we problematize the agency concept employed by well-known decision theories by rescuing Dewey and Bentley's levels of inquiry, namely self-action, inter-action and trans-action. Based on the trans-action perspective, our objective in this paper is to propose an understanding of the decision as a relational element of/ for the action. Therefore, we articulate an explanation based on the relational understanding of reality (Emirbayer 1997). In this perspective, the action ceases to be an intentional result of the rational, non-problematic and reflective human actor. And so, it is understood as an effect of the system of relations (Emirbayer & Mische 1998) of multiple and heterogeneous participants distributed throughout time and space (Latour 2005, Sayes 2014). As a contribution, we combine the processual dimension (fluid, ongoing and temporally and spatially distributed) with the performative dimension (decision as a hybrid entity) of decision and suggest the concept of decision entity-ness (see Abbot 1996). Through the proposed theoretical and explanatory framework, we can explore the decision in organizational studies given the centrality it occupies in organizational reality (Laroche 2014, Ahrne, Brunsson & Seidl 2016), without breaking with the relational ontology in question and respecting the complexity required for theorization (Tsoukas 2017).

A Brazilian Perspective on International Drug Trafficking, Women Mules and Human Trafficking

The research seeks to analyze treaties and national laws aimed at protecting victims and criminalizing the perpetrators on the topics of international drug trafficking and trafficking in persons, as well as highlight the gender vulnerability existing in both scenarios. Thus, it addresses the aspects of human rights, globalization and epistemologies of the South to show how the crimes are being discussed in Brazil. In order to examine the situation of women who are victims of the international drug trafficking as mules, the Resolution 52/1 of the United Nations will be studied to put in evidence the gender issue, demonstrating that the involvement of women in trafficking points to their vulnerability. In addition, with regard to human trafficking, the important role of the Palermo Protocol, ratified by the Brazilian government in 2004, should be mentioned and explained. As a complement, informations will be presented on the topics provided mainly by the Brazilian Government and other national authorities, the United Nations, with special focus on the United Nations Office on Drugs and Crime (UNODC), and the International Labor Organization (ILO), as well as representatives of national and international third sectors organizations, such as the Global Alliance Against Traffic in Women (GATTW) and the Brazilian Association for the Defense of Women in Childhood and Youth (ASBRAD). In order to achieve the abovementioned results, documentary and bibliographic research with a descriptive character will be made, combined with the use of the inductive method for its main conclusions.

Far-Right Narratives Against Public Universities in Brazil: An Analysis of How Social Media and Governamental Attacks Have Been Articulated

Public universities and science have been under aggressive attack since the far-right former army captain Jair Bolsonaro assumed the presidency in Brazil, in January 2019. Government mesures go from budgetary contingency to investigations and moral offensives. The political discourse, highly delivered through social media, has multiple repercussion, reproduction, reinforcement and amplification by different groups. In spite of sounding an univocal speech for university delegitimization, we argue that it is composed by different interests and values that should be analyzed in depth in order to provide better understanding of the political moment. Based on a data set of twetts of federal government political authorities around the restrictions on university budgets and research grants, as well as on its reverberation on news and social media, this paper identifies the actors present in the dispute and their narratives. Recognizing points of convergence and divergence within these narratives, we pretend to contribute to building puzzle of the meteoric growth of the far-right in Brasil.

VILLETTE, MICHEL* (AgroParisTech, France)

Conclusions Principales D'une Enquête Sur Les Grandes Entreprises Marocaines Réalisée En 2019

Dans un pays où la productivité des facteurs de production (travail et capital) est relativement faible, les entreprises ne sont profitables que tant qu'elles bénéficient de la protection de la coalition dominante qui contrôle l'appareil d'Etat, c'est-à-dire, le Makhzen et ses alliés. Une telle protection est une condition nécessaire mais non suffisante pour qu'une entreprise puisse croître et durer.

Une seconde condition de la prospérité des entreprises est leur connexion avec des multinationales ou des investisseurs étrangers qui apportent les ressources qui permettent d'améliorer la productivité des facteurs de production (expertise, management délégué à des expatriés, financement, technologie, débouchés commerciaux, crédibilité sur les marchés...). Ces connexions permettent aussi aux dirigeants des entreprises de contrebalancer les tendances de la coalition dominante qui contrôle l'appareil d'Etat à abuser de son pouvoir. Ainsi, les liens capitalistiques avec des investisseurs étrangers peuvent permettre, dans une certaine mesure, d'éviter les spoliations auxquels se livrent régulièrement des membres de la coalition dominante.

En principe, l'activité économique du pays est régie par les mêmes règles que celles qui ont cours en Europe de l'Ouest et aux Etats Unis). Cependant, la mise en oeuvre effectives des lois et règlements d'inspiration libérale relève de décisions arbitraires sans lesquelles ces lois et règlements restent lettres mortes.

Qu'il s'agisse des milieux d'affaires, de la haute administration ou des universitaires, que l'on soit soutien du régime ou contestataire, l'importance cruciale du patronage et du clientélisme dans la vie des affaires marocaines est un lieu commun. On en tient le plus grand compte dans la pratique, c'est un élément essentiel dans la stratégie des entreprises. Lorsque le sujet est abordé publiquement, c'est toujours pour signaler les mesures nouvelles, prises ou à prendre, en vue d'éradiquer ce phénomène.

VINHAS, OTÁVIO* (University College Dublin, Ireland)

The Meanings of Jair Bolsonaro's Stabbing: An Online Sociocybernetics Network Analysis on Twitter

One of the most prominent events during the Brazilian presidential election of 2018 was the "stab" suffered by the representative from the Social Liberal Party (PSL), Jair Bolsonaro. Since the moment it was noticed, a multitude of social interactions instantly emerged on online social networks in order to address the complexity of the event. Following a sociocybernetics' perspective (Almaguer-Kalixto & Giglietto, 2019), we observe this phenomenon as associated to a wider context, in which contemporary complex society is characterized by the instability surrounding the concept of "truth" as an uncontested social construct (Altmann & Peters, 2018). Thus, we propose a methodology that combines the theoretical framework presented by the cultural network analysis (Fuhse, 2009) to the research model developed by the online social network analysis (Recuero, 2017). Following this approach, our research focus on the communication dynamics developed on Twitter, and how the social interactions through online social networks constantly produced meanings related to the "stab". More precisely, our main objective is to describe, comparatively, how the interactions on Twitter signified the "stab" during the occurrence of three different events associated to Brazil's political context: 1) the day of the stab (06/09/2018); 2) Jair Bolsonaro's presidential inauguration (01/01/2019); 3) the period when Jair Bolsonaro was hospitalized due to the

stab (01/28/19 to 01/30/2019). For this purpose, we analyzed a dataset of 41,413 messages (tweets), collected directly through the Twitter API using the software NodeXL. Through a second order observation (Luhmann, 2006), we verify how certain meanings emerge overtime, while others tend to disappear. Hence, we describe how themes such as post-truth and disinformation are related to the semantic overflow enabled by digital media, such as Twitter. Finally, we suggest the emergency of a paradigmatic transformation on the communication forms in which society deals with complexity (Bastos, 2013).

VINSON, ALEXANDRA* (University of Michigan, USA)

"Values Talk" in Healthcare Systems Change

Coordinating the action of group participants is a challenging task that draws on organization-specific forms of social control and organizational culture. However, this challenge becomes even more complex when the group is composed of multiple stakeholders, is a newly formed group, or is going through organizational change. In this paper, I discuss how several condition-specific healthcare collectives with all three of these features create cohesion and common purpose through the mechanism of "values talk." "Values talk" refers to an explicit organizational practice of naming key group values, associating the values to particular group events, and appointing different members to explicate the meaning of those values and the application of the values to the group's current activity. "Values talk" also includes elements of social control, as the action of members can be redirected using group values as a rationale. The data for this paper come from a multi-sited institutional ethnography of four condition-specific, multidisciplinary healthcare groups in the United States, as well as the Coordinating Center that is leading these groups through their organizational change.

VINSON, ALEXANDRA* (University of Michigan, USA)

The Scholarly Renaissance in the Sociology of Medical Education

The medical profession continues to grapple with the crisis of confidence that began in the 1960s and continues today. On a structural and macro-sociological level, it appears evident that the medical profession has lost autonomy, stature, and cultural authority. This is due to various factors beyond public mistrust; the democratization of healthcare information via the internet and the resurgence of complementary and alternative medical providers are other important contributors to the profession's loss of monopoly over healthcare provision. However, a crucial insight into the reproduction and perpetuation of professional groups is that they do not simply take their losses and move on. Rather, research has demonstrated that medical professionals find creative ways to maintain autonomy, authority and status, if not on a structural level, then on an interpersonal level. But how can this insight be demonstrated? Drawing on a renaissance within sociology of studies of medical education and professional socialization, as well as original empirical data, I will show how ethnographic approaches to medical education expose important aspects of medical culture that lead to a greater understanding of the preservation of professional authority as part of the cultural reproduction that occurs in professional socialization.

Sensibilidades, Violencia e Historia Reciente: Un Análisis De Las Dinámicas Sociales y Afectivas De La Violencia Letal En La Novela De Fernando Butazzoni

Fernando Butazzoni estudia las décadas de finales del siglo XX, colaborando en denunciar los olvidos de un período signado por la violencia de Estado. Extremando los recursos de la imaginación, ahonda simultáneamente en el abordaje de la verdad y su novela tiene carácter de testimonio. Aporte clave a la historia reciente, su obra consolida la posibilidad de reconstruir la verdad, contribuye a desarmar los usos del olvido y colabora en la construcción de la memoria colectiva a través de novelas que recrean las marcas del pasado reciente en los recuerdos, los testimonios, los relatos, el imaginario y el cuerpo. El autor, ha buscado revalorizar una de las posibilidades de la literatura que es la de impedir que lo que es verdadero quede oculto debajo de lo que aparece como "real". Es en este sentido que su obra reivindica la dimensión política de la reescritura de los acontecimientos y el posicionamiento del texto dentro de un relato aún en debate.

A través de dos de sus novelas, "Una historia americana" y "Las Cenizas del Cóndor", analizaremos las dinámicas afectivas y sentimentales que unen a los personajes. Centrados en la construcción social de las dinámicas del odio, el sufrimiento, el temor, el amor y la confianza, tal como aparecen en las dos novelas, abordamos la obra a través de una sociología de las sensibilidades. Ello contribuirá a focalizar, en el conflicto y su reconstrucción, las dinámicas expresivas que habilitan la emergencia de una violencia letal en contexto político. Recuperando la crítica, la reconstrucción política de la realidad y la búsqueda de la verdad

que el trabajo de Butazzoni permite, estaremos en condiciones de preguntarnos por las dimensiones ontológicas de la violencia y sus rastros estructurales para profundizar en una sociología del conflicto a través de la novela latinoamericana.

VISCARDI, NILIA* (, Uruguay)

Territorio, Jóvenes y Castigo En Uruguay. Justicia De Adolescentes y Control Policial En Los Barrios Vulnerables De Montevideo

Uruguay continúa siendo el país de América Latina que mayor tendencia tiene a privar de libertad a adolescentes y jóvenes. Aunque sus índices relativos son bajos para la región, en los territorios vulnerables de la ciudad de Montevideo se verifican dinámicas de violencia similares a las de los países más violentos del continente. Nos proponemos explicar en qué medida las prácticas punitivas y represivas de las instituciones de control social y de justicia colaboran en la radicalización de la violencia vivida por adolescentes y jóvenes de esos territorios.

Con la idea de abordar el proceso social de construcción de la violencia institucional, caracterizamos primero las visiones que tienen los agentes policiales que se dedican a tareas de patrullaje de los adolescentes pobres. Asimismo, analizamos las características fundamentales de la violencia policial en Uruguay. Los datos muestran evidencia significativa respecto de los procesos de etiquetamiento de adolescentes y jóvenes pobres y de exceso en el uso de la fuerza por parte de la policía, colaborando en el aumento de la letalidad policial en el país.

En segunda instancia, analizamos las prácticas del sistema de justicia adolescente, con particular énfasis en el estudio de las dinámicas que entorpecen la puesta en práctica de medidas alternativas a la privación de libertad. Abordamos las visiones de los operadores del sistema, el dispositivo institucional de atención a la infancia, la formación de jueces y fiscales y el rol de asistentes sociales y psicólogos en los tribunales especializados para explicar los motivos por los cuales la privación de libertad se consolida como práctica de rutina, aumentando la violencia sufrida por los adolescentes vulnerables en conflicto con la ley penal. Aquellos que, precisamente, viven en los territorios en que la experiencia de la cárcel colabora en radicar sus violencias.

VISSING, YVONNE* (Salem State University, USA)

Relationship between Social Structure and Willingness to Embed Human Rights Education

This paper explores the relationship between the social structure of a state or community and its willingness to embed child/human rights and human rights education. It focuses on United States data in 50 states and its relationship to both child rights and human rights. It is hypothesized that there is a reciprocal relationship between how a community is structured and the degree to which it embeds child and human rights into its cultural climate and institutions. A multivariate analysis using secondary data sets of indicators, including well-being, crime, support for education, poverty and other indicators will be tested in relation to child rights and well-being standards. Data will focus on how some areas are designed to be more, or less, supportive of human rights. Factors will be identified that are worthy of alternation in order to promote better human rights education and treatment.

Cooperation and Competition between Public and Private Sectors in Active Labor Market Policies' Local Implementation: Enterprises' Role. First Evidence from Lombardia and Emilia-Romagna

Despite the entry, alongside the public employment services (PES), of numerous private actors and the attempt to improve the coordination of services dedicated to employment policies and the passage of the PES to the regions (Legis-

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

lative Decree 150/2015), what can be seen from the Unioncamere data (2019) is the constant difficulty that companies have, in mobile and constantly changing labor market, in finding particular professional figures, because often characterized by transversal skills, often not related to coded ones. Although the data of Unioncamere show this mismatch between supply and demand, they do not tell us why this occurs and few studies focus on analyzing the relationships between the enterprises and the labor intermediary. Therefore, it becomes interesting to frame, by adopting a street-level perspective, the relationships that bind companies and labor intermediaries. This contribution, therefore, aims to analyze labor policies and, in particular active policies, from a multi-level perspective. It is in fact at the local level that the effective implementation of the policy takes place. In this context, labor intermediaries play a central role in shaping regional development. To try to answer, two Italian regions in particular are examined: Lombardia and Emilia-Romagna. The choice of these two regions lies in the fact that they represent, within a geographic macro-area with a dynamic labor market,, two different models in the offer of employment services: a quasi-market regime of the public service offer (Lombardia), collaboration and integration between public and private (Emilia-Romagna). The research question is the following: how does the different institutional nature of the region affect the research mechanisms of companies and the requests made to labor intermediates? And how does the street level bureaucrats guide how the policy is implemented?

VITALITI, JOSÉ* (CONICET, Argentina)

Pobreza y Desigualdad Social En Torno a La Infancia Institucionalizada En Los '90.

La década del 90 en Argentina, estuvo marcada por la pobreza y se intensificó en especial en los niños/as. Según se informaba desde la Secretaría de Desarrollo Social, el 45.3% de los chicos del país menores de 5 años vivía en hogares pobres y sobre un poco más de 10 millones de menores de 14 años, había 4.5 millones que vivían en hogares pobres e incluían a casi 1.4 millones de indigentes (Rappaport, 2010). La desigualdad social imperante debido a la precarización laboral y falta de empleo, inducía a las familias a buscar diferentes estrategias de supervivencia que permitieran lidiar con la cotidianeidad empobrecedora.

A su vez, las instituciones de infancia tenían significativas cantidades de ingresos de niños/as debido a diferentes motivos de internación. Así es como en la provincia de Mendoza las medias de ingresos comenzaron a tener los mismos números que entre los años 1988-1990 cuya etapa estuvo marcada por la hiperinflación que derivó en entrega anticipada del poder político nacional.

En el presente trabajo nos proponemos indagar en las causas del ingreso por internación de niños/as en la provincia de Mendoza entre los años 1995 al 2000. Con este fin, profundizaremos en casos de niños/as internados, reconstituyendo los mecanismos burocráticos, los documentos profesionales y las comunicaciones interinstitucionales hasta el momento en que es dado de baja. A su vez, repondremos los atravesamientos sociales, políticos e institucionales a fin de comprender las causas propias del ingreso. Por último analizaremos las dimensiones que operan a nivel familiar para internar a un/a niño/a o a un grupo de niños/as, la situación laboral a escala centro periferia y las motivaciones en razón de la decisión, si hay tal decisión a nivel parental.

VITE PEREZ, MIGUEL ANGEL* (Universidad de Alicante Spain, Mexico)

Ilegalidad y Castigo En La Convivencia Juvenil Mexicana

El objetivo de la ponencia es interpretar el resultado de una intervención policiaca realizada en un bar de reunión y diversión juvenil (llamado el *"News Divine"*) contra 350 jóvenes, el 20 de junio de 2008, en la colonia Nueva Atzacoalco, localizada en la alcaldía Gustavo A. Madero (Ciudad de México), donde murieron 9 jóvenes (entre 14 y 29 años) y tres policías (20, 55 y 65 años). Pero para cumplir con el propósito establecido, en la elaboración de la interpretación de ese hecho social, se usaría la idea de dispositivo manifestada como una relación de poder violenta (Agamben, 2016), por un lado, y por el otro, recurriendo al desfase existente entre la infracción de normas o leyes y el consecuente castigo, es decir, analizar cómo ese desfase ha generado situaciones de ilegalidad que no sólo se concretan en el encierro penal, sino en la justificación de acciones violentas que vulneran los derechos humanos de los que han sido transformados en supuestos infractores, desde las instituciones penales estatales (Fassin, 2017).

Al mismo tiempo, el análisis del hecho particular se acompañaría de la construcción de una explicación que es una realidad de cómo en México se ha ido consolidando una representación social que liga los diversos tipos de ilegalidades con las acciones sociales criminales, lo que ha legitimado, desde una perspectiva general, el llamado vigilantismo, ante la multiplicación de grupos armados regionales, que buscan impartir la "justicia propia", lo que ha sido tomado como una supuesta evidencia para argumentar que es una realidad la erosión del monopolio de la violencia legal del Estado, lo que debe de ser cuestionado porque la legalidad y la ilegalidad son parte de un proceso social.

VITTI, GUSTAVO* (UFRJ,)

Coloniality and Extractivism in Post Mining Disaster Contexts in Brazil

This paper relates two central concepts to understand the reality of power relations in southern countries: coloniality and extractivism. It aims to discuss the permanence of coloniality dimensions in the contemporary period and their relations with the extractive sector. The practices of power in the colonial project have been permeated by relations of pacification, coercion, and protection. We could observe the continuity and modifications of these practices in the corporate actions and policies of the mining companies nowadays through actions as "social risk management" and "indirect government". There are forms of control in how extractive companies manage the conflicts and the actions and subjectivities of the communities affected by their projects. We focused on the analysis of the Brazilian mining industry before two post-disaster scenarios: Mariana and Brumadinho, both in the state of Minas Gerais. We observed the forms of action of the different actors involved (mining companies, government, and social movements) and compared the mechanisms of power and the consolidation of governance structures in these two different disasters. We conclude that the practices and actions of mining companies and the government present dimensions of the permanence of colonial practices updated in the context of neoliberalism.

Fake News As a Tool for Aggravating Mistrust in Political Institutions in Latin American Countries

The last Brazilian presidential elections marked a turning point regarding the use of social networks in Latin American politics. Nevertheless the use of Fake News within Latin American politics is increasing, especially in the perspective of the new regional electoral cycle. Even if the use of Fake News has particularities in each country, they usually have been used to discredit opponents and institutions in order to gain support for a particular politician or cause. The question that emerges from this panorama is if the Fake News are the cause of the renewed discredit of Latin American politics or if they are the result of a long-standing political processes of democracy's discredit? Our hypothesis is that Fake News reflect the mistrust that Latin American have in their institutions. In that sense, from the perspective of political culture, we propose to analyze Fake News as a form of virtual expression of an existing political culture in the region. The dissemination of false content in social networks is a way in which Latin Americans express their values and attitudes in relation to their institutions, and in general about their society. Based on the data of the last wave of the World Values Survey, comparing Latin American countries, we can see how the positions of frustration with democracy, dissatisfaction with politicians, tiredness with corruption and the defense of traditional values of order, authority and family seem to have favored the dissemination of content that reaffirmed those beliefs. The preeminence of these values, paired to the increase in the use of social media and digital media over traditional channels of information (TV, radio, newspapers) have contributed to the success of Fake News as a political tool in Latin American Politics.

Hybrid Political Culture As Breeding Stock for Fake News in Brazil: New Tools, Old Phenomenons

Fake News erupted in the Brazilian political landscape during the 2018 presidential election, but the processes that led to the conditions of their success run way deeper in Brazilian History. This kind of news seems to be a symptom of a degrading relationship between brazilian citizens and politics. The success of fake news has its breeding stock in the distrust between Brazilians and their institutions and a growing dissatisfaction with democracy, both characteristics of a hy-

brid political culture. Thus, based on a longitudinal analysis of the data available in the World Values Survey - Brazil, the objective of this study is to reconstruct the evolution of the hybrid characteristics (a general support for democracy but also authoritarian attitudes) of the political culture of Brazilians. Our hypothesis is that Fake News success appeal to characteristics of the local political culture adapting their contents to these characteristics. For this purpose, we will also use data gathered from social networks and fake news revision websites in order to show these correspondence between Fake News discourses and Brazilian values. In that sense, we state that even if Fake News are in part a product of technological advances, the main components for its boom were already present within Brazilian society.

VOIGT, LUCAS* (Federal University of Rio Grande do Sul (UFRGS), Brazil)

Memory Institutions of German Ethnic Elites in Southern Brazil: Social Consecration, Ethnicity and Legacy

This PhD research, at a development stage, seeks to analyze the strategies of social consecration of German business elite families in Southern Brazil, through the formation of "memory spaces", such as museums, memorials and memory centers. As studies on elites have highlighted, self-assertion, self-legitimation and social consecration of elites in the most varied social spheres depend on specific strategies and a consequent investment by the ruling groups. In this context, the social uses of memory gain projection and centrality. Thus, this research proposes an analysis of the strategies of social consecration of German business elite families – that is, families of entrepreneurs linked to the processes of immigration and settlement in Southern Brazil –, through the investment in the spheres of culture, memory and history, by the institutionalization of the trajectory and the "legacy" of "pioneer" entrepreneurs in branches of commerce and industry, through the establishment of "memory spaces" destined to the consecration of such agents. The research, of an interdisciplinary nature, is based on the fields of the sociology of elites and memory, combining reflections from the fields of anthropology and history, especially anthropology of things/objects, material culture and public history. For the empirical analysis, three memory institutions are considered: the Carl Hoepcke Institute (Florianópolis, Santa Catarina), the Hermann Hering Foundation (Blumenau, Santa Catarina) and the Richter's Hof (Forquetinha, Rio Grande do Sul). The discussion allows, so far, to draw some conclusions: the imbrications between family and business memory and the experience of "German-Brazilian" ethnicity; the discursive emphasis on the "pioneering" and "entrepreneurship" as the "legacy" of the patrons of the memory institutions; the role of the memory institutions in the production of images and representations for the cities in which they are located, a process influenced precisely by the conceptions of ethnicity and legacy produced by these institutions.

The Welfare Pinball-Machine: Institutional Categorization of Migrant Clients in the Norwegian Labour and Welfare Administration

The main task of the Norwegian Labour and Welfare Administration (NAV) is to help unemployed people get (back) into employment. About thirty percent of NAV's clientele have migrant background. Due to this high percentage, clients with migrant background are a prioritized group in NAV. The share of migrant clients that succeed in getting employment nevertheless remains low, and a larger number of this group end up having to rely on means-tested and restrictive social service benefits on a permanent basis. In this paper, we use institutional ethnography to explore these institutional processes, through street-level caseworkers' work with migrant clients. Data consist of five-month ethnographic fieldwork at a frontline NAV-office. We map out the different ruling relations that come into play in the caseworkers' categorization work, through an inquiry into the knowledge and practices of caseworkers. In their work, the caseworkers operate amid several different policies, such as formal and informal divisions between teams, as well as regulations and criteria for different benefits and measures. In this institutional complex, the caseworkers have to categorize the clients based on what they perceive to be the clients' challenges. In this work, the caseworkers seem to make use of different policy texts and labels to *bounce* several of the cases involving migrants through the system. The caseworkers categorize several of the migrant cases as pertaining difficulties with *language*. However, our findings show that *language* is not as straightforward as the clients not speaking Norwegian, and might conceal other aspects of the case. Moreover, due to policy restrictions, the label *language* disqualify the clients from several benefits and measures. This institutional categorization of migrant clients thus enable the accumulation of migrant cases in the office's *drain*. By mapping the institutional relations at play in this categorization work, our findings have implications for policy and practice.

VOLI, STEFANIA* (University of Milan - Bicocca, Italy)
MAINARDI, ARIANNA* (University of Milano-Bicocca, Italy)

Speaking from the "Margins": Notes for an Intersectional Investigation in Youth Studies

Traditionally, youth studies has assumed that young people's relationships with the world are gender neutral, failing to question both masculinity (as a taken-for-granted way to experience public space) and the fact that girls' and LGBTQI+ subjectivities have been overshadowed. Furthermore, little attention has been paid to gender as a space of struggle and negotiation, and to its intersection with other vectors of inequality that affect the young people's in/exclusion from public space. Only certain feminist analyses of girls' political participation have shed light on the partiality of "youth experience", traditionally defined.

By connecting youth studies (and participation) and gender knowledge, this paper aims to contribute to the debate that seeks to define the relationships between gender and youth political participation, building on two empirical studies: the political participation of Muslim girls in France and youth trans experiences of subjectivation through body and gender in Italy.

The experiences of the Muslim girls question the rhetoric about the absence of girls' participation, and interrogate the gender order from an intersectional perspective – where colour, class, and religion are contested spaces that produce new repertoires of action, while, trans experiences demand a reconceptualization of bodies and genders in public space and citizenship.

These 'marginal' experiences, previously overlooked but nowadays more visible on a global scale, also thanks to an insurgent political subject who defines itself as intersectional and transfeminist, highlight gender as space of political subjectivation, and as a crucial dimension to claim rights and define new forms of participation. Our thesis is that these experiences represent an element of major importance in the debate around the new configurations – political, theoretical, and methodological – of (youth) action, in public space as well as in the margins of some of the categories, traditionally at the heart of youth studies: citizenship, participation, transition.

SHMATKO, NATALIA (National Research University - Higher School of Economics, Russia)

Digitalization of Research Activities: Assessing Basic and Advanced Computer Skills of Russian Researchers

Digitalization has significantly affected professional activities of the scientists; many research tasks now require the use of special information technologies and software products. The knowledge of statistical and data analyzing software, abilities to work with electronic databases, libraries, archives, to visualize research results and many other digital skills are already become basic requirements from the researchers. Digital skills of Russian Doctorate holders working for R&D organizations are examined within the framework of the project "Monitoring survey of Highly Qualified R&D Personnel". The sample included representatives from all fields of science, both from academic sector (research institutes and universities) and non-academic sector (industrial and service sector companies). The purpose of the study is to find out to what extend Russian researchers are familiar with modern digital terminology, how they evaluate their own level of proficiency in working with different software, and what digital skills they require to perform their work activities. The list of modern digital technologies and various special software tools was proposed for the assessment. The professional activity of most Russian researchers is associated with the regular use of basic computer skills, but advanced data analysis tools are not always common. Survey results show the potential for improvement of researchers' digital skills. The number of digital tools and technologies are relatively well-known, but have not yet found widespread practical application. For example, about 40% of researchers know about neural networks, but only 14% use them in their work. Significant part of Russian Doctorate holders have practiced in improving their digital skills on their own, with the help of colleagues or by taking part in various computer courses.

Who Wants to Become a Teacher?

In Argentina there are multiple educational challenges: among others, access to education, school trajectories and quality measured through standardized tests are uneven. In addition, the results of international assessments are below those of neighboring countries.

The literature agrees that teachers are a key actor in improving educational systems and that the initial recruitment of teachers is an important stage in the

607

denotes a presenting author. Abstracts are organized by first presenting author's last name.

improvement process. In the City of Buenos Aires, the focus of this study, there is a decrease in the number of aspiring teachers while there are low salaries in the profession.

This article aims to describe the socioeconomic profile of those students who, at age 15, expect to become teachers when they are 30 years old, and to calculate the probability of teaching as expected occupation according to individual and context variables in the City of Buenos Aires. In order to do this, I analyze the PISA student and school questionnaires through a quantitative approach. The results show that women coming from low socioeconomic and cultural backgrounds who study in public schools and whose mothers also work as teachers have a higher probability of expectation to teach.

Southern Childhoods: Field Perspectives from South American Countries' Production

The development of social studies of childhood field in South America is part of a multiple and unequal social scenario, regarding the political and economic conditions of this continent countries. Considering the results of two researches on the sociology of childhood in South American countries (FAPESP 2013/23337-0; CNPq 400829/2010-0), this paper presents researchers and investigations of the region, highlights local scenarios issues, and identifies regional approaches and characteristics that shape the childhood plurality in South American countries, which call for different research projects.

In this sense, we seek to discuss theoretical and methodological aspects of research in the South and to question the concepts of the field produced by the European and North American matrix, which may not account for certain socio-cultural contexts, or that need to be problematized in relation to these contexts, instigating a dialogue between South and North. It is noteworthy that the production found, besides the academic aspects, is concern about the elaboration of a political agenda that guarantee children and adolescents' rights.

VOLTERRANI, ANDREA* (University of Rome Tor Vergata, Italy)
CECCHERELLI, ALESSIO (University of Rome Tor Vergata, Italy)

The Role of Communication in Preventing the Risk of Radicalisation of Second-Generation Young People of the Muslim Religion. Results of a European Project Oltre

The paper presents the first results of the analysis on the application of the four phases (prevention, knowledge, incorporation, change) that compose the communication model of social problems and prevention (Volterrani, 2019) within the "Oltre" project (funded by DG Home of the European Union) whose aim is to prevent the radicalization of the second generation of migrants of Islamic origin in Italy.

The application of the model has been preliminarily focused on the analysis of the phenomenon of radicalization (perception phase) through in-depth qualitative interviews and focus groups in seven Italian cities, together with an analysis of Facebook, Instagram and Twitter profiles. Subsequently, through the Theater of the Oppressed methodology and specific laboratories on social communication, the contents of the prevention of radicalization (knowledge phase) have been deepened. Finally we started the third and the fourth phase of the model (incorporation and change), by the action research methodology and the direct involvement of the recipients of the analysis (second-generation young migrants of Islamic origin) in the communication campaign (Volterrani, 2018).

The results confirm the validity of the communication model, especially for what the perception and knowledge phase is concerned. The last two stages need more time for an adequate evaluation of the impact on second-generation young people.

Nanotechnologies and Their Applications in the Environment:

Between Risks, Self-Regulation and the Ods 12 - Sustainable Consumption and Production

The 21st century is characterized by the emergence of a techno-scientific revolution, driven by advances in nanotechnology products: it is the human possibility of accessing the nanoscale, which is equivalent to a billi on thof a meter. The number of nanotechnology-based products is growing rapidly. According to the Nanotechnology Products Database, we have the following data collected in September 22, 2019: 8,854products, manufactured by 2,289companies, which are located in 60 countries. The main sectors are food, cosmetics, electronics, house hold equipment, petroleum, renewable energy, textiles, medicine, environmental industry such as water, remediation and purification of water, waste water treatment and soil purification, and military use. As Klaus Schwab (2016; 2018) points out, nanotechnologies are at the hear tofth estructuring of the so-called fourth industrial revolution. A great possibility is the application to socio-environmental issues, especially those that are in theobjectivesof Agenda 2030 for SustainableDevelopment, published in 2017 by the United Nations Educational, Scientific and Cultural Organization. Considering the absence of nano-specific regulation, it is intended, from these objectives – that can be placed as ethical references, that dialogue with the structuring elements of Responsible Research and Innovation - propose a model of self-regulation (as studied by Günther Teubner) from the framework to discipline the "risks law", focused on the prospec to fanticipation and risk management in a scenario of probability of future and uncertain damages. It is intended to study and propose a so-called regulated self-regulation, in the sense that the framework will be permeated by the participation of private actors, but with filters or stages of public control, as is the case with the 2030 Sustainable Development Objectives, as an expression of human rights of responsible and anticipatory innovation in relation to risk management, especially ODS 12 – sustainable consumption and production.

RC37-463.4

VON KULITZ, LAYSSA* (Federal University of Rio de Janeiro, Brazil)

Discussing Popular Modernism: Caricature, Graphic Humor and Modern Art in Rio De Janeiro

The city of Rio de Janeiro was the stage of some of the most interesting incursions of the so-called "graphic humor", especially regarding the creations of Millôr, Jaguar, Fortuna, Claudius, Ziraldo and others. Their technical mastery of comics, cartoons, and caricatures gave them a kind of experimental strength that pushed each of these sub-genres to the limit of their artistic features, but more interesting than their visual foray was their relationship with modern art. In 1957 the Art Museum of Rio de Janeiro held an exhibition on Millôr Fernandes in which the reference to the "Affectation that for him was inseparable from the art world" was the central issue. Called Millôr Fernandes: Humorous Drawing, the exhibition was attended by quite an array of distinct characters, the vernissage included Carlos Drummond de Andrade, Di Cavalcanti, Paulo Mendes Campos, Jose Pancetti, Dorival Caymmi, Candido Portinari, Sérgio Porto, among other equally imposing figures. Manifested in the meeting of these representatives of national modernism is the familiarity with Millôr's form of social and artistic critique. This graphic artist from the mainstream press, dissociated with the formal artistic environment, was called to the Rio de Janeiro Art Museum, a project deeply linked to the modernist movements of the time, to start a public conversation about his civilizing project born from the newspaper, which had much to do with the popular character of many of the modernist discourses present in that museum. Rio de Janeiro lived an intense kind of popularization of the modernist discourse, with many authors, critics and intellectuals making use of newspapers to potentialize their progressive view of Brazilian art and culture. This event signaled an important attempt by the carioca art world to broaden their scope and, consequently, to create an ideal of a Brazilian civilization available to everyone.

VRYONIDES, MARIOS* (European University of Cyprus, Cyprus)
PAVLOU, VICTORIA (Frederick University Cyprus, Cyprus)

Globalization and Internationalization of Higher Education: The Case of Cyprus

In the past two decades higher education, amid influences from so-called neoliberal ideologies, expanded in many parts of the world and led to mass participation allowing social groups that were previously excluded to receive a university degree. Neoliberal ideologies have become increasingly influential worldwide and education is now a major factor in the world economy, both as a basis for national economic competitiveness, particularly in the race to develop 'high skills' labour, and as a traded good. On many occasions, however, the rapid growth and expansion of higher education should be seen beyond ideological lenses that revolve around the discussion of neoliberalism. There are at least three inter-related developments in this expansion: (a) The development of a private sector in higher education (b) the parallel development of public institutions with market conditions that usually refer to the imposition of tuition fees, which means that the cost of studies falls to the beneficiaries rather than the taxpayer and (c) the opening up of higher institution to international markets usually by offering English-speaking courses parallel to the courses offered in national languages. This paper will look into the case of Europe and will focus especially in Cyprus where over the past decade saw a rabid expansion of its higher education driven by calls to turn the country into a regional education hub. Using data from official statistics we will examine positive and negative effects of the expansion and internationalization of the country's universities to the economy and society. Findings will show that expansion policies of higher education systems did not necessarily maximize social equality prospects as inequalities persist and are now found in the unequal patterns of choices. Positive effects however, show a successful story whereby the education sector has gradually become a pillar of the country's economy.

WAECHTER, NATALIA* (Ludwig Maximilian University Munich, Germany)

Digital Youth Cultures: Gendered Challenges in Peer Communities

In research it has become widely accepted that online environments have to be considered relevant for young people's social and psychological development. The theoretical concept of "self-socialization" leads to assume that nowadays, young people master socialization and developmental processes in online (media) environments largely independently from adults. Transition theories which focus on challenges that may occur when entering a new life stage further imply that young people have to learn how to fit into online peer communities and how to become a regular teenage user of social media. Based on these theories, this paper investigates the challenges teenagers experience on Instagram and in multiplayer online role-playing games (MORPGs) regarding peer relations and the strategies they develop to overcome the challenges.

Data was collected in the frame of the research project 'The Profiler', funded by the Austrian Ministry of Science, using an explorative, qualitative approach and sampling 36 female and male adolescents, aged 13 and 15, for conducting problem-centered interviews and group discussions.

The results reveal gender-specific challenges in the teenage use of social media. One of the main girls' challenges was producing the "perfect selfie" whereas one of the main boys' challenges was developing strategies that prevent getting insulted through hate speech. The teenagers face gender-specific challenges but share the common goal of becoming accepted in their peer context, of strengthening peer relationships and of constructing peer collectivities. Interestingly, despite individualized social media use and a strong focus on authentic self-presentation, young people routinely use social media for connecting and building relationships with other young people their age. Results suggest that self-presentation and peer collectivity overlap and have to be considered together – as exemplified by the group selfie.

Democracy ,Inequality and Suicide: A Study of Nepal after 2006AD

This paper conduct the qualitative test on the relationship between suicide and democracy in the context of Nepal(2010-2018). This research is totally is tatally based on secondary date provided by the police and the governmental development indicators. Causes of suicide which has categorized into economic, health, education, employment, family matter. After democracy 2006 the suicide rate of Nepal is increasing dramatically. So this research present the argument that democracy is more likely to experience suicide than no democracy in the past.

Suicide is personal, family and societal crises which is generating serious social problem in the world. One person dies by suicide every 40 second somewhere in the world (WHO,2015). Nepal is not far behind from this problem. 4667 cases were recorded in the physical year 2016/2017 AD which is nearly doubled after ten years period. This shows that suicide is increasing tremendously in the context of Nepal. Nepal has declared federal Democratic Republic after the mass movement 2006, which was institutionalized by the constitution of Nepal promulgated through constitutional assembly in 2015. This democracy has not been able to meet the desire of the poor, marginalized and women of Nepal.The unemployment , crime, internation migration,the level of social injustice, has increased after democracy which leads to suicide. Overall the finding of this research shows the increasing suicide rate after democracy 2006. Now everyday 12 people kill self in Nepal.

Challenges to Investigating the Image of Social Inequality As Fact

This proposal aims to guide visual research on "Inequality, as a Fact and a Permanent Image of Investigation." The phenomenological methodology, which implies a description of what is seen, considers visual experience as a hypothesis. Therefore, visual challenges must be overcome in situations where these assumptions are not confirmed. To advance a reflection on the condition of social inequality as fact, this study seeks answers through an iconology of the questions presented in the subject of this session about the "image" in the constant analysis. In this sense, the expected results are based on the discovery of the fundamental visual elements for understanding the representativeness of the human condition in the media and artistic achievements. This investigation directly implies the search for fundamental values of humanity still present in the social imaginary that guides cultural interpretations. The values of this human condition are thus questioned, eliminating potential illusions through aesthetic experiences, analytical logic, and the possibilities of visual representations.

RC57-JS-55.1

WAGNER, CHRISTIANE* (University of São Paulo, Brazil)

The Visual Claim through Images of Children

In this work, visual manifestation is investigated by focusing on the exploitation of images of children on social media in terms of fundamental human rights or, more specifically, the rights of the child. To this end, an analysis of images of children that present content that makes one think about how they are produced and perceived is essential. First, we seek to understand the meaning of these images when they are manipulated and instrumentalized according to political-ideological interests that relate to society and its global and cultural impact. Second, the objective is an iconological analysis of the sociocultural context in Brazil. One of the fundamental subjects of this analysis is visual productions released to the media by UNICEF. The investigation focuses on UNICEF Global's image in relation to its local focus, UNICEF Brazil. Considering the polysemy of these images, this visual research seeks a strict sense, more ethical than aesthetic, by means of which to demonstrate how images are socially constructed in hegemonic cultures. Next, we identify possible signs relating to the power of image manipulation based on ideological discourses and government strategies. In this regard, certain questions guide our discussion: Is there an aim to achieve a set of political and economic goals using images of children? Given images of children that depict inequality, vulnerability, and injustice, is it possible for children to achieve their rights? The need to recognize injustices and to understand children's developmental needs is clear. There remain many goals left to achieve in order to attain the ideals of fundamental rights. Finally, what is the ideal configuration of the image of children and its dissemination in the search for these rights?

Transformative Politics and the Fourth Age: Experimenting with the Pre-Story Space in Collaborative Digital Storytelling

Digital Storytelling (DST) has been long considered an agent of social change as a mode of unearthing alternative narratives and marginalized voices (Hartley and McWilliam, 2009). Recent years has seen growing interest in DST in gerontology fields; studies account positive influences on health and lifelong learning (see Alexandrakis et al. 2020). Yet, frail, oldest old individuals are rarely involved in DST workshops. Moreover, political transformation – the founding sensibility of DST – is typically overlooked in workshops with older adults. As public concerns amount over the social and civic exclusion of older adults, this research examines the political potential of DST in later life and with individuals whose lives fall within the social imaginary of the non-agentic 'fourth age' (Higgs and Gilleard, 2020).

We employ a collaborative form of DST (Ogawa and Tsuchiya, 2017). For the purposes of this paper, we focus our analysis on experiences of the pre-story space, where facilitators and participants piece together a narrative that represents and potentially reconstructs the participant's standpoint. The material and social dynamics of this space play a key role in shaping the narrative and its positioning within everyday politics. Drawing on qualitative interviews and participant observation, we compare the phenomenology of pre-story spaces in group and individual DST workshops conducted online and offline in Canada and Japan in late 2020. Where the physical touch of photos and notepads and face-to-face interactions with other storytellers can meaningfully engage participants, we describe ways in which this (re)politicizing, collaborative work can (and cannot) be supported by an online pre-story space. Furthermore, we reflect on the value of collaborative storytelling workshops for communicative and social agency in later life.

Contesting Colonial Criminalisation of Queer Lives: How Customary Law Requires Us to Rethink Critical Analysis of LGBT Human Rights Struggles

This paper will discuss how critical social analysis of global struggles for the decriminalisation of same-sex sexual acts needs re-thinking to address the complex legal frameworks defined by colonialism. The British Empire criminalised same-sex sexual acts, with a legal legacy that persists in 35 Commonwealth states (over half those globally that criminalise); and current social movement organisations including ILGA and The Commonwealth Equality Network campaign for decriminalisation. There have been some victories such as in India (2018). However I will argue that certain social actors in transnational LGBT politics - notably Human Rights Watch in an influential report This Alien Legacy: The Origins of 'Sodomy' Laws in British Colonialism (2008) - have produced a narrative that British colonial criminalisation of same-sex sexual acts was primarily intended to regulate colonized peoples, thus using a decolonizing discourse in struggles for human rights. This discourse has been produced by largely ignoring the existence of customary law in British colonialism, which considerably reflected indigenous law and permitted indigenous peoples to regulate their practices in various respects. By drawing on archived documentary sources, especially from post-WWII British reports on customary law in Kenya (as a case study), I will explain the scope of customary law. Different ethnic groups had differing legal practices in relation to same-sex sexual acts. Therefore to take decolonizing analysis seriously, issues of indigenous and customary law need to be taken seriously. Moreover if customary law is given due attention, there are implications for narratives deployed by LGBT social movements. To understand the meaning of decriminalisation in the present we need to understand the scope of criminalisation in the past. The paper draws together strands of international political sociology, sociology of human rights, historical sociology, sociology of law, and decolonial thought. Sociological analysis enables us to reflect on how discourses are deployed.

Elder Care in Trans-European Families: A Restrictive Legal Framework and Its Influences on Care and Gender Inequalities

The organisation of elderly care within a transnational family network represents a specific case because of moral family bonds changing the global care chain concept and the specific way it is provided in terms of gender and the restrictive legal frameworks across the borders of the European Union and thus Switzerland. An important figure in this setting is the socioeconomic successful female migrant. Many difficulties arise from a restrictive legal framework between the global south and the global north.

The amount of administrative procedures and the restrictive conditions of the European Union and the Swiss legal framework structure eldercare in transnational family networks across the European Union's borders and exclude the parental family reunification not only of most female migrants working in the low-paid domestic care sector, but also many professionally successful female migrants. Eldercare is still or even more predominantly a woman's affair, also within transnational family networks. The more female migrants are economically successful and legally stable in their country of residence, the more they contribute not only to the traditional caretaking tasks, but also to the financial elderly care. Eldercare in transnational family networks across the borders of the European Union and Switzerland adds a new perspective to the global care chain concepts as we focus on the first generation of migration. A restrictive legal framework prolongs the gender inequalities in the global care chain along gender and socioeconomic class lines and prevents more fluid care circulation.

The presentation will illustrate the above issues with a few relevant cases and situations regarding female migrants and restrictive legal frames.

Agile-Cognitive Production Systems: Social Impacts and Modifications

Research highlights the increasing pressures for companies towards short lead-times to market when it comes to product development. This is predominantly achieved through data-driven performance and is leading to a digitalization of production systems. The goal in the further evolution of manufacturing is to create quasi-autonomous, agile-cognitive production systems, which are adaptive and self-organizing in the light of increasing customization demands of products.

Concentration on core competences has created a network structure of production systems, exemplified by far-reaching supply chains. Social issues emerge firstly with the problem of interoperability, which facilitates data and information exchange across different systems, including humans, artificial agents and organizations along the supply chain. Interoperability assumes that data is existing in a decentralized manner. The concept also assumes that continuous learning and the corresponding alterations of knowledge, be it humans' mental models, knowledge of artificial agents or organizational knowledge, are occurring in a decentralized way. Data and information must of course be shared among different people, agents, departments and companies. This necessitates an ontology-based semantic interoperability, which allows models and understanding to be shared, and achieved through ontology mapping and matching. Thus, this is shaping the way humans think and communicate and this way adapts to the requirements of interoperability.

At the downstream end of the supply chain, market data is increasingly important as a driver for upstream agility. The market is the place where observations are made upon the observations of others. Thus, social aggregates are emerging. So, for the purpose of decision support, user behavior is sensed in order to analyze patterns of behavior. Using increasingly artificial intelligence approaches,

*** denotes a presenting author.** Abstracts are organized by first presenting author's last name.

the results of such analyses may reflect real-time situations. The status, interests or knowledge of people evolves with social interaction. Therefore, not only social interactions, but also operations in cyberspace influence human behavior.

Brokering Good Death: Hospice Care Professionals in Taiwan

In the past three decades, Taiwanese main place of death has gradually changed from home to hospital. The transformation alters the way people organize death and the cultural meaning of death. Hospitalized death has been challenged as damaging patients' dignity. However, the hospice professionals exclaim they impotence and expertise about rendering a "good death" for patients. The study aims to examine how medical professionals possess the authority of managing death and defining the cultural appropriate death. The researcher did the participant observation in a palliative hospice ward in a medical center from August 2019, to probe how the professionals arranging the end-of-life caring process. Besides, the study adopts content analysis to investigate the documents produced by the Ministry of Health and Welfare, and the content of the Legislative Yuan Gazette from 1990 to 2018. That document shows what challenge the medical professionals faced and how they responded to those controversies. The study found that the social norms for death and dying changes owing to the advanced medical technology and the hospice movement. The rising life-sustaining treatment make is possible for saving a life. However, people also argue the problem of prolonging death caused by medical professions. The medical professions claim the authority of managing death by promoting hospice movement and patient autonomy.

Greying with an "Elephant Trunk": The Controversies of Nasogastric Feeding in Elderly Care in Taiwan

There is an arguably medical issue about using nasogastric tube feeding in elderly care. According to the national survey, there are 197 thousand Taiwanese using nasogastric tube feeding per year, which is 5 times higher than Japan. The controversies of prolonged nasogastric feeding arise because people concerns it may disturb the elderly's quality of life. This study investigates why does the nasogastric tube feeding distinctly prevail in Taiwan, while other countries prefer to use a gastrostomy tube as ways of artificial feeding. Furthermore, how does it become an option to withdraw or withhold at the end of life care in the legal frame? Probing this issue could reveal how the medical technology involved may help to improve life quality for the seniors. The study adopts the content analysis method to analyze the documents produced by the Ministry of Health and Welfare and the content of the Legislative Yuan Gazette from 2000 to 2018 about the discussion the impact of artificial nutrient and on life quality. And the researcher did the participant observation in a palliative hospice ward in a medical center from August 2019 in order to probe the elderly caring process. Besides observing the working in the ward, the researcher also observed the caring process of hospice home care, hospice shared care and outpatient service. The result found that the provision of artificial nutrition and hydration become an option in an advanced directive after the Patient Autonomy Act passed in 2015. It presupposes people as a reasonable citizen following the logic of choice. However, using the feeding tube is not only implicate the nutrition intake but also involve in social value and the normativity of technology.

IE As Resistance to the Ruling Relations for Indigenous Peoples

IE provides an approach for scholars to integrate social activism and research, particularly the work of George Smith. I will illustrate how IE's key ideas---standpoint, disjuncture, invisible work and text-mediated ruling relations, have been applied in the advocate work for indigenous peoples in long term care policy. As current long term care system fails to meet the needs as well as to reflect the worldview of indigenous peoples, an alliance to advocate on behalf of indigenous peoples has been formed to challenge current LTC policy and practices. Storytelling is combined with IE by the alliance to work with indigenous communities in order to disrupt the ruling relations of LTC in which elders are constructed as frail and dependent and the care provider as professionally trained workers. Two strategies were applied to mobilize community for change. First, following the disjuncture experienced, community workers are invited to present their daily work on elder care. For example, 'Toona Tamu', which means a land guided by elders' wisdom in the Kanakanavu tribe, is analyzed how elderly persons are empowered as keepers of culture knowledge rather than a frail dependent; relationship between the cared and the carer is reframed as collective and reciprocal companion, rather than as divided client groups in needs of help; and most importantly, care/

healing comes from deep spiritual connection with land, rather than professional knowledge/training. Secondly, how indigenous voices disappear in the representation of statistics is identified to change policy narratives. Demanding statistics to be presented at the township level is to make indigenous communities visible to the state. When the statistics become available, community members are invited to interpret the service figures by telling the stories to map out the care system at work, especially the informal care work that is unrecognized in the textual reality of the state.

Local Residents' Responses to the 2018 Indonesia Earthquake and Tsunami

This study seeks to address fundamental issues on the evacuation time estimates associated with earthquake and tsunami hazards by linking social science warning research, transportation engineering, and casualty modeling. This research used the Protective Action Decision Model—PADM as a guide and collected a valuable empirical data on people's behavioral responses to the 2018 Palu earthquake and tsunami through in-person interviews/surveys. Questions include how many people recognized the earthquake shaking as an environmental cue for a tsunami onset? How many people received warnings from officials, news media, and peers? How did people respond to the threat? This research used essentially the same survey procedures as those Lindell and his colleagues used in previous earthquake-initiated tsunamis--American Samoa (2009), Christchurch (2011), Tohoku (2011). Specifically, this study has conducted personal interviews for a random sample of 500 households to address seven major research objectives on (1) the amount of time it took officials to decide to issue tsunami evacuation warnings; (2) the tsunami warning sources, channels, messages and warning dissemination times. This will include data on people's ability to recognize earthquake shaking as an environmental cue to tsunami onset; (3) people's evacuation participation rates (vs. sheltering in-place), preparation times, and departure times; and (4) people's evacuation logistics (e.g., route choices, destination/accommodations choices, evacuation durations, and evacuation costs). The collected local residents' response behavior data is used to (5) assess the extent to which earthquake/tsunami brochures were distributed or workshops were held before the event and if they predict shorter evacuation preparation and departure times; (6) assess the ability of physical, social, and household contexts; social and environmental cues; socially-transmitted warnings; demographic characteristics; prior experience; and cultural background to predict warning receipt, risk perception/personalization, evacuation decisions, and evacuation departure times; and (7) assess the ability of demographic data to predict people's evacuation logistics.

Los Conflictos Entre La Cultura Tradicional y La Civilización Moderna En Cien Años De Soledad y Bailu Yuan

La literatura, como el testigo y testimonio de la historia de una nación, siempre presenta mucha atención al cambio social. Y como América Latina y China, comparten muchas similitudes sociales y culturales, la comparación de sus obras literarias puede aproximarse a la psicología y mentalidad de los dos pueblos. Cien Años de Soledad y Bailu Yuan, como novelas panorámicas representadas de América Latina y China, describen respectivamente una historia completa de un pueblo tradicional. En la escritura de las historias, tanto García Márquez como Chen Zhongshi mencionan los conflictos que sufren el pueblo conservador a la llegada de la modernidad. El presente trabajo, basándose en las teorías de la Literatura Comparada, con el análisis textual, intenta realizar una comparación paralela entre las dos novelas mencionadas, a través de lo cual, se investiga la piscología de las dos naciones frente a la civilización moderna y el entendimiento del autor sobre la relación entre la tierra que habita y la modernidad. Al final de Cien Años de Soledad, Macondo se desaparece para siempre, sin embargo, Baiyu Yuan se incorpora a la sociedad moderna. La diferencia en el desenlace refleja la reflexión de los dos autores. Para García Márquez y América Latina la civilización moderna es algo ajena, a su vez, Chen Zhongshi muestra su identidad cultural y sentido de pertenencia a la misma.

Human Capital and Upward Occupational Mobility of Rural Migrant Workers in China

Existing literature has provided abundant empirical evidences for the positive connections between human capital resources and upward occupational mobility in the labor market (Wen 2006; Yao and Yu 2006; Yang and Chu 2013; Wang and Wu 2015). Nevertheless, traditional social stratification and mobility research often discusses human capital and occupational mobility without differentiating the starting points of individuals' professional lives. Using 2012 China Labor-force Dynamics Survey data, this paper examines the associations between human capital and upward occupational mobility of rural migrant workers conditional on the occupational classes of their first jobs. Firstly, before conducting modeling, a mobility table is created to figure out the origins and destinations of occupational mobility of the sample. Then, conditional on first job attainment, one set of Multinomial Logit (Mlogit) models are constructed to predict the occupational classes of current jobs. Finally, conditional on first job attainment, another set of Logit models are constructed to predict whether there is upward mobility from first jobs to current jobs. The findings confirm the positive associations between human capital and upward occupational mobility of rural migrant workers. In the meantime, they suggest differentiated marginal effects of different human capital factors across heterogeneous occupational classes. Formal education is positively related to the upward mobility of rural migrant workers who land their first jobs as industrial production personnel or professional technicians; professional training is positively related to the upward mobility of those who land their first jobs as business and service personnel; knowledge of foreign language is related to the upward mobility of those whose first occupational class is industrial production personnel; while technical certificate proves non-significance for all occupational classes. Given the results, failure to account for the heterogeneity of first job attainment may lead to misrepresentations of the mobility patterns among rural migrant workers.

Creative Improvisation in Disaster Response : The Case of Practice in the Area Affected By the Kumamoto Earthquake

In the face of disasters, organizations and groups collaborate continuously and fluidly, coordinating with one another in order to overcome extraordinary challenges. When researchers explored this phenomenon in-depth, they employed the concept of "improvisation". However, there is a dearth of research in the area of "creative improvisation" relating to civic agencies that do not have special plans or approaches to disaster response (Wachtendorf & Kendra 2005). This study, therefor, aims at identifying some of the most effective improvisational approaches taken by civic agencies in the field of communication where information, consciousness, and ideas converge. This paper classifies cases of creative improvisation observed during the April 2016 Kumamoto earthquakes into two types and considers the respective conditions of improvisation. These are: 1) "Place-making": by raising several cases representing "place to convergence" scattered throughout the region, the improvisational condition that can be summarized as, "Awareness of gathering to support the affected key places" is highlighted. 2) "Forming a commonality": through participant observation at the "informal talk" held by local civil agencies, the interaction between agencies in the sense-making process is highlighted, thus clarifying the improvisational approaches of, "the process of realizing the role while being encouraged to participate initially," and "ingenuity to induce new movement by co-editing opposite opinions".

Effects of Local Religious Institutions and Collaborative Networking on Post-Disaster Communities in Japan

In Japan, traditional Buddhists and their families fulfill certain key functions in the local community, and the daily activities of Buddhist institutions such as sermons, funerals, and rituals promote the formation of a community identity. However, both practicing Buddhists and traditional Buddhist institutions are facing a major crisis. After being forced to evacuate and relocate due to the numerous natural disasters Japan is subject to, many communities face collapse. To revitalize the communities in devastated areas, restoration events are held through expanded family networks of Buddhists and cooperative networks outside of devastated areas. Such events have religious as well as secular aspects, which give distant community residents an opportunity to reunite and rekindle the spirit of their previous community. Local Buddhists, who have strong connections with local people, coordinate the relationship between the local people and external volunteers in these kinds of events by establishing partnerships with internal and external collaborators such as government officers, multi-denominational religious services, civic agencies, and self-motivated individuals before and after disasters. These collaborators will support local people who are affected immediately after the disaster, and continue to support their active involvement in community reconstruction.

This presentation examines the functions of local traditional Buddhist institutions and their collaborative network in the community recovery process, through participation observation and interview surveys conducted at restoration events held by the Buddhist temple after the 2016 Kumamoto earthquake. The findings of this study can provide insights into the ways in which religious people and religious institutions may involve themselves with local resources to bolster the resilience of communities in disaster-prone areas.

Return of the Slum? Slumification in the C21st

Today most scholars, policy makers, and residents themselves eschew the term "slum" and argue that it is high time to retire the term altogether (Mayne 2017). We agree, and yet we identify and explore counterfactual analyses of Latin American housing processes in which the conventional wisdom of successful housing consolidation appears to be severely constrained or stymied altogether. In the context of self-help ownership, low-income rental housing markets, and mass social interest housing estates which show high levels of abandonment and vacancies, this panel analyze why some types of housing remain heavily deteriorated, or having successfully consolidated, later enter a downward decline of deterioration into what might constitute the erstwhile term of "slums". This paper will draw upon examples from the Latin American Housing Network (www.lahn.utexas.org) nine-country study, and will present findings from different types of consolidated settlements (30 years after their formation) and now located in the "innerburbs" ("first suburbs"), and where we have argued for new policy imperatives of housing and community rehab to overcome deterioration and dilapidation (Ward et al 2015). Despite the apparent success of self-building consolidation since the 1960s and 1970s, we are now beginning to observe evidence of heavy distress to the physical fabric of dwellings and communities – de facto *"slumification"*. This is due in part to the failure to rehabilitate deteriorated housing conditions after many years of intensive use. Other triggers will also be examined: title "clouding" due to intestacy; overcrowding and densification; rising informality under neoliberal and post-neoliberal economic conditions, etc.

Implementing „Industry 4.0": Challenges for German Industrial Companies Regarding Work-Integrated Learning

In recent years there is a huge debate on the impacts of sensor technology for modern industrial companies. With an increasing connectivity of production systems IT-engineers have created a new generation of technical support options. For industrial companies the availability of Big Data and the possibility to create digital twins of production facilities enables the usage of artificial intelligence to plan, control and assist production. These so-called assistance systems affect not only the working processes of shop floor workers, but also management members. This creates new challenges for traditional systems regarding work-integrated learning.

Task profiles and thus skill requirements are considerably affected by implementing these new technologies to a socio-technical production system. While some research indicates an upskilling through the introduction of new technologies, other indicates a process of deskilling or a polarization of skill levels. This paper contributes to the discussion on the effects of digitization on skill development and working conditions. With our presentation and paper we address two main questions: How has learning in the work-process changed with the introduction of data-based assistance systems? What are side-effects of digitizing industrial workplaces for workers and on the organizational level?

To examine the interactions between digital assistance systems, organizational parameters and work-integrated learning, we conducted empirical data and analyzed the implementation of digital assistant systems in two different groups: low-skilled assembly workers and high-skilled shopfloor supervisors. Our findings suggest that a lack of autonomy in the workplace has a negative impact on learning in the work process and thus on the development of employees' competences. We want to discuss the potential consequences: If the design of assistance systems comes without learning concepts and participation, will the existing inequalities perpetuate? Does the use of assistance systems lead to a polarization of qualifications and a digital divide within the workforce?

Overcoming Methodological and Logistical Challenges in Navigating Institutional Ethnography Research in a Healthcare Setting.

Institutional ethnography, Dorothy Smith's alternative sociology, offers a unique way to explore how healthcare systems are socially organized through texts that coordinate and constrain what people know and what they do. By its very nature, the work of unpicking these complex webs, even as we remain captured within them, presents a distinct set of challenges. IE's philosophical approach to staying grounded in people's everyday activities rather than starting within pre-defined concepts requires researchers to work "outside the box". Yet, when the "box" is the strict requirements of an academic study in a healthcare setting, as IE researchers, we find ourselves caught up in institutional structures that textually organize us to describe, conduct and disseminate our work in particular forms. Not surprisingly, those new to this approach struggle to explain what they are doing at each stage of the research process. Ethical approval and data collection can be intimidating when using an iterative method that resists concepts, precludes structured questions and does not identify all participants prior to a study. As IE researchers, we often experience discomfort and isolation as we uncover the structural processes organizing a particular set of actions, disrupting what we thought we knew about a situation. This sense of unease may be magnified for participants and stakeholders directly involved in the work under investigation. Even as people are keen to voice their concerns with the status quo, coming face to face with empirical evidence that things are not always as they appear can be quite disconcerting. Presenting critical analysis of health care institutions in a way that is not perceived as threatening requires skill and knowledge. In this paper, the authors discuss methodological and logistical challenges they have faced in conducting IE research within healthcare systems and offer practical suggestions for how to overcome similar hurdles.

WATKIN, THOMAS* (Université de Nîmes, France)

Designing with the Elderly for Innovative Housing Services and an Inclusive City

Housing for the elderly has been recently developed in different ways in Europe by reconsidering how it relates to generations and ages. In this ongoing creation cognitive boundaries, social norms, are usually either develop through top down initiatives such as public policies, or undertaken by private initiatives somehow commercial oriented or engaged. My talk will explain how practices of design (service design and social design) participate in repositioning these actions by bringing a user centered approach but also be part of an inquiry to observe and analyze a social phenomenon in housing and the habitat for the elderly.

I will explain this phenomenon in housing services in which both public policies and the housing market seek in designing the public realm and interests through the lens of user centered practices or even citizen centered design. Two elements within a same "research-project" will illustrate this context on housing services and codesign.

The case of intergenerational cohabitation providing a solution for an old person to organize new ways of co-living with a younger dweller in need of a cheaper rent or conviviality. Our contribution will show an experience of a "research-project" initiative using codesign methods and participatory practices to promote such intergenerational housing across cultures of work and habits while understanding at the same time its scope (health, mobility, communication) and larger context of development (central cities, rural areas). On the same perspective of this research I will explain how the inclusive habitat for the elderly has been recently introduced in public policies and promoted as a collective project through collaborative practices and the involvement of social design.

WATKIN, THOMAS* (Université de Nîmes, France)

Thinking Metropolitan Coproduction through and By Design: A Changing Paradigm in Urban Research and Public Policy Making?

In recent years the practices of design appeared in public and social policies by involving designers to change and think through "design" social issues and urban problems. This proximity between design and the public good through policies and social actions is a twofold effect. On one hand the evolution of managerial practices within the administration at different levels (from national to local) and on the other hand a progressive shift in action research, political science and public policies to integrate bottom initiatives, participatory processes and less bureaucratic actions to transform the public good and the habitat of cities.

With a more user centered way to think social problems and actions designers and design found a favorable position to put in action this context and get involved in the public realm in cities. Public innovations (Gagnon, Watkin, 2017), design of public policies (Scherer, 2015; Bason, 2013) and the design of public services (Junginger, 2016) are considered as specialized fields of social oriented design emerging from this political and social need.

Our communication will explain the composition of the panorama of the French context in this field of public innovation by design through organizations, professionals, experimental initiatives. If public innovations occur in public spaces or in development of participatory processes (Pallez, Weller, 2017) other fields of action appeared such as tools and mechanisms of collaborative governance for cities and "designing" public data.

The case of a collaborative research (POPSU Métropoles) between a public administration and research labs involved in thinking the metropolitan phenomenon of Montpellier (a growing and attractive metropolis located in the south of France) will question this evolution of design. We will explain how integrating coproduction and a "designerly way of thinking" produced a debate between researchers and public administrative on making cities and thinking urban research.

WATTS, GALEN* (KU Leuven, Canada)

Spirituality and Social Science in Neoliberal Societies: Friends or Foes?

Increasing numbers of North Americans and Western Europeans self-identify as "spiritual but not religious" (SBNR). Much of the academic debate surrounding the rise of SBNRs has focused on the relationship between spirituality and social justice. Critical scholars have argued the SBNR discourse is intimately tied to neoliberalism (e.g. Carrette and King 2005; Martin 2014; Altglas 2014). According to these scholars, the problem with the discourse of spirituality is that its individualism occludes the structural sources of suffering, and thereby encourages acceptance of, and accommodation to, the neoliberal order. What these critical accounts share is a commitment to social scientific, or critical, perspectives that remain suspicious of emic conceptions of social life, autonomy, and agency—made evident by Craig Martin's claim, "individuality is zero." Drawing from qualitative research consisting of interviews with fifty Canadian millennials who self-identify as SBNR, I argue while this interpretation has merit, it misses much of significance. First, articulating the discourse of spirituality in one realm of social life does not necessarily preclude one from articulating social scientific, or even critical, discourses in another. For instance, it was common for my study participants to invoke spiritual discourses regarding their personal lives, and to then invoke social scientific discourses when speaking about society. In short, commitment to spirituality does not prevent adoption of a structural perspective. Second, among political progressives—the majority of my study participants—spiritual discourses often serve as necessary correctives to what are perceived as disenchanting, even nihilistic, critical or (post)structural discourses—by providing their adherents with a framework of meaning and a sense of individual agency. I conclude, therefore, that critical scholars of spirituality who reduce its popularity to economic duress and ideology are not only partial in their assessments, but fail to realize their own complicity in producing a need for the very thing they criticize.

WEBB, ANDREW* (Pontificia Universidad Catolica de Chile, Chile)

Staff Perspectives on Creating Positive Environments in Multi-Ethnic Chilean Elementary Schools

This paper draws on qualitative interviews conducted with school staff in eight multi-ethnic urban public schools in Santiago, Chile, to provide a sociological analysis of common-sense constructs surrounding victimization, racism and inclusion. The questions guiding the study are: to what extent school staff share similar perspectives toward victimisation, and how this impacts the capacity to generate positive school climates in multi-ethnic elementary urban schools in Santiago. Secondly, in contexts where indigenous students have historically been victims of discrimination, I question how recently-arrived migrant populations from other Latin American countries change staff expectations of these environments and interpersonal relationships. Theories about institutional habitus suggest that shared pre-dispositional ideas among staff toward the types of students who attend their schools may result in deficit theories or notions of limited capacities for learning. Vang (2006) argues that schools located in multi-ethnic settings are incapable of producing positive school climates precisely because the school's culture does not consider heterogeneous norms and values, but rather reproduces a (whitened) hegemonic order. Hence, the concern of this paper is to address how ideas about intercultural/interethnic school climate are constructed in these spaces. I demonstrate that this has important repercussions in contexts of higher-than-average ethnic compositions where assimilation is encouraged, and victimisation is denied or attributed to other causes. Symbolic and superficial celebrations of multiculturalism are common, but cultural discourses of difference maintain ethnic youth in marginalised positions and prevent more inclusive educational practices. Some staff perspectives adhere to colour-blind liberal forms of racism in these contexts, and these are most common in school cultures where

victimisation is downplayed or thought to be an issue cultivated in the home. Recommendations are made to incorporate culturally-sensitive pedagogies and cultural mediators to confront these narratives among school climate committees.

From Neo-Nazism to Reactionary Tribalism – The Radical Right's Journey to Brexit

Studies of the far right in Britain have posited the opening and closing of a 'strategic window of opportunity' to explain the brief success of the British National Party between 1997 and 2010. Under this hypothesis the BNP's failure after 2010 is explained by the waning salience of its core policy preferences and the lapse of a constellation of conditions that were favourable to its success. Observing the sociological movement identified by Robert Antonio in which the plural and anti-hegemonic logic of postmodernity is politicised and appropriated in such a way as to promote ethnic and cultural incommensurability, as well as the attempts by the British National Party to adapt to these changing circumstances in the light of similar movements on the continent, this paper instead posits a more long-standing shift than a passing 'window of opportunity'. The paper will assert that there is a fundamental movement away from neo-Nazi or fascist extremism, toward a postmodern radicalism that is more comfortable engaging with the liberal democratic state and so in a much better position to pursue radical constitutional change along the lines of a Brexit. The failure of the extremist British National Party, and subsequent success of the radical right-wing United Kingdom Independence Party, despite their many overlapping commonalities, is cited as evidence of such a change.

WEDAM, ELFRIEDE* (Loyola University di Chicago, USA)

Religion and Violence in American Urban Context

Religious congregations in the U.S. are members of civil society. They are voluntary institutions that nevertheless play social and political roles. The case in point is whether religious congregations can effectively address causes and consequences of Chicago's urban violence. I will review the recent history of violence in Chicago and the variety of strategies that have addressed its remediation, with great variation in outcomes. While violence is part of the human condition; it also has high human costs. I will examine the concepts of personal and structural violence (self-violence, suicide, relationship violence, child abuse and neglect, rape and homicide, property crime, corruption and fraud). At the personal level, violence has psychological and emotional consequences (traumas) that are difficult to overestimate. At the structural level, violence is associated with inequality and poverty. Violence has historically been treated as a criminal justice problem, however, recent research has demonstrated that a public health paradigm is more effective in finding solutions due to its attempts to examine a wider range of factors. Public health approaches also avoid moralistic judgments and victim blaming. To the degree religious organizations are willing to adopt such an approach, they may become effective civil actors on this issue. However, most faith groups have been limited by (and limited themselves to) the presumption that they lack the capacity to have a real impact. Indeed, much of the difficulty in finding long-term solutions stems from a lack of coherent, comprehensive, and preventative strategies focusing on long-term, widespread, and lasting changes in a community. Instead, the American public health administration recommends that multi-tiered and multi-institutional sectors become involved, including public health, health care, education, justice, social services, and business. Faith communities can have a vital role and this presentation will assess congregations that have tackled the violence problem.

WEGHMANN, VERA* (University of Greenwich, United Kingdom)
LOBINA, EMANUELE (University of Greenwich, United Kingdom)

The Struggle for Public Water in Berlin. Lessons Learnt in the Fight for Remunicipalisation.

In recent years hundreds of cities worldwide have taken back control over their water often due to public resistance. More water remunicipalisations - the return of privatised services back into public ownership on a local level - are likely to follow as the pro-public-water movement is growing and lengthy contracts with private companies are due to expire. The purpose of this paper is to conceptualise the social relations between various actors in the struggle for water remunicipalisation in Berlin to stimulate reflection and learning for future remunicipalisation campaigns. In particular, this paper sheds light on the contradictory social relations between the various agencies participating in the resistance, namely trade unions, civil society groups and progressive politicians, and shows in what

way these dynamics impacted on the strength of the struggle. By paying specific attention to the labour angle we address an important gap in the literature as to date the workers voices have been side-lined in the academic debate on pro-public-water struggles. In this regard the remunicipalisation struggle in Berlin offers important insights. Workers vehemently but unsuccessfully resisted the water privatisation plans in the mid-1990s. But a decade later when due to the failure of privatisation progressive politicians and civil society groups successfully campaigned for the remunicipalisation of water the trade unions did not join the struggle. To conceptualise the complexity and contradictory nature of the agency of resistance to water commodification this paper combines a neo-Gramscian understanding of the state-civil society complex through which the struggle against water privatisation in Berlin is analysed as part of the wider resistance against the hegemonic neoliberal mode of production with Gibson-Grahmans concept of productive powersthrough which communities create non-capitalistic spaces within capitalism that are socially and environmentally just. Empirically, this paper draws on 10 semi-structured interviews with various actors of the resistance.

Biographical Strategies of Kenian Middle Classes

Within this talk I would like to present the first findings of the research project "Biographies of the Middle Classes: Spatial Experience and Meaning in the Life Course Narrative" that explores the typical forms of lifestyles of middle class members in Nairobi (Kenia) and Berlin (Germany) from a spatial perspective.

The emerge of the middle classes in in the global north is strongly connected to the arise of a strong nation state as a social state that ensures at least the survival of the society members in the case economic or health struggles. The middle classes of the global south, especially in sub-Saharan Africa, had mainly developed in the last decades without such a framework. So their members find different ways to build up social security often based family- or religious- or other social networks. But these networks cannot be described simply as traditional, but rather as new forms of solidarity that run on the base of mediatisation and use all forms web 4.0 interactions like crowdfunding and so on.

Simultaneously they often try to ensure basic security by staying connected to places of origin on the countryside, where it is possible to survive on a more subsistence economic level. On the other hand, the orientation within the working sphere is highly globalized. The research project seeks for biographical strategies of middle class people in Kenia to handle this tension.

Risk and Adaptations to Climate Change in China's Ecological Civilization Project: For a Differentiated Analysis of Eco-Compensations in the Sustainability Debate

Global environmental changes resulting from human activities affect societies unequally, so it is necessary to analyze opportunities and threats of various adaptation strategies from different perspectives. The sudden economic, political and cultural changes that China underwent in the twentieth century and throughout its integration into the globalized economy contributed considerably to its current environmental challenges. In response to those challenges, the Communist Party leadership adopted the "Construction of an Ecological Civilization" in 2007. Under Xi Jinping, in 2013, the "greening" of institutions become one of the party's core missions. The policy framework is expected to guide a Chinese vision of sustainability and a future approach to, among others, urban development and ecological management. A stark rise in academic publications that apply the new term indicates that Chinese science and policy are engaging in the discussion on sustainability under the rhetorical umbrella of Eco-Civilization. We inquire about the possibilities of a differentiation of the Chinese approach to Climate Change adaptation in the form of "Eco-Compensations" and in how far Chinese scholars and theorists dialogue with Western ideas of sustainable development or question its underlying neoliberal premises. While Confucian and Daoist influences can be identified in the political modernization project of the Eco-Civilization, we understand it to be not only a contestation of the Western development mode, but also as an opportunity for reassessing the inclusion of human-nature relations in national and international politics, through the perception of the imminent environmental crisis. For this reason, the theoretical framework that guides this initial discussion uses East Asian re-interpretations of sociologist Ulrich Beck's (1986) Risk Society framework to understand in how far Eco-Compensations can be understood as a new form of dealing with risk in the Chinese context.

Understanding the Corporate Strategies Preventing Labour from Disrupting Global Supply Chains at Choke Points

In January 2019 the ports of Lázaro Cárdenas and Manzanillo faced backlogs of several thousand containers, causing daily losses of millions of dollars, especially in the car manufacturing industry. Yet the railways were not blocked by railroad workers; it was the CNTE teacher's union demanding unpaid compensations from the government by strategically targeting key choke points of global supply chains. Concurrent strikes held by *Maquiladora* auto parts workers in Matamoros caused technical shutdowns across Mexico and at GM and Ford assembly plants in the US. Unable to find effective alternatives, corporations pressured the government to give in to the demands.

The impact of these disruptions demonstrates the criticality of choke points in a global capitalist system characterized by increased outsourcing of production processes to low-cost countries and increased efficiency through "Just in Time" delivery and made-to-order production. However, these practices create global interdependencies that pose heightened risks of disruption to the flow of capital. To mitigate this, capitalists invest in their Supply Chain Risk Management. They fine-tune their operations and logistics strategy, organize backup suppliers, enforce harsher labour policies, and create playbooks and so-called "war rooms" to deal with disruptions.

From a left perspective, these trends point towards workers' "logistical power" to take advantage of global choke points through strikes, blockades and other forms of disruptions. Their actual power to act upon this potential not only depends on their ability to organize locally and across sectors, but also on the strategies that management directly and indirectly implements to mitigate the risk and scale of such disruptions. Through analysis of operations strategies and case studies of supply chain labour disruptions in Latin America, this paper seeks to demonstrate how corporations' Supply Chain Risk Management can inform workers' struggles to more effectively disrupt various nodes and links of global capital.

Riding Downhill: Precarization of Labour and Bike Couriers in Porto Alegre

The present paper discusses the precarization of labour of the bike couriers related to the companies Uber Eats, Rappi and iFood in the city of Porto Alegre, Brazil, in the year of 2019. The research has as a reference the analysis of work conditions in a wide conception, including interrelating bio-psico-social dimensions such as "Health", "Identity" and "Work Socialization". For a complex sociological apprehension of the phenomenon, precarization of labour is conceived as a social process of institutionalizing instability that includes spaces marked with uncertainty, insecurity, risk and unpredictability. Transformation in the labour distribution in the country led by recent change in labour laws and massive unemployment create the ideal structural condition for the growth of this kind of work organization. The adjective "partner" used by the priorly cited companies to describe the relationship worker-company can apparently demonstrate an open and fair association between both sides, creating an image of new opportunities for anyone who glances at an income increase or even a higher level of freedom and quality related to labor. Empirical research demonstrates the opposite, achieving outcomes further than the mere conclusion that this work is precarized - which is already expected based on similar cases. In the studied case, work journeys regularly overcome twelve daily hours, amount of income is uncertain - even tho averaging near the brazilian minimum wage - and a considerable level of work accidents with no safeguards raise the feelings of anxiety and instability within the workers. It is then possible to relate these more objective and structural indicators with subjective transformations lived by the ones who realize the work, observed in expressions as anxiety, instability and uncertainty.

WEISS, PIERRE-OLIVIER* (Aix-Marseille University, France)

Victimization and Fear of Crime on French University Campuses

Most research on school (Cacouault-Bitaud & Œuvrard, 2009) reminds us of the current situation of "violence", relayed by the media, but also of how emotionally charged this issue is. In addition, the public data processing provided to institutions shows the current instruments' imperfection in counting victims and perpetrators. While researchers are interested in victimization in Secondary Education (Debarbieux, 2004), we have very little evidence of victimization of students in Higher Education. In France and Europe, the public debate is fueled by a single statistical source: police statistics. However, researchers have developed general population surveys in the United States (Fleury DeVoe & Bauer, 2011; Barrett &

al., 2012; Sloan & al., 1997) and more particularly in France (Robert & Zauberman, 2011; 2017). Thus, we focus on positioning oneself from the victim's point of view. Based on victimization surveys conducted on 3 university campuses in France, the results of my research presented reveal the nature of the acts of delinquency and incivility among students by showing that they differ according to the location of these particular social spaces. This research, which is unprecedented in France, highlights the prevalence of victimization, the victim profiles and attempts to measure the feeling of insecurity (with statistic data: 1250 questionnaires) in an institution that welcomes a growing proportion of young people. This inventory constitutes essential scientific knowledge at a time when issues of securing public places, in the context of the Bologna Process at work, are the subject of much debate across Europe.

WESTERMAN, RICHARD* (University of Alberta, Canada)

Populism, Alienation, and the Logic of Commodity Fetishism: Lukács's Theory of Reification and Authoritarian Leaders

The long aftermath of the 2008 financial crisis and its aftershocks has seen, on the one hand, the electoral collapse of the technocratic centrism that dominated in the 1990s and early 2000s, and on the other, the corresponding rise of authoritarian populists such as Trump and Rodrigo Duterte. Such figures portray themselves as "strong men," the only ones capable of protecting their supporters from a globalized economy. Their very disregard for established norms of law, politics, and even truth seem rather to have strengthened them in the eyes of their supporters; their irrationality seems to be part of their appeal.

For Georg Lukács, such an opposition between rational-technocratic expertise and the *soi-disant* 'great man' who operates outside the logic of the system is a necessary product of the alienation produced by commodity fetishism in capitalist society. For Lukács, this is seen in 'bourgeois' theories of history; I extend his argument to suggest that it explains the rise of authoritarian leaders in practice too.

I will begin with a phenomenologically-informed reading of Lukács's account of the commodity structure as a structure of social forms in the Simmelian sense. Commodity fetishism means that people and objects can only come into social relations to the degree that they can be rationalized and universalized – everything substantial and particular is alienated from social relations, signified as irrational. Authoritarian populism, I will argue, appeals precisely to such 'irrational' elements, grounding social unity on immediate particulars such as blood, culture, or spirit. They are defined in opposition to the abstract forms of social relations defined by commodification and rationalization. They consist, in other words, of that which the commodity form alienates from social relations. In this way, capitalism symbolically defines its own antithesis – not, unfortunately, a revolutionary proletariat, but a mystical unity of the *Volk*.

RC36-456.1

WESTERMAN, RICHARD* (University of Alberta, Canada)

Reification and Alienation: Reversing the Subject and Object

In introducing the concept of reification to Marxist theory in his 1923 "History and Class Consciousness," Georg Lukács brought new philosophical dimensions to a theory that had hitherto largely been understood as an economistic account of the need for revolution. Though Lukács was heavily criticized at the time, the publication of Marx's own 1844 Manuscripts in the early 1930s seemed to vindicate him: his critique of reification and commodity fetishism seemed so close to Marx's newly-rediscovered account of alienation as to be virtually indistinguishable.

Nevertheless, I will argue that there are important differences between reification and the account of alienation offered in the Manuscripts – ones that allow a reinterpretation of alienation that can have renewed relevance today. The young Marx's account, I will suggest, relies heavily on a labour ontology: alienation is the product of a subject labouring under particular social circumstances, externalizing their 'species-being' in certain ways. Lukács's account of reification draws instead on Marx's much later account of commodity fetishism, and is correspondingly more focused on the objective situation that produces alienation. It is the abstract, internally-coherent form of the commodity that excludes everything particular and concrete: by treating objects within social relations as exchange values, it excludes their use value and specific content. This, Lukács suggests, is best exemplified by the antinomic ways in which the concept of 'nature' comes to be defined in the eighteenth century, indicating both the predictable, rational universality of the laws of nature, and the spontaneous, irrational notion of natural feeling and sentiment in opposition to artificial society. It is the commodity as form that is to blame: the object alienates the subject, not (as for Marx) the reverse. Understanding this allows us to reconceptualise forms of social relations that are subject-inclusive – and which may thereby help to overcome alienation.

Terrorism, Radicalisation and Mental Health: Unravelling the Connections and Illuminating the Contradictions

Despite longstanding agreement that the violence committed by those with mental disorders is relatively low, the relationship between mental health and offending remains an area of contention across the globe. In recent times, this debate has featured prominently in the UK, France, Australia, New Zealand and the United States in relation to what are ostensibly instances of religious and politically motivated violence. In such cases, the process of 'radicalisation', whereby individuals are inculcated into accepting extremist ideology, has been defined as a critical precursor to violent action. Whilst the discourse of 'radicalisation' simplifies a diverse range of drivers that motivate individuals to pursue violence, there is a need to better understand the 'place' of mental health in debates about the causes of terrorism. The tendency toward complexity reduction - typified in Donald Trump's response to the 2019 attacks in Dayton and El Paso - belies a range of knotty issues regarding the 'links' between terrorism and mental illness. Drawing on case studies in various global locales, this paper both unravels the complicated connections in this domain and excavates the perils that arise in establishing causal connections between extreme violence and psychological and behavioural disorders. Drawing on case study evidence, it is our contention that - echoing patterns in other contexts - mental illness is becoming an explainer that obscures the role of more material and structural factors that may push individuals toward indiscriminate violence.

WETZEL, DIETMAR* (University of Basel, Switzerland)

Interprofessional Cooperation of Health Professions in the Mirror of Professional Theory

Regarding the important discussion about the professionalization of healthcare, my presentation concentrates on a sociological (inter-)professional theory of organization. What can such a theoretical and empirically based access achieve in the context of inter-professional cooperation between health professionals? Basically, it stands for a "reflexive work design", a reconfiguration of practices and an organizational development at the level of inter-professional cooperation. It also includes a role understanding as "hybrid professional" (Noordegraf 2007). An organizational (inter-) professional theory focuses on (collective) practices, discourses and material conditions in organizations in the context of professionalization. Organizational change and complex division of labor lead to the training of hybrid professionals which can communicate and coordinate their values, believes and techniques (Laloux 2014). I will face the different interprofessional challenges due to cooperation and competition with other players/professions.

Thesis 1: The sociological theory of "professional organization" contributes to a better understanding of interprofessional cooperation (Wetzel 2020).

Thesis 2: Professionalization is a multidimensional and open-ended process of developing a certain organizational form in a field of activity (cf. Brandt 2009).

Thesis 3: Based on the case study of care, the possibilities and difficulties of interprofessional cooperation (e.g. power, concurrence, struggle for recognition) can be illustrated.

Resonance and Mindfulness – Response Strategies to Vulnerabilities of the Body in Postmodern Societies

The vulnerability of societies and individuals is increasing in our times. "Multiple crises" (Welzer & Leggewie 2009) are the triggering factors in the background. Whether ecological, social, political or economic dimensions are considered depends on the perspectives and vulnerabilities of communities and individuals. The manifold aspects of "power to hurt" (Wetzel 2019) refer to the vulnerability of postmodern societies. In this lecture I am interested in the "response strategies"

that individuals or groups develop in order to be able to react appropriately to vulnerabilities of their body. To this end, I will focus on two currently observable strategies that are discussed: Resonance and mindfulness.

(1) Resonance, which can be understood as a bodily mediated response relationship and as an affinity to the world, needs a (inter-)bodily foundation. Particularly in physical interaction, an existential vulnerability of the other becomes apparent, which can express itself both positively (example: dance) and negatively (example: violence). The addresses the question of whether it is possible to eliminate or merely conceal vulnerabilities in our societies by recurring on resonance and enabling resonance experiences (and: under which conditions).

(2) The individuals suffering from the (working) world search for experiences of mindfulness in meditation and mindfulness courses in a compensatory way. There are often members of a privileged middle and upper class who achieve an individual reduction in their personal suffering with this conscious "escape from the world". The positive effects on the well-being and the body feelings of the individual can hardly be denied. It is critical to note, however, that structural and political causes that make the vulnerability of individuals and communities possible in the first place tend to be ignored (Bröckling 2017). This strategy of the individual, self-responsible coping with collectively caused experiences of a pity is explored in the lecture based on examples.

WHITAKER, CHICO* (World Social Forum, Brazil)

Would the Wsf be a Movement or an Space?

At the end of last year, during the electoral campaign in Brazil that led to the sad situation we are living here now, I wrote a long text about the WSF's future, to be published in a collective book of Globalizations, of Finland, by Routledge, to be presented soon.

In this text I tried to identify the divergences existing about the WSF as it was conceived by the WSF Organizing Committee in its first edition in 2001, and why this Committee decided to give to the WSF the character of an space and not a movement, this decision leading to a growing interest of people in the WSF all over the world. This first edition had 20.000 participants and not only 2.000 as expected by us, till the ones of Porto Alegre in 2005 and Belem in 2009, each one with 150.000 participants.

I tried to show in the text that this Organizing Committee decision was not a previous theoretical one but a result of a process of discussion on the special exigencies of creating a new tool of the planetary civil society as a political actor facing capitalism as an economic and cultural regime.

The text presents propositions on the WSF future considering the still absolute necessity of as many as possible open critical spaces - at all levels as well as on specific themes - where to reflect on the action in course and to inspire and create conditions to launch as many and diverse as possible civil society and parties new actions and movements, to face the the capitalism monster that Is menacing more and more the continuity of life in our planet. Spaces and movements are both necessary, as reflection and action must coexist, linked to each other, in the struggle for change.

Playing the Fields: Theorising Research Impact and Its Assessment

How research is assessed affects what types of knowledge are valued, incentivised, and ultimately produced and circulated. An increasingly important element of contemporary research evaluation is the measurement of the wider impact of research (e.g. benefit to society, culture or economy). Although the measurement of impact has been highly contested, the area is under-theorised and dominated by pragmatic research policy imperatives. Informed by a sociological perspective, this article intervenes in this context by reframing research impact as the attainment and maintenance of capital (i.e. symbolic power or status) in various fields beyond academia. It argues that research impact occurs at the intersection of these fields of power. The article shows that impact involves various combinations of capital from the scholarly field, the field of politics, the field of application, the media field and the economic field, which provide credibility, clout, utility, visibility and weight, respectively. In exploring the forms of worth and value that underpin the pursuit of legitimacy in these fields, the article provides a new theoretical framework for understanding research impact and its assessment.

Expanding Access to Aid-in-Dying in the United States and Latin America: Lessons from a Cross-National Examination of Aid-in-Dying Practices

As many U.S. states are actively campaigning for the legalization of aid-in-dying (AID), questions regarding how to build upon the existing legislation and develop improved legislative models have become of central concern. Discussions of whether and how to expand access to aid-in-dying often ignore a number of important, but contentious issues. The present cross-national, comparative study examines evidence from a variety of jurisdictions where aid-in-dying is legal to better inform debates and foster the development of new legislation that will improve access to aid-in-dying and could be replicated, with minor modifications, across the U.S. and abroad. This study draws upon legislation in relevant jurisdictions, quantitative empirical medical studies, and qualitative sociological studies in addition to participant observation at medical conferences and advocacy events, and 50 semi-structured interviews with 27 healthcare providers with experience providing aid-in-dying and 23 policy makers and advocates. Participants were located in the U.S. (Oregon, Washington, California, Colorado, Vermont, Hawaii, Montana, New Jersey, Maine), Canada, Québec, Netherlands, Belgium, Switzerland, Colombia, and Victoria, Australia. We find evidence suggesting that expanding the eligibility criteria and procedural requirements for aid-in-dying in the U.S. would reduce disparities in access experienced by many persons seeking aid-in-dying. Potential eligibility criteria expansions include: expanding access to individuals for whom death is reasonably foreseeable and potentially mature minors. Potential procedural requirement expansions include: legalization of advance directives, physician-administration of medication, and allowing, under certain circumstances, for waiving of the waiting period between requests. For the foreseeable future, expansion of aid-in-dying within the U.S. is likely to proceed on a state-by-state basis. As we see it, the eventual expansion of aid-in-dying to include many Latin American countries will make the experience of programs in an ever increasing number of countries around the world of interest to related debates in Latin America as well.

WILSON, SARAH* (School of Social Sciences, University of Stirling, United Kingdom)

Researching and Resisting Neo-Liberal Subjectivity in the Context of the Marketization of Universities Using Visual and Auto-Ethnographic Methods

The marketization of higher education has important effects on the subjectivities of academics. Understanding the processes of self-modulation (Raunig 2013) and subjectification (Ball and Olmedo 2013) and possibilities of resistance thereto is important. But how might these processes be researched by those affected?

For Ball and Olmedo, processes of subjectification include the isolation of the subject through individualisation, while the value of each individual as a person is simultaneously devalued through continual recording of their practice. In Foucaultian terms, such target-setting and monitoring constitute techniques of power. Academics are no longer encouraged to account for themselves in terms of the meaningfulness of what they do, but to produce measurable and continually 'improving' outputs and performances. Such techniques of performance produce feelings of anxiety and sometimes emptiness.

These techniques also open spaces for struggle and resistance however, to 'reterritorialise' and take back time and space (Raunig). Drawing on Foucault, Ball and Olmedo argue that resistance to subjectification requires the deciphering of the practices of performativity followed by a process of 'self-overcoming' to develop a technology of the self (and of who we might become) that reflects personal principles. '[R]esisting performativity at a discursive level [...] requires the [...] *recreation* of the self' and, therefore, experimentation and doing things differently. Since it would be difficult (and unethical) for academics to examine such moments of experimentation 'from the outside', I argue that spontaneous but rigorous auto/ethnographic methods are useful. The paper reflects on the author and colleagues' attempts to change the visual aspect of their university to better reflect notions of dialogue rather than individualised performance or the blandness of corporate branding, and on the successes and failures of visual tools employed in a prolonged strike in the terms of Judith Butler's call to 'take the street'.

WG05-701.4

WILTSHIRE, ANNE* (Stellenbosch University, South Africa)

Bequeathing the Burden of Work

It has been well documented within social reproduction theory that the increased participation of women in paid economically productive work has come at the cost of a 'second-shift' (Hochschild & Machung, 2012) of unpaid socially productive work for women who are unable to afford privatised services. This adversely affects lower-income women in the form of a 'care drain' (Isaksen *et al.*, 2008) which in the absence of informal networks manifests in a household 'care deficit' (Hochschild, 2004). The narrative, however, seems to end with the experiences of adult women. This chapter urges against adultcentric lenses of analysis to argue that children plug the 'care drain' and also experience a 'second shift' adversely affecting lower-income children.

This chapter draws on a longitudinal case study of households employed in the South African commercial fruit sector to examine the manner in which and the implications of how lower-income households negotiate paid and unpaid work. The case study employed an explorative qualitative research strategy interviewing 12 farm-working women stratified by employment and residential status over the course of one year.

Most research on work has predominantly focused on paid economically productive work, within the sociology of work as well as the sociology of childhood. Even when unpaid socially productive work is recognised, studies merely give reference to the social productive work of children or remain adultcentric. Not recognising unpaid social productive work and the varied scope of persons who conduct these activities silences the voices, experiences, development and opportunities of the most vulnerable in society.

WINTER, MARTHA* (University of Johannesburg, South Africa)

"Family Dynamics." Negotiating Temporalities of Migration and the Evolving Family Systems Among Malawian Families Living in South Africa.

Drawing from the migration timescales and new mobilities frameworks, this paper explores how Malawian men and women who are working in South Africa negotiate the uncertainities sorrounding their trajectories and at the same time maintain relations with their partners back home in Malawi. The paper will investigate the future of family in the presence of increased globalisation of labour markets that alters ways of " doing family" Acedera and Yeoh (2019: 2) and marriage. The exploration of changes in family systems is particuraly important considering the fact that it is in the family where labour is produced and maintained. Labour migration enhances capital accumulation in both the labour sending and receiving countries. However, the sale and purchase of labour power is as crucial to capital accumulation as the maintenance and reproduction of the working class is. Family systems are continuously being altered by the current global high intensity of labour migration and the transnational lifestyles. Migration time scale scholars look at how labour migrants experience, negotiate and engage with the various temporal aspects of their trajectories, especially in relation to structural constraints and opportunities. The paper will also look into how these structural constraints and opportunities intersect with gender and race to reproduce inequalities.

Disaster inside out: Room for Universals, Bridge to a Cosmopolitan, Engaged, Disaster Studies?

JC Gaillard has outlined an insightful 40-year research agenda for disaster studies (DS) that has three elements. Firstly, he calls for a DS that "builds on the importance of local researchers, analyzing local disasters using local epistemologies, especially in the non-Western world". Secondly, he asserts that "[s]uch subaltern disaster studies are to be fueled by increasing consciousness of the need to resist the hegemony of Western scholarship". Finally, Gaillard calls for us "to relocate disaster studies within the realm of its [the vulnerability paradigm's] original political agenda". I propose a dialogue that would clarify precisely aspects of these three elements.

1. What counts as local epistemology and what else is needed for local researchers to meet the practical and political aims of research, that is, to reduce disaster risk and to change government policy and practice?

2. What does it mean for "subaltern disaster studies ... to resist the hegemony of Western scholarship" and if, perhaps, Western scholarship itself is not the root cause of the problem, but rather the systems of power that have given rise to Western scholarship? Perhaps such scholarship is as a reflection of power relations that employ ideology as well as economic power to open up new markets and new opportunities for direct foreign investment.

3. Finally, I ask whether the original political agenda of the vulnerability paradigm as it emerged in the 1970s and 1980s was ambitious enough. I will argue that local epistemologies were truncated and simplified in a functionalist manner as "local knowledge" rather than life worlds that give meaning to local knowledge.

WITTE, NICOLE* (University of Goettingen - Center of Methods in Social Sciences, Germany)

Haifa in Biographies – Biographies in Haifa

The aim of my paper is to shed light on the interrelationships between biographical constructions and life in an urban context, based on my field research in the city of Haifa in Israel.

On the one hand, I examine the significance of 'urban' (physical and non-physical) contexts for the biographical courses of my interviewees. On the other hand, from a social constructivist perspective, we can assume that human 'life' (understood as a well-structured process of actions) continually (re)produces or transforms its contexts. Therefore, I am also interested in reconstructing how the actors (re)produce their urban contexts through their interpretations and actions. My focus here is on dialectical relationships and not on the linear course of the way in which one phenomenon affects another.

The interviews I conducted very clearly show how people's life courses are significantly affected by life in the city; however, as a rule, scholars systematically underestimate, or do not recognize or accept, the significance of people's life in the city for their urban context.

On the basis of a combination of biographical case reconstruction and ethnographical methods, I present various cases that illustrate this circular interrelationship between biography and city, and show how they represent different types of interrelationship.

The Dominant Cultural Content (discourse) Pertaining to Bodily Practices of the Polish Men Since the 1950's until the 2020's

The presentation is based on research which are supported by the National Science Center grant entitled Cultural Practices Related to the Body in Everyday Life of Four Generations of Polish Men.

There are three research aims of this project: (1)identification and analysis of everyday practices pertaining to the body in representatives of four generations of the Polish men (the so-called Baby Boomers generation, generation X, generation Y, and generation Z). (2)Analysis of the dominant cultural content (discourse) pertaining to bodily practices of the Polish men since the 1950's until the 2020's. (3)Identification and analysis of the symptoms of social change generated by male practices concerning the body.

The study is executed by means of broad-scale: analysis of secondary data concerning the dominant cultural content on male bodily practices and symptoms of social change generated by them, and qualitative analysis of data from 60 in-depth interviews with elements of biographical interview with representatives of four generations of Polish men.

The aims are interlinked by means of the theories of social practices. The project assumes obtaining answers to detailed questions e.g. concerning similarities and differences in the practices of older and younger men, functions of the prac-

tices for different men, constructing and reconstructing corporeality and masculinity within the practices, the evolution of the discourse on the male body under the influence of Internet and transformations of the social value of the body. Analysis are conducted from a generational perspective, because it is particularly important in Polish society, which underwent political transformation and is still in the process of consumerism development. As a result, there are men who were next to each other socialized to take care of the body in very different ways.

The research is in progress, therefore I will present the results of the second of the project's objectives.

WOLF, STEVEN* (, USA)

Accountability, Discipline, and Agrifood Sustainability

As we confront planetary boundaries and injustice, it is worthwhile to reflect on conceptions and practices of accountability. I aim to explore accountability as a process of social regulation that links social values to assessment routines, and ultimately, to discipline. Discipline here refers to the mobilization of sanctions and rewards that condition competitiveness and, ultimately, social right to operate. In inviting a discussion of discipline applied to sustainability, we must confront the potential for authoritarianism. This tension - the introduction of discipline potentially enables sustainable transitions and unaccountable exercise of authority - animates our critical discussion of governance of agrifood systems. The Accountability Framework initiative, Behind the Brands, and The Sustainability Consortium provide an empirical focus for the analysis.

RC24-283.5

WOLF, STEVEN* (, USA)

Governance, Accountability, and Discipline

I aim to conceptualize accountability as a process of social regulation that links social values to assessment routines, discipline, and, ultimately, changes in social and ecological relations. Discipline refers here to the mobilization of sanctions and rewards that condition competitiveness and legitimacy, thereby constituting selection effects. In inviting a discussion of discipline applied to sustainability, we must confront the potential for authoritarianism. This tension - the introduction of discipline potentially enables sustainable transitions and the unaccountable exercise of authority - animates this critical analysis of governance.

Electric Car, the Social Production of a Green Innovation

The present study aims to investigate the role of complex interaction networks in the process of social production of innovations focused on environmental problems, such as the electric car. The study is based on the assumption that these innovation networks are central to the introduction of technological and economic novelties in different contexts, since the production of innovation also depends on the introduction of institutional and cultural novelties (norms and habits). The research is focused on the investigation of three experiences of electric car implementation in the Brazilian context: (1) a network of actors oriented to the development of technologies and knowledge related to the electric car, within the scope of the Electric Vehicle Project of the Itaipu Binacional hydroelectric power plant; (2) a network turned to the installation of public-private urban sharing systems for electric vehicles in the cities of Recife (PE) and Fortaleza (CE); and (3) a network oriented to the creation of an urban mobility laboratory to investigate the impacts of electric cars on the electricity distribution system. Therefore, the study sought to investigate, through complex network analysis, how the configuration of these networks transform the forms of regulation of the automotive market, in order to enable the implementation of technological innovation. For this, it seeks to explore the (a) configuration of these networks, based on the analysis of their members, their links and their structure; and (b) the transformations promoted by the initiatives in the forms of regulation of the markets. The analysis of these experiences reflects the diverse tensions (environmental, urban mobility, public health) about the automotive market and its *modos operandi* and point to the different degrees of changes in the forms of market regulation, based on the ability of networks to articulate the various competences and interests of the social actors involved.

WONGSA, KRIDTIYAPORN* (Chiang Mai University, Thailand)

Multi-Sectoral Environmental Governance: The Case of Haze Pollution in Thailand

Thailand's natural resources and environmental governance has its ground on sectoral-based policy. This is best to govern natural resources and environment

within its own, single kind, be it forest resource, water resource, waste, coastal resource, or mining. However, area-based, multi-sectoral natural resources and environmental issues have gained momentum. The obvious examples include climate change adaptation, urban natural resources, and haze pollution.

Thailand, particularly in the northern region, which includes Chiang Mai, the second largest city in Thailand, and one of the top tourist destinations in the world with around 10 million visitors in 2017, has been facing haze pollution over the past decade, particularly during the dry season from February to May. The haze pollution started to occur once every few years but has occurred annually in at least the past 5 years. The impact has become more and more severe and has affected health and quality of lives as well as socio-economic conditions in the region. In March-May 2019, the level of United States Air Quality Index (US-AQI) hit the world record and had been in unsafe level for more than 90 days.

This should by far have been considered and declared a disaster or a health crisis on the national level. The governments, both central and local, have nonetheless had some structural difficulties to respond to the problem, efficiently and effectively. The difficulties could have been rooted in the fact that natural resources and environmental governance in Thailand has been structured based on type or sector, not multi-sectoral or area-based. This research aims at analyzing policies and institutions related to governance of haze pollution in order to understand the root of the difficulties in governance of such pollution in Thailand.

WOODCOCK, JAMIE* (University of Oxford, United Kingdom)

Workers' Struggle in the Platform Economy: The End of the Beginning

It has now been more than three years since the high-profile strikes of Deliveroo workers in London. Since that time, there have been waves of strikes across Europe on food platforms, as well as local and internationally coordinated strike action by Uber drivers. Food platform workers have coordinated across borders with the Transnational Courier Federation and app-based drivers have held an international meeting to coordinate their actions. In the process, platforms workers are building new organisations and testing tactics and strategies, signalling the beginning of a powerful new recomposition of platform workers. This paper presents an ongoing workers' inquiry with platform workers (including ethnographic findings, interviews, and forms of co-research) that seeks to make sense of this new class composition. First, it traces out the new connections these workers are making beyond the platform economy, for example, with Uber Eats and McDonalds workers. Second, it examines the new organisational and transnational structures these workers are building. Third, it reflects on the new resistance tactics and strategies these workers are experimenting with. The paper reflecting on what can be learned from this new class composition of platform workers: what forms of struggle are proving successful? What organisational forms can sustain these struggles and their victories? The paper concludes by placing these arguments within broader debates about the future of work/ers and trade union renewal, connecting the examples with the wider challenges and opportunities of the labour movement.

A Sociology of Youth for the Asset Economy: How the Impact of Assetization Is Transforming Young People's Work, Everyday Lives and Family Relationships

Social divisions are increasingly interpreted through the lens of generational conflict in the context of economic change. Such an approach has, however, been critiqued for obscuring class inequalities nospanning multiple generations. This paper draws on data from a 26-year mixed-methods longitudinal study of two cohorts of Australians who left secondary school in 1991 and 2006 respectively and were tracked through their twenties, looking at differing patterns of resource transfer between parents and their children across the two cohorts. Focusing particularly on housing and employment strategies, we highlight how the current debate about class and generation resonates with earlier debates within sociology between functionalist (youth as a structure and culture) and subcultural (youth cultures as class-based subcultures) approaches to understanding youth. To move beyond these stalled debates, we highlight the importance of developing aspects of a Mannheimian approach to the sociology of generations if youth researchers are to trace the remaking of class inequalities, and other structures of inequality, in the context of the rise of the *asset economy*, where access to assets is driving economic inequality more than access to good employment (although the two are related). We show the shifting interaction of income, assets and family transfers that is reshaping young lives. Between the two cohorts, the importance of access to family assets in young adulthood has become increasingly important in navigating contemporary insecurities and accessing opportunities in employment and the housing market. The rise of the asset economy is central to the changing life chances between generations at a societal level but simultaneously enhances the importance and qualitatively shifts the role of intergenerational sol-

idarities and transfers within the family. We contend that a sociology of generations that attends to solidarity, and conflict, is ideally positioned to uncover the creation of inequalities in this context.

RC34-439.2

WOODMAN, DAN* (University of Melbourne, Australia)

Making Time for the Tribes: The Work of Synchronization in the Making of Youth Collectivities in the Age of Digital Media

The subcultures/post-subcultures debate has reached a stalemate and there is a search for alternative, productive, framings. Such an alternative can begin to be traced out by attending to the assumptions and blind spots about collectivity shared by subcultural and post-subcultural framings of youth culture. Both approaches take finding time for collective practices for granted, focusing on a contest over the coherence and multiplicity of these practices, particularly in the context of the rise of digital technology. Drawing on ten years of qualitative data (2007-2017) from an Australian mixed-methods study of youth in Australia I show how the individualizing social structure that shapes contemporary lives means that investments and demands in one sphere, such as employment, often do not articulate easily with those in other spheres, such as leisure. The timetables and rhythms of the participant's lives are constantly varying in ways that are difficult to control and 'non-standard' hours of employment are common. Contemporary life demands new activity, often drawing on digital technology, to synchronize schedules to engage in leisure and collectively create and consume culture off line. A paradox of contemporary life for these participants is that periods of collective creativity and 'tribal' abandon require active synchronization, and even routinization (which can only partially be moved 'online', yet it is exactly this on an offline 'work' that goes into finding time for co-present 'tribal' abandon that can lead to a 'special occasion effect' that heightens the pull towards liminal experience when the 'gang is all together again'.

WORM, ARNE* (University of Goettingen, Germany)

Becoming a Refugee and the Politics of Participation.

a Biographical and Figurational Perspective.

The social category of refugee has been marked by state policies of bordering and "managing" migration, powerful discourses on social groupings, as well as social conflicts around participation and exclusion. The complexity of this category has been emphasized by the critical approaches in the fields of refugee studies and sociology of forced migration which has been crucial to de-essentialize it. However, the different meanings and consequences that the label entails for the people who are fleeing from violence and are in the process of (re-)establishing a life in respective contexts also need to be considered.

In this paper, I will present empirical findings from the DFG-funded research project "Biographies of migrants from Syria and West Africa in Brazil and in Germany - processes of inclusion and participation in the context of so-called irregular migration". Based on case reconstructions on the biographies of people who fled the Syrian war, I will present different *courses* of flight and different meanings of the label of refugee as a self-definition, we-image and they-image. The case reconstructions show how the processes of becoming a refugee constitute not only different experiences and sequentialities of crisis, violence, biographical rupture, but also continuity – dependent on diverging life-, family- and collective histories. I will argue that different meanings of becoming and being a refugee also reflect diverging and changing power (im-)balances *within* a certain "refugee grouping". These differences also affect participation chances as "a refugee" in the country of refuge as well as patterns of action in transnational spaces. To understand these differences, I argue, it is important to reconstruct in what ways a marginalized – or established - position within power balances before and during the war has been reproduced or transformed during the process of flight.

Drive-By Solidarity: Mapping Online Relationships between Twitter Campaigns of #Blacklivesmatter and Anonymous' #Opkkk

How can short term, strategic campaigns be a basis for solidarity? This paper offers a theoretical and empirical exploration of a less-frequently discussed form of solidarity between two diverse campaigns; one based less on shared identity and more on shared values; one that is aimed less at persistence and more at short-term impact. Building upon earlier conceptual work (Wright *et al.* 2018), we call this form *drive-by solidarity* because of its spontaneous, unilateral, and unsolicited nature. This paper examines drive-by solidarity through the case of Anonymous' "Operation KKK" (#OpKKK), an online hacktivist campaign against the Ku Klux Klan carried out in response to threats of violence they made against #BlackLivesMatter protesters in Ferguson, Missouri, in November 2014. After constructing a timeline of events from available news stories and videos for context, we use over three million tweets to conduct a series of network analyses to model the most significant online accounts associated with each campaign as well as the connections built across the respective online discursive spheres through direct retweets and mentions. We graph both the period of the 2014 #OpKKK campaign, along with its revival one year later, in order to empirically examine both the short- and long-term effects. Although Anonymous acted unilaterally and made no efforts to be inclusive of #BlackLivesMatter activists in their deliberations, the campaigns became politically coordinated in the short-term. #OpKKK successfully achieved its initial goals; however, longer-term effects were more volatile. This form of solidarity is theoretically compelling because it seems to challenge much extant theory on the role of identity in building solidarities, and even forces us to rethink how we define social movement success. Furthermore, we propose that drive-by solidarity could offer a possible model for other movements seeking high-impact, low cost, short-term campaigns.

Home Is Where My Kids (Sh)Are: Changing Intergenerational Family Relationships in the Digital Age

Virtual spaces like Facebook have become an extended version of "the home" for many adult children and their older parents. It provides a means of keeping in touch and staying up-to-date on day-to-day lives, especially for older parents about the lives of their independent and mobile adult children. However, recent research has shown that many in the millennial generation are now leaving Facebook in lieu of other social media platforms (e.g. Instagram) or managing their online privacy by sharing less. This can be attributed to a variety of compounding factors, including both the younger generation's increased concerns with privacy and disinformation as well as the older generation's online sharing behaviors. The disruption of intergenerational contact in "the virtual home" can have consequences in the lives of both generations. Most extant literature has investigated this new phenomenon by focusing on the online experiences and perceptions of the younger millennial generation. There is a more limited understanding of how the older generation (baby boomers) has perceived their role in and reacted to their millennial adult children's decreased visibility on or exodus from Facebook. In this study, we address this gap by conducting in-depth qualitative interviews with older parents in the United States about their attitudes towards and practices of social media use, "sharenting", and privacy in regard to their relationships with their adult children. By capturing the changing experiences of proximity and contact between generations from the perspective of older parents, this work will have significant implications for our understanding of spatial and affective aspects of contemporary family life in a digitalized society.

Smog and Citizen Science. Environmental Activism Regarding Air Pollution in Polish Cities

High level of particulate matter (PM10 and PM2,5) makes Polish air quality one of the worst in Europe. This is mainly related to the fact, that Polish individual energy consumption is based mainly on coal. Although the problem exists for quite long time now (since the 90s), it became a subject of public concern only recently. Citizens in big Polish cities started to pay more attention to air quality. Numbers of NGOs exclusively concerned with the problem (so-called Smog Alerts) have been created. NGOs not only direct the attention of policy makers, local politicians and public institution to poor air quality, but they also create alternative data infrastructure. This infrastructure consists on sensors and mobile applications (that makes the data easy to obtain by regular users). Some of the Smog Alerts engage in citizen science projects which aim to engage ordinary people in creating air pollution measurement devices.

The aim of the paper is to present Polish environmental activism regarding air pollution. I want to show:

1) relations of Smog Alerts with other actors (private and public) engaged in debates around air pollution; since there is growing controversy around policies, infrastructures and standards between activists and politicians, I want to show main points of this controversy, especially those related to knowledge production;

2) main form of their activism, especially those related with citizen science approaches; first Smog Alert was established in 2012 and since then Alerts all over the Poland engaged in various activities; recently some of them launched citizen science projects; by showing those activities I want to show some common features and compare them to other European examples of environmental activism regarding air pollution,

Earthquake Hazard Adjustment Differences between Communities

Hazards challenge us to reconsider our safety measures in communities, leaving key stakeholders to reduce risks and thereby curtail vulnerability. When addressing risks in communities, college students in college towns and households might have different approaches and views. Person-Relative-to-Event Theory (Mulilis and Duval, 1995) indicates that differences in exposure, experience, and demographic factors shape risk perceptions and influence hazard adjustments. To test this theory, this study uses survey data collected from college students in Stillwater, Oklahoma, and households in Shawnee and Sapulpa Oklahoma, exploring their hazard adjustment to earthquakes. Our results show some interesting findings across both populations and considerable differences between the student and household samples. The result shows households have higher levels of hazard intrusiveness and risk perceptions. To capture how residents are adjusting to the earthquake risk, the survey also asks respondents to report their intention of adopting 12 earthquake hazard adjustment actions. Among these items, five of them show significant differences between the two samples. We find that households are more interested in undertaking these activities to mitigate their earthquake risk. Curiously enough, students are more likely to believe state government will lessen the risk of earthquakes. These findings suggest that, while students are considered a vulnerable population, they offload responsibility for adjusting to the risk to the state government. In addition, students are more optimistic about earthquake hazards and believe Oklahoma state government will lessen the risk in the next few years.

WYNDHAM-WEST, MICHELLE* (OCAD University, Canada)
DUNN, JAMES (McMaster University, Canada)

Co-Designing a Digital Tool for Capturing Low-Income Older Adults' Lived Housing Experiences to Inform Equity-Based Policymaking.

The emerging fields of design sociology and anthropology are increasingly deploying respectful design (Sheehan 2011) and methodological approaches, such as co-design (Greenhalgh et al 2016) to address, "social inequalities, disadvantage and marginalization" (Lupton 2018:8) in order to produce scholarship directed at social change (Pink et al 2016). As such, we are co-designing a digital qualitative tool for capturing the lived experiences of housing among Canadian low-income older adults in an effort to inform equity-based policymaking. As the number of older adults in Canada grows, it is important to understand the housing experi-

ences of low-income older adults, including rapid urban change, rising housing costs and housing instability, and the effect of these experiences on health equity. Currently, it is difficult for policymakers to source recent and accurate housing data through which to inform equity-based policymaking (Cairney 2012, 2016). To address this challenge, we are co-designing a digital qualitative tool by: 1) understanding the lived housing experiences of low-income older adults in Canada's rapidly changing urban housing environment through participant-generated digital media; 2) analyzing participant digital media use habits and patterns while digitally recording lived housing experiences; and 3) co-creating a digital qualitative research data collection tool drawing upon data from stages 1 and 2. Therefore, in this presentation we will critically explore co-design as a mechanism to lessen power relations in social-change oriented research and how co-design pragmatically unfolds from process and outcome perspectives. First, we will discuss how co-design processes engage and maintain the engagement of low-income older adults, a traditionally hard-to-reach grouping (Littlechild et all 2015; Mulvale et al 2019), by training participants as co-researchers and working to create sustained research relationships. Second, we will explore how participatory data gathering techniques, such as photo-voice, work to build new types of experiential evidence outputs to fold into equity-based policymaking processes.

WYSIENSKA-DI CARLO, KINGA* (Institute of Philosophy and Sociology at the Polish Academy of Sciences, Poland)

Is Motherhood Really a Status Characteristic?

Gender inequalities are a fact. It is also a fact that mothers experience more hardships than fathers. But research on gender pay gaps and motherhood penalties provides mixed results regarding the claim that motherhood produces unequal outcomes.

That is, while women earn less than men, and mothers earn less than fathers, mothers do not always earn less than women with no children. For example, Wysienska and Karpinski (2020a forthcoming) show that although women in Poland are significantly disadvantaged on the labor market compared to otherwise similar men, both men and women enjoy moderate premia for parenthood, even though such premia are higher for men than for women.

Wysienska and Karpinski (2020b forthcoming) also directly tested a set of hypotheses and find little evidence for treating motherhood as a status characteristic, except for mothers of three of more children. Similarly, a study by Abromaviciute (2018) shows that motherhood status only matters in the case of married women.

These results suggest that motherhood as a status characteristic only activates the status generalization process under certain conditions – that is, when motherhood is especially pronounced either because of multiple children (as suggested by Wysienska and Karpinski's results) or because the role of mother is assumed to be dominant in a given setting (as suggested by Abromaviciute).

In this paper, I delve into the newest research results and propose a theoretical formulation that accounts for the seemingly incongruous findings. I also propose an innovative way to test this new theoretical formulation and preliminary findings.

XAVIER, BEATRIZ* (Health Sciences Research Unit: Nursing - UICISA:E Coimbra Nursing School, Portugal)

Cardiovascular Risk, Diets and Salt: Their Meaning in the Language of the Elderly in Portugal.

Healing is a relational process involving both the patient's and the professional's roles in different health care contexts. The language and meanings available to the actors in this process is a central element for effective communication and understanding of meanings. Meanings are often not shared and become a major barrier. A study was conducted with hypertensive patients that shows how among the older population of Portugal there is a misunderstanding of the medical language used in healthcare provided. The ability to understand therapeutic prescriptions and the meaning of symptoms and cardiovascular disease is limited, with implications for the behaviour of the elderly regarding the disease. Medical personnel should be clear about language and communication with these users.

People with high blood pressure create their own language and ideas of moderation, care and balance as mechanisms of operationalization between medical recommendations and their behaviors. Patients who are followed-up and guided through the process of leading healthier lives, through the individualization and internalization of medical and social norms and complying with the treatment, show different and unique ways of acting and combining medical information with the experience of coping with the disease and their everyday experiences.

What Nursing Students Say about Interdisciplinarity and the Presence of Sociology and Anthropology in Nursing?

The presence of social sciences and behavioural sciences in the training and professional practices of health professionals is considered important but its operationalization in the curriculum is generally considered problematic. The teaching of these sciences to health professions students faces considerable difficulties: medical students and nursing students may have problems with realizing and understanding the relevance of social sciences to clinical practice. Social sciences are loosely defined and the multitude of topics that include creating confusion about the priorities of education. The qualitative studies suggest that students consider that learning sociology in the nursing curriculum is "disturbing."

The purpose of this paper is to reflect on the importance that nursing students attach to interdisciplinary and the presence of sociology and anthropology in their course.

Impact of Self Help Groups on Well-Being of Rural Women - a Case Study of Punhana Block of Nuh District of Mewat Region of Haryana State.

Microfinance has been recognized as a powerful tool for alleviating poverty, particularly of rural poor women. It is an important institution for improving lives of women on various social components. Self Help Groups (SHG) is an important tool in the participatory approach for social and economic empowerment of women. SHGs are recognised social groups where members of the groups work together and help each other with no profit motive to upgrade the quality of living. A self-help group is fully organised and managed by its members who have common interests and have common background. SHG helps in improving the socio-economic status of rural women through income generating activities and empowering the rural women to have a greater influence in decision making with improved status in their families. The impact of SHG can be seen in terms of improvement well-being of rural women. The impact of Micro Finance and well being is also being considered as an important aspect for policy framework. This paradigm well being is considered as a "Civil Duty" and empowerment is seen at a large canvas for improving the status of women. The role of SHGs has been identified as one of the enabling factors to promote well being of rural poor women. Role of SHGs in bringing the well being in the rural areas is evident in terms of indicators i.e. improvement in income, education and health. The present paper is based on a study which has been carried out in Punhana block of Nuh district of Mewat region of Haryana state and examine the impact of SHGs on well-being of rural women. The study is based on primary and secondary sources.

Adolescents' Contribution to Democracy: Experiences and Effects on Young People in the Context of Ethiopian Political Transformation

Following the critical roles that youth mobilisation played in the 'Arab Spring' there has been growing interest in the role of young people in processes of political transformation in low and middle-income contexts. More recent literature has highlighted the importance of disentangling the interplay between context-specific political opportunity structures, the degree of ideological coherence underpinning youth movements and the extent to which they are able to adapt their strategies as political change processes unfold.

Recent political transformations in Ethiopia—in which organised youth played a key role—have been dramatic, with regional peace treaties forged and multi-party elections now slated for mid-2020. To date, however, there has been scant academic research exploring these dynamics and the role of young people therein.

This paper aims to contribute to this knowledge base, drawing on qualitative research from 2017-18 at the height of the country's political crisis and in 2019 following the transfer of power to reformist Prime Minister Dr Abiy Ahmed. The research is part of the Gender and Adolescence: Global Evidence (GAGE) study and involved in-depth qualitative and participatory research with adolescent girls and boys, their caregivers, community leaders, and service providers, in Amhara and Oromia regions.

The paper finds that while young people were publicly recognised as key actors in securing political change, and have been actively encouraged to redirect their energies to community development initiatives, the government has been slower to respond to youth-specific demands for greater educational and employment opportunities. Moreover, in the case of adolescent girls and young women in particular, redress for sexual and gender-based violence suffered during the civic conflict has also been very limited. These unmet demands have resulted in high levels of frustration, social media activism and a turn in some communities to criminal and violent activities, which officials are struggling to contain.

Quantitative Features for Adults and Teenagers Genre Fiction Classification

In the modern world we live, we have access to an enormous sets of text data. In the internet space every day we are looking for different fictional texts to read and as usual we have no convenient genre annotations. And sometimes it is really needful to learn text genre before reading. So, correct and useful fiction classification could help us with this problem. But how can we confidently define genre to classify it? And how could we make sure that this particular text is suitable for our purposes? For example, if we are to look for teenager fiction, we expect to find the book, which would be comprehensible and interesting to teenagers.

We focus our attention on quantitative features which can differ adults genres from teenagers genres for later use in automatic classification. We collect fairy tales, fantasy, detective and adventure fiction corpora to analyse each feature role and weight. There are different types of features for this research: lexico-grammatical, contextual, informational and so on. Set of these weighted features for each genre can allow us to build an NLP system that can automatically classify texts.

Intergenerational Class Mobility in Mexico and Its Regions: A Multidimensional Approach

This paper documents historical patterns of intergenerational mobility of social classes in Mexico and its macro-regions, using a novel method to define and measure social stratification based on individuals' functionings and access to household commodities. The economics literature has traditionally defined class unidimensionally, mainly considering monetary metrics like income, expenditure or wealth. Meanwhile, the sociological literature has provided a broader array of approaches ranging from financial aspects to complex notions of status, occupational hierarchy and even relations of work exploitation. Nowadays, most social scientists agree that the construct of social class must be multidimensional in nature. This paper contributes to the discussions on the multidimensional definition of social class by presenting a novel technique for the measurement of social stratification grounded on the Sen-Nussbaum capability approach, and operationalised with the burgeoning counting approach; the latter inspired by the popular Multidimensional Poverty Index (MPI) featured in the UNDP's Human Development Reports. Our methodological framework rests on the classic Aristotelian three-class division (the poor, the middle class and the affluent) but is amenable to generalisations involving finer partitions. In our empirical analysis our proposed multidimensional identification of social classes considers current and retrospective information on sociodemographic and household characteristics of respondents, using data from the Mexican ESRU-EMOVI 2017, a for-purpose survey of intergenerational mobility with rich information on the socioeconomic conditions of the respondent's household of origin (i.e. where respondent grew up). Thus, we can measure intergenerational mobility from the probability elements of a transition matrix connecting the respondents' current and past social classes. Thereby we can gauge the degrees of social rigidity/ fluidity in Mexico and its regions (where important development divides have been documented in the literature, e.g. between the south and the rest of the country, especially the central urban highlands).

The "Universality" of Transition to Capitalism: An Experience of Japan in Capitalist Development and Its Implication

As a result of globalization, capitalism has appeared to become the "universality" of the world. Given that various social problems such as increasing inequalities and social exclusion have been present in globalization, the reason why capitalism, which devastatingly affects ordinary people, can be still preferred needs to be clarified. Addressing a case of Japan, this paper tries to examine theoretically why people prefer capitalism in spite of its negative effects.

Firstly, in this paper, free wage labor, which is one of basic "structures" in capitalism, is focused on, and the structural formation of capitalism is reconsidered. In this task, it is indicated that capitalist structural formation or transition to capitalism can become all the easier because pre-capitalist social relations, which should be inherently untied in transition to capitalism, can persist to some degree. In other words, this paper asserts that capitalism needs pre-capitalist relations in its development. From the Polanyian perspective, reciprocity and redistribution, which are closely related to pre-capitalist relationships, can prompt transition to capitalism, while these relationships should be dissolved in capitalist development.

Secondly, this paper addresses a case of Japan and examines the function of its land-owning system in transition to capitalism. In Meiji era, unique land-owning system was constructed in Japan. It has often been asserted that land-owning system in Japan stagnated capitalist development because relationships between land-owners and sharecroppers were so strong that sharecroppers were difficult to turn into proletariats. However, this paper aims at clarifying that one of characteristics in Japanese land-owning system entailed "moral economy" or reciprocity in rural regions, and that its characteristics enabled sharecroppers to prefer this system. Thirdly, this paper suggests that capitalist development in Japan has been accelerated through turning its characteristics into unique enterprise system in Japan, "management familism".

How Representative Are the Political Elites of the Citizens' Voices? : A Comparison of Equality Views

How to overcome economic inequalities is one of the most important policy issues in Japan. There is disagreement about how far inequality should be tolerated and how far the government should intervene to reduce inequality.

So how do political elites - politicians, bureaucrats, interest group leaders - and ordinary citizens perceive the current inequality and what stance do they take on addressing it? Are there any discrepancies between the two? If there is a wide gap between the two attitudes, it suggests that the political elite in Japan does not adequately represent the will of the people. In other words, the democracy is not working properly.

Therefore, this presentation compares the political elite's and the general public's view of equality and examines how the citizens' ideas are reflected in politics. The data are based on questionnaire surveys conducted with elites and citizens in 2018 and 19, respectively.

The results of the analysis revealed a congruence in the view of equality between the main elite in policy formation, such as the ruling party (LDP), bureaucrats, and top business leaders, and citizens who are higher in income and professional status. These people tend to perceive the status quo as equal, tolerate social inequality and are oriented towards individual independence. On the other hand, innovative political parties, trade unions, and civil society organizations are oriented towards reducing inequality and expanding social welfare, but they are stronger than those with similar orientations among citizens, creating a mismatch.

The above results show that in contemporary Japan, the higher the strata of the society, the higher the response from the mainstream elite in policy formation on policies related to equality. This suggests that the political process may rather reproduce economic inequality.

Covert Racism or Environmental Problems?: A Comparative Newspaper Analysis of Asian and German Carp

In the past two decades, both online and offline American newspaper articles headlined "the War Against Asian Carp." These articles reported sensationally Asian carp in Midwestern rivers would cause serious damages to native fish communities because it often outcompeted native fish for food and aquatic habitats. Some maintained the U.S. government should do its best to prevent the Asian carp from invading into the American waterways. Notably, the "War Against Carp" discourse also appeared in the early 20th century newspaper articles, especially after the U.S. government had declared war on Germany. At that time, however, the target was not the Asian but the German carp. Thus, the socio-political climate of that era can influence how alien species are anthromorphized in the

American media discourse. Building on these findings, the presentation further examines what accounts for the similarities or dissimilarities between two cases. While the use of the term German carp has gradually faded and has lost its social appeal, the term Asian carp has received nationwide attention not only because of the effortless rebranding strategies (e.g. Silverfin, Kentucky Tuna) carried out by U.S. city and state officials but also because of political correctness. In 2014, the Minnesota Legislature passed the bill that banned the use of the term Asian carp in public documents so as not to offend Chinese communities in Minnesota. Chinese investors, according to the audio recording of the legislature meeting, were important to the Minnesota economy. Therefore, a study of invasive species discourse enables us to recognize and uncover covert racism by analyzing how a society responds to it. These evidences also suggest the spirit of "the war on something"(e.g. the war on terror, the war on immigrants, the war on drugs, etc.) is inherited in the anti-invasive species campaigns in the United States.

Public Engagement Under Authoritarian Environmentalism in China: Climate Change Communication Networks on Weibo

In the face of the urgent need for effective climate action, there are growing debates over the possibilities and limitations of authoritarian environmentalism as an alternative model of climate politics. Authoritarian environmentalism is seen as a non-participatory model that relies on top–down mechanisms and strong state capacity to produce rapid and strong environmental actions. However, it is necessary to move beyond a binary interpretation of state–society opposition and re-examine the presumed exclusion of public engagement. We examine public engagement in climate communication in China by comparing communication networks oriented around the *IPCC Fifth Assessment Report* and the *IPCC 1.5 ℃ Special Report* on the pre-eminent Chinese microblogging platform Weibo. Our social network analysis reveals a more nuanced picture of public engagement than is suggested by the concept of authoritarian environmentalism. Instead of excluding the public, we find an expansion of public engagement in climate communication in recent years. However, we also find restrictive communication patterns, including decreased dialogical relationships, inadequate bottom–up information flow, and an increased homophily effect among eco-insiders and governmental organizations. This mixed image shows us the coexistence of both opportunities and constraints on Weibo and the need to direct more attention to the dynamic interactions between state/elite actors and the general public in China's climate politics.

20 Years after World Social Forum (WSF), What Place for Subaltern Workers in Public Policies and Counter-Movements to Commodification?

The first World Social Forum (WSF) held in Porto Alegre in 2001 highlighted participatory practices and their capacity to involve "marginalized" populations, especially informal and poor workers. It made also visible a heterogeneous movement in practices but marked by common objectives through the different experiences, that of the solidarity economy, highly developed in Brazil and Latin America, and also on other continents, especially in Africa.

Since the first WSF, we witnessed a wealth of experiences, both across countries and in contemporary times (since the 1960s and 1970s), showing by what strategies (popular education, intersectional action, see for example Theodore, 2015, or Chun and al., 2013), these populations are mobilizing. But there is hardly any study on the ways and conditions by which their situated standpoints are taken into account in public policies or by trade-unions or counter-movements.

So, we invite interested participants to submit papers that shed light on "good practices", or that question the conditions under which informal or poor working populations, which can be called subaltern, because they are at the heart of social power relations in terms of class, gender and race, manage to build local and global solidarities (Lindell, 2009 and 2010). What they want and how they make themselves heard? On the contrary, can we highlight instrumentalizations of their mobilization? In any case, can we shed light on the limits of the usual analytical frameworks (mainstream) to grasp the stakes around these mobilizations of subalterns?

Decolonizing Knowledge through Narrative. the Kurdish Case on Violence and Injustice

The business of data and knowledge production is on rise as it has never been. "The information one seeks can easily be reached nowadays" has not lost anything from its popularity in our time. Yet, for alternative voices the situation changed barely, especially in countries with authoritarian tones. Through attempts of meaning-making, these oppose the very nature of regular knowledge production. Hence the knowledge generated by the marginalized ones requires political efforts in order to reach people. How should we treat this sound in the margin when it pops up under sociopolitical circumstances of injustice and violence? Is narrating past and current violence, for instance through writing books, an activist effort? Or should it be considered an intellectual capacity?

This paper discusses the questions of knowledge production as acts of disobeying. In particular, this paper looks into the Kurdish biographies that address(ed) violent events performed and material and mental damage caused by the Turkish state's armed forces. Remembering and narrating the past violence stay put in the epicenter of this resistance. Reconstructing the narrative keeps the resistance in Kurdish discourse alive, be it on massacres of 20thcentury or present injustice. It flourishes, in Walter Mignolo's terms, the epistemic disobedience that finds pockets through biographical storytelling and further literal and artistic forms. The epistemic disobedience attempts to decolonialize state structures' power on knowledge.

In this respect, this paper explores the opposing attempts of meaning-making in biographies through the analysis of Kurdish narrative interviews that were gathered during the last urban war in Turkey in 2015/16.

YEW, WEI LIT* (City University of Hong Kong, Hong Kong)

Environmental Justice and the Ethnic Politics of Legal Mobilisation in Malaysia

Southeast Asia has received scant attention from socio-legal scholars, despite its rich repertoire of environmental legal action. Thus, I seek to partially address this lacuna by evaluating a subset of Malaysia's environmental legal mobilisation. Specifically, I investigate localised legal responses to the (potential) threats to the environment posed by foreign-owned plants. Complicating the picture is the predominant ethnic Chinese profile of these communities in a country where ethnicity retains marked political salience. However, if Malaysian courts have been prone to executive interference, why and how does law still matter for minority ethnic communities in their struggle to attain environmental justice? How has the meaning-making process of these citizen activists shifted, if at all, through time? I argue that the logic driving grassroots environmental litigation is forged through three conditions: Malaysia's post-colonial legacy of constitutional liberalism and ethnic divisions has privileged law as the prime dispute processing mechanism, leading to the state's contingent toleration of a relatively resilient activist-politician-lawyer alliance. The activist coalition would shape grassroots motivations for legal action, imprinting an activist tactical logic of garnering political legitimacy and publicity. Further, the precarious position of the ethnic Chinese in Malaysia's body politic sharpens the protagonists' natural desires for the legitimacy gifted through court action. Based on data from interviews with activists and documentary research, I utilise three case studies, each from a distinct historical period, to demonstrate how a liberalising political opportunity structure, instead of legal opportunity structure, better explains the growing confidence and willingness of citizen activists to litigate.

Green Protests in the Shadow of Authoritarian Rule: Boundary-Spanning Contention in China and Malaysia

Over recent decades, urban middle-class residents in East Asia have risen up and spilled into the streets, demanding an end to the construction of noxious facilities in their backyards. To what extent does the authoritarian regime type shape the variation in environmental protest strategies? Protests in Malaysia are generally thought to be contained within electoral mobilisation. By contrast, China's contentious activities appear transgressive, given the recurrence of "troublemaking" direct action. Taken together, it seems to support the conventional wisdom that protest tends to be more transgressive in a more authoritarian society. This paper reconsiders this through a comparative study of local environmental protests in these two different illiberal regimes. I argue that protesters respond and channel their radicalism in institutionally-specific ways, as they straddle the bounds between prescribed politics and politics by other means (O'Brien 2003). In both countries, the institutional logics of (de)centralisation, accountability

mechanism, and regime ideology generate popular expectations about official behaviours. In accordance with those logics, protesters deploy an ambivalent strategy that is neither transgressive nor contained against the state. Based on interviews with activists, this paper examines four case studies that nospan distinct geographies and historical periods from 2002-2016. By zeroing in on where and how protesters broaden their goals and tactics, this paper proposes a nuanced conceptualisation of political opportunity structure, which hints at the broader possibilities and challenges accompanying green activism in illiberal regimes.

Selling "Global Work Experiences": South Korean Student Work Placement Programs in Australia

Youth unemployment is a major social issue that has been the focus of policy-makers in South Korea. In response to this issue, the government designed the Youth Overseas Employment Support Program (YOESP) in 2006, which has substantially grown in size over the last decade. YOESP trains young South Koreans to acquire foreign qualifications and facilitates their overseas internship and job placements. The largest number of program recipients is sent to Australia to work in the service industry, particularly early childhood education and hospitality sectors. While the two sectors experience labour shortage in Australia, they also have seen widespread employment practices not compliant with the Australian labour standards. For this reason, the mistreatment of young South Korean workers has been documented by both Australian and South Korean government agencies and the media. Although the government policies use global mobility as a counter-unemployment measure, the quality of overseas employment and the experiences of the program recipients have seen little critique from the perspective of migration studies. This paper uses data from government documents and in-depth interviews with young migrants and relevant stakeholders (government officials and education partners) to understand the different meanings of "the global", "work", and "experiences" from the perspectives of the government, industry stakeholders and the young migrants. This paper adopts a transnational lens to study migration as a process where aspirations from students, governments, potential employers, and education institutions converge and clash. I argue that different understandings of the global and work by the multiple parties involved inevitably make the "global work experiences" contentious.

RC31-384.2

YI, SOHOON* (Kyungpook National University, South Korea)

Temporarily Family: Questioning the Border through Temporary Kinship Migration in South Korea

Over the last decade, scholars have paid attention to the commodification of personal lives by global financial capitalism, focusing especially on the labor of migrant women in the intimate sphere. This paper expands the scholarly debate on intimate labor by introducing the state's bordering practices and temporary migration scheme to the discussion of cross-border kinship. The paper examines the experience of Korean-Chinese (Chinese citizens who are ethnic Koreans) and Vietnamese women who come to South Korea on a temporary legal status mediated by their marital or kinship relationship with citizens. I call such legal status "temporary kinship visas," introducing family migration into the discussion of the managed migration paradigm. The grafting of temporariness onto kinship migration programs is an important site of investigation given the central role of the family to shape women's labor and the state (especially immigration authorities) to validate family relationships. By examining the regulation of time through immigration policies, the paper presents new perspectives to the previous work on time-space compression that considers the relationship between the arrangement of space and time, global capitalism, and the power. The paper explores the cross-border relational labor, which is the performative work of proving migrants' connections to South Korean families, through which migrants mediate their visa time. As the visa expiry date fundamentally shapes one's experience of space, segregated temporal experience rearranges space and creates border encounters in migrants' everyday lives. I argue that extending the time on their kinship visas requires migrants to prove to the immigration administration their connections to South Korean families, and the temporal duration of the visa are conduits of dialectic relationships between migrants, their families, and immigration authorities.

Social Movement in Authoritarian Regimes - a Strategic Action Field Approach

Social movement mobilisation in authoritarian regimes is an uphill battle. Yet cracks in the ruling regime as well as ups and downs of political control offer

opportunities for sporadic and often uncoordinated activism. Whilst activism on human rights, environmental protection, etc in China has attracted the attention of the international media in recent years, most of such activism has either been cooptated by the state (e.g. environmental protection) or has been high-handedly oppressed (e.g. workers' rights activism). Yet activism of homeowners presents an interesting case. Not only have they kept their momentum and even been proliferated from rich coastal cities to smaller inland cities, embryonic network organisations began to emerge. The paper argues that the survival space of homeowners' activism in urban China offers a window to reveal the dynamic of social movement in authoritarian regimes. In fact, the proliferation of homeowners' activism has moved beyond the initial triggering concern on economic interest to issues of political implications like autonomous self-governance as well as free and unsupervised elections in the neighbourhood. This paper will employ the strategic action field approach to uncover the intersection and interaction of the economic, political and social institutions at the neighbourhood. It is the dynamics of these interacting fields that creates a contradiction at the grassroots that on the one hand provoke homeowners' activism but the same dynamic also prevents the intensification of state oppression. Analysis of this paper is based on information from a range of sources which include primary information from in-depth interviews with homeowner activists and government officials, participant observation in activists' meetings as well as from secondary sources like media clips, social media groups and printed materials of activist organisations. This paper contributes to our further understanding of social movement in authoritarian regime and to the state-society relation in BRICS countries.

Paradox or Blessing of Meritocracy?: Conflicting Effect of Meritocratic Work Evaluations on Female Managerial Representation in Korean Firms

The persistence of the glass-ceiling effect in workplaces has been a puzzle calling forth the attention of various academic fields. One such approach was 'gendered organizations', which attempts to uncover the institutional hurdle working against female workers in seemingly gender-neutral organizations. Although various studies have attempted to investigate the mechanism by which glass-ceiling effect continues, there have been two major research gap left uncovered. First of all, there was a scarcity of research capturing the glass-ceiling effect by the proportion of female in managerial positions. Female representation in the managerial level is a crucial indicator of the 'glass-ceiling' effect. At the same time, low representation of women in the managerial level itself perpetuates the existing organizational norm against female workers. Secondly, there was a scarcity of studies looking into the effect of institutional practices, especially meritocratic work evaluation practices on female managers.

Therefore, this study attempts to fill in the research gap by focusing on how the adoption of meritocratic work evaluation strategies—accomplishment and ability evaluations—influence female representation in the managerial ranks in Korean workplaces. South Korea is an especially relevant context, as it is one of the countries experiencing the glass-ceiling effect most pervasively. Panel regression analysis was conducted using the Korean Women Manager Panel Survey(WMPS). As a result, different mechanisms operating at managerial ranks were found. On the one hand, the existence of accomplishment evaluation had a positive impact on the proportion of women in middle managerial level, holding other firm characteristics constant. On the other hand, ability evaluation had a negative effect on female representation in higher manager ranks. This hints to the existence of 'paradox of meritocracy' in the higher managerial ranks against women, reflecting how meritocratic social structure contributes to perpetuating the glass-ceiling against women in Korean firms.

Nationalized Networks, Self-Observing Society, and the Polarized World: A Study of U.S. Social Scientists' War Efforts in WWII and after

Modern warfare requires "reasons" to fight. Willingly or not, most of the academic scholars in the countries involved in wars, play some role in producing the discourses as regards "why we fight" or "why fight them".

How, then, do social scientists respond to this situation? What kinds of investigation are promoted? To tackle these questions, this paper focuses on social scientists' "war efforts" in the United States just before and after the her entrance into the WWII. Their activities were, I shall argue, quite functional in making the image of "our society" and in making its people a conscious entity that observe "ourselves". These activities, among others, anticipated the "we"-versus-"they" polarization of the international relations that constructed the Cold War.

I explore how the social scientists in some groups advocated the idea, "we observe our own society", by studying two groups of intellectuals – one being the Council for Democracy, based primarily in New York, and the other being the network called American Defense, Harvard Group. I focus on memos and pamphlets,

as well as articles and books, which were generated by the members of these groups, including the sociologists Robert Lynd in Columbia and Talcott Parsons in Harvard University.

The result of the study will show their actions in two series: first, the nationalized networks of the interdisciplinary scholars to investigate their society, inquiring whether it is democratic or not; second, the local institutions that would encourage the American people to re-examine what "our society" is like – whether it is worth fighting for or not.

This emergence of the idea and practice of "self-observing society", I will argue, anticipated the construction of the polarized world, laying the new lines of the schemes for the international conflicts that would give shape to the coming Cold War.

How Public Policies Affect Firm-Level Work–Life Balance: A Longitudinal Analysis of the Impact of Incentive-Based Work–Family Policies in Japan

Public work–family policies and their effects are drawing increasing attention, as many developed countries have experienced an increase in the participation of the female labor force. Sociological literature has focused on the impact of these policies on individual careers, especially on female employment after childbirth, yet little is known about how these policies affect the work–family balance at the organizational level. In particular, how firms react to incentive-based policies, unlike mandate-based ones, remains to be addressed, for sociological research on organizations has usually paid attention to their responses to coercive pressures, such as laws or regulations. This paper addresses this knowledge gap by examining the impact of public incentive-based policies on the firm-level work–life balance in Japan. The government of Japan has recently implemented a new work–family policy that provides governmental certification and its concomitant economic benefits to those firms that meet all of the standards with respect to a work–life balance, which should provide an incentive for firms to improve their work–life balance. Thus, this study investigates how this policy influenced key components of the firm-level work–life balance, that is, parental leave and overtime work. I used longitudinal survey data for large companies in Japan, combined with official data on governmental certification. Quantitative analyses showed that before attaining governmental certification, to-be-certified companies improved employees' parental leave more than did their counterparts, while this was not the case for overtime work. However, after those firms received certification, the degree of improvement in parental leave for certified firms was no greater than for noncertified firms, which implies that the support for working parents receded after firms became certified. These findings suggest that public incentive-based policies have a positive effect on certain aspects of the firm-level work–life balance, albeit only in the short term.

Participatory Action Research and Multi-Level Perspectives to Education Pathways of Congolese Refugee Youth

A majority of refugees worldwide are children and adolescents, according to UNHCR, and the proportion of minors is higher among those from African. In the USA, a country that has been receiving an increasing proportion of refugees from Africa, however, high schools and colleges struggle to provide adequate educational support for youth and young adults of refugee and immigrant backgrounds. For resettled refugee youth, higher education is an invaluable empowerment tool for envisioning and preparing for a renewed life trajectory. Unfortunately, numerous obstacles and challenges inhibit them from pursuing higher education and career development, such as interrupted schooling, language barriers, and psychosocial trauma, just to name a few. Without school policies and programs, refugee youth face structural and institutional challenges.

To address this inequality in education, we have initiated a participatory action research (PAR) project involving Congolese refugee community leaders, a student-run grassroots organization for refugee youth, and university administration, faculty and student members in a Midwestern city. The aims of this PAR is multi-fold and include empirically investigating and documenting refugee youth higher education pathways (e.g., lifecourse trajectories, drivers an barriers, promising interventions at the individual, institutional, and societal levels), strengthening the capacity of refugee youth, families, and community leaders, and implementing and evaluating collaboratively developed interventions. Data collection methods include focus groups, life-history calendar interviews, surveys, and participant observation. This presentation will discuss findings from our ongoing community assessments, as well as the processes and outcomes of the recent higher education-pathway workshop.

Social Exclusion and Mental Health of Older People in East Asia: Comparison of China, Japan and Korea

Previous research pointed out that population aging began in East Asia before the welfare state was developed and the modern families were stabilized. At the same time, influenced by modernization and economic development as well as globalization, family relationships and norms in East Asian countries have been changing, and social exclusion of older people became one of the most critical social issues as trends demonstrate a shift from multi-generational households to nuclear households.

Using a nationally representative samples from China, Japan, and Korea, this study examined social exclusion and mental well-being of older people. The data were drawn from the 2010 East Asian Social Survey (EASS), which included information about various dimensions of social exclusion measures such financial resources, social support, basic services and neighborhood information. A sub-sample for this study was 2244 respondents over 60 years old.

The associations between social exclusion variables and older peoples' mental health were explored and compared across the three countries. First results of logistic regressions showed that the associations between the types of social exclusion variables and mental health varied across countries. While lack of financial resources and services were found to be associated with lower mental health status in China and Korea, they were not significant for Japanese. Rather, lack of social support (both emotional and actual instrumental support) were found to be negatively associated with mental health for Japanese.

The findings highlight the variations within East Asian countries in the associations between social exclusion variables and mental health of older people, which may be due to differences in social and policy environment of each country. Discussions include the welfare states in the three countries and implications for policy.

The Role and the Limitations of Ethnic Non-Formal Education for the Empowerment of Brazilian Migrant Youth Living in Japan

The aim of this research is to identify the role of ethnic non-formal education (ENFE) for the empowerment of migrant youth as well as their limitations. The research data were obtained trough semi-structured interview with students and educators of three different types of ENFE– distance higher-education, job training and language learning.

As Brazilian community celebrates thirty years of immigration in Japan, the integration of young migrants to Japanese society has become a matter that requires increasing attention. Research data indicates that compared to students with Asian backgrounds, Brazilian students have the lowest educational achievement reaching only 60% of high school enrolment and 10% of Japanese university enrolment, not to mention the high dropout rate.

While Japanese government is reluctant to introduce a social integration policy to promote educational and occupational achievement of young migrants, a movement of resilience has emerged within the Brazilian community. That is to organize ENFE activities aiming to support those who lost educational opportunities due to linguistic, cultural and institutional barriers in Japanese school system.

ENFE are often led by members of the Brazilian community who have lived in Japan for many years and have actually worked as non-regular factory workers in the past. This enables the educators to provide a more flexible education based on each student's language ability, studying hours, and learning purposes. Also, learning directly from their role models seemed to have a positive impact on Brazilian students' aspiration.

However, the results point out that the human capital, cultural capital, and social capital that students acquired through ENFE may not be fully valued in Japanese society where there is a lack of diversity awareness. Consequently, the students were struggling to have a smooth transition from ENFE to white-collar jobs, being forced to remain as irregular factory workers in Japan or to move abroad.

YOUNG, GARY* (Cooper Medical School of Rowan University, USA)

Sociogenesis of Disease: Bourdieu and Social Epidemiology

This paper addresses sociological processes that help explain the sociogenesis of disease in human populations. Pervasive health inequalities in both advanced capitalist and developing societies implicate fundamental social causes. Social epidemiology has contributed a range of empirical investigations of lifestyle behaviors, psychosocial processes, and social structural and cultural contextual factors, in the causal pathway of disease. Yet to date, there is no widely accepted conceptual framework for incorporating social causation in the biomedical-pathophysiological model dominating contemporary epidemiology. This paper demonstrates how Bourdieu's core concepts of *habitus, capital, and field*, interact in the social production of health and disease. At a granular level, the paper links *habitus* and *capital* with empirical evidence adduced in support of the biopsychosocial model of cumulative psychologic and physiological vulnerability. *Capital* is differentiated into social and political forms; the former manifest in the role of social support and collective efficacy, and the latter linked to the role of corporate and state entities structuring health systems and individual-level health behaviors—all with extensive empirical support as social determinants of health. The paper also shows how physiological studies provide support for the plausibility of a causal linkage between social determinants and associated stressors and health outcomes; for example, the link between dysregulation of the stress response system (hypothalamic-pituitary-adrenal pathway) to cardiovascular disease. Epigenetic research links both *habitus* and *field* with associations observed among environmental, genetic and stochastic factors and human disease phenotypes. Group/place differences in allelic frequencies for multiple genes affecting a single biologic mechanism lends credibility to the interaction of a genetic role and social factors contributing to health disparities. The paper summarizes accumulating evidence of multiple pathways underlying differential population exposure and disease susceptibility and how these can be conceptually integrated with Bourdieu's concepts into a physiologically-grounded sociological theory of the sociogenesis of disease.

A Life Course Perspective on War Exposure, Migration History, and Later Life Wellbeing of Northern Vietnamese War Survivors

Building on a previous study that used retrospective individual-level data to investigate the association between pre-migration conditions, exposure to war, and lifelong patterns of voluntary and forced migration, this study examines how the migration patterns of older northern Vietnamese war survivors moderated their later life well-being, in particular, health and socio-economic wellbeing. We use the life course perspective, specifically, the principles of timing, context, agency, and linked lives, to frame our analysis of data detailing the early life experiences and conditions of 2,447 older Vietnamese men and women. The data come from Wave 1 of the Vietnam Health and Aging Study, collected in 2018, and comprising retrospective survey data capturing family background, early childhood circumstances, experiences during the Vietnam War, migration history, occupational history, current health, and current social support structures. We use this data to construct multilevel structural equation models for the purpose of understanding how migration volume, timing, and context intervenes in the life course to shape later life wellbeing. We look at the proximate, root, and demographic sources of migration; the reasons for migrating, whether for education, marriage, employment, military deployment, or wartime evacuation; and a host of demographic and behavioral predictors of health and wellbeing. We anticipate that the different reasons for migrating will exert different influences on traditional predictors of the health and economic wellbeing, differentially shaping the wellbeing of older northern Vietnamese war survivors.

Racism in Canada's Post World War II Immigration Policy: An Archival Study

Through an analysis of a collection of correspondence among Canadian state authorities with officials of Lebanese, Syrian and Armenian descendant, in the time period of 1947-1952, it was found that in the immediate era of post-World War II, in spite of superficially adopting a liberal 'non racist' stand, Canadian officials, especially in terms of immigration policies, continued to be racist. While the events of the Second World-War, had made institutionalization of racial politics utterly unfashionable, the archival analysis shows how Canadian officials were cognizant of it, yet continued to struggle in justifying their exclusion of 'Asiatic' policies from a liberal lens. An even more interesting observation, however, is how different ethnic minorities attempted to bargain for inclusiveness without chal-

lenging such social Darwinist discourses. While on the surface one might argue that the ethnic minorities' discourses and struggle for inclusion is a story of struggle to challenge the Canadian racist policies, analysis of this archive shows that their modus operandi never seriously challenged the racial discourse. Instead, their primary struggle was to fit themselves within the Indo-European lineage. The most important takeaway from the research, however, is a humbling reality of how racial discourses continue to pervade seemingly liberal Western politics. While this research is historical, it hints at the tools and mechanisms that continue to self-reproduce through modern constructions such as liberalism, states and political agents. An eerily similar immigration policy is in effect right now in contemporary America, which puts a blanket ban on immigration from Muslim majority countries. Similar to the findings of the archival analysis, the Trump Administration currently justifies the ban in the name of national security. The findings of this analysis are, thus, important, because they reinforce the understanding that racial politics and policies can continue to reproduce within a liberal state.

Gender and Adolescence in Complex Conflict-Affected Contexts: The Case of Lebanon

Gender is a determining variable that influence the process of youth participation, their pathways, challenges, and opportunities. For older adolescents at the juncture of transitioning into adulthood, their lived experiences are shaped by their gendered sociocultural environments and political contexts. To better understand how girls and boys perceive their worlds as gendered, their wider political context, and their place in the changing social order particularly in complex conflict-affected settings, Gender and Adolescence: Global Evidence (GAGE) programme is carrying out a longitudinal participatory research in Lebanon with adolescents within and among the Syrian and Palestinian refugee communities and the vulnerable Lebanese host communities.

Through following the lives of adolescents over the course of 3 years (2019-2021) using interactive participatory tools, which include participatory photography, GAGE aims to gain a better understanding of 'what works' to empower various groups of adolescents in conflict-affected contexts, especially adolescent girls. GAGE participatory research methodology comprises a set of tools that has been developed with the aim of enabling adolescents to articulate their thoughts, experiences and perspectives, thus promoting their participation as active agents who inquire upon issues affecting their lives and those of their community.

The preliminary findings of the study derived from the first 9 months of research activities reveals disparities in the individual and collective capabilities and opportunities of the different groups of adolescents in Lebanon, which is a highly diverse society with the world's highest per capita refugee population. Adolescents' experiences, pathways, challenges, and access to services and opportunities vary by gender, nationality and status, socioeconomic status, religion and sect, as well as geographical location. The study's evidence will be used to contribute to policy and programming dialogues on progress towards the achievement of gender- and adolescent-relevant SDG targets.

YTTERSTAD, ANDREAS* (Oslo Metropolitan University, Norway)

The Norwegian Oil Worker and the Crisis of Climate Change Hegemony

Norwegian Climate Change Hegemony has gradually found it more difficult to sustain the historical division between oil policy and climate change policy (Nilsen, 2001). The school strikes in Norway has been strong, there was a substantial growth of the "green vote" in 2019, and the Labour Party and LO Norway are both more divided over the future of Norwegian Oil than ever before.

This is the backdrop for a remarkable rise in the public discussion of the role of the oil worker in Norway. The shift in public image is palpable, from "hero of the welfare state" to "climate villain." Employers and right wing politicians who in the 80s fought the oil workers unions tooth and nail now elevate the significance of the "the oil worker" in the singular, both in commercials made by the oil industry and in op-eds by the Oil and Energy Minister of Norway.

This paper combines media analysis with analysis of how unionists in and around the oil industry themselves contribute to this debate in contradictory ways. With a Gramscian lens, these views are seen as a poignant symptom of "a crisis of hegemony" (Ytterstad, 2012). The paper ends with a discussion of the broader context: In a world polarized between Greta Thunberg and Donald Trump, the allegiance of fossil fuel workers may be key. School students from Norway to Australia are beginning to make alliances with unionists in fossil fuel dependent countries. Can such alliances develop credible just transitions to climate jobs?

Nuclear Compensations and Political Attitudes in Nuclear Municipalities

In this presentation, we are focusing on trends of local public finance and voting results of national elections in some Japanese nuclear host municipalities. We have a hypothesis that nuclear compensations act on political attitudes in these municipalities.

Location of nuclear power plants or other nuclear facilities have been bringing many kinds of compensations to host municipalities. They have been becoming dependent on the compensation more and more.

After Fukushima nuclear disaster in 2011, 20 or more nuclear reactors have been abolished in Japan (Most of them are not decommissioned yet). As of November 2020, number of operating reactors is 10 or less. Japanese government still maintains its nuclear policy, but some of nuclear host municipalities can lose their all reactors. They can't be dependent on it more.

Japan has a unique compensation package and nuclear municipalities have been relied on it for around 50 years. Among compensations, fiscal support can have considerable impacts on political attitudes in these regions. How can the fiscal compensation acts on political attitudes? Can it make these attitudes more conservative? If it is so, how can this type of attitude work as nuclear phase out moves forwards?

We take data of two nuclear municipalities named Omaezaki and Kashiwazaki. For understanding how fiscal compensation acts on political attitudes in them, we are analyzing trends of fiscal data of operational period of nuclear power plants at first. Second, the voting results on national elections during the same period will be taken. Third, we will make a comparison between them. By these investigations, we will find a relationship between fiscal compensations and political attitudes. The result may provide clues to know how political attitudes can work when nuclear phase out is under way.

How Do Mothers' and Fathers' Work-Family Conflict Impact Children's Problem Behaviors?

Using 509 mother/father-child dyads drawn from Wave 8 of The German Family Panel (pairfam), this study examines the direct effects of mothers' and fathers' work-family conflict (WFC) on children's internalizing (emotional) and externalizing (conduct) problem behaviors. We also test whether these effects are moderated by several child characteristics and family characteristics. Results suggest that both mothers' and fathers' WFC are associated with greater emotional problems, whereas only mothers' WFC is associated with greater conduct problems. The detrimental effect of fathers' (mothers') WFC on emotional problems is stronger for older children and for girls (households with a preschool-aged child and boys). There is no direct effect of fathers' WFC on conduct problems. The results, however, show that the detrimental effect of fathers' (mothers') WFC on conduct problems is stronger for households with less income (more children in the household, households with a preschool-aged child, and boys).

Non-Offending Pedophiles in Japan: How They Narrate Themselves in Existing Local Gender Regimes

This paper examines the narratives of **non-offending pedophiles** in Japan. Through the reconstruction of these narratives, it explores how their experiences are to be situated in existing local gender regimes.

As seen in Rubin's provocative interrogation in "Thinking Sex," pedophilia is a sensitive topic in gender and sexuality studies, giving rise to questions such as "Are pedophiles deviant sexual perverts or are they oppressed sexual minorities with different 'orientation'" and "Are they possible criminals or mentally challenged individuals who need support"? These questions lead to the broader consideration of **how gender studies as a counter-dominant scholarship should regard pedophiles, especially non-offending ones**. However, existing researches on pedophiles share a major flaw: they focus only on sex offenders, mainly because of the difficulty of accessing non-offenders.

For this paper, data were collected from seven self-identified non-offending male pedophiles in Japan. The narratives of these pedophiles revealed that their invisible experiences were diverse, dependent on sociological variations. For

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

example, while non-heterosexual informants' cases frequently showed commonalities with those of sexual minorities in general, for example isolation and self-loathing in their youth, some heterosexual informants with a strong educational background viewed their school lives as "open," sharing dominant values of homophobia and misogyny with non-pedophile male friends. However, at the same time, they showed great concerns for their future, knowing they could never fit in the existing gender norms that required them to get married and have children.

By elaborating these points with the interview data, this paper shows how non-offending pedophiles in Japan construct unique **counter-narratives in local discursive situations, which do not employ the simplified dichotomy of "pedophiles as monsters" or "pedophiles as vulnerable minorities"** often seen in Western countries.

YUSUPOVA, SEDA (Grozny State Oil Technical University, Russia)

Sociolinguistic Aspect of Trust Value in the Modern World

Trust is the value of interaction between people that determines the course and outcome of communication. In a globalized world, there is a national-cultural specificity of perception and a different level of trust in different countries. Objective: A comparative study of linguistic cultural idioms representing the value of trust.

Method: the material of research was idioms and contexts of their use, obtained from phraseological and other dictionaries, as well as from the language corpora. The data of opinion polls in different countries were taken to identify the level of trust in society.

The results of research show that idioms receive additional meanings in contexts that are not fixed in dictionaries. The inner form of idioms and contexts of use reveal their semantic and syntactic properties, the peculiarities of trust conceptualization. For example, English brain trust – «a group of experts who give answers to questions», Russian polnoe doverie (lit. full trust), German blindes Vertrauen (lit. blind trust), Chechen bokkha tesham (lit. a great trust).

English place trust in / put trust in, German jemandes Vertauen gewinnen (lit. win someone's trust – «to gain someone's confidence»), Russian vtiratsya v doverie (lit. to ingratiate), Chechen tesham bakkha (lit. to achieve trust) – "enter into trust". In English, the emphasis is on trusting a smart person, trusting knowledge. In German, total confidence is blindness. In Russian, trust is associated with fullness. In the Chechen language, faith is the basis of trust. In verbal phrases, the emphasis is on the fact that trust must be achieved, won. Thus, in different languages, both conceptual similarities and differences are discovered. Linguistic and cultural perception of trust in different cultures correlates with the level of socio-historical development of people; the connection of trust among people with political regimes and the type of state structure is revealed.

ZABLUDOVSKY, GINA* (Facultad de Ciencias Políticas y Sociales, Universidad Nacional Autónoma de México, Mexico)

El Desarrollo De La Sociología En México.

La ponencia abordará la historia de la sociología en México desde mediados del siglo XIX a la actualidad, proponiendo una periodización en etapas que responden a las transformaciones en la vida política y cultural del país y al desarrollo de la vida universitaria.

Si bien es cierto que el primer instituto de ciencias sociales en una universidad se crea hasta 1939, desde mucho antes, el discurso sociológico había jugado un importante papel en la defensa de la educación laica y la legitimación política de distintos gobiernos. Hacia mediados del siglo XX, el desarrollo de la sociología y otras ciencias sociales en México estuvo estrechamente relacionado con la construcción de una visión del país. A medida en que la sociología se va institucionalizando dentro de las universidades, también se consolida como una ciencia social autónoma En los años setentas, bajo la influencia del marxismo y la teoría de la dependencia, se concibe más bien como una ciencia social crítica del régimen existente. Hacia finales del siglo XX y principios del XXI, la disciplina se caracteriza un creciente proceso de especialización en distinto campos temáticos.

La ponencia hará un diagnóstico de los factores que influyeron en la creación, consolidación y transformación de la sociología como: los vínculos entre el gobierno y los intelectuales, los principales acontecimientos políticos , los movimientos sociales, la atmósfera ideológica del país, las publicaciones y casas editoriales más importantes, los líderes intelectuales más influyentes, la fundación y consolidación de las instituciones de investigación y docencia, la génesis transformación y cambios curriculares de la carrera de sociología, la producción de investigación, los textos fundamentales para la docencia, y otros factores de relevancia para la vida académica y profesional.

ZABLUDOVSKY, GINA* (Facultad de Ciencias Políticas y Sociales, Universidad Nacional Autónoma de México, Mexico)

Rituales y Religiones Cívicas. La Sociología De Durkheim y Su Aplicación En México.

La ponencia se basa en una re-apropiación de las teorías de Émile Durkheim para el análisis del papel de lo simbólico, las manifestaciones colectivas, los calendarios conmemorativos, y los rituales políticos en México

El estudio parte de la diferenciación entre lo sagrado y lo profano, y de una concepción de religión que, en la medida en que se basa en las creencias, representaciones sociales y los estados de opinión, también puede ser punto de partida, para al estudio de las "religiones cívicas." y sus manifestaciones en México y América Latina.

El trabajo se preguntará sobre la vigencia de los conceptos y las teorías de Durkheim para el análisis de una realidad diferente a las sociedades europeas del "Norte" y a la Francia del fin del S XIX y principios del siglo XX en la que produce su obra. A la vez, en la medida en que *Las formas elementales de la vida religiosa* parte del análisis de las prácticas de los aborígenes australianos, el estudio se preguntará hasta qué punto esta obra puede considerarse como una "sociología sobre el Sur" y en qué medida ésta es útil para el análisis de México, un país que, aunque está situado en el hemisferio norte, en términos geo-políticos, como parte de América Latina, también es considerado como "el Sur".

A partir de estos puntos de partida, la ponencia reflexionará sobre las ambivalencias de las relaciones entre el "Sur" y "Norte", tanto en términos geográficos como de generación, producción, difusión y recepción del conocimiento.

'Empty-Nest Syndrome'? the Domestic Micro-Project Strategies of 45+ Year Old Couples Whose Children Have Recently Left Home.

Our study explores how changes between partners in intimate relationships are mirrored in the materiality of the household. We are focusing on the empty nest period of family life. The research explores the process of transition in a relationship that is affected by the departure of children from home. First of all, we are interested in how this process is reflected in the materiality of the household: how the couple rearranges their empty nest and how this rearrangement both demonstrates and initiates more general changes in the relationship. Secondly, we want to explore everyday practices of couples in the process of transition to the empty nest stage, following the new family studies that consider practices as the key to identifying and understanding intimate relationships (Morgan 2011). This perspective changes focus from "being family" to "doing family", that is, to observe how the family is constantly being constructed and reconstructed in everyday life practices (Schatzki 2001, Reckwitz 2002). Thirdly, we are interested in the emotions that are experienced as children leave home.

This paper will consider the following research questions:

How does the design of the household change as part of the couples' "empty nest" micro-project?

What does the couple gain and lose from a material perspective?

How are the boundaries between individual, private and shared home space redefined?

The research sample includes 25 heterosexual Polish couples (50 people aged between 45 and 64) who have been married for over 20 years. The couples are in the early stage of the "empty nest" phase: their children have recently left, or they are still in the process of leaving the household. All the informants live in big cities and they are diversified in terms of their religiosity, economic position and education (socio-economic status) and career models (both partners employed or only one).

Outsmarting Corporate Power in Global Value Chains? Prospects and Limits of Digitalizing Labour Power in Factories of the Global South. Challenges in Pandemic Times

While there are intense debates about how digitalisation affects the conditions of production and flow of goods in global value chains (GVCs), less attention is paid to how it affects workers' collective power. Combining research on GVCs, power, labour and social movements, this paper explores how digital worker voice and reporting tools have been developed and used across different levels of supply chains, especially in the Global South. These new technologies promise to enable workers to engage themselves actively by reporting about grievances, misconduct of managers and other well-being related questions in their workplace. Drawing on a database of these tools and interviews with the providers and civil-society organisations that develop them, as well as with multi-stakeholders initiatives and companies, we argue that the digitalisation of GVC governance has ambiguous effects: On the one hand, workers and their allies are able to use digital tools, e.g. smartphone apps, in combination with offline strategies to form collective action and make claims. Digital communication can increase information exchange, and workers can better participate in transnational campaigns during labour struggles in the GVC. On the other hand, digital tools are effectively used by transnational companies. They improve monitoring capacities over labour standards, thus improving the transnational management of supplier factories, displacing traditional union tasks and carrying the risk of an increasing managerial control over worker voices. The paper contributes to our understanding of how digitalisation of GVC governance affects labour relations and workers' power in online and offline actions in GVCs, potentially creating enabling structures for workers as well as global and regional trade unions, but also new constraints and control mechanisms and how this is affected through the current pandemic.

ZALAF CASEIRO, LUIZ CARLOS* (University of São Paulo, Brazil)

Horizontal Stratification and Student Dropout in Brazilian Higher Education

The Brazilian higher education system has expanded and diversified dramatically since the 1990s. Professional and academic courses are offered at elite public research institutions, community colleges, and for-profit sector. After the 2000s, quota policies in the public sector, state-sponsored scholarships, and student credit in the private sector allowed individuals from disadvantaged social backgrounds to access higher education at higher rates. Despite this recent expansion, Brazil still has one of the lowest access rates to higher education in Latin America and one of the highest wage premiums for a college degree in the world. Notwithstanding, official estimates point to an average dropout rate of 45% in public institutions and 55% in private institutions. In this paper, we seek to understand why many Brazilian undergraduates fail to pursue their degree, despite the high rewards they could earn in the job market. For doing so, we utilize a unique joint dataset constructed with three different administrative records of the Brazilian government: The Higher Education Census (2012-2018), the National High School Exam (2009-2011) and the Annual Social Information Report (2011-2018). Through this joint data, we follow the trajectory of the 2012 cohort of undergraduates until 2018, including possible transfers. It also allows us to construct programs' and institutions' prestige indicators that are relevant to explain student dropout, and to control for students' socioeconomic background, academic skills, work and research experiences, and scholarships and student credit obtained. To answer our research question, we estimate two multilevel logistic models. The main finding is that horizontal stratification of higher education is more important in explaining the probability of individual dropout than social background. Particularly, programs' market prestige (measured by median wage returns of graduates) and field of study heavily influence the likelihood of degree completion. Among individual characteristics, gender, more than social class or race influence dropouts.

MACIENTE, AGUINALDO (National Institute for Applied Economic Research - IPEA, Brazil)

Horizontal Stratification of Higher Education and Wage Returns of Graduates in STEM Fields.

Brazilian higher education and labor market conditions underwent dramatic changes in recent decades. Undergraduate enrollments have doubled over fifteen years. The system has become more diverse and inclusive, with an increased availability of academic and vocational programs at institutions of different prestige levels. On the labor market side, there was an important trend of job creation and formalization of labor relations between 2004-2014. At the peak of this economic cycle, businesspersons complained of the lack of skilled labor in the STEM fields. Since 2015, however, a severe economic crisis rapidly raised the unemployment rate, especially among youths. This article investigates the transition into the formal labor market of recent graduates of STEM programs between 2012-2017. Three questions guide our investigation: What is the occupational profile of graduates? How horizontal stratification of higher education influence their wages? How did these change over time? To answer these questions, we worked with a unique joint dataset of three different administrative records from the Brazilian government: The Higher Education Census (2011-2014), the National Undergraduate Performance Exam (2011-2014) and Annual Social Information Report (2010-2017). In addition to a rich set of descriptive statistics, we use four multilevel regression models to estimate the effect of horizontal stratification of higher education on graduates' wages over two different periods (2012-2014 and 2015-2017). The main results are: 1. Although 3/4 of the STEM-field graduates work in the formal market one year after graduation, most of them are employed in lower-prestige occupations that are not related to STEM fields; 2. When horizontal stratification is included in the models, there is a sharp reduction of the individual's background effect on wages. Nevertheless, within-group differences explain most of the wage variation; 3. There is a trend of increasing inequality in workers' wages over time, associated with both social background and institutional factors.

ZAMBRA ÁLVAREZ, RAFAELA* (École des Hautes études en sciences sociales, France)

"La Incertidumbre Del Porvenir y Su Potencial Democrático: La Experiencia Política En El Contexto De La Verticalización En La Comuna De Estación Central En Santiago De Chile"

A partir del año 2008, la comuna de Estación Central, situada al sur poniente de la ciudad de Santiago de Chile, comienza a experimentar un proceso de verticalización cuya particularidad reside en su magnitud. Este fenómeno, como reflejo de una serie de ajustes técnico urbanísticos entre el mercado inmobiliario y el gobierno municipal, ha arrastrado una serie de conflictos socio-espaciales. En 2015 se formaliza la primera organización de "defensa" contra los efectos de la verticalización, y ya para el año 2017, el caso de Estación Central logra instalarse en el debate público. Tomando en consideración este escenario, el año 2017 se realizó una *etnografía de la participación* en el sector más afectado por este fenómeno y cuyo objetivo fue analizar las practicas participativas relativas a la planificación urbana de la comuna de un pequeño grupo de vecinos/as compuesto por dirigentes vecinales y vecino/as que comienzan, por primera vez, un proceso de problematización de este *mal público* (Cefaï, 2011). El objetivo ulterior fue comprender cómo el ideal de la democracia deliberativa es puesto a prueba (*mise à l'épreuve*) dentro de este grupo de individuos. A través de la combinación de herramientas propias de la sociología y de la antropología, se concluye que la *mise à l'épreuve* de la democracia deliberativa se expresa en la complejidad del universo simbólico definido por experiencias individuales y colectivas de descubrimiento de las propias posiciones frente a este *mal público.* La experiencia deliberativa de este grupo de vecinos/as revelará una forma particular de la democracia y de la acción colectiva. Una forma efímera, localizada en el tiempo y el espacio, y que encuentra un lugar en pequeños grupos de individuos que se movilizan entre los espacios institucionales y no institucionales, según los recursos y potenciales democráticos que cada uno ofrece de manera aislada o articulada.

From Dagong to Paodanbang: Contesting Markets, Dismantling Subalternity between China and Taiwan

In China, female migrant workers move from the countryside to the city to work in local factories, where they face a triple condition of social, eocnmic and moral subalternity. Marriage-migration to Taiwan represents for women a chance to renegotiate a status and to access modernity. However, this is framed into a rigid mobility regime, vector of local and global inequalities and hierarchies. Governmental biopolitics (Ong 1999) limits access to social rights, to the right to work and to residency in Taiwan. Until 2009 women had not right to work during the first two years of stay. The Reform of 2009 put an end to such legal ban. However, the access and the integration to the labour market still represents the core of discrimination. If initially women performed undeclared jobs because of the working restrictions, today they still integrate lowly-visible and weakly legitimate sectors of the labor market (care sector, catering, haidressing, cosmetics).

To resist, women mobilize sociala nd emotional networks to produce entrepreneurship and translocal multipolar economies, which connect the different spaces women have crossed during their mobilities: Chinese rural villages of origin, the Chinese cities and Taiwan.

Through online applications women's entrepreurship, *e-commerce and mobilities transgress* local order by generating global disorders. When the access to the local labor market is obstructed, women "contest" (Steiner 2005) the market and transcend highly monitored administrativeborders. The *e-commerce* they set, the multipolar economic circuits they navigate through enable women to lessen a condition of subalternity, "taking their place" inside new physical and virtual, material and emotional, local and global spaces. From factory workers, by contesting rigid norms and rules, women switch to "itinerant suitcase carriers" (*paodan bang* 跑单帮), who set sails through global capitalism and local consumption by commercializing a huge variety of (import-export forbidden) goods and products across borders.

RC02-27.1

ZANI, BEATRICE* (Sciences Po Lyon, France)

Mobilities, Virtual Worlds and Emotions: From Physical to Virtual Markets, from Local Order to Global Disorder

Through multi-situated and virtual ethnography, I investigate the link between mobilities, emotions and the production of *online* economic practices. Drawing on the case study of Chinese migrant women in Taiwan, I explain the social and emotional construction of translocal virtual markets, which connect on different scales, the temporalities, spatialities and emotions of women's mobilities. In Taiwan, Chinese migrants contest a local condition of social, economic and cultural subalternity by exploring physical and virtual, glocal markets. When local order

becomes oppressive for migrants, they can produce global disorders through creative social, economic and emotional practices. When access to the local taiwanese labor market is obstructed, Chinese migrants "contest", by exploring new virtual markets which connect the places, spaces and temporalities of their mobilities. the commodities and the objects commercialized embody subjectivation processes, identity making and are sustained by and, at their turn sustain the emergence of heeterogeneous repertoires of emotions. New labor forms, labor relations and labor practices emerge at the crossroad between the local and the global, the physical and the virtual, the material and the emotional. Setting sails through local consumption and global production, through the *online* application *WeChat,* partially digital, internally networked translocal multipolar economies are produced. On hidden, alternative trails, objects, subjects, social ties and emotions circulate and rotate: an e*motional petit capitalism* emerges with Chinese women's daily microcosms, between China and Taiwan.

ZARIAS, ALEXANDRE* (Fundação Joaquim Nabuco, Brazil)

Body, Person and Self in Brazilian Legislative Proposals

The purpose of this communication is to examine the notions of body, person and self in what is called public order of the human body by analyzing legislative proposals on organ donation, abortion and euthanasia. The body as a sign of the relation of human beings to the social, cultural and physical environment surrounding them encloses a set of representations of individual and collective life, composing a grammar that became a particular object of a specialized corpus within sociology. Discussions about the body statute can reveal the political dimension of the confronting different scientific conceptions and common sense about the body in our society. This explanatory research, based on documental analysis, focused on the legislative proposals contents concerning the body. The legislative corpus is available in the Brazilian Electronic Library of the Chamber of Deputies, and comprehends the period from 1946 to 2019. The article shows that it is necessary to analyze the boundaries of the body in relation to the notion of person and the varied forms that this relation assumes in different spheres of the law.

ZUCCATO, MARLIES (University of Vienna, Austria)

Children's Concepts of Post-Divorce Custody and Care Arrangements

After a parental break-up, children's lives are highly affected by the agreed custody and care arrangements. However, we have limited scholarly knowledge about how children conceptualize such arrangements and how they discuss their concepts among their friends and schoolmates. We address this research gap and ask how children from diverse family backgrounds, with divorced and non-divorced parents, construct and negotiate post-divorce custody arrangements in their peer groups.

Based on a participatory study with 60 8- to 10-year-old children in one rural and one urban Austrian region, we analyze children's concepts about post-divorce regulations. The study comprises focus groups based on concept cartoon discussions, individual interviews and a wide range of participatory child-friendly methods like drawings, games, handicrafts or story- telling. Data analysis was based on the documentary method.

Results show that the respondents conceptualized joint parental custody as a means of establishing fairness for parents. Regarding custody, contact and residency, children prioritized fairness for parents – in terms of equal time shares or equal numbers of children to care for – over child wellbeing. This stands in sharp contrast to legal regulations that clearly consider the best interest of the child as the *ultima ratio*. Children's concepts were rich in detail and mainly aimed at improving parents' interests and living conditions. The respondents developed sophisticated ideas about strategies to establish fair conditions on different levels (e.g.; legal regulations, time resources, custody and residential arrangements, emotional aspects). The impacts of these findings for research on post-divorce custody and care arrangements and its consequences for children will be discussed.

Las Disposiciones Juveniles a La Participación Sociopolítica Heterogénea

El presente trabajo analiza las disposiciones de las/los jóvenes a la participación en contextos de vulnerabilidad y violencia.

Para tal efecto, compara resultados de cuatro regiones de Veracruz en México caracterizadas por entornos violentos y de vulnerabilidad en los cuales se de-

sarrollan procesos de socialización política en un periodo de interregno entre el viejo régimen y un nuevo gobierno que incentiva la institucionalización de nuevas reglas de participación política y una sociedad cuyas transformaciones más significativas se manifiestan en las estructuras familiares, escolares, barriales que constriñen la participación de los jóvenes dentro y fuera del campo electoral.

En estas circunstancias, presenta resultados de un proyecto de investigación colectivo orientado a la identificación de oportunidades de participación sociopolítica juvenil mediante el contraste de transformaciones de las instituciones de socialización primaria y secundaria y las estrategias de las/los jóvenes en ámbitos rurales, semiurbanos y urbanos -participación comunitaria, en movimientos sociales, movimiento anarquista y militancias- con el propósito de producir insumos para el diseño de políticas gubernamentales a escala subnacional.

ZAWADSKY, JOSE* (,)

Análisis Comparado De La Pobreza Laboral EN Chile Y España

El objeto de la presente comunicación es realizar un análisis comparativo de la pobreza laboral en Chile y España. Presentaremos el marco teórico, el estado el arte y los resultados del análisis cuantitativo de las bases de datos existentes para ambos contextos.

Los cambios recientes en las condiciones de empleo han individualizado el riesgo y la incertidumbre, ampliando las condiciones de precariedad y profundizando las diferencias entre los segmentos laborales. En el contexto español, especialmente después de la crisis económica de 2008, un sector que hoy se puede identificar como trabajadores en situación de pobreza ha visto surgir mayor inestabilidad en el trabajo, mientras que sus ingresos continúan disminuyendo. Mientras tanto, en Chile, las condiciones de trabajo nunca han sido una garantía para mantenerse al margen de la pobreza, ni siquiera en el sector formal. De hecho, la ciudadanía social nunca se ha desarrollado completamente y la segmentación del mercado laboral muestra diferencias importantes entre los segmentos formales e informales, así como entre los segmentos primario y secundario de la economía formal.

En la ponencia nos referiremos, de manera comparada, a los elementos estructurales, de los hogares e individuales que inciden en la pobreza laboral, dando cuenta de la incidencia de cada uno de ellos para los diversos casos. Analizaremos las bases de datos de la CASEN para el caso de Chile y la ECV para España, lo que nos permitirá conocer las principales características de la pobreza laboral en ambos contextos e identificar tipologías de trabajadores en situación de pobreza. Finalmente, daremos cuenta de cómo, a pesar de tratarse de casos distintos, con algunos elementos similares, encontramos tanto características como perfiles similares de trabajadores en situación de pobreza en Chile y España.

ZAYED, HANY* (University of Illinois - Urbana Champaign, USA)

The Social Life of Tablets in Egyptian Schools: A Critique of Technological Reason

Egypt's educational reform has historically been punctuated by socio-economic and socio-political junctures. The most recent historical juncture, the Revolution of 2011, heralded a deluge of transformations whose messy realities continue to shape the Egyptian society in general and the education domain in particular. Since late 2018, Egypt has been implementing an audacious slew of reforms intended to completely transform the national education landscape by 2030. This research is concerned with one particular reform: the introduction of digital technologies in public secondary education.

Against celebratory official discourses and problematic academic analyses touting the transformatory inevitability of digital technologies in education, this research presents a critical sociology of educational technology that is socio-technical and political. Concretely, this research examines the social life of tablets and asks how their introduction in Egyptian public high schools is changing, reproducing and disrupting social relations and educational processes. By problematizing digital technologies in education, this research seeks to parse out the difference between how education is intended and how it actually operates, underscore how the old is not supplanted but heavily accreted in the new, and carve out space for contingent and contradictory possibilities. Towards those ends, this project utilizes theoretical insights from Bourdieu, Latour, Foucault as well as resistance theorists, and relies on relational and digital ethnography in its methodological orientation.

In telling a story about digital technologies and educational change, this project brings together, and contributes to, the sociology of education, the sociology of technology and the new emergent field of digital sociology. It unsettles the dominant technological reason, redresses the gross inadequacies and glaring imbalances plaguing the literature, and provides a critical and timely intervention from the global south to a body of work that is sharply skewed to the north.

Socio-Ecological Consequences of Suburbanization in Postsocialist Urban System. Case of Poznan-Lubon, Poland

The paper discusses the suburbanization (Clapson 2003) of the large cities, and the rise of so-called "in-between city" (Young, Kiel 2010), and its many social and ecological consequences in the aftermath of the post-socialist transformation in Eastern and Central Europe. The suburbanization in the region—(driven by the differences in property prices and growing internal migrations) –leads to disturbances in the proportions of the smaller cities in relation to the metropolitan center, and causes tensions among the inhabitants of the metropolis, as the core of the urban system and those of its surrounding cities around many points, including environmental and spatial issues and public policies concerning the use of water and natural resources. (Polanska 2018, Domaradzka 2018). The paper analyzes these broader processes of suburbanization in the region by focusing on the dynamic relations between the Poznan metropolis and its suburban small city of Lubon. In particular, the presentation deals with the changing meaning and boundaries of the local identity for the inhabitants of Poznan as the core of the urban system in relation to its growing, Lubon suburbia, and the evolving understanding of sustainability and apportioning of environmental and cultural goods in the metropolis and its suburban city as the basis of policy formation and push for Right2city social movements. The presentation will be based on focus-, in-depths- and biographical interviews describing the transformation of "Cities outside the city".

Electoral Outcomes of Social Movements: Methodological Considerations and an Empirical Illustration of Ukraine's Local Maidan Movement

Social movements aim at institutional change, including electoral outcomes. Broadly speaking, any social change has multiple factors that contribute to it. As such, it is difficult to provide empirical evidence for the link between what movements do and the change to institutions. The social movement literature reflects these difficulties: it is strongest in how movements form and how they act, but weakest in whether and how movements create change, and by what methods we can discover the link between movements and change. In this presentation, I explore methods that potentially visibly connect movements to institutional outcomes. I use an empirical example of 2013-2014 Ukraine's nationwide Maidan movement that manifested in several dozen local protests across the country. While Maidan clearly brought national level changes -- the president fled, new national and local elections were called, and Ukraine became an international conflict zone -- Maidan the movement was equally a local level phenomenon. I focus more narrowly on local electoral outcomes, by which I mean a change in the electoral environment indicated by changes to formal institutions that govern elections and to personnel (including local politicians and appointees), to the parties and their promises, and to trajectories of political alliances in two of Ukraine's localities before (2010 - 2012) and after Maidan (2015 - 2020). I compare and contrast qualitative and quantitative methods available in the social science toolkit to discuss their potential in uncovering different parts of the research problem and the major pitfalls of their application.

ZEYER-GLIOZZO, BIRGIT* (Ruhr-University Bochum,)

Does Training Help Workers to Keep Pace with Technological Change? Returns to Formal, Non-Formal and Informal Training for Workers in Routine-Intense Jobs

The automation of job tasks due to technological change can lead to an increase in social inequalities. Those workers who perform analytic and interactive tasks that are complementary to modern machines become more productive and more in demand as a result of ongoing digitalization. Meanwhile, workers who perform a high proportion of automatable routine tasks are at risk of job or wage losses. In this context, politics and science attach great importance to further training to help employees keep pace with technological change. However, the benefits in terms of adapting job tasks for affected workers have hardly been investigated. Building on considerations of human capital theory and the task-based approach, this study examines the effect of training on job tasks for employees in routine intense jobs. The study uses data from the German National Educational Panel Study (NEPS), which provides the opportunity to compare the returns to different forms of further training, namely formal, non-formal and informal training. Fixed-effects models are estimated to account for unobserved heterogeneity. The results show that non-formal and informal training in the form of media use actually helps to reduce the intensity of routine tasks. The effects of

training on analytic, interactive and manual tasks differ depending on the type of training but are in many cases not significant. There is some evidence that high-skilled workers benefit more from non-formal training, while lower-skilled workers tend to obtain higher returns from informal learning. In addition, the degree of computerization and job changes also seem to play a role in the extent to which training affects job tasks. Taken together, these findings suggest that policies to promote training in the context of technological change should take into account the different types of training, target groups and contexts.

ZHAKUPBAYEV, MADI* (Nazarbayev University, Kazakhstan)

Dysfunctional Families: Implementation of Case Management Models in Nur-Sultan, Kazakhstan

While the national modernization programs of developing states include the improvement of social infrastructure, contemporary approaches in social work are not applied. In particular, social service provision with the usage of case management (CM) models in Kazakhstan is not widely practiced and considered to be underdeveloped. Exploration and evaluation of social work practice in the Center of Adaptation for Youth (CAY) in Nur-Sultan show that the range of employed activities do not improve and sometimes even harm the psychological state of children. Rather, CAY act as a temporary dwelling for children from dysfunctional families. Observations and interviews with children and CAY staff show that beneficiaries are mentally suffering from being detached from their family members. The approaches of social service do not use complex methods of CM models. The results of this research show that the implementation of CM models as Critical Time Intervention and Strength is crucial in achieving the goals of the CAY. These models are specified for achieving the mission of CAY and can affect positively on the family members in its entirety. They demonstrate that addressing the families based on their individual needs and the peculiarity of their situation should be viewed as a potential solution for solving their problems and thus have to be the part of the state social modernization program.

ZHANG, HAN* (, Hong Kong)

One Country Two Systems: Political Behavior and National Identity of Chinese Immigrants in Hong Kong

Under the "one country two systems" model, Hong Kong is an ideal laboratory to examine the effects of political regime and cross-border migration on individuals' political behavior and national identity; because one third of the territory's population are immigrants grown up in the socialist mainland China without political freedom but later on living in the capitalist system with political consciousness and political participation. This paper attempts to examine this issue by comparing Chinese immigrants to Hong Kong locals, using a recent sample of the *Hong Kong Panel Study of Social Dynamics*. The migration experience of Chinese immigrants and the contrast between the political systems across the border lead us to expect different consequences in political behavior. The "escaping" *migration experience* would lead us to expect a higher political participation rate for Chinese immigrants relative to locals. After the long repression by the party-state in political rights, Chinese immigrants may be "bounced up" to voicing out their concerns once they arrive in the freedom realm of Hong Kong. However, it is quite possible that there is a *lingering effect of the totalitarian regime's political control*: Chinese immigrants may be less likely than locals to participate in political activities because they were educated to obey to the governments, and the impact of such education may be life-long. Be it or not that there is a difference for Chinese immigrants before and after migration, it is likely that the group won't be able to catch up with locals in political participation. I attempt to adjudicate the two possibilities in this paper, and will also examine Chinese immigrants' identity as "a Chinese" vis-a-vis "a Hongkonger" relative to that of locals. Results from my analysis may provide new insights regarding how political institutions and individual experience interact to shape people's political participation and identity.

RC37-467.4

ZHAO, YIKUN* (York University, Canada)

Etiquette As a Culturally-Bifurcated Commodity in Today's China

Etiquette has become a new cultural commodity in mainland China in recent years, but it is not a culturally homogeneous one. This field-study based empirical analysis intends to show that there are mainly two sources of cultural capital, based on which etiquette training businesses position themselves relatively. On the one hand, native etiquette trainers who are educated locally strive to culturally align their training programs with the mainstream cultural trend that is popularized top-down by the state, as shown in various projects mobilized from above to promote "Cultural Renaissance" (wenhua fuxing) and to cultivate the "Socialist Spiritual Civilization" (shehuizhuyi jingsheng wenming). These businesses are unique in seeking opportunities through participating in these civility projects by providing etiquette training. On the other hand, there are more private and

pricy etiquette training services offered by "foreign" (e.g., French, British) trainers and by Chinese-born trainers who have been educated abroad in the West. They tend to allude to the "royal" root of Western etiquette to attract economically better-off clients that aspire to become cosmopolitan. Methodologically, this analysis charts this field of the rising etiquette industry in today's mainland China through extracting a set binaries empirically: material-cultural, East-West, and national-individual. Through tensions and intersections, these binaries enable an understanding of the rising etiquette market that appears culturally bifurcated. I argue that while these two major types of etiquette businesses co-shape the culturally dichotomized topography of the field of commercial etiquette training, they also together transform etiquette into a form of embodied cultural capital for market exchange, at a time when rapid economic growth sets social re-configuration in motion.

ZIELINSKI, MARCIN* (Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland)

The Silent Tool of a Devil – on Data Weighting in Survey Practice.

Data weighting is a procedure intended to be used in order to improve survey estimates. The need of poststratification weighting comes from unit or item non-responses if the mechanisms behind its occurrence is missing at random (MAR) but not completely at random (MCAR) or missing not at random (MNAR) (Rubin, Little, 1987) and is used to reflect populational characteristics in a sample. The need of design type of weighting comes from strategies of sampling with unequal probabilities that need to be equalized by weighting the data.

Weighting rarely brings spectacular (or even noticeable) results what is related to its general property – weight, or to be more precise, a component that is used in its creating, has to be related with survey outcome for the weight to work. This implies that in a case of design type of weighting the weight should be related to the probability of being selected to the sample.

The question to weight or not to weight is not simply a matter of a mere decision as one should remember each time the weight is used, additional variance is entered into the data. The decision on using or abandoning data weighting should therefore be based on empirical advantages that weighting can bring. Therefore, before making a decision, one should check whether weighing data makes any sense in a given specific case and whether weighting data changes the result in a relation to unweighted data at all.

The paper deals with the issue of empirical importance of data weighing in international survey projects carried out on a large scale and is based on evidences from over 2000 studies harmonized within the SDR (*Survey Data Recycling*) project.

TG04-745.2

ZINN, JENS* (University of Melbourne, Australia)

Risk, Threat and Danger and Political Populism in the US, UK and Australia

With the British vote for Brexit and the election of Donald Trump for President of the United States the last decade witnessed substantial changes in global politics. The presentation reports from a project that examines changes in the discourse-semantics of risk, threat and danger in the UK, US and Australia comparing newspaper coverage in 2010 with 2017. The project determines the influence of growing populism and nationalism on newspaper coverage about risk, threat and danger and whether similar trends towards a 'post-truth' era are observable in Australia.

Conceptually, the presentation aims to advance sociological theorizing beyond mainstream approaches to risk such as the risk society (Beck), governmentality (Foucault, Dean, Rose, O'Malley) and risk culture (Douglas, Lash) and follows trends in media studies, linguistics and digital humanities by using digitised mass data to identify diachronic changes in social patterns. The project uses corpus linguistic tools to analyse the discourse-semantic differences and link them to social events and institutional changes (Müller & Stegmeier 2019; Zinn 2020).

ZINN, JENS* (University of Melbourne, Australia)

The UK 'at Risk' - the Analysis of Long Term Social Change

This presentation reports from a case study on the proliferation of at risk-language in The Times news coverage 1785-2009 illuminating the changing social experience of risk. It contributes to historical sociology by examining the forces which have shaped the language of risk over time, and considers how linguistic developments in recent decades are underpinned by issues such as cultural and

structural transformations, the management of health and illness and climate change. It also explores changes in the production of news print media. Methodologically the project uses corpus linguistic tools to analyse discourse-semantic differences and link them to social events and institutional changes, a methodology which has been developed in earlier research (compare Müller & Stegmeier 2019; Zinn 2020).

The presentation shows that a number of different developments and events contributed to the proliferation of at risk-language such as technological advancements (e.g. new vaccines and treatments, epidemiology), changes in human nature (e.g. rise of chronic and civilisation diseases) and degeneration of the natural environment (e.g. extinction of species, flooding), major disasters (e.g. railway/ferry disasters, AIDS), and institutional changes (e.g. uncertainty of work, the NHS). Additionally, the notion of putting somebody unreasonably at risk has become a widespread motive in the new instantiating the at risk-semantic while the adjectival at-risk indicates that increasingly social groups are characterised by their at-risk status. Finally, the notion of risk remains ambiguous. There are clear indications for a technical understanding of risk underpinned by scientific research. Simultaneously, risk stands for a generalised worry referring to the normative dimension of risk.

ZIPP, DANIEL* (University of California, Los Angeles, USA)

Confronting King Coal in China: The State, Capital, and Labor in a Dying Industry

China is the king of coal. In 2017, China was the world's largest producer and consumer of coal and the world's largest coal-related polluter; over half of the world's coal was mined and burned in China in from 2014 through 2016. Since 2016, in tandem with increased coal consumption, coal-related pollution has steadily risen. Chinese coal has disastrous effects on the human population—causing increases in various cancers and killing approximately 1.5 million people in 2016 alone—and has wrecked havoc on Chinese, East Asian, and Pacific environments. However all is not grim. Coal is a dying industry, especially in China where Beijing is aiming to drastically reduce coal production and consumption by 2020 and extending through 2050. Beijing's strict policies highlight a key fact: The power of coal—both economically and politically—is not equally distributed throughout China. While China is the king of coal, coal is king in North-Central China. Although Beijing hopes to lessen its reliance on coal, local states in China, specifically in Henan and Shanxi, rely to varying degrees on coal for economic viability. When the national state implements policies that are in direct opposition to the economic goals of local states, what are the ways in which the local state interprets and enacts these laws? Using coal as the case, and conducting 10 months of ethnographic field work in the coal producing regions of China, I aim to show how environmental protection laws are enacted and interpreted by the state actors tasked with carrying out these policies. Following the deeds of local state actors and coal workers, I theorize from the and for the Global South while melding theories of the state and regional political economy to explain how the state functions with regard to other state agencies, labor, and capital.

ZONTAG, NOAM* (Taub Center for Economic and Social Policy Research, Israel)

SHAVIT, YOSSI (Tel Aviv University, Israel)

Socioeconomic Background, Early Childhood Education and Care, and Scholastic Achievement in Israel

This study concerns three main issues: (1) the association between the social and economic background of families and the kind of early childhood education and care (ECEC) their children attend. (2) The correlation between the kind of education and care attended by a child and their scholastic development which we measure at ages 10, 13 and at the end of secondary education. (3) The extent to which the type of education and care attended by children, mediates the effects of families' SES on scholastic achievements.

We employ the 2004 Israeli social survey which focused on ECEC and merged its records with administrative data on children's standardized test scores.

Preliminary results show a correlation between household demographic variables and the type of framework the children attended. Parents, those with higher incomes and those with fewer children are more likely to send their children to paid daycare. In addition, Educated and well off parents are more likely to send children to municipal kindergarten. Interestingly, parents with many children are also more likely to send them to municipal kindergarten, probably because they

are eligible for state subsidies. Finally, odds of Jewish children to be cared for in paid daycare or municipal kindergarten is significantly higher than the odds of Arab children.

While the proportion of the children attending paid frameworks (excluding municipal kindergarten) in ages 3-4 is significantly higher than in ages 0-2, the proportion decreases in ages 5-6 at which municipal kindergarten were (in 2004) compulsory and publicly funded. Among children in ages 5-6, around 90% attend municipal kindergarten. Therefore, it's reasonable to assume that the regression coefficients in the second part of the results are smaller than the coefficients in the first part, because the effect of demographic variables is weaker when it comes to publicly funded frameworks.

ZOUGBEDE, EMELINE* (University Paris Descartes, France)

Support, Coordinate and Win? the Cgt's Role in the Organization of Illegal Workers' Strikes

In a context of increasing deregulation of both labour markets and employment relations, different categories of workers organize public protests, mobilising to fight for their rights and to defend the right to a decent life. The processes of delocalising/relocating employment pools or maintaining an underemployed and exploited workforce structure these mobilizations in different regions of the world. On this matter, the French case presents no exception, particularly in the capital area (Ile-de-France). Illegal workers, a precarious but largely stabilized workforce operating in different sectors of activity, are self-organizing to demand for the regularization/legalization of their administrative and employment status, in order to benefit from existing legal protections against forms domination and subordination at work. Trade unions have played a central role in supporting such groups to take public action, often acting as an official relay for these protests/mobilizations. This paper will examine the role and position of the CGT in organising, structuring and supporting working illegal aliens strikes. Based on a detailed ethnography of the latest collective protests/mobilizations of illegal workers, we will seek to analyse and put into perspective the efforts carried out by the CGT to shape a collective group contributing to the smooth running of the protests/mobilizations, their success, as well as the establishment of more balanced power relations between the collective group, the employers and the competent administrative authorities. One of the challenges in organising the group ready to go on strike is to set the issue of working illegal aliens back at the centre of the public debate, thereby questioning the inclusive capacities of French society. In this talk, we will start-off from a Parisian case study which will be used in a comparative perspective to examine, more generally, the pre-eminence of trade unions in similar struggles opposing illegal workers to private or public institutions.

Assessing Dynamics of Segregation with Spatial and Threshold Models

Empirical studies that seek to asses why ethnic minorities' neighbourhood segregation—and its association with spatially concentrated deprivation—persists over time, are limited in the European context. Using a combination of individual microdata and aggregated neighbourhood data, the paper presents two methodological approaches that can serve to predict the evolution of neighbourhood ethnic segregation over time. These approaches consider, in different ways, three explanatory mechanisms that have been highlighted by the literature: ethnic groups' socioeconomic resources and how they interact with housing prices and residential structures; discrimination in the housing market; and individuals' preferences to live close to members of the same group (Logan and Alba 1993).

The first methodological approach considers Bayesian spatial models of segregation to predict observed segregation patterns. We consider local and spatial indices of segregation at two time points and aim at finding which factors help in predicting the observed patters using prior aggregate level information, while also considering segregation as a spatially autocorrelated phenomena. The second methodological approach is based on agent-based models and, more specifically, on Schelling's model of segregation. Schelling (1971) showed that individuals' preferences for in-group members—as well as their "thresholds of tolerance"—play a key role in spatial segregation. Using individual and aggregated neighbourhood data, we inform the Schelling model and make predictions of different segregation scenarios based different parameters.

For both analyses, we use the city of Bradford in the UK as a case study. Bradford is interesting from both policy and research perspectives: it has one of the

highest levels of spatial segregation of ethnic minorities (Zuccotti 2015); and it has also become the centre of debates on segregation following the 2001 riots occurred in predominantly Pakistani neighbourhoods.

ZUCCOTTI, CAROLINA V.* (CONICET, Italy)

Migration and Education in Argentina: Exploring Integration Patterns in the Global South

The migrant status of individuals is a central determinant of opportunities in education. In a context of growing South-South migration (Campillo Carrete 2013), understanding how different migrant-origin groups in the Global South perform in the educational system is fundamental for improving our understanding of social stratification and migrant integration theories. Argentina is a very interesting country to study these issues, not only because of the persistent educational inequalities the country still faces (Krüger 2013), but also because of the increasing presence of South American children in its educational system (Cerrutti and Parrado 2015). Research that looks at the educational performance of migrant-origin individuals in a comparative and large-scale perspective is, however, scarce (Dalle 2016).

The paper studies patterns of educational attainment and educational mobility of the most numerous South American groups, in comparison with majoritarian native Argentineans. The analysis is based on Census microdata (2010), in combination with aggregated Census data. Census microdata is formed by a 10% sample of the total population, and includes questions related to individuals, their households and the dwellings they inhabit. Neighbourhood information at the level of department and communes, obtained from aggregated Census data, can be attached to individuals. The combined analysis of different levels of variables (individual, household/dwelling, and neighbourhood) will allow answering questions related to the role of social origins (the focus of this paper) and of neighbourhood characteristics on educational achievements. Furthermore, the large sample will allow working individually with diverse migrant-origin groups (Peruvians, Bolivians, Chileans and Paraguayans). The study focuses on individuals that reside with at least one adult person, be it a father, mother or another adult relative; hence, I limit the analysis to children and young individuals in school age (including individuals born in Argentina of migrant parent(s) as well as young migrants).

ZULUETA, JOHANNA* (Soka University, Japan)

Ageing, Migration, and Graduated Citizenship: Examining the Case of Older Female Migrants in Japan

In the 1980s, Japan saw an influx of Southeast Asian women to work in the entertainment and service sectors, many of them coming from countries such as the Philippines and Thailand. Most of these women are now married or have been married to Japanese men who they met while working in Japan; others were introduced through mutual friends, and there were also those who came to Japan as marriage migrants. These women have made Japan their home and have now reached (or are close to) their "retirement years". Looking at the Philippine case, there are currently 38,508 Filipino women aged 50 and above in Japan, with more than 50% of them in their early 50s (Ministry of Justice, 2017). Many of these women have acquired permanent residency that gives them access to rights that are almost at par with Japanese citizens, except voting rights. Despite this, they are living as foreigners and non-citizens who deal with issues that any other ageing person in Japan deals with, e.g. social support in terms of welfare, pension, and access to healthcare. This study looks at some concerns that these older Filipino women currently have in Japan. There are several instances where these women rely on social welfare to support themselves and their children. Meanwhile, there are some women who are not eligible to receive retirement pension as they have not sufficiently paid their dues. Based on semi-structured interviews of these women, this paper explores the limits of social policies in Japan, particularly with regards to its aging migrant population. It examines how social policies and citizenship regimes illustrate a form of "graduated citizenship" (Ong 2006), by looking at this particular case. Moreover, the significance of gender in this whole notion of "graduated citizenship" is emphasized.

ZULUETA, JOHANNA* (Soka University, Japan)

Migration, Ageing, and Transnational Care Circulation: Examining the Case of Older Female Migrants in Malaysia

How do older female migrant workers engage in transnational care circulation when faced with the uncertainties of remaining in the country of work? In what ways do these older women migrants negotiate their desire to go home "for good" with the responsibility of caring for their family in the homeland? This exploratory study looks at older Filipino migrant women in Malaysia, one of the largest Southeast Asian groups in the country, who mostly work as domestic helpers. Most of these women have been employed by the same employer for a long period of time, thus enabling them to continue working through their late 50s to 60s. Based on semi-structured interviews conducted in Kuala Lumpur and Petaling Jaya in March and August 2018, this study looks at these women's experiences of ageing, which is thought of as a socio-cultural process that is not only tied to one's physical body, but is also linked to several factors such as gender, social class, as well as societal expectations on their familial roles. This study argues that the performance of care among these women migrants is seen to be more possible when it is done from a distance, where these older migrants are able to carry out their dual roles as breadwinners and nurturers for family and kin back in the homeland. While many of these older migrants hope to go back to their homeland "for good" in the near future, doing so prematurely would cause a break in the circulation of care between the migrant and her family, thus disrupting existing intergenerational relationships. This study hopes to contribute to existing literature on migration, transnational ageing, care, and transnational families by analyzing this specific Asian case.

ZVINGOWANISEI, TSITSI* (International Christian University, Japan)

"for Better or for Worse?": The Progress of Agricultural (Bio) Technologies, and the Experience of Small-Scale Farmers in Africa

Agricultural (bio)technologies are a fast-growing area of innovation, with prospects of finding new opportunities for sustainable societies. While other regions are experiencing remarkable progress, significant pockets of food insecurity are recurring (Food Aid Organization (FAO) 2015), and a worrying reality in most parts of Africa. Agricultural production is low and is called upon to decrease, raising the status of Africa as a new frontier for agricultural development. Regardless, since small-scale farmers play a decisive part in securing food security in Africa, this paper, therefore, explores agri-biotechnology initiatives and their impact on food security drawing upon local narratives of small-scale maize farmers in Zimbabwe and Kenya comparing the cases of Honde Valley and Kericho respectively. A critical examination of how emerging technologies replicate social inequalities and vice versa is conducted to reveal why agricultural (bio)technologies adoption and utilization is slow in Sub Saharan Africa.
